The British beet sugar industry. A. J. V. UNDERWOOD. *Food Manuf.* 1, 76-77 (1927). E. H.

The algebraic theory of the extraction of juice by milling. NOEL DEBERR. *Intern. Sugar J.* 30, 247-59 (1928).—The development of the algebraic expressions obtaining in systems of simple and compd. imbibition is given and also expressions which may be useful in establishing standards of comparison whereby the operation of a milling plant can be studied and controlled, and the results of different mills can be compared.

W. L. OWEN

Notes on the method used to obtain seedlings of sugar cane in Hawaii. J. A. VERRET, A. J. MANGELSDORF, W. TWIGG SMITH AND U. K. DAS. *Intern. Sugar J.* 30, 80-2 (1928).—The freshly cut tassel-bearing stalks are preserved in a soln. of SO_2 until the seed becomes mature enough to plant. Selfing takes place in the SO_2 soln., and in a no. of instances it has been observed that the tassel had not emerged before the stalk was placed in soln. and isolated. The strength of soln. used is 0.03% of SO_2 in water, but Lahaina cane keeps longer in a soln. of 0.5 that strength.

W. L. O.

Determination of available sugar in cane. G. SYLMANS. *Algem. Synd. Suikerfabr. Nederland.-Indie, Handel. 10th congres, 1st Gedeelte, 15th Aftn.* 31 pp.—To get an idea of the sugar losses which take place between the cutting of the cane and the end of the milling operation, and also to calc. probable yields of fields to be cut, a method of cane sampling in the field is proposed, based on probability considerations and on actual tests. A field of about 8 bouws is divided into 200 plots. Cane samples are taken from 25 of these plots, distributed systematically. Each sample consists of 20 stalks; 4 of these samples are taken from every plot, and each is analyzed separately. For smaller or larger fields the system of sampling must be modified somewhat. The samples are ground in a power-driven lab. mill, juices and bagasse are weighed and analyzed, and the available sugar is detd. by the usual formulas. Examples of analyses are given. These show that precautions must be taken to prevent evapn. and loss of juice by spattering during the grinding operation. The sampling method may also be used to det. the degree of ripeness of cane in the field.

F. W. ZERBAN

Rapid and accurate determination of ash electrically using the "Salometer." ANON. *Intern. Sugar J.* 30, 205 (1928).—The detn. of ash in the different products, and at different stages of the sugar-manufg. process, is very important, but because of the time required for such analyses, these data have not been obtained as frequently and as systematically as they should. Recently, however, the detn. of ash by cond. methods has made great progress (cf. *C. A.* 21, 1025, 2569, 2394). An app. for detn. of ash, known as the "Salometer" has been recently devised. It consists of a bridge, giving direct readings in ohms, a pair of telephones, a hummer, 2 small dry cells and a pair of dipping electrodes of special construction.

W. L. OWEN

Determination of sulfur dioxide in sugars, golden sirup, glucose, etc. ANON. *Intern. Sugar J.* 30, 259-62 (1928).—In their investigation of the methods of SO_2 detn. in food products the Committee of Chemists in the Manufg. Confectioners Alliance had first distributed samples of confectioners glucose and starch among the members of the committee for analysis. The specified method consisted in the ordinary distn. with H_3PO_4 , collection of the distillate in I soln., using an ordinary still head and condenser. Some of the analyses were low, which was attributed to oxidation in the distg. flask, and to the escape with air in the receiving flask. Oxidation in the flask could be greatly decreased by boiling very rapidly but this necessitated the use of a special still head, and a bubbler form of adapter. A description of the special still head and adapter and of the method of operation is given.

W. L. OWEN

The Clerget coefficients in diastatic inversion. The point of easy filtration and the p_H of the reducing sugars formed. EMILE SAILLARD. *Chimie et industrie* 19, 599-601

(1928).—The work of various investigators on the detn. of the Clerget divisor is briefly reviewed. The amts. of SO_2 and of AcOH which must be added to beet juice to obtain easy filtration are chemically equiv. and correspond to a p_H value of 4.05. The amt. of inversion produced by this acidity in 1 hr. at atm. temp. is nil or negligible, while in 30 min. at 85° it may reach 0.27% reducing sugars.

A. PAPINEAU-COUTURE

A comparative standard for factory efficiency. S. S. PECK. *Intern. Sugar J.* 30, 198-201(1928).—Efficient factory operations depend principally on the results in 7 directions, viz., (1) a high extn. of sucrose from the cane by the mill, (2) clean mills, juice pans, etc., with a min. of deterioration of the expressed juice, (3) efficient clarification with the highest possible removal of non-sugars, (4) correct reaction of the juice to minimize inversion losses, (5) good equipment and no mech. losses as by entrainment, (6) low losses at the filter press station both as regards sucrose left in the cake, and destructive losses, and (7) a low-purity final molasses. The basis of comparison should begin with the sucrose % cane, which should be detd. by weighing the sucrose in the extd. juice, and adding this to the sucrose in the calcd. bagasse. The first juice expressed from the milling train, being the only one free from possibilities of deterioration, should be taken as the basis of the purity of the liquor to be treated. W. L. O.

Observations on the value of balancing the total soluble solids of the cane sugar factory. E. E. BATTELL. *Intern. Sugar J.* 30, 89-92(1928).—It is the general custom to base lab. reports of sugar-mill operations on a detailed account of the polarization losses at the several stations throughout the factory. The sum total of these losses and the polarization recovered in com. sugars is presumed to represent a balance of polarization % cane. For the purpose of ascertaining the actual relative technical value of different factories, this method may be improved upon by extending the balance sheet to include the total sol. solids. B. reconstructs the solids in the several products and by-products into terms of cane, and also calcs. the composite purity of the com. sugars plus the final molasses. The application of this system of control is illustrated by the example of 2 factories reporting yields of 12 and 11% of com. sugars, resp., from cane having the same % fiber, Brix of undild. juice, and purities of com. sugars and final molasses. Both factories report the same aggregate polarization loss % polarization of the cane. Evidently the factory obtaining 12% of com. sugar on cane is operated to better technical advantage than the other either by reason of more efficient equipment, or more skilful manipulation or a combination of these factors. The lab. reports based upon polarization balance do not disclose this variation in technical efficiency and it is of great technical importance for the cane sugar industry to adopt a system of reports which will include a balance of the total sol. solids received in the cane.

W. L. OWEN

Raw-juice strainer and unstrained juice pumps. W. J. DIEM AND CHAS. COWAN. *Intern. Sugar J.* 30, 72-5(1928).—The ordinary chain and slat type of juice strainer has always been regarded as a source of infection of mill juices and of much trouble otherwise, because of its inaccessibility, and the difficulty of repairing it. Before this type of strainer could be dispensed with, it was first necessary to elevate the juices intended for return maceration, and no pump has heretofore been found which would handle the unstrained juice holding a large amt. of cush-cush. In recent yrs. a pump has been developed which is capable of handling the unstrained juice from modern mills. These pumps are steam driven and direct acting, are self-cleaning, and there are no dead pockets in which juice may remain and become inverted. In a series of tests on the increase of acidity per 100 Brix through both tandems of a factory, the increase in acidity was much lower with the unstrained juice pump than in the mill equipped with the usual strainer. Juices from the 1st and 2nd mills are elevated by an unstrained juice pump, into the maceration juice distributor. These juices are distributed over a set of screens just below the distributor. The angle of these screens is adjustable, although the angle of 37.5° has been found to be best for the self cleaning of the screens. Four figures are given illustrating the design of the pump, and method of circulating the juices over the straining screens.

W. L. OWEN

The Gilchrist process of clarification. J. J. SEIP. *Intern. Sugar J.* 30, 82-4(1928).—While it cannot be stated positively that elec. neutralization, dehydration and adsorption are all involved in the customary defecation of cane juice with lime and heat, it is quite probable that they are. It is probable that adsorption of colloids by Ca phosphate plays a very prominent if not the largest part. The question is often raised of whether a greater elimination of colloids and non-sugars would result in the production of better grades of raw sugars. It has been conclusively demonstrated that cold liming of juice is subject to wide variations, from a p_H of 3.1 (burnt cane) to 9.5 and more. Even with the most modern methods of mixing it is not possible to distri-

bute the lime evenly in the raw juice and as a result alk. and acid zones exist. The Gilchrist process is designed to overcome the defects of cold liming and irregular mixing of lime in cane juices. When raw juices are heated to the isoelec. point of 5.0–6.1 p_H , the complex org. substances are coagulated. The 3 factors necessary for the efficient coagulation or flocculation of any liquor are (1) temp. control; (2) very slight excess of reagent (lime); (3) controlled agitation to build the flocs to their max. size. The advantages of hot liming with sucrate soln. are (1) it gives larger flocs, and inclusion of finer particles within the flocs; (2) better flocculation; (3) greater colloidal elimination as proved by dye values; (4) lighter colored juices; (5) better and uniform p_H control; (6) reduction of lime salts; (7) better quality of sugars; (8) greater recovery; (9) improved defecation of sirups.

W. L. OWEN

The removal of gums by various methods of clarification. MAURICE BIRD. *Intern. Sugar J.* 30, 196–7(1928).—A comparison is made of the gum content of the juices of 2 factories, one of which employed the superheating method of juice treatment, while in the other the juices were limed cold, and then heated to only 212° F. More gums were eliminated, by sodium phosphate treatment, from the juice which had not been clarified by superheating. With "superheat" the rise in recovery of sugar % sugar in the juice and the increase in filterpress cake % cane were very marked, and convincing of the removal of appreciable quantities of deleterious non-sugars by this treatment.

W. L. OWEN

Treatment of beet-sugar-factory effluents. O. SPENGLER. *Intern. Sugar J.* 30, 267–72(1928).—The simplest method of avoiding press and diffusion waste water effluents consists in their reutilization in the freshest state possible either separately or jointly after depulping and settling. But the org. acids increase in these effluents and contribute to the corrosion of the Fe app. The reutilization process is used in only a few places in Germany, and most factories are forced to discharge both kind of effluents, after clarifying them, into the rivers. Certain methods such as the Proskowetz process, and the Heinhold process in which the waste water is treated with milk of lime and then run into settling ponds, from which it is later discharged to a shallow drained irrigation field, and then stored in tanks, are no longer employed. The Moller-Folsche process depends upon the fermentation of the effluents in special ponds followed by the addn. of lime and then treating on irrigation fields, but this process has great disadvantages also. It is now generally considered advisable and cheapest to treat the various effluents separately, the particular method to be adopted depending upon local conditions. Some of the German factories store the diffusion and pulp press water in ponds of sufficient capacity to receive all the water used during the campaign. A factory with a daily production of 1750 tons should have ponds with a capacity of 140,000 cu. ft. According to the latest developments there are 2 methods for the disposal of the most troublesome effluents, the pulp press and diffusion waste water, the double fermentation or Hildesheim process, and the fermentation and putrefaction or Salzwedel process. The double fermentation process consists of a repeated fermentation process during which the carbohydrates are decomposed and transformed.

W. L. OWEN

Treatment of effluents from beet sugar factories. B. J. OWEN. *Intern. Sugar J.* 30, 75–80(1928).—The normal sugar factory in Great Britain operating the diffusion process for 3 months in the yr. at the rate of 1000 tons per day discharges approx. 3.5 million gallons of effluent daily from all of its processes. This consists of: (1) conveying and washing water; (2) diffusion waste water; (3) pulp press water; and (4) general waste water from the washing of floors, etc. The conveying and washing water, which is by far the greatest portion of the effluent, and which contains besides earth, small roots, etc., considerable amts. of dissolved and suspended org. matter, is now regarded as the most objectionable of the effluents. The 1st step in the disposal of these effluents is the removal of the suspended matter before any decompn. can take place. Further treatment of the bright effluent is then necessary in order to reduce the org. matter in soln. to such an extent as to render it innocuous. This may be done by 2 methods, viz., (1) treatment either biol. or chem. so as to bring the whole of the effluent to a condition which insures its discharge into any river without objectionable results, (2) a system of recirculation of the clear bright effluent so that only a small proportion if any need be discharged into the river. The plant used in the expts. was a Brackett 2-stage cup-type screen and a Pennell Wyllie filter. Uniformly successful results were obtained. With the normal effluent from the beet wash the screen removed all but the fine mud. The larger mesh retained the whole of the beet tails and leaves in a cleaned wash condition. Trials with the filter consisted in pumping the screened effluent at the rate of 600 gallons per hour through the 4 strainers and 2

scrubbers. With the addn. of 90 grains of lime per gal. a clear bright effluent was obtained, colorless and contg. no suspended matter. W. L. OWEN

Extracts from a laboratory note book. J. P. OGILVIE. *Intern. Sugar J.* 30, 120-6 (1928).—There are 2 classes of *decolorizing vegetable carbons* on the market at the present time, viz., (1) very expensive and powerful carbons which are not intended to be revived, and (2) less expensive carbons, which are less active, and which require a special installation for their revivification. The method used in detg. the decolorizing power of these substances is to compare their effects upon a standard molasses soln. with that of a standard C, e. g., Carboraffin or one of the grades of Norit. After mixing the carbons in the soln. to be treated, the latter are placed in a water bath at 95° for exactly 15 min. Among the carbons giving the highest decolorizing power are "Carboraffin," "Anticromos," "Supra Norit 5X," "Supra Norit 3X" and other grades of Norit, "Suchar," "Radit," etc. The desideratum of refiners is a C which is cheap enough to throw away, after one use, and which will adsorb 10-20 times as much color as bone black. Comparisons of the decolorizing values of some infusorial earths have shown that a German sample has an equivalent of 8, as referred to "Superior Norit" as a standard. The value of $\text{Na}_2\text{S}_2\text{O}_4$ in sugar manuf. makes its analysis of considerable importance. Of the various methods used the iodometric titration method is to be preferred, because results are not vitiated by the presence of bisulfites. When the cost of hyposulfites and bisulfite is considered in reference to their comparative decolorizing powers it would seem that the latter would prove the cheaper decolorizing agent. From analyses of many samples of lime, it has been found that many of them are too high in org. impurities. The quality of kieselguhr can best be detd. by the estn. of its apparent d., its performance under the subsiding test, and the observation of its microscopical appearance. The detn. of As in materials used in the manuf. of sugar is desirable especially as regards lime, coke, S and superphosphate. W. L. OWEN

Distilling vinasses (Brit. pat. 277,932) 16. Decolorizing sirups (Brit. pat. 278,485) 13.

THIEME, JOHANN GOTTFRIED: *Studies in Sugar Boiling*. Translated from the Dutch by O. W. Willcox. New York: Facts about Sugar. Price \$3 00.

Refining sugar. RAFFINERIE TIRLEMONTAISE SOC. ANON. Brit. 278,302, Sept 30, 1926. Sugar crystals which are practically freed from adhering sirup but which are not quite colorless are decolorized by mashing with a satd. or nearly satd. colorless sugar soln. The soln. is removed after decolorization of the sugar is effected and may be then decolorized for treating another batch of sugar.

Apparatus for bleaching saccharine solutions by gases from burning sulfur. C. G. SONGY and P. G. SONGY. U. S. 1,671,844, May 29.

Saccharifying wood. INTERNATIONAL SUGAR & ALCOHOL CO., LTD. Brit. 278,450, July 9, 1926. Highly concd. HCl such as 40% acid and HCl gas are employed and sufficient HCl is used to convert only a portion of the cellulose; the acid-moistened mass is then treated in a second stage of the process with HCl of somewhat lower concn. (suitably about 38%) to complete the saccharification.

Saccharification of wood. E. FARBER and T. W. M. POND. Can. 276,843, January 3, 1928. Wood is converted into sugar by first treating the wood with concd. HCl and HCl gas in quantities insufficient to effect the complete conversion into sugar, and then completing the conversion by treatment with HCl of medium concn.

Starch from corn. PENICK & FORD, LTD. Brit. 277,400, April 19, 1926. The bulk of the water which has passed over the starch tables and has afterward been sepd. from the gluten is sterilized to avoid fermentation, and is reused with make-up water to treat fresh starch-bearing material. Numerous details are described and a flow-sheet of the process is given.

Starch from corn. CORN PRODUCTS REFINING CO. Brit. 277,572, April 8, 1927. Corn or other starch-bearing material is steeped and disintegrated, germs, bran and fiber are sepd., the starch is tabled to remove gluten and water, filtered with fresh water to remove solubles and the water from the gluten is used for treating further material (a part in the steeping and a part in the germ and coarse slop prepn.), while the filtrate from the starch is preferably heated and used in the fine slop sepn. An app. and numerous details are described.

ALLEN ROGERS

Critical study of the biochemistry of soaking. I. Study of the changes occurring within the skin. E. R. THREIS AND E. L. McMILLEN. *J. Am. Leather Chem. Assocn.* 23, 226-33(1928).—Cured domestic hide, cut into $\frac{1}{8}$ in. cubes, was soaked from 0 to 120 hrs. at 25°, and changes in distribution of N, according to the methods of Hausmann and of Van Slyke, were detd. Amide and melanin N remains constant, N of non-basic amino-acids increases, and N of basic amino acids decreases, due to decompn. of arginine, lysine, and histidine by bacterial or enzyme action. Amino N of monobasic acids increases, and imino N decreases.

H. B. MERRILL

Depilation by means of the enzymes of the mold. GIORGIO ABT. *Conceria* 35, No. 1000, Tech. Pt. 33-37(1927); cf. *C. A.* 22, 1056.—The protease produced by *Aspergillus oryzae* causes a very efficient depilation. The hide is immersed for 24 hrs. in a 1% infusion of "Piltan," a dry powder contg. the enzyme. The temp. must be above 20°, as the protease loses its activity below 18-19°. As an antiseptic, 0.4% boric acid and 0.4-0.8% NaHCO_3 are added. The optimal p_H for the protease to act on hides is around 8.0.

GUENTER SCHWOCH

New method for determination of insolubles in tanning extracts. ANDREW TURNBULL. *J. Am. Leather Chem. Assocn.* 23, 224-5(1928).—The liquor, dild. to the usual analytical strength, is filtered on a Buechner funnel provided with a fretted glass filter disk with the aid of kaolin. Results yielded are somewhat lower than those yielded by the filter candle, and considerably lower than those yielded by the filter paper method.

H. B. MERRILL

Utilization of tanning materials containing a large amount of soluble nontannins. V. S. SADIKOV AND P. A. YAKIMOV. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 6, 40-63.—While the bark of badan (*Saxifraga crassifolia*, *Bergenia crassifolia* Engl.) is as rich in tannins as quebracho, it gives an aq. ext. which is so rich in substances which cannot be absorbed by hides that its utilization in tanning is impracticable unless the tannins and the non-tannins are sepd. from one another. To effect this sepn. 2 methods have recently been proposed, namely that of A. I. Smetkin and that of P. A. Yakimov. An investigation has shown that both methods have serious defects and a new method, which is based on the methods of Smetkin and Yakimov, has been worked out by the authors. The finely powdered bark of badan is treated in the cold with the calcd. quantity of Ca(OH)_2 needed to bind only the most sol. part of tannins which is capable of dissolving in cold water. Then the mass is treated with cold water in closed vessels under a layer of water so as to prevent the oxidation of tannins, which is very apt to take place in alk. soln. Almost the total amt. of non-tannins, which consists of crystalloids, diffuses through the cells of the bark and dissolves. Next comes the treatment of the solid mass with hot water in the presence of oxalic acid or of NaHSO_4 taken in the quantity necessary to decompose the Ca tannate formed, which adheres to the cells. A series of lab. expts. shows that it is possible in this hot-water extn. to obtain valuable exts. contg. tannins and non-tannins in the ratio 5:1 instead of the ratio 0.9:1 obtained by an ordinary aq. extn.; the ext. contains over 60% of the tannins originally present in the bark. The cold-water ext. which belongs to the first treatment by this method contains 30% of all the tannins and about 6% of the sugar. The new method has been applied also to other Russian tanning materials, particularly to *Skalice gmelini*, which contains tannins and nontannins in the ratio 2:1, *Polygonum alpinum*, *Rheum tataricum*, *Rumex confertus*, *Salix acutifolia* (ivy), pine bark. The results obtained on a lab. scale were very satisfactory. Numerous tables and detailed exptl. data are given. The method has not yet been tried on a factory scale.

BERNARD NELSON

Russian resources in tanning materials. P. A. YAKIMOV. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 6, 5-39.—In 1925 U. S. S. R. has consumed 34 thousand tons of tanning materials of which 80% were imported from abroad. In view of this unsatisfactory position Y. made a study of the possibility of greater utilization of indigenous Russian plants for tanning purposes. Practically all these plants contain a very high proportion of non-tannins extractible together with tannins, thus lowering the value of exts.

BERNARD NELSON

Titration of tannic acid. S. KRISHNA AND NATHU RAM. *Ber.* 61B, 771-ON(1928).—Tannic acid gives an orange ppt. with an excess of acid TiCl_3 soln. The excess of TiCl_3 may be titrated back with a known ferric alum soln. Gallic, salicylic and mandelic acids also ppt. with TiCl_3 but the ppt. is sol. in dil. HCl , whereas the tannate is dissolved

only by HCl more concd than 2N This new method shows that the titration with hide powder gives only 90% of the tannates present, and that this titration should not be used when gallic acid is present, because the latter is adsorbed on the hide substance. The $TiCl_3$ method has been successfully used to titrate the tannins in the extracts of various barks containing tanning and non-tanning hydroxy acids.

C. C. DAVIS

Rubber inventions and processes. ANON. *Bull. Rubber Growers' Assoc.* 10, 237-9(1928)—Seven British patents are described

C. C. DAVIS

The Italian rubber industry. H. B. NEWMAN. *Rubber Age* (N. Y.) 23, 203-4 (1928).—A survey of present developments.

C. C. DAVIS

Use of "Moac" in the rubber industry. RUDOLF DITMAR. *Caoutchouc & gutta-percha* 25, 13,968(1928)—"Moac" is a very finely divided form of mica which when used as a dusting agent gives a silky luster resembling that of Al powder. Because of its ability to increase the dielec. const. of rubber when used as a filler, it is also useful in rubber goods for elec. use. When the surface of rubber is swollen slightly with C_6H_6 and "Moac" is rubbed in, the rubber is protected from subsequent oxidation.

C. C. DAVIS

Earlier observations and new hypotheses on (the structure of) rubber. J. DUGUÉ. *Rev. gén. caoutchouc* 1928, No. 40, 3 9.—A review of various aspects of the subject is followed by the development of a new hypothesis to explain the tackiness, plasticity, elasticity, hysteresis and structure of raw rubber. This is based on chem. activity resulting from a peculiar spatial arrangement of the atoms in the rubber mol., a unique structure which is most comprehensible by reference to the original spatial diagrams.

There are no double bonds and the mols. are constructed of $\begin{matrix} H_2C & & CH_2 \\ & \diagdown & / \\ & C & \\ & / & \diagdown \\ H_2C & & CH_2 \end{matrix}$ nuclei.

Within the mols these nuclei are united through the CH_2 groups, but on the extremities or on the exterior (depending on the spatial structure), certain CH_2 groups are unsatd. and exert forces of attraction which, in the presence of other similar groups, are manifest as tackiness. With this as a basis, the other characteristic properties are explained

C. C. DAVIS

Investigations of sodium fluosilicate. I. R. VAN DILLEN, C. KNAUS, G. M. KRAAY AND R. REHL. *Arch. Rubbercultuur* 12, 61-125(1928). (In shorter form in English 126-54.)—The investigations include a study of the most economic method of coagulation with Na_2SiF_6 , the corroding action of Na_2SiF_6 on Al, the relation between the pH value and coagulation, the influence of Na_2SiF_6 on the phys. properties of rubber, and the in-

fluence of Na_2SiF_6 on the tendency of rubber to become moldy. Though too close a comparison between the small and large scale expts. is not justified, owing to certain variables in the methods and technic on different plantations where the expts. were made, the large no. of expts. warrant certain general conclusions. Coagulation with Na_2SiF_6 of latex contg. more than 15% dry rubber was nearly always incomplete, the serum remaining milky, and contg. rubber even on standing 24 hrs. after a large dose of Na_2SiF_6 . Latex with only 12% rubber was completely coagulated in 24 hrs. and sometimes in a shorter time. In all expts. 8–10 g. of Na_2SiF_6 per kg. of dry rubber were required for the satisfactory coagulation of latex contg. 12% rubber, and even then the serum was sometimes milky. In general the coagulating power of Na_2SiF_6 was very sensitive to small variations in the state or compn. of the latex, e. g., its p_H value. Expts. showed that Na_2SiF_6 solns. have an acid reaction (cf. *J. prakt. Chem.* 32, 300 (1885)) because of hydrolysis, e. g., 0.1 and 0.5% aq. solns. showed p_H values of 3.1 and 3.4, resp., at 30.5°. The clearness of the serum and its p_H value were closely related, the most complete coagulation, without loss of rubber, occurring in the range p_H 4.4–4.5. This range is most readily controlled by diln. of the latex. This acid reaction causes aq. Na_2SiF_6 to attack Al, so that Al equipment is impracticable. Comparative tests of the loss of wt. of Al in different solns. for 24 hrs. showed the following % losses: water, 0.0; 0.5% Na_2SiF_6 , 0.2; 0.1% Na_2SiF_6 , 4.6; Na_2SiF_6 serum, —0.9; 5% MgSiF_6 , 0.1; 0.1% MgSiF_6 , 2.8; 2.5% HCO_2H , 0.2; HCO_2H serum, 0.0; 5% AcOH , 0.1; 5% NaHSO_3 , 2.6. The gain in wt. with Na_2SiF_6 serum was due to a deposit on the Al. This Na_2SiF_6 serum subsequently ppts. a white flaky substance contg. 43% ash. The variable losses with different concns of Na_2SiF_6 and of MgSiF_6 depend upon the deposition of products on the Al, which temporarily protect the latter from further attack. The influence of Na_2SiF_6 on the formation of air bubbles remained unsettled, though evidence indicated that it tends to diminish bubble formation. Aside from a tendency to retard the rate of vulcanization, Na_2SiF_6 had no material effect on the phys. properties of rubber. An advantage of Na_2SiF_6 was found to be its bleaching action, as a result of which only about 0.5 the usual quantity of NaHSO_3 need be used for producing pale crepe. On the other hand Na_2SiF_6 caused a temporary stickiness during creping of the coagulum, but this was no longer manifest in the dried crepe. Used as a coagulant alone or in combination with acid, Na_2SiF_6 had no influence on the tendency of rubber to become moldy, whereas immersion of sheeted rubber for a short time in concd. aq. Na_2SiF_6 greatly diminished any subsequent growth of mold. Certain evidence, however, showed that this immersion increased the formation of air bubbles, in which case the economy of Na_2SiF_6 as a disinfectant is seriously impaired. The advantages of Na_2SiF_6 as a coagulant rest on its use in the solid form, its tendency to reduce air bubbles, and its economy compared with HCO_2H ; its disadvantages are the necessary diln. of the latex and the consequent larger app., and its corrosive action on Al app. Though coagulation by Na_2SiF_6 is cheaper than by HCO_2H , its general use is not recommended at present, and only where abnormal air bubble formation is encountered is it recommended as a coagulant, and only in cases of serious moldiness is immersion in aq. Na_2SiF_6 recommended. C. C. DAVIS

The behavior of Prussian blue and some other ferrocyanides in rubber. J. R. SCOTT. *India Rubber J* 75, 549–50 (1928).—The investigation includes (1) the effect of Prussian blue (I), Turnbull's blue (II), $\text{Pb}_2\text{Fe}(\text{CN})_6$ (III) and $\text{Zn}_2\text{Fe}(\text{CN})_6$ (IV) on uncured rubber; (2) the behavior of I and II during mixing and (3) the effect of I, II, III and IV on the phys. properties of cured rubber. The particle size of III and of IV were 1.3 and 3.5 μ , resp. I and II had a particle size of approx. 0.25 μ , but whereas I dispersed easily and completely, II dispersed only with difficulty and incompletely, the reverse of their behavior in water. Their dispersion was not influenced by the presence of S in the rubber. However, rubber contg. I but no S became soft and sticky when milled, whereas rubber-I-S mixts. were too tough and elastic to sheet. The latter effect was not a result of incipient vulcanization, for analysis showed the absence of combined S. When stored for a few weeks or heated to 90° for 1 hr., rubber-I mixts. became very soft and fluid, while rubber-I-S mixts. became tougher and more elastic, changes probably identical with those occurring during mixing. When immersed in C_6H_6 , rubber-III and rubber-IV mixts. became viscous and diffused slowly, and in general they behaved like masticated raw rubber. On the other hand, rubber-I and rubber-II mixts. retained their structure, swelled at a continuously diminishing rate and in general behaved like slightly vulcanized rubber or rubber-C black mixts. Rubber-I, rubber-II, rubber-III and rubber-IV mixts. with and without S, and in turn with and without quinol (as antioxidant) were stored in air and *in vacuo*. In air and without S or antioxidant, I and II accelerated oxidation so that the rubber-I and rubber-

II mixts. became tacky and resinous, whereas **III** and **IV** were without influence, showing that ferrocyanides as a class do not accelerate the oxidation of rubber. The oxidation induced by **I** and by **II** is greatly retarded, though not inhibited, by **S** and by an anti-oxidant. Rubber-**I** and rubber-**II** mixts. appeared black by reflected light, and the n values of **I** and **II** were found to be 1.55 and 1.54, resp., the same as rubber, so that the mixts. appeared black for this reason. With the addn. of a white pigment, however, the mixts. became blue. On hot vulcanization, rubber-**S** mixts. contg. **I** and **II** became green and brown-green, resp., as a result of decompn. of **I** and **II** by heat, rubber, rubber resin and **S**. **I** and **II** did not have a reinforcing effect in keeping with their fineness, but no evidence could be found that this was a result of agglomeration. C. C. D.

The rotatory power and the melting point of the resins in gutta-percha, balata and allied gums. S. MINATOYA AND H. KANEKO. *Researches Electrotech. Lab.*, Tokyo, Japan, No. 223, 18 pp. (1928).—The authors collected 26 kinds of gutta-percha, 8 kinds of balata and 3 varieties of allied gums, such as African flake, jelutong and re-boiled jelutong. Their resinous substances were sep'd into the following 3 groups by means of soly. differences in abs. alc.: (1) fluavil, (2) spherical alban, (3) needle alban. The rotatory power and the m. p. of these 3 groups of resins in all the samples were det'd. The results of the expts are summarized as follows. The m. ps. of fluavils of gutta-percha lie between 37° and 90° and they can never be found in liquid form at room temp. Fluavils of balata, on the other hand, are always obtained in liquid form at room temp. with only 1 exception, the fluavil of F. A. Q. Iquitos reboiled block balata has a m. p. of 43°. The m. ps. of spherical alban of gutta-percha lie between 54° and 200°. The needle alban content in gutta-percha is generally so small that the m. p. detn. is difficult, but 2 kinds of gutta-percha, i. e., Kamper white and Siam white, contain just enough of the needle alban to measure the m. ps., which were 192° for Kamper white and 90–96° for Siam white. Generally speaking, the m. ps. of needle alban are higher than those of spherical alban. The quantity of spherical and needle alban in balata is insufficient to det. the m. p. The $[\alpha]$ values of fluavils of gutta-percha lie between 32.23° and 58.33°, with 2 exceptions, Bagen Seen and Pokan Seen. The $[\alpha]$ values of the resins of the latter 2 kinds are very low, like with those of balata; i. e., 21.66° for Bagen Seen and 18.00° for Pokan Seen. The $[\alpha]$ values of fluavils of balata, however, are generally low and lie between 13.83° and 37.33°. The $[\alpha]$ values of spherical alban of gutta-percha lie between 39.20° and 56.75°, while those of balata lie between 20.00° and 35.00°. The needle alban of gutta-percha and balata are not only insufficient in quantity to det. the specific rotation, but are difficult to dissolve in solvents, such as C_6H_6 , for the purpose of measuring optical rotation. W. OGAWA

Puncture proofing pneumatic tires. CHAS. E. MULLIN. *Textile Recorder* 45, No. 538, 65(1928).—A discussion of the products offered and the results obtained.

Automatic regulator for vulcanizers. ANON. *Engineering* 125, 406(1928).—The app. which is described and illustrated (Drayton Regulator and Instrument Co., W. Drayton, England) automatically controls the rate of increase of temp. to a max., maintains the temp. const. at this max. point for the desired period of time and at the termination of the cure shuts off the steam supply, signalling the completion of the operation. C. C. DAVIS

Studies of the aging of vulcanized rubber. IV. Relation between wave length of light and the deterioration of vulcanized rubber. TAKEJI YAMAZAKI. *J. Soc. Chem. Ind. Japan* 30, 804–13(1927).—Samples of vulcanized rubber were exposed to sunlight filtered through 1 of 4 glass plates, which were transparent down to 2900 Å. U., 3130 Å. U., 3300 Å. U. and 4360 Å. U., resp. Since heating of the sample by the light was unavoidable, the effect of heating alone was exam'd. in control expts., in which the sample was kept at 70–71° for 150 hrs. in darkness. The color of the rubber became darker by mere heating, but when the rubber was exposed to sunlight at 60–70°, the change in color was far more remarkable. The higher the degree of vulcanization, the greater was the change in color. Moreover, the rubber was hardened by the action of light. The shorter the wave length of the light and the higher the temp., the sooner did hardening occur. The action of light of 4300 Å. U. was very weak, except for over-vulcanized rubber, which was noticeably hardened even by light of longer wave length. The acetone ext. increased with the time of exposure, the rate of increase being less when light of longer wave length was used. In some cases, the acetone ext. reached a max. and then decreased. It was considered that increase in acetone ext. was due principally to the oxidation of the rubber, and that the decrease in acetone ext. by the further exposure was due to a change in part of the oxidized products into substan

insol. in acetone. A remarkable decrease in free S by the action of light and heat was also noticed. Y. NAGAI

Soil erosion [in rubber cultivation] (ASHPLANT) 15. Thermoplastic compositions for shoe toe stiffeners (Brit. pat. 277,719) 18.

Rubber. G. H. CARNAHAN (to Intercontinental Rubber Products Corporation). U. S. 1,671,570, May 29. Guayule plant or similar material is ground in successive stages with different proportions of water, to sep. rubber, bagasse and "cork." An app. is described.

Coagulating latex. BATAAFSCHE PETROLEUM MAATSCHAPPIJ AND F. R. MOSER. Brit. 278,395, April 7, 1926. Natural emulsions such as rubber latex are coagulated by the method described in Brit. 245,418 (C. A. 21, 319). Rubber latex contg. NH_4 is added to a soln. of AlCl_3 and the colloidal $\text{Al}(\text{OH})_3$ formed produces a protected dispersion of the latex. Fillers, vulcanizers, accelerators, preservatives and the like may be added.

Treating latex, etc. K. D. P., LTD. Brit. 277,373, Sept. 10, 1926. Latex or similar material (which may be mixed with fillers) is dried while continuously exposing new surfaces and heating the mass, *e. g.*, on rollers or endless belts or by slitting and folding a rolled sheet.

Compounding latex with fillers. K. D. P., LTD. Brit. 277,374, Sept. 10, 1926. In compounding latex with active fillers such as lampblack the filler is added while the latex is manipulated continuously to expose fresh surfaces and with simultaneous drying. A mixt. may be formed of rubber as latex 100, tar 5, ZnO 20, S 3, and palm oil 0.6 parts and 200 parts of gas black may be added to this gradually while drying.

Rubber coatings. K. D. P., LTD. Brit. 277,375, Sept. 10, 1926. Surfaces such as those of wood, metal, stone or leather are sprayed with latex and water is simultaneously evapd. from the latex by application of heat. The compn. of the latex may be varied during the spraying to produce films of varying characteristics.

Molded rubber articles from latex. E. A. HAUSER (to K. D. P., LTD.). Brit. 277,376, Sept. 10, 1926. Latex is sprayed onto the surface of a mold and water is simultaneously evapd. by heating. Artificial dispersions as well as natural latex may be used and auxiliary ingredients may be added and reinforcing fabrics or the like may be embedded in the material for making tires or other articles.

Composite rubber sheet patches for tires, etc. R. D. KAMDM and J. LEADBITTER-SMITH. Brit. 278,192, Oct. 25, 1926. A glass plate or former is dipped into rubber soln. to form a layer and a sheet of vulcanized rubber previously treated with rubber soln. until tacky is pressed on the layer. Subsequently the materials are stripped from the glass.

Fiber-reinforced rubber articles. W. B. WESCOTT (to Rubber Latex Research Corporation). U. S. 1,671,914, May 29. Fibrous material such as a "fabric," felt or bat is passed through a latex bath into an acid bath, coagulation is permitted, the article is pressed to remove water, washed, and dried *in vacuo* to a subnormal moisture content at about 65° and compressed while still warm.

Polymerized vinyl alcohol. W. O. HERRMANN and W. HAEHNEL (to Consortium für elektrochemische Industrie). U. S. 1,672,156, June 5. Vinyl esters such as the acetate or propionate are polymerized, *e. g.*, by use of benzoyl peroxide, and the polymerized esters are treated with an alk. reagent such as KOH and alc. Cf. C. A. 21, 3369; Whitby, McNally and Galloway, C. A. 22, 2079.

Rubber-like polymerized terpene product. W. B. PRATT (to Dispersions Process, Inc.). U. S. 1,671,314, May 29. A polymerized terpene of the general type formula $(\text{C}_5\text{H}_8)_n$, capable of reacting with S and which may be formed from isoprene is dispersed in particles of colloidal size coated with hydrophilic protein films such as albumin or casein and the latter are tanned, *e. g.*, by use of tannin, to increase their strength and toughness, the particles are coagulated and the coagulated mass is sep'd. and dried. The product thus obtained is suitable for some uses similar to those of rubber.

Vulcanizing balls, tire tubes or other closed hollow rubber articles. W. L. FAIRCHILD. Brit. 277,410, June 14, 1926. Mech. features.

Apparatus for vulcanizing rubber tires. AKRON STANDARD MOLDING CO. Brit. 277,851, Jan. 6, 1927.

Apparatus for vulcanizing tire tubes, etc. O. J. KUHLEK (to Kuhlke Co.). Brit. 277,934, Sept. 21, 1926.

Vulcanizing rubber. W. P. TER HORST (to Rubber Service Laboratories Co.).

U. S. 1,672,548, June 5. A tetrasubstituted guanidine such as dipiperidylguanidine is used as an accelerator.

Vulcanizing rubber. L. B. SEBRELL (to Goodyear Tire & Rubber Co.). Brit. 278,689, Oct. 8, 1926. Vulcanization accelerators comprise reaction products of mercaptans or their derivs. and basic N compds. such as NH_3 or di-Et, Pr and Bu amines, e. g., the reaction product of mercaptobenzothiazole and ethylenediamine or the diphenylguanidine salt of mercaptobenzothiazole. Cf. *C. A.* 22, 512.

Vulcanizing rubber. L. B. SEBRELL and C. W. BEDFORD. Can. 277,225, January 17, 1928. Rubber is vulcanized in the presence of a metallic salt of mercaptothiazole.

Vulcanizing rubber. P. M. PAULSON. Can. 276,866, January 3, 1928. Rubber is combined with a vulcanizing agent and an accelerator consisting of a guanidine substituted on but 1 N atom and whose substituents contain a total of more than 6 C atoms.

Vulcanizing rubber. LIVERPOOL RUBBER CO., LTD. AND F. AMENDE. Brit. 278,064, June 26, 1926. An app. is described comprising a vulcanizing chamber heated by steam pipes or the like and also by preheated air or other gas which is circulated through the chamber.

Preventing adhesion of unvulcanized rubber sheets. K. MEDGYES. Brit. 277,928, Sept. 25, 1926. Dusting preps. are used which lose their antiohesive properties when the sheets are die-stamp welded with hot tools, so that there is no weakening of the welded seams. Among the substances which may be used are: C_{10}H_8 , acetanilide (in alc. soln.), $(\text{CH}_3)_6\text{N}_4$, thiocarbonylurea (in aq. suspension) and org. metal salts such as fatty acid salts of Pb or Zn.

Rubber-like vulcanized polymeric vinyl compounds. W. O. HERRMANN and W. HAEHNEL (to Consortium für elektrochemische Industrie). U. S. 1,672,157, June 5. Polymerized products such as may be obtained from vinyl alc. or vinyl acetate are vulcanized with S chloride. Cf. *C. A.* 21, 3767; Whitby, McNally and Gallay, *C. A.* 22, 2079.

Reclaiming and dispersing vulcanized rubber. T. G. RICHARDS and G. P. F. SMITH (to Dispersions Process, Inc.). U. S. 1,671,316, May 29. The material is heated under pressure with an alkali such as NaOH soln. and with "cumar" or other softener and resin oil to produce a plastic mass contg. sufficient soap, formed *in situ*, to permit dispersion by manipulation in water, and dispersion in water is then effected, to obtain a product which is suitable for use as a reclaimed rubber.

CHEMICAL ABSTRACTS

Vol. 22.

AUGUST 10, 1928

No. 15

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

"Greasy" burets. W. LOWSON. *Nature* 121, 14(1928).—Inaccuracy due to "greasiness" is avoided by the addn. of a trace of saponin to standard acid. R. C. A.

Laboratory thermostat. MARIO COPPOLA. Reale Scuola d'Ingegneria Napoli. *Ann. chim. applicata* 18, 97-8(1928).—The const.-temp. thermostat which is described and illustrated is heated electrically or is cooled by brine; and is equipped to carry numerous flasks on revolving wheel supports, thereby furnishing agitation. Numerous other accessories add to the efficiency and convenience of the thermostat. E. C. D.

Automatic apparatus for the determination of small concentrations of sulfur dioxide in air. MOYER D. THOMAS AND ROBERT J. CROSS. *Ind. Eng. Chem.* 20, 645-7(1928).—An automatic app., in both stationary and field types, has been constructed to analyze continuously air contg. SO_2 in concn. from 0.1 to 60 p. p. m. The method checks satisfactorily with the Selby method. Expts. have also been made to det. the stability of *I soln.* and its efficiency in absorbing SO_2 . T. S. CARSWELL

Design of equipment for measuring the specific volume of carbon dioxide vapor. C. H. MEYERS. Bur. Standards. *Refrigerating Eng.* 15, 157-8(1928).—The most authoritative data on sp. vol. of CO_2 vapor are accurate to only 0.5%. This is not sufficiently accurate for calcg. tables of thermodynamic properties of CO_2 . M. choses essentially the equipment which was used for detg. sp. vol. of superheated NH_3 . The containers are of Monel metal brazed with silver solder, one 600 ml. capacity for lower pressures and the other 60 ml. capacity for higher pressures. The bath liquid is circulated by a centrifugal impeller. A Pt resistance thermometer measures the temp. of the bath liquid while thermocouples will be used to measure the temp. of the CO_2 in the tube connecting the container with the manometer. A diagram of the app. is shown. H. F. ZOLLER

Apparatus for determining melting points. S. AVERY. *Ind. Eng. Chem.* 20, 570(1928).—A Thiele tube is lengthened and the branch which does not carry the thermometer is modified to carry a propeller agitator, with which the liquid in the tube is circulated. T. S. CARSWELL

An apparatus for demonstration of heat conductivity of hydrogen. E. SOKOLOWA. *Z. allgem. anorg. Chem.* 170, 128(1928).—A carbon lamp is so arranged that either CO_2 or H_2 may be admitted or mixts. of the 2 gases. The glow observed indicates relative heat capacities of the gases. A figure of the app. accompanies the article. R. H. LAMBERT

A simple apparatus for the determination of water in bleaching powder, jelly, etc. T. SOMIVA. *J. Soc. Chem. Ind. (Japan)* 31, 213-6; *Suppl.*, 59B(1928). [In English].—S. has improved the app. for water detn. devised by Dean and Stark (*C. A.* 14, 2145) and by Kafuku, by attaching a 3-way cock and a siphon to the bottom of the graduated tube to return the solvent automatically to the flask. With this app. H_2O was detd. in bleaching powder and millet-jelly, with such solvents heavier than H_2O as CCl_4 , C_2Cl_4 , etc. The accuracy of this method is nearly the same as that of the methods already known; the simplicity of the app. and the procedure and the shortness of the time required for the detns. are the merits of this method. Y. TOMODA

Laboratory apparatus for fractionating mixed liquids. THEODOR HÖPNER. *Chem.-Ztg.* 52, 389-90(1928); 3 cuts.—The atm. condenser is fused on the side of the neck and is provided with an elec. heater for high-boiling oils. The app. is suitable for the distn. of tar oils. J. H. MOORE

A mold for casting cylinders of fine powders. J. K. MORSE. *J. Optical Soc. Am.* 16, 380-1(1928). E. J. C.

Cover-glass for conducting microchemical reactions in the Zeiss quartz cell. J. JOCHIMS. *Z. wiss. Mikroskop.* 44, 214-6(1927). H. G.

Stirrer for rapid electroanalysis. H. ROM. *Chem.-Ztg.* 51, 985(1927).—The

stirrer consists of a rod covered with vulcanite and provided with means for attaching any type of electrode at its lower end and with 3 driving pulleys of different diams. at its upper end, the whole being mounted on a suitable support. A no. of stirrers connected together with a common driving belt may be operated by 1 motor.

B. C. A.

Electrocolorimeter. F. STOCKHAUSEN AND F. WINDISCH. *Wochschr. Brau.* **45**, 231 (1928).—A new photoelec. malt-color measuring app. is described. A. SCHULTZ

Return cooler for wide-mouth vessels. KURT SCHMIDINGER. *Chem.-Ztg.* **52**, 390 (1928); 2 cuts.—A galvanized sheet Cu cooler with flat top and cone bottom is designed to stand in the mouth of the vessel. The bottom has concentric corrugations to prevent condensed H₂O from the burner from entering the vessel. J. H. M.

Spray for washing and absorption towers. PAUL MAHLO. *Chem. App* **15**, 97-9 (1928); 4 cuts.—Ott's spray consists of 4 perforated disks of different sizes mounted on the delivery pipe in the top of the tower so that the whole top of the filling material is sprayed. J. H. MOORE

Normal slip-joint make-up piece with tube for introducing gas and with cock funnel. J. FRIEDRICH. *Chem.-Ztg.* **52**, 390 (1928); 5 cuts.—The tube has a ground slip-joint on each end and is inserted between the cooler and boiling flask to introduce gas or liquid into the flask. J. H. MOORE

A rotating tube drying furnace. J. A. L. ORTLEPP. *J. Chem. Met. Mining Soc. S. Africa* **28**, No. 9, 210-3 (1928).—A complete description and test results are given. The rotating tube has an 8-in. diam. and the length of its heated surface is about 8 ft. The furnace is wood-fired. It is used for drying tin concentrate. D. GORDON

The thermal investigation of metallurgically important reactions in a calorimeter operating at elevated temperatures (TOTH, CHALL.) **2**. Sensibility of the thermobalance (SOMIYA) **7**.

Air filter. C. P. HEGAN (to Reed Air Filter Co.). *Brit.* 279,102, Oct. 15, 1926.

Apparatus for straining or filtering. F. C. FULCHER and W. R. BELDAM. U. S. 1,673,743, June 12.

Filter for liquid fuels or other liquids. SOC. DU CARBURATEUR ZENITH. *Brit.* 279,382, Oct. 23, 1926.

Retorts. SOUTH METROPOLITAN GAS CO. AND R. H. B. LAMPREY. *Brit.* 279,201, Aug. 21, 1926. Gas-fired retorts and like app. are protected from erosion at the parts which are most highly heated, by application of a paste or tiles of a highly aluminous material, e. g., a paste formed of plastic refractory clay 20, calcined Al₂O₃ 60 and grog 20%.

Device for separating oil and water from compressed air. E. H. STEPHAN. *Brit.* 279,321, March 28, 1927.

"Bubble cap" for towers such as those used for distillation. E. BURKE (to Crane Co.). U. S. 1,674,464, June 19.

"Bubble cap" for gas and liquid contact apparatus. C. M. ALEXANDER. U. S. 1,673,895, June 19. A cap is described suitable for use in fractionating or scrubbing towers.

Continuous slab-heating furnace. F. W. MANKER (to Surface Combustion Co.). U. S. 1,673,771, June 12.

Reheating continuous furnace hearth. E. D. WRIGHT. U. S. 1,674,147, June 19. Structural features.

Valve for reversing furnaces. H. C. PERDUE (one-half to William R. Wilson). U. S. 1,673,018, June 12.

Temperature indicator and controller for furnaces. T. A. REID (to Westinghouse Elec. & Mfg. Co.). U. S. 1,673,591, June 12.

Heat-exchange apparatus. G. H. KELLEY (to Winchester Repeating Arms Co.). U. S. 1,673,409, June 12.

Devices for governing the output and steam supply for heating rectifying columns for distilling ammonia, alcohol or other substances. WILLIAM A. PETERS, JR. (to E. I. duPont de Nemours & Co.). U. S. 1,673,373-4, June 12.

Distilling apparatus employing molten metal or similar baths heated by a submerged burner. C. F. HAMMOND and W. SHACKLETON. *Brit.* 278,985, April 15, 1926.

Apparatus for distilling hydrocarbons or similar heat treatment by use of molten metals, etc. C. F. HAMMOND and W. SHACKLETON. *Brit.* 278,768, April 15, 1926.

Rotary hearth annular ovens for dry distillation, etc. TROCKNUNGS-VERSCHWELGUNGS- und VERGASUNGS-GES. and F. BARTLING. *Brit.* 279,343-4, May 26, 1927.

Apparatus (with funnel-shaped rotating plates over which the material spreads) for low-temperature carbonization and hydrogenation processes. R. FEIG. Brit. 279,120, Oct. 15, 1926. Elec. discharges may be passed between the rotating parts and fixed surrounding parts, to expedite the reactions.

Apparatus for dehydrating milk or other liquids by spraying. S. M. DICK. U. S. 1,673,066, June 12.

Apparatus for sterilizing or pasteurizing milk or other liquids by the "holding" method. WILLIAM G. TARBET (to Aluminium Plant and Vessel Co., Ltd.). U. S. 1,673,215, June 12.

Mixing valve for water or other liquids. A. E. HOHMEISTER (to John Douglas Co.). U. S. 1,674,365, June 19.

Safety electric cut-out for Röntgen-ray apparatus. W. OTTO. Brit. 278,757, Oct. 9, 1926.

Cathode-ray, Röntgen-ray or rectifier tubes. W. D. COOLIDGE (to British Thomson-Houston Co., Ltd.). Brit. 279,444, Oct. 20, 1926. Structural features.

Vacuum tubes. E. Y. ROBINSON and METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Brit. 278,787, July 7, 1926. A straight W or Mo filament is drawn through a paste of insulating material such as kaolin and water with or without feldspar, lime or other material to facilitate sintering and increase the strength of the material and the coating is dried naturally or by artificial heating and is then sintered or vitrified; 2 or more coats may be applied, and a metal coat forming the equipotential surface is then applied either as a sep. Ni tube or as Ni or Pt foil or Pt strip or by chem. or elec. deposition; this may be provided with an alk. earth oxide coating. Various structural features are described.

Acetylene generator. E. MENZ. Brit. 278,977, April 29, 1927.

Safety device for acetylene distributing pipe systems. W. GOERG (to Air Reduction Co.). U. S. 1,674,172, June 19.

Apparatus for gas analysis. A. B. CUNNINGHAM. Brit. 279,319, March 24, 1927. Numerous structural details are specified of an app. for taking measured samples of combustion gases for analysis, passing them through liquid for absorbing CO₂ and recording the analysis on a revolving chart.

Recording apparatus for analyzing gas. F. J. BAST (to Charles J. Tagliabue Mfg. Co.). U. S. 1,673,898, June 19.

Gas calorimeter with recording thermometer. J. F. SIMMANCE. Brit. 279,253, Nov. 3, 1926. Differential expansion elements and recording mechanism of the differential thermometer are mounted on a support which can be removed without interfering with the remainder of the app. Numerous details of construction are described.

Centrifugal apparatus for removing dust from gases. PNEUMATIC CONVEYANCE & EXTRACTION, LTD. AND W. A. SMITH. Brit. 278,900, Nov. 8, 1926.

Device for removing dust from air or other gases by collection on moist surfaces. M. C. E. MULO. Brit. 279,000, June 18, 1927.

Device for separating dust from air or other gases by centrifugal action. AC. SPARK PLUG CO. Brit. 278,935, Jan. 24, 1927.

Apparatus for rectifying and revaporizing liquefied gases such as constituents of air. STUDIENGES. FÜR GAS-INDUSTRIE. Brit. 279,041, Oct. 18, 1926.

Apparatus for proportioning flow of gases or liquids. K. HUESSENER. U. S. 1,673,872, June 19.

Electrically operated valve for controlling the flow of gas to burners, etc. E. J. PACE (to Payne Furnace and Supply Co.). U. S. 1,674,021, June 19.

Electrically operated valve for controlling the flow of liquids or gases. C. W. SNYDER. U. S. 1,673,923, June 19.

Heat-exchange apparatus adapted for use with gases under high pressures. M. MAURAN. U. S. 1,673,918, June 19.

Apparatus with tubes and screw conveyors for passing iron oxide or other gas-purifying materials countercurrent to the gas being treated. G. CHRISP. Brit. 279,184, July 28, 1926.

Thermionic valve. C. TIETIG (to Arthur Andriessen). U. S. 1,673,850, June 19. A chem. reaction such as combustion of a "thermit candle" is utilized to produce carriers of elec. charges in valves such as those of large size and capacity.

Thermostat with expansible chamber. H. R. LORANGER and D. D. PARSHALL. U. S. 1,673,255, June 12.

Thermostatic electric switch. G. O. WILMS (to Reliance Co.). U. S. 1,674,078, June 19.

Thermostatic electric switch. J. W. ANDERSON. U. S. 1,674,151, June 19.

Thermostatic control device for water heaters. L. S. CHADWICK and M. RESEK (to Perfection Stove Co.). U. S. 1,673,900, June 19.

Thermostatically actuated valve for controlling gas supply, etc. J. J. KENNEY. U. S. 1,674,473, June 19.

The theory of crystal growth. W. KOSSEL. *Nach. Ges. Wiss. Göttingen. Math. physik. Klasse* 1927, 135-43. —K. discusses the growth of a crystal of the NaCl type from the standpoint of the energy released in the deposition of an ion upon different surface positions. Thus the relative energies released by depositing an ion upon a

100 face, upon the 010 edge between two parallel 100 faces, separated by one ionic layer, and upon the end of an uncompleted row, lying along such an edge are, resp.: 0.0662, 0.1807 and 0.8738. Hence, on 100 faces, uncompleted rows will first be completed, then new rows started, and so on. The energy of deposition upon a complete 110 face is 0.2077 and upon the end of a row in the direction of a cube edge is 0.9009. However, for the deposition of an ion beside such a row, the energy is -0.02702 , because such an ion must be placed next to an ion of like charge. Thus a true 110 face will not be expected, but instead a step-wise development of rows parallel to the cube edge. Observation seems to verify this expectation. The examn. of other planes in the zone of the cube edge shows that the electrostatic forces play the important role in detg. growth, and not the planar distances or point d. Thus, the 210 plane will, like the 100, grow as a true planar face.

R. L. HERSHEY

The crystal structure determination of the alkali metals and strontium. F. SIMON AND E. VOHSEN. Univ. of Berlin. *Z. physik. Chem.* 133, 165-87(1928); cf. C. A. 21, 2406—A vacuum, low-temp. Debye-Scherrer camera was used to det the crystal structure of Na, K, Li, Rb, Cs and Sr. The features of the camera are: a Cu frame for supporting a cellophane film, suspended and metallicly connected to the liquid-air reservoir of a metal Dewar flask, and a small built-in oven for evapg. the metal sample to be deposited on the cellophane film. The procedure was to mount the cellophane, place the freshly cut metal in the oven under ether, evacuate the camera, cool the frame by placing liquid air in the Dewar, and deposit metal on the cellophane by heating the oven. Li and Sr could not be evapd.; so thin films of these had to be mechanically prepd. The alkali metals at liquid-air temp. are all body-centered cubic and have the following dimensions: Li, $a = 3.46$ A. U.; Na, $a = 4.24$ A. U.; K, $a = 5.25$ A. U.; Rb, $a = 5.62$ A. U.; Cs, $a = 6.05$ A. U. K and Na were examd. at room temp. and showed the same lattice. Sr rolled into a film at liquid-air temp. showed a face-centered lattice, with $a = 6.03$ A. U. and it retains this type lattice at room temp. Sr prepd. by evapn. showed the lines of this lattice and some other unidentified lines. It is suggested that there are two modifications, a cubic at room temp. and an hexagonal at higher temps. X-ray examn. of Zn and Cd at room and higher temps. showed no transformation points. Phenomena suggestive of these are ascribed to change of crystal size.

R. L. HERSHEY

A strongly birefringent crystal species. P. TERPSTRA. *Physica* 8, 95-100(1928).—Crystals of 1,6,8-trinitro-2-ethylaminonaphthalene were examd. crystallographically. The crystals are monoclinic, $a, b, c = 2.2013 : 1 : 1.1027$; $\beta = 106^{\circ}29'$. The planes observed were $\{100\}$, $\{001\}$, $\{111\}$, $\{110\}$, $\{010\}$ and $\{201\}$; the crystals are often stretched along the b axis, platelets are formed on 100; the crystals cleave well along (010). The refractive indices (D light) are $\alpha = 1.5177$, $\beta = 1.854$, $\gamma = 2.316$.

B. J. C. VAN DER HOEVEN

The relation between chemical constitution and x-ray diffraction in liquids. I. Mono- and di-substituted benzene derivatives. P. KRISHNAMURTI. Calcutta Univ. *Indian J. Physics* 2, 355-64(1928).—Examn. of a no. of o -disubstituted C_6H_4 derivs. shows that 2 substituents in the o -position invariably give rise to 2 distinct rings clearly sepd. from each other. The outer ring increases in brightness as the sizes of the substituting groups are increased. In the m compds. examd., 2 rings are present; they have shrunk in size slightly as compared with the o ; the outer ring increases in brightness relatively to the inner more than in the corresponding o -compds. The p -substituted compds. give only one broad ring, which diffuses outwards. Benzene derivs. with a single long side chain show a similarity to the corresponding aliphatic deriv. PhCOOEt is somewhat similar to AcOH since both of them show a faint inner ring.

A. L. HENNE

An x-ray study of the heat motions of the atoms in a rock-salt crystal. R. W. JAMES AND ELSIE M. FIRTH. *Proc. Roy. Soc. (London)* A117, 62-87(1927).—A brief introductory review is given of the theoretical consideration of the temp. coeff. of the intensity of reflection of x-rays. To provide exptl. data for testing these, a series of observations was made with rock salt at the temp. of liquid air, and compared with the results at room temp. The temp. factor has the form e^{-m} where $m = (hf(T) - \sin^2\theta)/(h^2\lambda^2)$, where b is a const. which depends on the reflecting atoms. For corresponding angles, the temp. factor is considerably larger for spectra of the type Cl + Na than for the type Cl - Na. These results, combined with those at still higher temps., agree fairly well up to 500° K. with the theoretical expression derived by Waller, rather than with Debye's, though at the higher temps. the decrease in intensity is more rapid than the theory indicates, as might be expected, since the assumptions on which the theory is based are less valid. The abs. value of the integrated reflection

for the (200) spectrum from rock salt has been detd. for both MoK_α and RhK_α and an estimate has been made of the extinction for Mo radiations. The integrated value for the (200) spectrum with Mo K_α is 0.000492 and for Rh K_α 0.000544. The reflections from a no. of faces of the rock-salt crystal have been compared with the (200) spectrum, and their abs. values thus detd. These enable the F factors, or at scattering factors, of the atoms of Na and Cl to be calcd. at 0° , 86° , 290° and 900° K. By means of Fourier's analysis, the distribution of electrons between the (111) planes was then calcd. at different temps., and from the broadening of the peaks in the distribution curves, the mean amplitudes of the at. vibrations have been estimated as about 0.20 A. U. at 290° K. and 0.58 A. U. at 900° K. This estimate appears to be consistent with other considerations of interatomic forces.

A. W. KENNEY

The temperature factors of x-ray reflection for sodium and chlorine in the rock-salt crystal. IVAR WALLER AND R. W. JAMES. *Proc. Roy. Soc. (London)* **117A**, 214-23 (1927), cf. preceding abstract.—In rock salt the intensities of reflection for the two kinds of atoms for a given spectrum are proportional to $F_1 e^{-M_1}$ and $F_2 e^{-M_2}$ resp., where F_1 and F_2 are the at. scattering powers of the atoms, and M_1 and M_2 are temp. functions. Over a considerable range the following expression is valid: $M_k = (8\pi^2 \sin^2 \theta) (1/\lambda^2) (\alpha_k + \beta_k T + \gamma_k/T + \delta_k/T^3 + \dots)$. α_k is zero if Planck's value of the zero-point energy be assumed, γ_k and δ_k may be calcd. from at. consts. β_k depends on interatomic forces and cannot be detd. directly, though a weighted mean can be calcd. in terms of the elastic consts. From the formula given above and the exptl. results of James and Firth (cf. preceding abstract), β is calcd. as 5.8×10^{-21} . From Voigt's values of the elastic consts., β is calcd. as 5.7×10^{-21} . By assuming zero-point energy, M can be calcd. for each atom, and at corresponding temps. and angles is greater for Na than for Cl, implying that equal forces do not act on each. At 290° K. the root-mean-square amplitude of vibration for Na is 0.242 A. U. and for Cl 0.217 A. U. From the M values, curves showing the variation of intensity of reflection of x-rays with temp. are drawn for the (400), (600) and (800) spectra of rock salt, and are found to agree well with the observed values up to 500° K. Waller's theoretical formula for the temp. coeff. is thus verified by expt. in the case of rock salt from 86° K. to 500° K., if allowance is made for the different values of M for the two atoms.

A. W. KENNEY

The atomic arrangement in the crystal of orthorhombic iodine. PRESTON M. HARRIS, EDWARD MACK, JR., AND F. C. BLAKE. *J. Am. Chem. Soc.* **50**, 1583-1600 (1928).—Five differently prepd. samples of solid iodine, analyzed by the Laue and oscillated-crystal methods, were found to possess a unit cell of 8 atoms and orthorhombic bipyramidal symmetry, which is that of space group V_h^{18} having atomic arrangement (f). The cell dimensions calcd. from powder-photograph data were $a_0 = 4.795$ A. U., $b_0 = 7.255$ A. U.; $c_0 = 9.780$ A. U.; corresponding to an axial ratio of 0.661:1:1.348 to be compared with Mitscherlich's value, 0.6644:1:1.3653, as given by Groth and a d. of 4.913/cc (using axes according to Groth). The atoms were grouped in mols. of I_2 , with a distance of 2.70 A. U. between centers of two atoms in a mol. The ionic radius of I was suggested as 3.54 or 4.35 A. U. There was no indication of a monoclinic variety of iodine. The values of the two parameters, detd. from intensity data by the structure factor method and the Duane Fourier-series method, were: $u = 0.150$ and $v = 0.117$. The abnormal absorption effects due to crystal perfection were shown to be negligible. Intensity data, diagrams and lattice-structure drawing are given.

H. W. WALKER

Orientation of aluminum mono crystals determined by optical methods. J. WEERTS. *Z. tech. Physik* **9**, 126-36 (1928).—On observing in polarized light, etched Al single crystals HF and HCl, the cubical crystal faces can be distinguished by their unchanged perpendicularly reflected interference color on rotation of the crystals (cf. Sachs, *Z. Metallkunde* 299 (1925)). On this principle an app. was built to study the orientation of uncrystals in wires. The wire is suspended in a Cardanic ring with 3 scales, illuminated by parallel polarized light; the reflected light is observed in a microscope perpendicular to the illuminating beam. A glass plate at an angle $< 45^\circ$ reflects the returning light into the microscope and transmits the irradiating light. The microscope is provided with analyzer and gypsum plate so as to give the sensitive violet of first order. Details and examples of the method are discussed at length. The etching was performed by 45 sec. in HF, 30 sec. in HCl for preliminary observation; final 3 to 4 mins. in HF and HCl. In 40 crystals measured in 99.70% Al wire, drawn to 3.5 mm. and recrystd., the rhombic dodecahedral orientation is preferred by the faces. The new method is compared with that of Bridgman (*Proc. Am. Acad.* **60**, 313 (1925)) and with x-ray results.

B. J. C. VAN DER HOEVEN

The structure of cyanite. W. H. TAYLOR AND W. W. JACKSON. Manchester Univ. *Proc. Roy. Soc.* (London) **119A**, 132-46(1928).—The crystal structure of *cyanite*, Al_2SiO_5 , has been detd. by means of a qual. investigation based on data from x-ray photographs obtained by the rotating crystal method. There are 4 mols. in the unit cell, which is triclinic, with the following axial lengths and angles: $a = 7.09$ A. U., $b = 7.72$ A. U., $c = 5.56$ A. U.; $\alpha = 90^\circ 51\frac{1}{2}'$, $\beta = 101^\circ 2'$, $\gamma = 105^\circ 44\frac{1}{2}'$. The structure is based on a slightly distorted cubic close packing of O atoms, the Si and Al atoms being distributed in a uniform manner among the interstices of the O arrangement in such a way that independent tetrahedral SiO_4 groups are formed, while each Al atom is at the center of an octahedral group of 6 O atoms. The existence of densely packed at planes, separated by a wide spacing, parallel to (100), explains the existence of the very perfect cleavage parallel to this direction. In a similar way, planes parallel to (010), densely packed with Si and Al atoms, and widely spaced, account for the less perfect but clearly marked (010) cleavage. The variation of hardness on the (100) face is explained as being due to the existence of this cleavage. It is apparently possible to extend this explanation to include the examples, which frequently occur, of hardness variation of much smaller amount.

R. L. HERSHEY

X-ray diffraction in carbon tetrachloride (liquid). C. M. SOGANI. *Indian J. Physics* **2**, 377-86(1928); cf. *C. A.* **22**, 1098.—The diffraction in liquid CCl_4 is studied with $\text{Cu K}\alpha$ rays. The pattern shows a sharp inner and a diffuse second ring sep'd. by a very clear space. The sharpness of the inner ring is quite compatible with the highly symmetric tetrahedral shape of the mol. Two alternative explanations are discussed for the 2nd ring: (1) that it may be a second-order effect which becomes important in this case on account of the compact shape of the mol.; (2) that it may be due to shape of the mol. F curve, which must obviously be considered in any complete discussion of x-ray diffraction. The first view is preferable, as Hg and liquid A which are monoatomic also show a similar second ring. The analogies between the x-ray diffraction in liquids with spherical mols. and the optical haloes observed with homogeneous chromatic emulsions are pointed out.

A. L. HENNE

Molar weights of saturated vapors of pure liquids and of mixtures by the air-saturation method. M. S. VREYSKII. Leningrad Univ. *J. Russ. Phys.-Chem. Soc.*, Chem. Part, **59**, 593-7(1927); *Z. physik. Chem.* **133**, 357-61(1928).—From the values of the vapor pressure of the pure substance, detd. by the usual b. p. method, and of the vapor pressure of the pure satd. vapor or of its aq. soln. detd. by the air-satn. method (cf. *C. A.* **19**, 2292) substituted in the following formula $[V(B - b)/(B - b - P)] = V + m_1[(RT)/(B + b)] + m_2[(RT)/(B + b)]$, V. proposes to calc. the molar wt. M_1 of the dissociated vapor and the partial pressure of the constituents. V = vol. of air in l., $(B + b)$ the total pressure (atm. + hydrostatic of the liquid column); P = total vapor pressure of both liquids; $m_1 = (g_1/M_1)$, $m_2 = (g_2/M_2)$ (g = wt. in g., M = mol. wt., m = no. of moles for each component). When $m_2 = 0$ then M_2 refers to pure liquid the partial pressure of each can be calc'd. from the ratio m_1/m_2 .

E. R. SCHIERZ

The dissociation of acetic acid vapor and the equilibrium between its aqueous solutions and their vapors. M. S. VREYSKII, K. P. MISŤCHENKO AND B. A. MUROMTSEV. Leningrad Univ. *J. Russ. Phys.-Chem. Soc.*, Chem. Part, **59**, 598-607(1927); *Z. physik. Chem.* **133**, 362-9(1928).—The authors have found that between 30° and 90° satd. AcOH vapor follows the same laws that were detd. for unsatd. vapors by Gibbs. The vapor pressure (P) of pure AcOH, purified by repeated freezing (m. p. 16.63°), was detd. by the usual dynamic method at various pressures (the ebullioscope heated electrically in a thermostat). The pressure of the satd. vapor was detd. by the air-satn. method and the mol. wt. (M_v) and the d. (D) of the vapor by a formula (cf. preceding abstr.).

t°	P	D	M_v
30.05	20.8 mm.	3.81	110.5
42.00	38.5	3.79	109.9
50.05	57.3	3.73	108.1
59.65	89.0	3.71	107.5
80.09	208.3	3.59	103.9
85.20	250.8	3.54	102.7
90.00	299.0	3.44	99.7

At const. temps. 42.00° and 80.09° the vapor pressures of aq. solns. of AcOH of various concns. (4.84-49.6%) are also in accord with the Gibbs equation. The partial pressures of AcOH (p_1) and H_2O (p_2) for varying concns. are: at 80° (18.45%) $p_1 = 12.3$ mm.,

$p_2 = 339.8$ mm., (96%), $p_1 = 171.9$, $p_2 = 74.8$ mm.: at 42° (18.35%), $p_1 = 1.9$, $p_2 = 55$ mm. (95.12%), $p_1 = 30.8$, $p_2 = 16.4$ mm. The av. ratio $[K = p''_1/(p'_1)]$ of the partial pressure p''_1 of $(\text{AcOH})_2$ to p'_1 (AcOH) at 80° is 0.0414; at 42° is 0.707.

E. R. SCHIERZ

The dissociation of formic acid vapors and the equilibrium between its aqueous solutions and their vapors. M. S. VREVSKII AND A. A. GLAGOLEVA. Leningrad Univ. *J. Russ. Phys.-Chem. Soc.*, Chem. Part, **59**, 608-16(1927); *Z. physik. Chem.* **133**, 370-6 (1928).—Using the method previously applied to AcOH (cf. preceding abstrs.), V. and G. have detd. the d. (D_g), the vapor pressure (P), the mol. wt. (M_x) of the satd. vapor of pure HCO_2H purified by repeated freezing (m. p. 8.40°).

t°	P	D_g	M_x
25.0	42.5	2 962	85.8
40 0	82.3	2 889	83.7
50 0	127.5	2.835	82.1
60 0	190.3	2 767	80.2
80 0	397.9	2.628	76 1

These values together with those of the vapor pressure of aq. solns. of HCO_2H at various concns. (4-98.5%) at 60.0° and 80.0° were found to be in accord with those calcd. from the Gibb's equation which was derived for unsatd. vapors. The mixts. which boil unchanged at 60° and at 80° contain 69 and 73% acid, resp. The degree of association of the acid into double mols. decreases for any given acid content of soln. as the temp. rises, but is always smaller than that for solns. of AcOH of equal (percent) acid content. The partial pressures of HCO_2H (p_1) and H_2O (p_2) vary with temp. and concn. At 80° (21.3%) $p_1 = 13.5$, $p_2 = 324.8$ mm.; (98.5%) $p_1 = 376.4$, $p_2 = 14.2$ mm.; at 60° (22.9%) $p_1 = 6.2$, $p_2 = 132.7$ mm.; (85%) $p_1 = 95.0$, $p_2 = 40.5$ mm. The av. ratio ($K = p''_1/(p'_1)^2$) of the partial pressure of $[\text{HCO}_2\text{H}]_2$ (p''_1) to HCO_2H (p'_1) is 0.013 at 80° and 0.058 at 60°.

E. R. SCHIERZ

The equilibrium between vapor and liquid in solutions of formic acid in benzene. M. S. VREVSKII, N. A. GELD AND S. A. ŠHČHUKAREV. Leningrad Univ. *J. Russ. Phys.-Chem. Soc.*, Chem. Part, **59**, 617-30(1927); *Z. physik. Chem.* **133**, 377-89(1928).—The authors have investigated the general characteristics of const-boiling heterogeneous mixts. of HCO_2H and C_6H_6 as well as the vapor pressures of HCO_2H vapor in the presence of C_6H_6 . Both reagents were purified by repeated freezing (m. ps. C_6H_6 , 5.5; HCO_2H 8.4°). The satd. vapors were obtained by the air-satn. method (cf. preceding abstrs.) and analyzed after having been condensed by means of solid CO_2 . The vapor-pressure was detd. by boiling the solns. at reduced pressures. The acid contents of the solns. which boiled without change in concn. at 25°, 59.95°, 65.0°, 70.0° and 71.8° were 31, 31.5, 31.6, 32.6, 35.5%, resp. At lesser concns. the vapor is richer in acid; in greater concns. the vapor is poorer in acid. With increase in temp. the compn. of the liquid and gaseous phases of the homogeneous systems approach each other. In the heterogeneous system of $\text{HCO}_2\text{H}-\text{C}_6\text{H}_6$ the following conditions obtain. In the region where the liquid contains more acid than the vapor, increase in temp. causes the compn. of vapor to approach that of the liquid. In the region to the left of the point indicating the compn. of the mixt. which boils unchanged, increase in temp. has the opposite effect. In the vapors from practically all of the solns. the no. of associated $[\text{HCO}_2\text{H}]_2$ mols. exceeds that of single mols. In the soln. containing 2% acid the no. of each kind is equal. This is in agreement with the associating action of C_6H_6 . By the cryoscopic method the mol. wt. of HCO_2H in C_6H_6 is practically two times the value obtained in water. The partial pressures of HCO_2H (p_1) and C_6H_6 (p) vary with temp. and concn. At 59.96° (3.08%) $p_1 = 61.0$, $p = 126.8$ mm.; (91.41%) $p_1 = 173.1$, $p = 254.2$ mm. At 25.00° (8.52%) $p_1 = 29.8$, $p = 90.2$ mm.; (96.52%) $p_1 = 39.1$, $p = 40.2$ mm. The ratio ($K = p''_1/(p'_1)^2$) of the associated $[\text{HCO}_2\text{H}]_2$ (p''_1) to the non-associated HCO_2H (p'_1) is 0.063 at 59.96° and 1.36 at 25.00°. Below 73.2° HCO_2H and C_6H_6 are not miscible in all proportions.

E. R. SCHIERZ

Vapor equilibrium of aqueous glycerol solutions. D. F. STEDMAN. *Trans. Faraday Soc.* **24**, 289-98(1928).—An app. is described in which the compn. of the vapor in equil. with glycerol solns. is detd. from 50° to 200° and from 760 to 60 mm. pressure. Thus at 50° and 60 mm. there is 0.014% glycerol in the vapor (w) with a partial pressure (p) of 0.0016 mm. Hg. At this pressure and 100°, w is 1.525% and p is 0.3807 mm.; at 150° w is 27.36% and p is 4.119 mm.; at 200° w is 94.18% and p is 45.6 mm. At 360 mm. and 90°, w is 0.037% and p is 0.0261 mm.; at 150° w is 5.230% and p is 3.846 mm.; at 200° w is 41.06% and p is 43.19 mm. With a pressure of 760 mm., at 110°

w is 0.072% and p is 0.1071 mm.; at 150° w is 2.135% and p is 3.231 mm.; at 200° w is 22.98% and p is 41.93 mm. At const. temp. the partial vapor pressure of glycerol regularly increases as the pressure decreases, and by extrapolation the vapor pressure of pure glycerol is obtained at any desired temp. From these values the heat of evapn. is calcd. as follows in calories per mol.: at 195°, 18,170; 155°, 19,740; 105°, 19,300; 55°, 21,060. In this work the stronger distillates are analyzed by means of a Pulfrich refractometer, but for solns. contg. less than 6% glycerol a Rayleigh interferometer is used.

H. STOERTZ

The compressibility and pressure coefficient of resistance of ten elements. P. W. BRIDGMAN. Harvard Univ. *Proc. Am. Acad. Sci.* 62, 207-26(1927).—The elements investigated were Pr, La, Ce, Be, Ba, Th, for both compressibility and elec. resistance, and Cr, V, S and P (both red and black) for compressibility only. The temps. were 30° and 75° and the pressures varied from 0 to 12,000 kg./sq. cm. The Pr was prep'd by electrolysis of salts contg. 0.02% Nd and 0.01% La. At red heat it was readily drawn through dies of Cr-V steel into wires. At 30°, $\Delta V/V_0 = -33.8 \times 10^{-7}p + 13 \times 10^{-12}p^2$. At 75°, $\Delta V/V_0 = -34.6 \times 10^{-7}p + 13 \times 10^{-12}p^2$. The second term is not highly accurate. The elec. resistance decreased with pressure. The mean coeffs. of resistance to 12,000 kg./sq. cm. are: for 30°, -3.1×10^{-7} ; for 75°, -8.3×10^{-7} . The sp. resistance at 30° is 6.9×10^{-6} , and the temp. coeff. at 0° is 0.00165. The low temp. coeff. may be due to absorbed impurities, probably gases. La melted sharply at 826° (accepted m. p. = 810°). Wires were easily made by extrusion through dies. At 30°, $\Delta V/V_0 = -35.13 \times 10^{-7}p + 14.7 \times 10^{-12}p^2$. At 75°, $\Delta V/V_0 = -35.13 \times 10^{-7}p + 17.1 \times 10^{-12}p^2$. The temp. coeff. of compressibility is abnormal for La in that it is negative. The abs. sp. resistance of La at 0° is 5.76×10^{-6} . The temp. coeff. of resistance at atm. pressure is 0.00213. The change in resistance at 30° is represented by the equation $\Delta R/R(1 \text{ kg., } 30^\circ) = -1.199 \times 10^{-6}p$. $\Delta R/R(1 \text{ kg., } 75^\circ) = -1.810 \times 10^{-6}p + 9.7 \times 10^{-12}p^2$. Ce was readily drawn into wires. It was polymorphic at high pressures. The transition points are at 7600 kg./sq. mm. at 30° and at 9400 kg./sq. cm. at 75°. Because of this transition, compressibilities were measured up to only 4000 kg./sq. cm. At 30° $\Delta V/V_0 = -45.63 \times 10^{-7}p - 161.4 \times 10^{-12}p^2$. At 75° $\Delta V/V_0 = -45.03 \times 10^{-7}p - 151.5 \times 10^{-12}p^2$. These results are anomalous in 2 respects. The temp. coeff. of compressibility is negative, and compressibility increases with increasing pressure. Polymorphism might account for these anomalies. Change of resistance through a range of 3000 kg./sq. cm. at 30° is represented by $\Delta R/R(1 \text{ kg., } 30^\circ) = +4.42 \times 10^{-6}p$. Change of resistance through a range of 6000 kg./sq. cm. at 75° is represented by $\Delta R/R(1 \text{ kg., } 75^\circ) = 2.77 \times 10^{-6}p$. The sp. resistance of the low-pressure modification at 30° is 7.48×10^{-6} . The temp. coeff. of resistance, 0-75°, is 0.00097. The change in resistance with change of pressure for the high-pressure modification between 9000 and 12,000 kg./sq. cm. at both 30° and 75° is linear and the pressure coeff. is -1.42×10^{-6} within exptl. limits of error (about 10%). Be was very hard to work and a cast rod 4.6 mm. in diameter was used. The compressibility at both 30° and 75° is represented by the equation, $\Delta V/V_0 = -8.55 \times 10^{-7}p + 3.88 \times 10^{-12}p^2$. The sp. resistance at 30 is 10.6×10^{-6} . The temp. coeff. of resistance at 0° is 0.00328. At 30°, $\Delta R/R(1 \text{ kg., } 30^\circ) = -1.11 \times 10^{-6}p + 12 \times 10^{-11}p^2$. At 75°, $\Delta R/R(1 \text{ kg., } 75^\circ) = 1.58 \times 10^{-6}p + 2.6 \times 10^{-11}p^2$. The density of Be at 20 ± is 1.820. The Ba was formed into wire by cold extrusion under oil through a steel die. At 30° $\Delta V/V_0 = -101.9 \times 10^{-7}p + 129 \times 10^{-12}p^2$. At 75° $\Delta V/V_0 = -106.3 \times 10^{-7}p + 149 \times 10^{-12}p^2$. The resistance of Ba decreases with increasing pressure up 8000 kg./sq. cm. at 0° and up to 10,000 kg./sq. cm. at 75°, and thereafter increases with increasing pressure. A table gives relative resistances for 0°, for 30°, and for 75° at 1000-kg. intervals up to 12,000 kg./sq. cm. The relative resistances at 1 kg./sq. cm. are 0°, 1.0000; 30°, 1.1520, 75°, 1.4380. The min. relative resistances and the corresponding pressures are: for 0°, 0.9705 at 8000 kg./sq. cm.; for 30°, 1.1100 at both 8000 and 9000 kg./sq. cm.; and for 75°, 1.3565 at 10,000 kg./sq. cm. The relative resistances at 12,000 kg./sq. cm. are: for 0°, 0.9764; for 30°, 1.1144; for 75°, 1.3620. The temp. coeff. of resistance for Ba at atm. pressure is represented by the equation $\Delta R/R_0 = 0.004795t + 5.71 \times 10^{-7}t^2 + 1.119 \times 10^{-9}t^3$. The compressibility of Th at 30° is represented by the equation, $\Delta V/V_0 = -18.18 \times 10^{-7}p + 12.78 \times 10^{-12}p^2$. At 75°, $\Delta V/V_0 = -18.46 \times 10^{-7}p + 13.29 \times 10^{-12}p^2$. The variations in resistance for 30° are expressed by the equation, $\Delta R/R(1 \text{ kg., } 30^\circ) = -2.787 \times 10^{-6}p + 1.89 \times 10^{-11}p^2$. At 75° $\Delta R/R(1 \text{ kg., } 75^\circ) = -2.966 \times 10^{-6}p + 2.18 \times 10^{-11}p^2$. The av. temp. coeff. of resistance at atm. pressure for the range, 0-100° is 0.00239. The compressibility of Cr at 30° is represented by $\Delta V/V_0 = -5.187 \times 10^{-7}p + 2.19 \times 10^{-12}p^2$. At 75° $\Delta V/V_0 = -5.310 \times 10^{-7}p + 2.19 \times 10^{-12}p^2$.

The purity of the sample was doubtful. The V was 95.02% V and 0.07% C . At 30° , $\Delta V/V_0 = -6.090 \times 10^{-7}p + 2.58 \times 10^{-12}p^2$. At 75° , $\Delta V/V_0 = -6.117 \times 10^{-7}p + 2.55 \times 10^{-12}p^2$. The red P was made from white P at 4000–12,000 kg./sq. cm. in the presence of Na as a catalyst. The density of the red P was 2.348 at room temp. The linear compressibilities in two directions differed by 14% at 30° and by 12% at 75° . For red P at 30° , $\Delta V/V_0$ varies from 0.0101 at 2000 kg./sq. cm. to 0.0469 at 12,000 kg./sq. cm. At 75° , $\Delta V/V_0$ varies from 0.0100 at 2000 kg./sq. cm. to 0.0476 for 12,000 kg./sq. cm. This is much less than Richards' value and the d of this sample is greater than that of ordinary commercial red P (2.296). Some unchanged white P may be included. For black P at 30° , $\Delta V/V_0$ varies from 0.0052 at 2000 kg./sq. cm. to 0.0205 at 12,000 kg./sq. cm.; at 75° from 0.0052 at 2000 kg./sq. cm. to 0.0209 at 12,000 kg./sq. cm. The compressibility of rhombic S was measured along three axes at both 30° and 75° , and the values at 2000-kg. intervals are recorded. At 30° , $\Delta V/V_0$ varies from 0.0233 at 2000 kg./sq. cm. to 0.0949 at 12,000 kg./sq. cm.; at 75° from 0.0258 at 2000 kg./sq. cm. to 0.1027 for 12,000 kg./sq. cm. The compressibilities of these 10 elements generally follow the curves formed by plotting log to the base 10, plus 7, of the compressibility against the at nos. La , Ce and Pr are not quite as expected, since Ce , the intermediate element, has the highest compressibility. The new data on elec. resistances only increase the confusion, and strengthen the belief that elec. cond. is not due to one simple type of mechanism.

F. E. BROWN

The viscosity of mercury under pressure. P. W. BRIDGMAN, Harvard Univ. *Proc. Am. Acad. Arts Sci.* 62, No. 8, 187–206 (1927). The viscosities of Hg at 30° and at 75° under pressures up to 12,000 kg./sq. cm. were detd. The app. was composed of 2 Cu reservoirs connected by a Cu tube. The app. was tipped through an angle and an elec. contact recorded the flow of a definite vol. of Hg to the lower reservoir. Corrections are large and include change of pressure during the flow, kinetic energy correction, and the compressibility of Hg , of the petroleum ether, and of the Cu vessels and capillary. The density of petroleum ether at 30° varied from 0.683 at 1 kg./sq. cm. to 0.889 at 12,000 kg./sq. cm. Petroleum ether was used, because H_2O decomposed under the sparking at high pressures to give some conducting substance. At low pressures such a change does not occur. The abs. viscosities at 30° and at 75° , resp. are: for 1 kg./sq. cm. 0.01516 and 0.01341, for 2000 kg./sq. cm. 0.01588 and 0.01399 for 4000 kg./sq. cm. 0.01663 and 0.01463, for 6000 kg./sq. cm. 0.01742 and 0.01528 for 8000 kg./sq. cm. 0.01825 and 0.01599, for 10,000 kg./sq. cm. 0.01913 and 0.01675 for 12,000 kg./sq. cm. 0.02008 and 0.01757. The data agree in general with those of previous investigators. Viscosity increases at an accelerated rate with increasing pressure. The curve for 75° could be found by shifting the curve for 30° along the pressure axis about 5750 kg./sq. cm. The vol. of 1 g. of Hg at 75° and 2000 kg./sq. cm. is the same as that of 1 g. at 30° and 1 kg./sq. cm., but the viscosity at 75° and 2000 kg./sq. cm. is 0.0140 and that at 30° and 1 kg./sq. cm. is 0.0152. The pressure coeff. of viscosity would need to be nearly 3 times as large as it is found to make viscosity a function of vol. only. It is of considerable significance that Hg , a monat. liquid, should depart so far from the results expected on the assumption that viscosity is a function of vol. only. There must be some sort of interlocking mechanism between the mols. of a liquid.

F. E. BROWN

The system: sodium tin. WILLIAM HUME ROTHERY, *J. Chem. Soc.* 1928, 947. 63.—The equil. diagram of the Na - Sn system is detd., over 60 samples being investigated under varying conditions of annealing and quenching. All alloys are mounted in fusible metal for microscopic examn., the grinding, polishing and photography of the Na -rich being carried out under oil. The compds. found were Na_4Sn (in 408°), Na_3Sn , Na_2Sn (m. 487°), Na_4Sn_3 (m. 479°), $NaSn$ (m. 578°), $NaSn_2$, $NaSn_3$, $NaSn_4$, and $NaSn_6$. All were metallic but decompose on melting, excepting where the m. p. is given. Na_4Sn_3 is stable only above 357° , splitting into Na_2Sn and $NaSn$ below this temp., the reverse taking place above. Na_3Sn exists only as a solid, decomposing into a mixt. of Na_4Sn and Na_2Sn on heating above 377° . $NaSn_2$ is formed from a reaction between $NaSn$ and liquid Sn at 307° , $NaSn_3$ from $NaSn_2$ and liquid 289° , $NaSn_4$ from $NaSn_3$ and liquid at 229° , and $NaSn_6$ from $NaSn_4$ and liquid 226° . The diagram is further discussed, the probable electronic structure of $NaSn_6$ and $NaSn_4$ being indicated. No evidence could be obtained for the existence of solid solns.

J. BALOZIAN

Critical temperature measurements on carbon dioxide in small capillaries. H. T. KENNEDY and CYRIL H. MEYERS, Bur. Standards, *Refrigerating Eng.* 15, 125–30 (1928).—An improved purifying train for CO_2 is illustrated and described. Detns. of crit. temps. were made on purified CO_2 in two small capillary tubes whose internal diams. were 0.004 mm. and 0.060 mm., resp., as measured microscopically and cor. for

the magnifying power of the glass. The temp. $30.96 \pm 0.01^\circ$ appears to be the crit. temp. of CO_2 as measured by this app., independent of the diam. of the tube in which measured. Whether or not this is true for tubes whose diam. is of the same order as the pores in charcoal, etc. is conjectural. The point of appearance and disappearance of the meniscus in the tubes under the illumination provided seemed to afford the best period for reading the crit. temp.

H. F. ZOLLER

Index of refraction and specific gravity of liquid sulfur and of viscous sulfur. P. M. MONVAL AND PAUL SCHNEIDER. *Compt. rend.* **186**, 1356-7 (1928).—The variation of n of liquid S as a function of the temp. has been detd. With increase in temp. n decreases up to 160° , then rises. Density decreases up to about 160° , remains const. for a few degrees and then decreases steadily. Sp. refraction is calcd.

L. D. R.

Surface tension of some organic substances in the molten state and Sugden's parachor. S. S. BHATNAGAR AND BALWANT SINGH. *J. chim. phys.* **25**, 21-7 (1928).—The surface tension (dynes/cm) was detd. for the following, in the molten state, by the drop method: naphthalene, 32.26 at 80.1° , α -nitronaphthalene, 43.31 at 61.5° ; phenanthrene, 37.24 at 100.5° , phenol, 37.92 at 41.0° , *o*-nitrophenol, 41.91 at 45.2° ; *p*-nitrophenol, 44.71 at 114.0° and *p*-nitrotoluene 37.15 at 54.0° . The mol. parachor is calcd. for the above and also for OH and the nuclei of naphthalene and phenanthrene.

E. G. VANDENBOSCH

Variations in the surface tensions of solutions. S. LAWRENCE BIGELOW AND E. ROGER WASHBURN. Univ. of Mich. *J. Phys. Chem.* **32**, 321-53 (1928).—This research was undertaken to discover and show how to guard against the difficulties of detg. surface tension by the capillary method. This paper deals with variations of surface tension with time. The app. used was that of Richards (cf. *C. A.* **18**, 1932). If a capillary tube is clean, the meniscus will reach the same equil. point by even, regular motion whether it is displaced by raising or lowering it. The surface tension of a sodium oleate soln. decreased from 71.0 dynes at 0 min to 42 dynes in 570 min. The surface tension of a glycerol soln. remained const. at 70.7 dynes for 34 min. and then decreased to 56.0 dynes at 528 min. Solns. of *ovalic*, *propionic* and *succinic acids*, *phenol* and *resorcinol* also showed a decrease of surface tension with time. After a fall of the meniscus a vigorous agitation causes a rise followed by a second lowering. When the meniscus is drawn down from its min. value, it snaps quickly back to the min. value. If the meniscus is forced up a few mm. before being lowered, it snaps up to the top of the forced rise. This is due to adsorption of solute on the walls of the capillary. The forced rise washes the walls as far as the liquid rises. The surface tension of a soln. of AmOAc increased from 62.6 dynes to 69.6 dynes in 30 min. Solns. of EtOAc , Pr butyrate , BuOAc , EtOH , PrOH , iso PrOH , $(\text{CHCl}_2)_2$, Me_2CO , Pr formate and MeOAc showed similar increases in surface tension with time of standing. Solns. of PrOAc were investigated at 20° , 30° and 40° . The initial surface tensions were higher at the lower temps., but the increase in tension was so much more rapid at the higher temps. that the soln. at 40° had the highest surface tension within 10 min. The ultimate surface tensions should be in the inverse order of their temps. A quant. study was made with EtOAc as the solute. In an open capillary the surface tension increased. In a closed capillary the surface tension decreased. In a capillary connected to a more concd. soln. of EtOAc , the surface tension decreased. The increase of surface tension is due to the evapn. of solute from the meniscus. When the capillary was closed with rubber the surface tension increased because rubber dissolves much of such esters. Rubber dissolved from vapor above 0.5 M EtOAc about 0.1 of its wt. in 9 hrs. In a 0.5 M soln. of PrOAc a collar of liquid formed by drainage from the walls following lowering meniscus. When the meniscus met this drop a rise occurred because the ester had evapd. from the liquid of the collar and the liquid of the collar formed a meniscus of almost pure water with a surface tension higher than that of the soln. Throbbing or successive temporary falls of the meniscus during a general rise is probably due to the soln. of impurities from the walls of capillary producing a lower surface tension. When the impurities are diffused out of the meniscus a rapid rise occurs in the part of the tube just rinsed out. When a new section of the tube is reached a second contamination may occur, and a second fall may result. There were a few cases of throbbing with a falling meniscus. The fact that change of meniscus takes place more rapidly in a small capillary than in a large one is hard to explain by diffusion and no satisfactory explanation is available. *Concn. in a surface* may be detd. by finding the surface tension when surface and body of liquid are of the same concn. Any surface contg. only the same solvent and solute which shows this same surface tension has the same concn. in the surface. Extent of adsorption may be measured

by applying this principle. If hydrolysis occurs, the products of hydrolysis will affect surface tension. Rates of hydrolysis may be measured by changes in surface tension. Rates of diffusion in liquids and in gases may be measured by detecting the arrival of the minute amt. of material necessary to affect a surface tension. Air drawn through rubber and into a capillary may contaminate the capillary and cause erratic values for surface tension.

F. E. BROWN

Coagulation of solutions of colloidal sulfur. GUISEPPE ROSSI. Univ. of Bologna. *Rev. gen. colloides* 5, 624-9(1927); cf. *C. A.* 22, 191.—A colloidal soln. was prepd. It contained in each 100 cc. S, 3.3380 g.; H_2SO_4 , 1.0991 g.; Na_2SO_4 , 1.5455 g. When 5 cc. of this sol. was dild. to 100 cc. the cond. of the dild. sol. was found to increase rather regularly with rise in temp. from 0.0034047 at 17° to 0.0053219 at 64° , except for a sharp rise in cond. at about 52° . When the cond. of a soln. contg. the same concns. of H_2SO_4 and Na_2SO_4 but no S was measured a similar increase in cond. from 0.0041939 to 0.0058380 was found. There was a break at about 52° also. The presence of the S had decreased the cond. at all temps. In another sample the increase in cond. due to the removal of the S sol varied from 32.19×10^{-6} at 19° to 8.73×10^{-6} at 54.1° . Again there was a break in the curve at about 52° . No explanation is known for the behavior at 52° . In general stability of S sols depends on adsorption of electrolytes. Coagulation due to rise of temp. is caused by less adsorption of electrolytes. F. E. B.

Colloidal phenomena in dye solutions. WALTER C. HOLMES. *Bur. Chem., J. Am. Chem. Soc.* 49, 790-1(1927).—If rosaniline base is fused with phenol, rosaniline phenolate, $C_{20}H_{20}N_3.C_6H_5O$, is obtained. Its aq. solns. are very colloidal and when dild. their depth of color increases instead of decreases. This is due to dissociation. The respective extinction coeffs. of (a) the original soln., (b) the soln. dild. with an equal vol. of H_2O , and (c) the soln. dild. with an equal vol. of EtOH are: immediately, $a = 0.54$, $b = 0.69$, $c = 0.88$; after 1 day, $a = 0.34$, $b = 0.63$, $c = 0.875$; after 6 days, $a = 0.16$, $b = 0.41$, $c = 0.85$. F. E. BROWN

The number of phases in colloidal systems. PAUL BARY. *Rev. gen. colloides* 5, 617-23(1927).—When a phase is defined as a mechanically separable part of a system the definition is ambiguous. Sepn. by filtration or osmosis depends on size of particle and pore of filter. Sedimentation, including centrifuging, seps. more or less, depending on the app. available. Centrifuging can remove a true solute. A better definition is, "The different phases which compose a system are sepd. from each other by surfaces whose surface tension is zero or positive." Undissolved solute in a satd. soln. would have an interfacial tension equal to zero. Colloids in a liquid present two cases. In the first case, the colloid is able to absorb only a definite amt. of liquid and swell to a definite size and be at equil. with unabsorbed liquid. This condition is exactly like that of a satd. soln. in contact with undissolved solute. The second case is that of a colloid which can swell indefinitely, perhaps even until its sepd. parts are mol. in size. It is difficult to see in what way this colloid differs from a soln. A protected Au-sol in a solvent is a two-phase system. The particles of protected gold constitute one phase and the soln. of protective colloid the second phase. Temp., pressure, elec. charge, p_H , and other factors will affect the swelling of gels and det. whether one or more than one phase is present. Soap mols., one end of which is sol. in water and the other insol. might be called a *hemiphase*. Soap in alc. is sol. and the system is only one phase. Soap in the presence of Ca ions becomes insol. and 2 phases are present.

F. E. BROWN

The immunity of the granule in colloidal solutions. A. BOUTARIC AND F. BANES. *Compt. rend.* 186, 1003-5(1928).—Sols of mastic resin, Au, casein and albumin were treated with a soln. of eosin and then sepd. by ultrafiltration. None of the eosin was found in the sepd. granules. When the mixt. was flocculated with $AlCl_3$ or by heating and then sepd. the greater part of the eosin was found to have been absorbed by the flocculated colloid.

E. G. VANDEN BOSCH

Barophoresis in gels. HARRY SOBOTKA AND ALBERT B. SABIN. *J. Am. Chem. Soc.* 50, 1561-72(1928).—Expts. on the rate of diffusion of colored solns. into agar gels show differences between the rate in upward and downward directions up to a crit. concn. of the diffusing soln. At higher concn. the direction of the max. rate is reversed. The term "barophoresis" is suggested for the phenomenon. J. G. McNALLY

The Brownian movement. KULESH CH. KAR AND MOHINIMOHAN GHOSH. *Physik. Z.* 29, 143-4(1928).—Einstein's formula for Brownian movement is derived from Kar's (*Physik. Z.* 24, 63(1923)) theory of the movement of particles under periodic impulses.

F. R. B.

The reversibility of various adsorbed compounds and their velocity of reversion. I. Inorganic electrolytes. NARANOSUKE KODA. *Acta Schol. Med. Univ. Imp. Kyoto* 10,

1-16(1928).—The expts. were performed at room temp. with bolus alba and blood-charcoal as adsorbents and KI as the substance to be adsorbed. Distd. water was employed as the medium in which the process of reversion occurred; the liberated KI was detd. and this value used for the basis of calcs. K. concludes from his data that adsorption and reversion are similar processes, the velocity of reversion, however, being greater than that of adsorption. The time of reversion increases with the amt. of KI adsorbed per unit of adsorbent. The equil. is produced more quickly at higher than at lower temps. Previous washing of the system charcoal-KI or bolus-KI has no influence on the velocity of reversion. Increasing the water vol. causes the amt. of KI reversed to rise, but has no particular influence on the velocity of reversion. Bolus and charcoal acted nearly equally in the expts. For each expt. the fraction $\log \text{mg./cc. of I liberated} \div \log \text{no. of sec.}$ was const. (C); the value of C ranged between 0.02 and 0.2. II. **Organic non-electrolytes.** *Ibid* 17-23.—The adsorbents were charcoal and bolus alba; the adsorbed material was glucose. The temp. ranged between 17° and 21° . With charcoal and glucose the results resembled those obtained with charcoal and KI; previous washing had no effect on the shape of the velocity curve and the velocity of reversion is favored by higher temps. The equil., however, sets in in less time than in the charcoal-KI system. The adsorption of glucose on bolus being almost zero, it was impossible to det. the reversion of this system with accuracy. III. **Organic dyes and emulsion colloids.** *Ibid* 33-42.—The reversibility of some org. dyes and an emulsion colloid was studied. The expts. were done on such dyes as give a true soln. (eosin, methylene blue, picric acid) or a mixt. of a colloidal and a true soln. (acid fuchsin, methyl violet, Nile blue, neutral red) or a colloidal soln. (Congo red, aniline blue, induline, scarlet red). Tributyrin emulsion was chosen for the emulsion colloid. Reversion was observed in only 2 cases, namely, in the system charcoal-picric acid and bolus-neutral red, where the curves obtained represented the same type as described above. Equil. is produced very rapidly. In all other cases, the adsorption was either irreversible or did not take place at all. IV. **Enzymes.** *Ibid* 43-55.—Pancreatin containing diastase, trypsin and lipase was used as adsorbed substance and blood charcoal and bolus alba as adsorbents. The adsorption of trypsin and lipase on charcoal is complete and irreversible. Diastase is fairly well adsorbed by charcoal, the process of reversion is rather slow. The adsorption of trypsin on bolus is nearly complete. The process is reversible and equil. occurs immediately. Bolus adsorbs a large amt. of lipase, but almost no reversion was seen. In the system bolus-diastase, the results obtained are similar to those obtained with charcoal-diastase.

G. SCHWACH

Nephelometric studies on starch hydrosols. A contribution to the question of the nephelometric dilution law. F. H. RITTER. *Biochem. Z.* 192, 337-50(1928).—A discussion of the deviations from Kleinmann's rule, observed with a highly dispersed starch soln. These follow a strictly formulated mathematical law. S. M.

Preparation of electrolyte-free gelatin. J. H. NORTHROP AND M. KUNITZ. *J. Gen. Physiol.* 11, 477-9(1928).—Powd. gelatin is soaked in $M/128$ AcOH for 1 hr. at $5-10^\circ$, washed 3 times with distd. water and filtered. It is then placed in approx. $0.02 M$ NaOH soln. for 1 hr., after which the supernatant liquid is removed and the gelatin is again washed 3 times with cold water. The amt. of NaOH removed is accounted for by measuring the vol. of wash water and by titrating samples of it. The quantity of NaOH left in the gelatin is calcd. and AcOH of known concn. is added to the gelatin in amt. double that present after washing. This brings the p_H to 4.7. Then follow 4-5 washings with cold water after which the gelatin is stirred into 95% alc., filtered, perfused several times with fresh alc. and then with Et_2O . Finally it is air-dried. 2.3 g. of this gelatin in distd. water had a p_H of 4.84 and a specific cond. of 1.5×10^{-5} , the cond. of the water used being 3.4×10^{-6} . Further washing does not materially change the cond. of the gelatin. If it is desired to keep the p_H at the isoelec. point, the gelatin should be dild. with water of p_H 4.7. C. H. RICHARDSON

Temperature of coagulation of pure copper colloidal solution. B. M. REID AND E. F. BURTON. *J. Phys. Chem.* 32, 425-32(1928).—The intention was to find the relation between temp. and coagulation in Bredig Cu-sols to which electrolytes had been added. It was discovered that coagulation takes place whether electrolyte is or is not added. The sols were heated in open Cu tubes sealed in Pyrex. No ebullition was permitted. Tables of data and graphs show that all colloids are coagulated by heat alone but more rapidly or at lower temps. if electrolytes are added. The longer the colloid stands after the addition of an electrolyte the lower the temp. required for coagulation. There are two cases. (1) The purest simplest colloids can be coagulated by heat alone. (2) Slow coagulation induced by traces of electrolytes may be

made rapid by rise in temp. There are three distinct changes by which rise in temp. may affect the rate of coagulation. (1) mol. motion, (2) dielectric const; (3) ionization of the solvent, water. The second should retard coagulation as temp. increased and the third is most likely to be the effective agency in hastening coagulation.

F. E. BROWN

The adsorption of iodine by charcoal in mixtures of organic solvents. J. TRIVINIC. *Compt. rend.* **186**, 1358-60(1928); cf. *C. A.* **22**, 2092.—Mixts. of H_2O -EtOH, PhH-PhMe, $CHCl_3$ - CCl_4 and EtOH-PhMe were used. The conclusions are: (1) The adsorption of I by charcoal in binary mixts. of org. solvents is expressed by the Freundlich adsorption equation. (2) If the values for the adsorption of I by charcoal are known for the pure solvents, the adsorption in any mixt. of the 2 solvents is indicated by a straight line joining these values where compn. of the solvent is plotted against adsorption.

L. B. MILLER

Contribution to the knowledge of electrolytic solution forces and of the electrolytic ionic state. III. Solubilities and solution forces, solubility and ionizing power. KARL FREDENHAGEN. *Z. physik. Chem.* **134**, 33-56(1928); cf. *C. A.* **21**, 3523.—Since every substance has a vapor pressure, solubilities can be expressed in terms of the distribution between gas and liquid phases. The distribution coeff may serve as a measure of the soln. forces between solvent and solute. Independence of the soln. forces and concn. is possible only in dil. soln. In a binary compd. the 3 distribution coeffs. of the undissocd. compd. and its 2 components must be considered. If electrolytic dissocn. occurs in the liquid phase electrolytic distribution coeffs. are required. These show how much greater the concn. of ions in the soln. must be than the concn. of corresponding neutral atoms in the gas phase in order that distribution equil and zero potential difference may prevail between the liquid and gas phases. A factor which depends on the choice of the reference zero enters into the electrolytic distribution coeff. P . However, a single such coeff. never occurs but instead the product of 2 coeffs. and the const. factor cancels. The ion product of a compd. in a solvent is given as the product of its dissocd. components in the gas phase and the P coeffs. Thus $C_{B^+} C_{S^-} = C_B C_S P_B P_S$. Values of P were detd. for a no. of elements in aq and NH_3 solns. and their order of magnitude estd. for other solvents (alc., HCN, HF). The sequence of P values in no way corresponds to the normal potentials and changes in different solvents. The ion product for a no. of substances in different solvents was computed from their known vapor pressures and calcd. dissociation consts. in the gas phase. The results agreed with the values found within the exptl. error. The agreement was considered as evidence that the p values det. the energy content of the ions as compared with the neutral atoms.

E. R. SMITH

A new form of the laws of Raoult. J. N. LANGINESCU. *J. chim. phys.* **25**, 70-82 (1928).—The formulas of Raoult for lowering of f. p. and raising of b. p. can be written $(T_{F0} - T_{F1})/T_{F0} = (RT_{F0}/L_F)x$ and $(T_{V1} - T_{V0})/T_{V0} = (RT_{V0}/L_V)x$, where L_F and L_V are the latent heats and x is the mol. fraction of the solute, the values RT_{F0}/L_F and RT_{V0}/L_V are const. for similar compds. Thus the depression or elevation, for analogous solvents, is dependent on x and independent of the nature of the components.

E. G. VANDENBOSCH

The neutral salt effect in ionic reactions. The temperature coefficient of the neutral salt effect. A. V. KISS AND I. BOSSANYI. *Rec. trav. chim.* **47**, -619 26(1928); cf. *C. A.* **21**, 3522.—The velocity of the reaction between $S_2O_8^{--}$ and I^- was measured at temps. between 0° and 75° and the temp. coeff. of the reaction was calcd. The results satisfied a 2-const. formula of the type $\log k = -(A/T) + B$. The temp. coeff. was found to have a normal value in every case and to decrease with increasing temp. The addn. of neutral salts did not change the temp. coeff.

E. R. SMITH

The neutral salt effect in ionic reactions. II. The neutral salt effect in concentrated salt solutions. A. V. KISS. *Z. physik. Chem.* **134**, 26-32(1928); cf. *C. A.* **21**, 3522.—The reaction between $S_2O_8^{--}$ and I^- was studied in concd. salt solns. to test the conclusion that the neutral salt effect follows different courses in dil. and concd. solns. This conclusion is based on the equation $v = k_R h_M C_A C_B f_A f_B / f_X$, where v is the velocity of a bimol. reaction, h_M is a const. depending on the reaction but not on the medium, h_M is a const. depending on the medium but not on the reaction, C_A, C_B, f_A, f_B are the concns and activity coeffs. of the reactants and f_X is the activity coeff. of the complex. It was found that the concn. effect of the reactants vanishes almost completely in concd. salt solns. and that the neutral salt effect follows the law of Grube and Schmid (*C. A.* **20**, 1548); i. e., the value of the velocity const. changes linearly with the salt concn.

E. R. SMITH

The activity coefficient of small ions. HANS MÜLLER. *Mass. Inst. Techn.*

Physik. Z. **29**, 78-82(1928).—M. improves his earlier paper (*C. A.* **21**, 3017) by using Gronwall and La Mer's better expansion of the Debye function. F. R. B.

Activity of hydrogen ions in aqueous solutions of beryllium sulfate. MILDA PRYTZ. *Trans. Faraday Soc.* **24**, 281-8(1928).—The H-ion activities in BeSO_4 solns. are studied by means of the H electrode, with the assumption that the H-ion activity of the reference electrode is unity and the use of Nernst's logarithmic formula. In the tabulated results, values are given for p_H and a for various concns. of BeSO_4 at 25°, 40° and 38°, in which a is the percentage hydrolysis of the salt. These values are calcd. on the assumption that for 100% hydrolysis each mol. of BeSO_4 yields 1 mol. of H_2SO_4 , and that the H_2SO_4 produced by hydrolysis is completely ionized. For dil. solns. a at 40° is always greater than a at 25°, while for more concd. solns. the reverse is true. Thus with 0.86 M BeSO_4 , p_H is 1.895 and a is 0.736 at 25° and p_H is 1.934 and a is 0.678 at 40°, while with 0.08 M BeSO_4 , p_H and a at 25° are 2.888 and 0.750 and at 40° are 2.854 and 0.816. Corresponding detns. are made in mixed solns. contg. BeSO_4 and added H_2SO_4 . For lower concns. of H_2SO_4 the effect of BeSO_4 is to decrease p_H and therefore a_H , while for higher concns. of H_2SO_4 the reverse is true. The results show that the unhydrolyzed part of the BeSO_4 makes it impossible to obtain an approx. estimate of the percentage hydrolysis of the salt by means of the H electrode except in the more dil. solns. An attempt to do this by comparing BeSO_4 solns. with equimol. solns. of MgSO_4 contg. sufficient added H_2SO_4 to give the same values of p_H was unsuccessful. H. STOERTZ

Activity coefficients of aqueous solutions of lead chloride at 25°. A. J. ALLMAND AND E. HUNTER. *Trans. Faraday Soc.* **24**, 300-6(1928).—Measurements of e. m. f. are carried out at 25° on the element Pb (amalgamated) aq. PbCl_2 -AgCl(solid)-Ag, and from the results the mean activity coeffs (γ) of the dissolved PbCl_2 are calcd. between the concn limits of satn. and 0.0003 M . For 0.0003 M , γ is 0.886, at 0.003 M , γ is 0.707, at 0.03 M , γ is 0.431 and at satn. (0.03908 M) γ is 0.388. The expts. are conducted in an atm. of N_2 , carefully purified from O_2 . H. STOERTZ

Monobasic, polybasic and polymonobasic acids and their differences. ERNST WEITZ AND HELLMUTH STAMM. *Ber.* **61B**, 1144-55(1928).—A discussion of the theoretical aspects involved in the difference of behavior of monobasic, polybasic and polymonobasic acids and salts, respecting ammoniate formation, hydrate formation and colloid coagulation. Regarding ammoniate formation the order is PO_4^{---} , IO_3^{---} , SO_4^{--} , F^- , $\text{S}_2\text{O}_8^{--}$, Cl^- , NO_3^- , Br^- , ClO_3^- , $\text{S}_2\text{O}_8^{--}$, I^- , CNS^- , ClO_4^- . There is a regular transition from polybasic to monobasic acids, with the apparent exception of $\text{S}_2\text{O}_6^{--}$ and $\text{S}_2\text{O}_8^{--}$. These are regarded, however, as constituted of 2 equiv. parts ($-\text{SO}_3\text{H}$) and ($-\text{SO}_3\text{H}$), each of which is a monobasic acid group, the acid therefore belonging to the poly-monobasic type. From the standpoint of relative coagulating ability, the polymonobasic acids occupy an intermediate position between polybasic and monobasic acids. Thus in coagulating a $\text{Fe}(\text{OH})_3$ sol, if the concn. of $(\text{NH}_4)_2\text{SO}_4$ required is 1, that of NH_4Cl is 100 and that of $(\text{NH}_4)_2\text{S}_2\text{O}_8$ is 7.5. H. STOERTZ

The strength of acetamide as an acid. G. I. K. BRANCH AND J. O. CLAYTON. *J. Am. Chem. Soc.* **50**, 1680-6(1928).—The conductivities of mixts. of (1) 0.02-0.08 N $\text{Ba}(\text{OH})_2$ and 0.0-10.0 N CH_3CONH_2 and (2) 0.02-0.08 N NaCl and 0.0-10.0 N CH_3CONH_2 , in aq. soln. at 25° were measured in the usual way. The slope, L , of the curves, cond. against concn. of base for const. concn. of acetamide, was the partial differential of the cond. with respect to the total concn. of base. The values of L were cor. for the influence of acetamide on the mobilities of the ions by the equation, $L_0 = L/(1 - E[A])$, in which $[A]$ was the normality of acetamide and E was a property of acetamide related to the solvent, and substituted in the equation, $(L_0 - L_{0B})/(L_{0B} - L_0) = K/[A]$, where L_{0B} and L_{0H} were the partial differential values for the pure barium acetamide and the base, resp. The equation was solved for K , the hydrolysis const. of acetamide. It was found to be 12, and corresponded to an acid dissocn. const. for acetamide equal to 8×10^{-10} . The dissocn. const. for benzamide was between 10^{-14} and 10^{-18} as detd. by similar measurements. A former value of 1.2×10^{-7} for benzamide was concluded to be erroneous. H. W. WALKER

p_H of buffered salt solutions. J. B. O'SULLIVAN. *Trans. Faraday Soc.* **24**, 298-300(1928).—A NiSO_4 soln. with a p_H of 5.0 is buffered with acetate, phosphate and borate buffers, the resulting solns. showing a lowered p_H . With an acetate buffer of p_H 5.0, the soln. showed a p_H of 4.4; with a phosphate buffer of p_H 6.4, the soln. showed a p_H of 4.5; and with a borate buffer of p_H 7.1, the p_H of the soln. was 5.9. The measurements are made with a quinhydrone electrode against a satd. calomel electrode, with satd. KCl as an intermediate. With a BaCl_2 soln. showing a p_H of 4.5, an acetate buffer of p_H 5.0 gave a p_H of 4.8; with CdCl_2 of p_H 5.7 the buffer gave a p_H of 4.3;

with CuSO_4 of p_H 3.7 the buffer gave a p_H of 4.0; with MnSO_4 of p_H 3.9 the p_H buffered was 4.7; with $\text{Al}(\text{NO}_3)_3$ of p_H 3.5 the p_H buffered was 3.1. On examn. of the effect of the buffer soln. upon CdCl_2 , NiSO_4 and $\text{Al}(\text{NO}_3)_3$, over a wide range of concns., an appreciable lowering of p_H is found even when the concn. of the added salt is below that of the buffer mixt

H. STORZT

The determination and significance of hydrogen-ion concentration. H. W. VAN URK. *Pharm. Weekblad* **65**, 515-27(1928).—A lucid discussion of the fundamental principles and practical application of p_H detn.

A. W. DOX

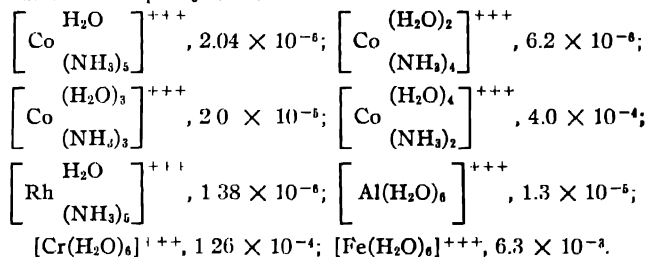

The use of quinaldine red for hydrogen-ion concentration determinations in acid medium. I. M. KOLTHOFF. *Biochem. Z.* **194**, 78-82(1928).—Quinaldine red changes color between p_H 1.4 and 3.2 from colorless to red. The indicator const. $pK_i = 2.73-0.007(t - 20^\circ)$. It has a fairly large salt error. In 0.1 N KCl a correction of +0.17 in p_H is necessary, and in 0.5 N KCl + 0.38. The protein error was not detd. 2,4,2',4',2''-Pentamethoxytriphenylcarbinol is a better indicator than quinaldine red.

S. MORGULIS

The acid dissociation of aquo ions. II. J. N. BRÖNSTED AND KIRSTEN VOLQVARTZ. *Z. physik. Chem.* **134**, 97-134(1928); cf. *C. A.* **22**, 526.—The acid character of the aquo

ions is detd. by the typical equil.
$$\left[\begin{array}{c} \text{H}_2\text{O} \\ \text{Co} \\ (\text{NH}_3)_5 \end{array} \right]^{+++} \rightleftharpoons \left[\begin{array}{c} \text{OH} \\ \text{Co} \\ (\text{NH}_3)_5 \end{array} \right]^{++} + \text{H}^+$$

and $\text{H}^+ + \text{H}_2\text{O} = \text{H}_3\text{O}^+$. The factors governing the acid strength are: (1) The elec. charge of the acid, and (2) the no. of dissociable protons. The methods generally applicable for the detn of the disson const. of these ions are: (1) Detn. of H-ion concn. by the catalytic diazoacetic ester decompn. method, (2) detn. of the soly. of salts of the cations in question in solns. of different acidity, and (3) detn. of H-ion concn. from the decompn. velocity of nitrate-aquo-tetrammine-cobaltic salts. The disson const. of a series of trivalent aquo ions were detd by these 3 methods. With increasing concn. positive deviations from the ideal behavior were observed. These deviations were found to be proportional to the ionic strength and were represented by the formula $\log K = \log K_0 - 2\sqrt{\mu} + \mu$, where μ is the ionic strength. The ions investigated and their resp. K_0 values at 15° were:

E. R. SMITH

Color variations of cyanidin chloride and 3,5,7,3',4'-pentahydroxyflavylium chloride as related to acidity and alkalinity. C. M. FEAR AND MAXIMILIAN NIERENSTEIN. *Biochem. J.* **22**, 615-6(1928).—The color changes of anthocyanidins and probably anthocyanins, in presence of acids and especially alkalies, must be standardized before any real value can be attached to them. p_H values, temp. and time of contact with reagent have to be considered.

BENJAMIN HARROW

The oxidation-catalytic action of iron. HANS HANDOVSKY. *Z. physiol. Chem.* **176**, 79-88(1928).—The oxidation of leucine to $\text{Me}_2\text{CHCH}_2\text{CHO}$, NH_3 and CO_2 by O_2 in the presence of various forms of Fe was tested by shaking the mixt. in a thermostat at 37° . No oxidation occurred when the Fe was in the form of FeSO_4 , Fe_2O_3 aq., $\text{Fe}(\text{OH})_3$ sol, $\text{FeSO}_4 + \text{Al}(\text{OH})_3$ or metallic Fe obtained by ignition of FeC_2O_4 . Metallic Fe prep'd. by heating pptd. $\text{Fe}(\text{OH})_3$ in an atm. of H oxidized leucine in an O atm. to $\text{Me}_2\text{CHCH}_2\text{CHO}$, NH_3 and CO_2 . All of these products were identified. The oxidation in 5-6 hrs. amounted to 19% of the leucine. This Fe prepn. catalyzed the oxidation also of glycine, alanine, valine, tyrosine, histidine, formylleucine and glycyllleucine, as shown by the fuchsin- SO_2 test for aldehyde. Oxidation by the Fe powder is inhibited by HCN. If, however, the reduced Fe is cooled in an atm. of N it loses its power of catalytic oxidation, but the activity may be restored by heating again in H. The activity is due to dissolved H, which is present in an activated form on the surface of the Fe crystals. This H combines with the free O to form H_2O_2 .

which then oxidizes the amino acid. If O is passed into a suspension of the active Fe in $\text{Ti}(\text{SO}_4)_2$ soln., an intense blue color develops which changes to colorless and finally yellow with further absorption of O. This effect is not obtained with the reduced Fe cooled in N. Animal charcoal, because of the presence therein of Fe, oxidizes leucine in the same way as reduced Fe. This power is lost when the charcoal is heated in a N atm. but restored by heating in H. There is no evidence that Fe in any form is capable of direct catalytic oxidation of amino acids.

A. W. DOX

Relation between the rate of stirring and reaction velocity in heterogeneous systems. ANIELA KLEIN. *Roczniki Chem.* 6, 867(1926); cf. C. A. 18, 3132; 20, 1936; 22, 1084.—In their paper on the soln. of Cu in $\text{Fe}(\text{NH}_4)(\text{SO}_4)_2$ Bekier and Rodziewicz adopt K.'s formula: $(K - a)/n = \text{const.}$ with the assumption, however, that a varies with the shape and position of the stirrer. K. shows that B. and R.'s figures, if properly calcd., prove the constancy of a within the limits of exptl. error.

MARY JACOBSEN

The relation between the hydrolysis equilibrium constant of esters and the strengths of the corresponding acids. R. J. WILLIAMS, ALTON GABRIEL AND R. C. ANDREWS. Univ. of Oregon. *J. Am. Chem. Soc.* 50, 1267-71(1928).—The Et esters of HCO_2H , AcOH , $\text{C}_2\text{H}_5\text{CO}_2\text{H}$, glycolic, lactic and of halogen acids were hydrolyzed directly until equil. was reached. In general, when the esters of similar acids are compared those formed from the stronger acids are more nearly completely hydrolyzed. When esters formed from acids of different types are compared, some other factor or factors produce great changes in extent of hydrolysis.

F. E. BROWN

The effect of neutral salts on the velocity of saponification of ethyl acetate by sodium hydroxide. I. S. D. WILSON AND ETHEL M. TERRY. Univ. of Chicago. *J. Am. Chem. Soc.* 50, 1250-4(1928); cf. C. A. 21, 3526; 22, 2307.—The salts used were NaCl, NaOAc and NaNO_3 . The initial molalities of ester and alkali were 0.008 and 0.01, resp. The molality of the salt solns. varied from 0.02 to 0.5. Data for the activity coeffs. of NaOAc and NaNO_3 were lacking. From the data available for the activities of NaOH and HCl and the equation $dx/dt = K_4(\gamma_{\text{NaOH}}/\gamma_{\text{HCl}})(B - X)$ ($E - X$), where dx/dt and K_4 have the usual significance, γ_{NaOH} and γ_{HCl} are the activities of NaOH and HCl, resp., and B and E are the initial molalities of the base and of the ester, resp., K_4 is found to be const.

F. E. BROWN

Heat of formation of molecular hydrogen. F. RUSSELL BICHOWSKY AND L. COVELL COPELAND. *J. Am. Chem. Soc.* 50, 1315-22(1928).—A mixt. of H_2 and H from a Wood's tube was passed through a small hole into a Pt calorimeter. The heat of combination of H to give H_2 was measured, and the amt. of H in the gas detd. from the law of flow of gases through small holes. The heat, thus detd. of the reaction $2\text{H} = \text{H}_2$, is $105,000 \pm 3300$ cal. per mol.

F. R. BICHOWSKY

The thermal investigation of metallurgically important reactions in a calorimeter operating at elevated temperatures. W. A. TOTH AND P. CHALL. *Z. Elektrochem.* 34, 185-99(1928).—A calorimeter which operates at elevated temps. with an accuracy of 1% is described. The calorimeter operates on the principle that when materials sol. in acids with the evolution of gases are used, the gases thus evolved carry the heat to the calorimeter liquid. Specific-heat data are given for HCl and HF solns., glass, platinum, marble, ppld. SiO_2 and quartz. The heat of vaporization of water is given as well as the heats of soln. in dil. HCl of CaO, $\text{Ca}(\text{OH})_2$, CaSiO_3 , marble, calcite, argonite, MgO, $\text{Mg}(\text{OH})_2$, Zn, $\text{Zn}(\text{OH})_2$, and smithsonite, and heats of soln. in dil. HF of quartz, sand, pptd. SiO_2 and SiO_2 contg. 33% H_2O . Data are also given on the heats of formation at 50° of CaSiO_3 from CaO and SiO_2 , of calcite and argonite from CaO and CO_2 , of $\text{Ca}(\text{OH})_2$ from CaO and H_2O , of $\text{Mg}(\text{OH})_2$ from MgO and H_2O , of $\text{Zn}(\text{OH})_2$ from ZnO and H_2O , of smithsonite from ZnO, and CO_2 , of ZnO from Zn and O; and heats of transformation of calcite into argonite and of amorphous to cryst. SiO_2 .

The question of the determination of the thermal equivalent of a calorimetric bomb. W. SWIENTOSLAWSKI. *J. Russ. Phys.-Chem. Soc.*, Chem Part, 59, 563-6(1927); cf. following abstract.—Calibration against the heat of combustion of some standard substance (BzOH) will make the results of various investigators comparable. The transport method advocated by Shchukarev (*Bull. of Thermotechn. Inst.*, 1926, Russian), while precise *per se*, will lead to further confusion.

BASIL C. SOYENKOFF

Swientoslawski's article on the question of the methods of determining the thermal equivalent of a calorimetric bomb. A. N. SHCHUKAREV. *J. Russ. Phys.-Chem. Soc.*, Chem. Part, 59, 567-72(1927); cf. preceding abstract.—S. upholds an abs. method of calibration as contrasted with the relative one against the heat of combustion of a standard substance. The following refinements were introduced into the transport method. The bomb was placed in a close-fitting leaden jacket, the 2 screws being replaced by corks, and left overnight in a reservoir of water at room temp. A ther-

mometer was immersed in the water, and another one dipped into Hg on top of the cover of the bomb. After the final measurements were made of the temp. of the calorimeter, some of the water was replaced by warm water until the temp. reached that at the beginning of the expt. V was read off with the water at the same level as before the immersion of the bomb. The av. deviation was 0.5 cal. with the limit of precision of the thermometer at 0.43 cal. BASIL C. SOYENKOFF

The condensation of certain substances below their melting points. N. V. TANTZOV AND T. N. KHODALEVICH. *J. Russ. Phys.-Chem. Soc.*, Chem. Part, 59, 631-8 (1927).—Tammann and others observed that camphor, borneol and isoborneol crystd directly from their vapor. Since their results contradict the principle of min. entropy change, a study was made of the supercooled vapors of the above substances in the absence of solid nuclei of crystn. A test tube was ground at the middle to fit into the constricted top of a cylindrical vessel contg. the substance. After heating to 15-30° above the m. p., the bath was allowed to cool and a current of air washed with Et₂O sucked through the bottom of the test tube. With the bath 10° above the m. p. and the end of the test tube 50° below, a transparent viscous film deposited on the latter which could be slowly cooled to room temp. without crystn. A similar optically isotropic film results when camphor is condensed after the beginning of crystn., while in the case of borneol it grows rapidly opaque. Isoborneol in each case gave a transparent film which crystd readily on further cooling. S and I are condensed in liquid drops which can be supercooled to room temp. BASIL C. SOYENKOFF

An extension of the idea of entropy. V. NJEGOVAN. *J. chim. phys.* 25, 65-9 (1928).—A concrete notion of entropy can only be obtained by considering its abs. value. The entropy const. must be considered as being variable, for then it will not disappear on differentiation but will stay in the final equation of energy. An attempt is made to combine laws of C_p and C_v with the entropy const. E. G. V. B.

Thermodynamical principles of chemistry. I. General and synthetic method of deriving and comparing in a simple and rigorous manner the fundamental formulas of physical chemistry. E. DENINA. *Ingegneria Rivista Tecnica Mensile* 1926, No. 8, 16 pp.—The initial and final states of isothermal processes are assumed to be determined by 2 curves AA' and BB' . By applying the second law of thermodynamics to a cycle of two isotherms, there is obtained the general equation, $A = T(\partial A/\partial T) + \Delta U + T[\partial(L - L')/\partial T]$. L and L' are the work done by the system along AA' and BB' , resp., starting at any arbitrary point A', B' . A is the max. work and U the decrease in internal energy. From this equation all the special formulas of phys. chemistry can be derived by assigning the proper forms to the curves AA' and BB' , which det. how the initial and final states vary with the temp. Particular consideration is given the case of thermodynamic potential at const. pressure, and the above equation is shown to be applicable generally, even when the initial and the final states vary according to different laws. II. The laws of equilibrium in perfect gases and ideal solutions. *Ibid* No. 10, 16 pp.—D. has derived synthetically the various equations expressing the affinity of a reaction, and the equil. conditions for systems of perfect gases and of ideal soln., emphasizing the exact significance of each symbol, and the conditions of validity of each formula. Particular emphasis is placed on the necessity of defining precisely the method of detg. the concn. Relations between the various equations, often of a simple algebraic nature, are shown. R. H. LOMBARD

Observation on my work on color and magnetism of ions. GEORG JOOS. *Phys. Inst., Jena. Ann. Physik* 85, 641-2(1928).—The colors of certain Ti compds. verify J's theory (cf. *C. A.* 21, 1053). A. L. HENNE

Note on the relation between color and magnetism of ions. BORIS MALYSCHIEFF. *Ann. Physik* 85, 794(1928).—Ni carbonyl is octavalent and colorless, in contrast to other Ni compds., while $\text{Fe}(\text{CO})_5$ is yellow and also is photosensitive. M., therefore, suggests that the measurement of the magnetic susceptibilities of the carbonyls of the paramagnetic metals in the gaseous, liquid and solid forms should be of great value in indicating their structure. W. W. STIFLER

Magnetization of single crystals of iron at high temperatures. KOTARO HONDA, HAKAR MASUMOTO AND SEIJI KAYA. *Sci. Repts. Tohoku Imp. Univ.* 17, 111-30(1928).—The intensity of magnetization of a small rectangular bar consisting of a single crystal of Fe was measured by the ballistic method at various temps. from liquid air up to 770°. At ordinary temps. the magnetization curve is almost straight up to $I = 1000$, then breaks sharply and again is almost rectilinear until the satn. value at $I = 1700$ approx. is reached, when there is another sharp break and the curve becomes horizontal. As the temp. is raised these breaks are gradually displaced toward lower fields and the satn. value decreases until it vanishes at the crit. temp., 790°. By

extrapolation the satn. value at zero abs. is estd. to be $I = 1752$. The relations between the magnetization and the temp. for the directions of the principal axes, as found from measurements on an ellipsoid, are all similar to each other and also to those for the rectangular bar. Honda and Okubo's theory of the magnetization of ferromagnetic crystals (*C. A.* 12, 2480) is explained briefly and the present results are shown to be in accord with it. W. W. STIFLER

Electrode potential crystals of iron. KEIZO IWASÉ AND KOZO MIYAZAKI. *Sci. Repts. Tohoku Imp. Univ.* [1], 17, 163-7 (1928).—The electrode potential of an Fe single cryst., having the surface (110), was compared with that of polycryst. Fe against a Hg electrode in a cell with $(\text{NH}_4)_2\text{Fe}(\text{SO}_4)_2$, KCl and Hg_2Cl_2 . The single crystal gave a higher potential than the polycryst. Fe. For the single crystal the time-e. m. f. curve rises rapidly to a const. value while the curve for the polycryst. Fe rises to a max. and then gradually falls to a const. value after a comparatively long time. W. W. S.

Electrically charged boundary surface. RUDOLF AUERBACH. Univ. of Leipzig. *Kolloid-Z.* 43, 114-31 (1927).—The equations for expressing surface energy on uncharged liquid spheres, for the effect of introducing elec. charges, for the criterion for positive, zero and negative surface tensions and for pressure in a small drop, are derived. They are, resp.: $\Omega = \sigma_0 4\pi r^2$ (1); $N = V^2/8\pi r^2$ (2); $\sigma_n = \sigma_0 - (V^2/16\pi r)$ (3); $D = 2\sigma/r$ (4). In these equations Ω = surface energy, σ_0 = surface tension of an uncharged surface, N = the expansive pressure of charges on the surface of a drop, V is the potential function, σ_n is the actual surface tension, D is the pressure in a drop. The third equation shows that the measured surface tension is the difference between the surface tension of an uncharged drop and the expansive pressure due to the charge on the surface. This value may be pos., neg. or zero. Surface tensions, σ_n , were measured by the swinging stream. The streams were photographed. Eight photographs are reproduced in the paper to show the forms of streams of acetone charged at 5000-v. intervals from 0 to 30000 v. The p. d. was detd. by measuring the attraction between a plate charged with the same voltage as the stream, and a grounded plate. The force between the plates varied from 4.21 g. at 5000 v. to 421 g. at 50,000 v. For H_2O the following values for surface tension in dynes per cm. were obtained: $\sigma_{0v} = 73$; $\sigma_{5000v} = 63.7$; $\sigma_{10000v} = 49.8$; $\sigma_{15000v} = 43.0$; $\sigma_{20000v} = 35.1$; $\sigma_{25000v} = 29.2$. "v" indicates p. d. in volts. For Hg, the values were $\sigma_{0v} = 450$; $\sigma_{5000v} = 441$; $\sigma_{10000v} = 432$; $\sigma_{15000v} = 416$; $\sigma_{20000v} = 405$; $\sigma_{25000v} = 394$. For acetone, the values are $\sigma_{0v} = 23.3$; $\sigma_{5000v} = 22.2$; $\sigma_{10000v} = 18.3$; $\sigma_{15000v} = 11.9$; $\sigma_{20000v} = 10.4$; $\sigma_{25000v} = 8.1$; $\sigma_{30000v} = 4.4$; $\sigma_{17500v} = 3.7$; $\sigma_{20000v} = 0$; $\sigma_{22500v} = -5$; $\sigma_{25000v} = -10$; $\sigma_{27500v} = -12$; $\sigma_{30000v} = -18$. When the surface tension is zero or negative the stream is soon dissipated as spray. If surface tension is due to an elec. double layer, and r and $r + S$ are the radii of the 2 concentric spheres, then as S increases the charge necessary to produce a given surface tension increases. The breaking of a stream into fine particles increases the electrostatic capacity of a given vol. of liquid more rapidly even than the surface increases. $\Sigma O_n = O_0 n^{1/3}$ and $\Sigma C_n = C_0 n^{2/3}$ represent these relations when ΣO_n represents the total surface of n particles and ΣC_n represents the electrostatic capacity of the same n particles. The capacity of 1 cc. of matter in colloidal particles ($r = 1\mu$) is greater than that of a single sphere whose radius is equal to the distance from the sun to the earth. It seems probable that any liquid may be sufficiently highly charged to break it up into fine droplets or even almost to vapor. But as yet no noticeable increases of vapor pressure have been produced exptly. by this means. Highly dispersed systems may be highly charged with their great capacity, be transported or transferred to other vessels and the electricity be recovered. F. E. BROWN

The dispersion of conductivity and dielectric constant of strong electrolytes. P. DEBYE AND H. FALKENHAGEN. *Phys. Z.* 29, 121-32 (1928); cf. *C. A.* 21, 3194.—When the force acting on an ion of a strong electrolyte is suddenly changed it takes a finite time of the order of 10^{-7} sec. for equil. to be reestablished. This time can be calcd. for certain cases if the theory of Debye for strong electrolytes is assumed. The calcn. is carried through to give the time of approach to equil., the phase difference between motion of an ion and the imposed force, and the dependency of cond. and dielec. const. on the frequency. These last quantities can be easily measured. F. R. B.

Birefringence and dichroism of thin layers of iron obtained by distillation. MARCEL CAU. *Compt. rend.* 186, 1293-5 (1928).—A method is described for heating iron wire in a vacuum and distg. it to obtain iron foils of varying thickness. These were studied with a Glazebrook polarizer and a Chaumont analyzer, carefully regulated on a pencil of monochromatic light coming from a Hg-vapor lamp, followed by a separator. The results showed: (1) The variations of the azimuth, the rotation to the right and the ellipticity can be represented by sinusoids; (2) the period of the sinusoids corresponds

to a half-turn of the foil in its plane; (3) the variations in rotation and ellipticity are concordant; (4) if the direction parallel to the generating wire be called the axis, the rotation and ellipticity are zero if the axis is parallel or perpendicular to the incident vibration. The results are explained by birefringence and dichroism, since birefringence alone would give a negligible rotation, and dichroism alone would not give the ellipticity. The effect is localized in the metallic deposit and is caused by the magnetic field of the current used to produce the distn. The effect is not modified by an intense magnetic field parallel to the foil.

AMY LEVESCONTE

Decimal classification of colors. A. RUTHARDT. *Farbe u. Lack* 1928, 116.—The ten colors, including black and white, are designated by the numbers 0 to 9. The amt. of color is indicated by nos. following the first one and is expressed as parts of color per 10 or 100 parts of inert. Thus, 25 means 5 parts of color 2 plus 10 parts inert. Mixts. are sepd by commas. Thus, 255,615 means 55 parts color 2 plus 100 inert, mixed with 15 parts color 6 plus 100 inert. The predominating color is written first. G. G. SWARD

Some remarks on the theory of the rocking extraction. UNO BOXLUND. *Skand. Arch. Physiol.* 53, 176-84(1928).—Original must be consulted for details of computation.

S. MORGULIS

The reaction of starch with iodine. STAIGER. *Z. Spiritusind.* 50, 300(1927).—Methods for prepg. the reagents are given. Pure I does not give the blue color with starch, but the color is produced if a trace of HI is added. The lower the temp. of the starch soln., the more intense the blue color. An excess of I is necessary to retain the blue color when added to incompletely saccharified starch solns. Heating to near the b. p. causes the blue color to disappear, but if not overheated it will return when cooled. Substances, such as alk. earths, H_2S , Cl , $KMnO_4$, and tannic acid, tending to remove KI or HI, prevent the reaction. Alc. causes decolorization by the formation of I_2I . Salts of metals affect the color, Ag causing violet tints to appear. Reducing substances tend to decolorize the starch-iodine complex. Addns. of HCl to starch-iodine may depress the dissociation of HI and permit the blue color to be retained even at the b. p.

C. N. FREY

Demonstration of a method of measuring particle sizes in ground powders. J. V. RAMSDEN. *J. Oil Colour Chem. Assoc.* 11, 16-7(1928).—A small quantity of the sample is mixed with water till a slight turbidity is obtained, and then poured into a transparent-bottomed dish made of xylonite. This dish is placed on the stage of an inverted microscope, specially designed for this work. By means of a $1/4$ -in. microscope objective, the image of the particles is projected on a ground-glass screen on which are ruled lines. These lines are set apart at a distance corresponding to a satisfactory mesh size for the particles. Should a particle be larger than the distance between 2 lines, the material is condemned. The instrument is in daily use for control testing of barytes.

3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

S. C. LIND

The waves in the ether. Their properties and applications. I. PLOTNIKOV. *Archiv. hem. farm.* 1, 111–26(1927).—A popular outline of the waves of the whole spectrum.

The dispersion and absorption of short electric waves and their production by means of cathode tubes. V. I. ROMANOV. *Physik. Z.* 28, 770–9(1927).—A rather thorough review is given of the literature. It is shown that the oscillations of associated mols. may correspond numerically to those of the elec. spectrum. A generator consisting of two tubes is described giving short undamped elec. waves. So far, waves of 18 and 3.6 cm, resp., have been obtained.

Ionization in the upper atmosphere of the earth. E. O. HULBERT. Naval Research Lab., Wash. *Phys. Rev.* 31, 1018–37(1928).—A theory of the ionization of the upper atm. of the earth by the ultra-violet light of the sun is developed, based on known laws of pressures and constitution of the high atm., ionic recombination, attachment of free electrons to neutral mols. and diffusion of ions. It is concluded that the solar ultra-violet light is a necessary and sufficient cause of the Kennelly-Heaviside layer, and that hypotheses of other agencies of ionization, such as charged particles from the sun, penetrating radiation, etc., are uncalled for except perhaps in unusual cases. The calcd. ionization using wave lengths below λ 1300 is shown to explain quant. many facts of wireless telegraphy, i. e., skip distances, overhead absorption coeffs. limiting waves, ranges and the apparent heights reached by the waves. Calcd. seasonal and diurnal changes in ionization are shown to be in agreement with the corresponding variations in wireless wave propagation phenomena. The potential energy of the day-time ionization in a one-cm.² column of the atm. is found to be at least 1 erg and the assumption that less than 1% of this is liberated as light will account for the light of the night sky or the non-polar aurora. As a result of diffusion of the ions along the lines of magnetic force the upper spray of the ionized layer diffuses to the magnetic poles, concentrates there and causes the aurora. Calcn. indicates that O₂ of the atm. is perhaps not directly connected with the foregoing ionization, but is formed by long wave lengths of ultra-violet light from λ 1300 to λ 1800.

The origin of the aurora borealis. E. O. HULBERT. Naval Research Lab., Wash. *Phys. Rev.* 31, 1038–9(1928).—It has been assumed by several that the aurora is caused by charged particles from the sun which are diverted to the polar regions by the magnetic field of the earth. There are possible objections to this and it is suggested that the aurora is due to the ultra-violet light of the sun, which produces ions and electrons in the high atm. of the earth above 200 km. or so. These diffuse along the magnetic lines of force, concentrate at the magnetic poles of the earth, recombine and in some way yield up their energy to form the aurora. The total aurora energy during a strong display is estd. to be 10¹⁶ erg sec.⁻¹, which is in rough agreement with the energy of the upper spray of photoelec. ionization in the high atm. indicated by wireless telegraphy.

The green auroral line. G. CARIO. Princeton. *J. Franklin Inst.* 205, 515–8 (1928).—C. proposes a somewhat different explanation of the green auroral line than McLennan *C. A.* 22, 2108. In consequence of absorption of solar radiation O atoms are formed in the lower singlet state. The absorption takes place at a max. in a postulated band 1.5 to 1.8 v. distant from the convergence limit at λ 1750. The emission of the green line is due to a transition from the singlet state.

A new optical phenomenon; pulsations produced when anisotropic molecules in rotation and vibration diffuse visible and ultra-violet light. J. CABANNES. *Compt. rend.* 186, 1201–2(1928); cf. *C. A.* 18, 3529; 19, 212.—The phenomenal spectrum obtained by diffusion through liquids, discovered by Raman (*C. A.* 22, 1079) may be explained on the basis of "optical pulsations."

A new radiation. C. V. RAMAN. *Indian J. Physics* 2, 387–98(1928).—R. made the discovery that the visible radiation which is excited in pure dry glycerol by ultra-violet radiation is strongly polarized. The same phenomenon was obtained with 80 liquids, compressed gases and transparent solids. Consequently, the phenomenon is considered as universal. The "complementary filter" test shows that the phenomenon is of the fluorescence type, but it differs from the latter by the fact that the scattered light is

polarized, and by the order of magnitude. When the incident light wave length is smaller than 4,358 Å., the scattered light exhibits 2 or more sharp bright lines in the blue and green regions of the spectrum. The position of the lines is practically the same for chemically similar liquids (hexane, octane). A slight shift was evident for C_6H_6 and H_2O . Hypotheses are presented regarding the nature of the new radiation, its relation with thermodynamics and its analogies with x-rays. A. L. HENNE

New precision in cosmic-ray measurements, yielding extension of spectrum and indication of bands. R. A. MILLIKAN AND G. H. CAMERON. Cal. Inst. of Tech. *Phys. Rev.* **31**, 921-30(1928).—A method is described which leads to *greatly increased precision in the measurement of capacities of the order of one electrostatic unit. More penetrating cosmic rays than have previously been found are indicated by a new absorption curve obtained with much greater precision than hitherto possible. The new curve affords definite evidence for the existence of bands in the spectrum of cosmic rays. The measurements indicate that the cosmic rays consist chiefly of two bands about 3 octaves apart of mean absorption coeffs 0.35 and 0.04 to 0.05 per m. of water. The total energy of cosmic rays at the top of the atm. is found to be very nearly $1/10$ that due to star light and heat as computed from Seares' data (Astrophys. J. **62**, 373(1925)).* B. L.

New effects in the optical excitation of vapors. R. W. WOOD. Johns Hopkins. *J. Franklin Inst.* **205**, 481-95(1928).—W. describes expts with optically excited Hg vapor and verifies the prediction that lines resulting from a two-stage absorption increased with the square of the intensity of the exciting light, while those which resulted from a three-stage absorption increased with the cube. Effects of other introduced vapors or gases on the light emission were studied. H_2O , N_2 and air were introduced. The result dealing with the appearance of the "forbidden line" is interesting. Both H_2O vapor and N_2 must be present, the N_2 bringing electrons to $2p_3$ on a very large no. of atoms. Their return from this level to 1S is greatly facilitated by the presence of H_2O vapor although the reason for this is obscure. Expts. are described dealing with the green fluorescence of Hg vapor which seem to clear up certain apparent discrepancies in the observations of others. Expts. dealing with the optical excitation of I_2 vapor in He at a pressure of about $1/2$ mm. show that in the bands brought out by the He only half as many lines were present as would be found in the corresponding band of the absorption spectrum. *The alternate lines were missing. It was found that the rotational quantum no. changes by 2, 4, 6, 8, etc. instead of by ± 1 as in absorption or emission processes. This is of interest in connection with recent developments in the theory of mol. mechanics dealing with nuclear rotations.* BERNARD LEWIS

The inner structure of the atom. JAMES PATRICK. *Pharm. J.* **120**, 105 8, *Chemist and Druggist* **108**, 179-82(1928).—Abstr. of an address. S. WALDBOTT

Kinetics of the dissociation of diatomic molecules. J. FRENKEL AND N. SEMENOFF. *Physik.-Techn. Rontgen institut, Leningrad. Z. Physik* **48** 216-30(1928).—The "activation" considered in the theories of reaction velocity is identified with the "excitation" of the quantum theory, and the principle of detailed balancing is applied to find the relative importance of radiation and collisions in activation. If q_r is the Einstein coeff. for absorption by the normal mol., q_m the no. of activating collisions suffered by the normal mol. per sec., p_r the Einstein coeff. for emission by the excited mol. (independently of temp. and pressure) and p_m the no. of deactivating collisions suffered by the excited mol. per sec. (proportional to pressure) it is shown that at temps at which kT is small compared with the energy of activation, $q_r/q_m = p_r/p_m$. Since q_r/q_m det. the relative probability of activation by radiation and collision, radiation becomes the more important factor at pressures below a few mm. and collisions at higher pressures. Application of the principle is made to the calcn. of the rates of the following typical dissoocs of diatomic mols. (1) A gaseous dissocn. with activation into a normal and an excited atom, for which the initial rate is proportional to $e^{-E_2/kT} b$ (E_2 = energy of dissocn to normal atoms + energy of excitation of the excited atom); (b = concn. of normal molecules); (2) a gaseous dissociation without activation into normal atoms, by collisions of the first kind, for which the initial rate is proportional to $e^{-Q/kT} b^2$; (3) a dissocn. by contact catalysis, for which the initial rate is proportional to $e^{-(Q-D)/kT} b$ where D = heat evolved when an atom resulting from the dissocn. is absorbed on the wall. For I_2 at atm. pressure, the calcd. rates for the 3 processes at 500° abs. are, resp., 10^{-13} , 6×10^{-7} , 10^{-4} and at 1000°, 10^6 , 10^4 , 3×10^2 . Similar data are given for bromine. W. WEST

The radioactive elements. L. R. KOLLER. *Sci. Monthly* **27**, 54-6(1928). E. J. C.

The exact determination of radium emanation. J. v. WESZELSZKY. Univ. Budapest. *Physik. Z.* **28**, 757-61(1927).—A new app. is described. The novel feature depends upon its calibration by means of the γ -radiation of a Ra sample to be attached

to the outside wall of the app. instead of by comparison with a standard soln. according to Curie.

EMIL KLARMANN

The electrodeless discharge through gases. J. J. THOMSON. *Proc. Phys. Soc. London* **40**, 79-89 (1928); cf. *C. A.* **22**, 725.—After a description of the method of producing the electrodeless discharge and a statement of the theory, expts. are described which show that the passage of ultra-violet light through the gas enhances the discharge. This is explained as follows: The energy absorbed by the gas from the transmitted light excites the mols. to a state in which they are more easily ionized than when they are normal. The external elec. field is, therefore, not called upon to supply as much energy to the free electrons to make them ionize the excited mols. as would be required to make them ionize normal mols., thereby enabling the ring discharge to pass more easily. The effect of foreign substances in the gas, such as deposits on glass rods of S, P, Cd, etc., is to diminish the intensity of the discharge. The effect does not depend upon the nature of the gas, but, if the impurity is electroneg., is attributed to its ability to capture the free electrons in the gas, thereby making it more difficult to start the discharge, and to maintain it. Another effect of the discharge is to cause the gas through which it passes to enter into chem. combination or produce compds. of which some are unexpected. The discharge puts some of the atoms and mols. of the gas into an excited state which enhances their chem. activity. Thus, MgO which phosphoresces brilliantly in O through which a discharge is passing, combines with the O to form a higher oxide. This is indicated by the loss of the characteristic phosphorescence of MgO and the very great reduction in pressure of the O in the tube. Similar results were obtained with CaO and ZnO.

C. C. KIESS

The electrodeless ring discharge. G. MIERDEL. Greifswald Univ. *Ann. Physik* **85**, 612-40 (1928).—The motion of ions in elec. fields of high frequency is discussed; it is concluded that in the electrodeless ring discharge, only the electrons act as an ionizing factor, consequences of this assumption are exptly. verified. Measurement of the initial tension shows that the dependence on the pressure is qual. the same as in the case of internal electrodes. The initial tension is always higher than in the latter case. The "clean up" phenomenon has been investigated in H, N, O and air. In each case the cause of the disappearance of the gas is the formation of active modifications (or even chem. compds.) which are adsorbed on the glass surfaces; the cooler the surface, the larger the adsorption. As it was expected, no pressure decrease was detected in A. Spectroscopic investigations of A and N show the radial intensity distribution of the simple frequencies as expected from the theory. In H the Balmer series appears very sharply, because of the high degree of disson. The continuous spectrum of H appears with a good intensity, and exhibits an intensity max. located in the far ultra-violet.

A. L. HENNE

A theory of the electric discharge through gases. PHILIP M. MORSE. Princeton. *Phys. Rev.* **31**, 1003-17 (1928).—Three general differential equations are set up which det. the av. behavior of a discharge of electricity through a gas. Approx. solns. giving the elec. field E and the concn. of electrons and positive ions, n_1 and n_2 , at any distance x from the cathode, are found for several ranges of value of E . When E is large, the soln. corresponds to the conditions in the cathode and anode fall spaces in a glow discharge. Equations are obtained for the potential drop V across the fall space, for the c. d. at the electrode divided by the square of the gas pressure, j/p^2 , and for the thickness of the fall space times the pressure, pd . The equations indicate that for the cathode fall space there is a certain min. value V called V_n ; and for j/p^2 , called j_n/p^2 and a corresponding max. value of pd , pd_n , beyond which values the discharge ceases. These values are const. dependent only on the nature of the gas used and of the cathode material and correspond to the normal cathode fall space. The equation detg. V_n is shown to be of the right form by comparison with the exptly. detd. values. From these values of V_n , values of j_n/p^2 and of pd_n are calcd. for 4 gases and 4 cathode materials and the calcd. values check with the exptl. data. The corresponding equations for the anode fall space show why there is no corresponding normal anode fall. A consideration of the discharge when E is large indicates another stationary value of the cathode fall space when the c. d. at the cathode reaches its max. possible value. The V in this case is much smaller than V_n for the glow discharge and the form of the equations indicates that they describe conditions in an *elec. arc*. Another approx. equation is obtained when E is const., which is the case in the positive column of a glow discharge. This soln. indicates that small sinusoidal variations about the av. value E_p are possible in E . They correspond to the striations sometimes observed in the positive column. A general discussion is given of the *Faraday dark space* and reasons are given why it should be near the cathode rather than the anode.

BERNARD LEWIS

The action of the Geiger counter. L. F. CURTISS. Bur. Standards. *Phys. Rev.* **31**, 1060-71 (1928).—Expts. performed with a Geiger point counter show that when the point is negative the sensitive surface is on the point, and not on the inner wall of the chamber as suggested by Kutzner (cf. *C. A.* **18**, 2103). It is further shown that this sensitive surface can only be obtained when the point has been treated in a way which makes it catalytic. Such catalysts as FeO, CuO and Pt black work very well. Their activity is destroyed by catalytic "poisons" such as Hg, SO₂ and H₂S. The expts. indicate that the gas layer usually adsorbed by such catalytic surfaces plays an important role in the action of the counter. The gas layer is demonstrated positively by observing the point during operation through a microscope in a dark room. With a vacuum-tube amplifier connected to the counter to actuate a relay at each count, a faint flash on the surface of the point is readily seen for each click of the relay. When the point is positive no special treatment is needed to make it work. This is shown to be consistent with the explanation offered for the action of the chamber when the point is negative.

BERNARD LEWIS

The spark potential of nitrogen. BERNHARD FREY. *Ann. Physik* **85**, 381-424 (1928).—The spark potential of pure, well-dried N₂ is studied. With an elec. discharge in a secondary spark gap, there is a gas fluctuation which can be explained as a dissonance of the H₂O vapor given off. The influence of the discharge on the spark potential can be made null by heating a W wire. With Ag and Mg electrodes at moderate dryness, the potential with the Mg electrodes is one v. lower than with Ag. With very dry gas the Mg electrodes have a considerably higher spark potential than the Ag electrodes. This behavior is explained by the assumption of a Mg₃N₂ layer being formed on the electrodes by the discharge. If moisture is present Mg₃N₂ is not stable. M. F.

Theory of the scattering of slow electrons. J. HOLTSMARK. *Tech. Hochsch., Trondhjem. Z. Physik* **48**, 231-43 (1928).—The scattering of electrons by A is calcd. by introducing the plane wave representing the electron stream into the central symmetrical field of force emanating from the A atom, and investigating the radiation scattered by this field. The curve giving the sphere of action of the scattering atom as a function of the electron velocity is in good qual. agreement with expt., showing the characteristic min. of the Ramsauer effect at low electron velocities. Almost complete quant. agreement would be obtained if the atomic field were slightly smaller than that calcd. The agreement for Ne is not so close and requires a greater polarization of the Ne atom than that used (He optical polarization) in the calcn. W. WEST

Application of the Fermi statistics to the distribution of electrons under fields in metals and the theory of electrocapillarity. OSCAR K. RICE. *Cal. Inst. of Tech. Phys. Rev.* **31**, 1051-9 (1928).—It is assumed that each atom in Hg is ionized into a positive ion and an electron. Because of the crowded state of the positive ions it is supposed that they cannot move in an elec. field, while, following Sommerfeld (*Naturwissenschaften* **15**, 826 (1927)) and Pauli (*C. A.* **21**, 1925)) the electrons are assumed to act like a completely degenerate gas following the Fermi (cf. *C. A.* **20**, 2265) statistics. The distribution of electrons under an elec. field due to a charge on the surface of the metal, is discussed, and a relation derived which gives the charge on the surface in terms of the p. d. between surface and interior. To a first approximation the charge and the p. d. are proportional to each other, as if there were a condenser of const. capacity at the surface. In order to find the capacity, an estimate must be made of the dielec. const. of the mercurous ions of the Hg. This is done with the aid of measurements of refractive index of mercurous ions. The magnitude of the equiv. capacity is such that, when considered in conjunction with the diffuse layer of ions in the soln., electrocapillary curves can be explained.

BERNARD LEWIS

The motion of conductivity electrons in metals. WERNER BRAUNBEK. *Physik. Z.* **28**, 803-5 (1927).—The electronic cond. of metals is usually dealt with on the basis of the Drude-Lorentz theory, which depends upon the assumption in metals of free electrons of a definite d., free path and thermal energy. A number of phenomena such as supraconductance cannot be explained on the basis of this theory. Haber has shown that certain properties of the alkali metals, e. g., their heat of sublimation can be calcd. in good agreement with exptl. findings on the basis of a lattice theory according to which the elementary lattice of the alkali metals consists of pos. alkali ions and electrons. B. shows that calcn. made on the basis of this electronic lattice theory (in contradistinction to the electronic gas theory) agree in their order of magnitude with the exptl. findings.

EMIL KLARMANN

Quantum theory of the electron. II. P. A. M. DIRAC. *Cambridge. Proc. Roy. Soc. (London)* **A118**, 351-61 (1928).—The theory of *C. A.* **22**, 1535, is further developed. Selection rules are derived which are equiv. to those of the older theory

and, therefore, in agreement with expt. The relative intensities of multiplet lines and the Zeeman and Paschen-Back effects are given by the new theory, in agreement with the deductions from the spinning-electron theory. W. WEST

General considerations on the photoelectric effect. P. W. BRIDGMAN. Harvard Univ. *Phys. Rev.* 31, 90-100(1928); cf. following abstract.—The equality of the stopping potentials, which is expressed in the equation $V_{AB} = (h/e)(V_{0B} - V_{0A})$, is a consequence of the principle of detailed balancing without any assumption about the mechanism of photoelec. emission. If the relation is not satisfied the system cannot be in equil. and there must be slow transformations taking place with evolution of energy. Differentiation of the above equation gives a hold on the numerical magnitude of the temp. coeff. of the Volta difference and also on the magnitude of the surface heat. In K the latter must be much larger than the ordinary Peltier heat. In a cavity in any body the equil. electron d. is the same whether the photoelec. effect and the thermionic mechanism act sep. or conjointly. This gives certain connections between the photoelec. threshold and thermionic emission. The difference between the photoelec. and the thermionic work function must be a universal const. for all metals as must also the difference between the sp. heat of the metal and the surface charge and the difference between the entropy of the metal and a surface charge at 0° abs. Expt. makes it probable that each of these 3 universal const. is zero. From application of this result to thermionic emission, it is probable that the abnormal emission from coated substances involves non-equil. conditions. Finally, B. suggests that the considerations of this paper enable another significance to be attached to the argument of Lawrence (C. A. 20, 2943) that photoelectricity and thermionic emission are identical. B. L.

The photoelectric effect and thermionic emission: a correction and an extension. P. W. BRIDGMAN. *Phys. Rev.* 31, 862-6(1928).—In connecting the photoelec. effect with thermionic emission B. eliminates the assumption made previously (preceding abstract) that the photoelec. characteristic frequency is independent of temp. The thermionic work function and the photoelec. work functions differ by a universal const. which must be zero in the light of the work of Warner (cf. C. A. 21, 2424) and DuBridge (C. A. 22, 1274). The temp. deriv. at 0° K. of the photoelec. threshold differs by a universal const., which is also probably zero, from $(S_p - S_m)_0$, the difference of entropy at 0° K. of surface ions and neutral atoms. The quantity $(S_p - S_m)_0$ enters the const. of the thermionic-emission formula, so that there is a connection between this const. and the temp. deriv. of the photoelec. threshold. In spite of the known small values of this latter, expt. allows a sufficient range of numerical values to account for the extreme variations of the thermionic-emission const. from the universal value. The connection found by DuBridge between the thermionic-emission const. and the work function is shown to be reasonable from the point of view of this analysis. B. L.

The velocity distribution of photoelectric electrons. FRITZ HEROLD. Heidelberg Univ. *Ann. Physik* 85, 587-611(1928).—The method of the homogeneous field, and the measuring procedure of the central field have been united in order to obtain accurate values of the velocities. The electrons were liberated by $\lambda = 254\mu\mu$ light. After consideration of the sources of error, the velocity distributions have been detd. for Cu, Pt, Al and soot. The observations show that the curves do not completely cover each other (even if secondary details are disregarded). It is thus obvious that the nature of the material has its influence on the shape of the curve. In Pt the velocity distribution is related to the gas content. If progressively evacuated the repartition curves shift first toward the large velocities, then back toward the smaller ones. The principal cause is the modification of the limit wave. Contact potentials also modify the position of the repartition curve. A modification of the shape of the curve has been observed, principally in the domain of the mean velocities; it is indicative of the influence of the nature of the excited material. The velocity repartition measured on a Pt surface depends on the Pt thickness only in the case of a very thin deposit. The orientation of a W deposit in the light beam has no influence on the repartition curves. A. L. HENNE

The photoelectric sensitiveness limit of ammonium amalgam toward the long wave lengths. SANDER AND NITSCH. *Z. Elektrochem.* 34, 244-6(1928).—Measurements of the limit of the photoelec. sensitiveness of NH_4 amalgam have been made with respect to K and Na amalgam. Results derived from a very large no. of expts. show the existence of the series NH_4 , Na, K, which is the same as the electrochem. tension series. A. L. HENNE

The Becquerel effect. I. G. ATHANASIU. *Z. physik. Chem.* 133, 39-42(1928).—An answer to Lifschitz and Hooghoudt (C. A. 20, 3860), who criticized Athanasiu (C. A. 20, 1005). MARIE FARNSWORTH

A reply to G. Athanasiu. J. LIFSCHITZ AND S. B. HOOGHOUDT. *Z. physik. Chem.* **133**, 43-4(1928), cf. preceding abstract.

MARIE FARNSWORTH

The polarization of spectrally resolved Röntgen rays. ERNST WAGNER AND PAUL OTT. *Ann. Physik* **85**, 425-69(1928).—The degree of polarization of a ray reflected at a glancing angle of 45° from the cubic face of NaCl is detd. This is defined as the ratio of the intensity of reflection perpendicular to the cathode stream to the reflection intensity parallel to the cathode stream. It rises with decreasing tube potential with a max. of about 2.7. A clear dependence of the value on the anticathode material of the x-ray tube (Pt, Ag, Cu, Fe) could not be established. It was the same for all at a tube potential of 10.88 kv. (1.4 ± 0.2). There was no change in the degree of polarization with the appearance of the characteristic rays of the anticathode materials. M. F.

The scattering of x-rays and electron distribution in the atoms of crystals. R. J. HAVIGHURST. Harvard Univ. *Phys. Rev.* **31**, 16-26(1928); cf. following abstract.—*A crit. examn. of the method of obtaining the at. structure-factor and of the Fourier analysis method of detg. electron distributions in crystals.* The application of the Fourier analysis to the model A atom indicates that the accuracy of the analysis depends predominantly upon the accuracy of measurement of the intensities of reflection within angular limits which are easily subject to exptl. investigation. Electron distributions obtained from Fourier analysis of the exptl. detd. at. structure-factor curves for several different atoms or ions contain almost exactly the amounts of electricity which are believed to exist in the crystals within radii in good agreement with those calcd. from interat. distances detd. by ordinary crystal analysis. Modification of the calcd. F values of model atoms to take into account the Compton effect results in F curves which give, upon Fourier analysis unreasonable distributions of diffracting power. The Fourier analysis can give reasonable distributions of electron density only if the F curves are approx. correct. Since the exptl. F curves do give reasonable distributions, it is concluded that any modification which is caused by the Compton effect in the intensity of regular reflection of x-rays is negligible.

BERNARD LEWIS

The intensity of reflected x-rays and the distribution of electrons in crystals. G. E. M. JAUNCEY AND W. D. CLAUS. *Phys. Rev.* **31**, 717-27(1928).—A reply to the criticisms of Havighurst (preceding abstract). By trial a reasonable Bohr model of the Cl ion has been found which gives modified F values at all angles in good agreement with exptl. The theoretical modified F curve and the exptl. F curves have a kink at the same angle. This occurs at $\sin \theta = 0.45$ (for $M\alpha$ K α x-rays) and is connected with the result on Jauncey's theory (*Phys. Rev.* **29**, 757(1927)) that at this angle the M electrons cease to act as diffracting centers. From the theoretical modified F values a U curve is plotted for a grating space of $D = 3.06$ Å. This U curve is similar to Havighurst's exptl. U curve for the Cl ion and has an area of 16.64 electrons in good agreement with 16.74 electrons for the exptl. curve. However, the theoretical U curve carries no particular information concerning the model from which it is derived. According to J. and C. this is because the method of Fourier analysis is invalid. The accuracy of exptl. F values and U curves is discussed. The exptl. F values for Cl seem to be subject to an abs. error of 0.3 electron and the area under the U curve to an error of 0.5 electron. Objection is raised to the practice of obtaining U curves for fictitious grating spaces. It is shown that the area under the U curve is a function of D and has no precise meaning even if crystal reflection is unaffected by modified scattering.

BERNARD LEWIS

The excitation of soft x-rays. II. O. W. RICHARDSON AND F. C. CHALKIN. *Proc. Roy. Soc. (London)* **A119**, 60-83(1928); cf. *C. A.* **20**, 1354.—The x-ray spectrum of Fe in the ranges 130 to 200 v. and 600 to 720 v. has been examd. A discussion of possible series relationships among the crit. voltages is presented; no definite conclusions can be made. Some expts. with deposited metal targets were made. A compensating method of measuring the photoelectric current is described. R. L. HERSHEY

The input limit of an x-ray tube with circular focus. ALEX. MÜLLER. *Proc. Roy. Soc. (London)* **A117**, 30-42(1927).—The condition which limits the energy input into an x-ray tube is chiefly the dissipation of the heat produced in the anticathode. This paper, therefore, is primarily a mathematical study of heat flow in a cylinder with different assumptions as to the boundary conditions. In particular, two cases are studied: (1) where the curved surface of the cylinder and the flat end remote from the target are kept at a const. temp., and (2) where there is no flow of heat through the curved face of the cylinder. The following formula is obtained for the first case, when the focal spot is small compared with the anticathode: $W = 15.8 (T_m - T_0) \cdot \delta \cdot \kappa / \theta$. $\theta = \int_0^\infty e^{-x^2} \tan h(\beta x) dx$. W is the max. input in watts. T_m is the m. p. of the target and T_0 the const. temp. of the boundaries. δ is the radius of the focal spot in cm. κ

is the heat cond. of the target in g. cal. per sec. per cm. per degree. Several numerical examples of the application of this formula are given, showing that the results are in accord with experience. In one example, the temp. of the cathode of a gas-filled x-ray tube is calcd. and found to be considerably below the m. p. of Al, indicating that the observed pitting is not due to melting.

A. W. KENNEY

Quality and quantity of the scattered radiation of water produced by x-rays. F. VIERHELLER. *Physik. Z.* **28**, 745-57 (1927).—A method is described permitting the detn. of the scattered radiation sepd. from the primary radiation which is characterized by its mean wave length. A max. of energy is established in a depth of about 1 cm., which is produced by both the primary and the scattered radiation; the max. of the latter alone lies in a depth of 3 cm. The logarithms of ionization currents which are produced by the scattered radiation are inversely proportional to the vols. traversed by the radiation. The detn. of quality according to the method of Duane indicates the occurrence of minima in all places where there is a max. of quantity. The mean wave length of the scattered radiation within the central pencil is considerably smaller than that of the primary radiation. The quality of total radiation remains const. in a depth of from 4 cm. on, but is about 10% less than the primary radiation.

E. K.

Diffraction of x-rays by means of ruled gratings. Spectroscopy of the intermediate region. JEAN THIBAUD. *Physik. Z.* **29**, 241-61 (1928).—The use of the ruled grating at grazing incidence is described for measurement of wave lengths of x-rays longer than those observable by ordinary crystal methods. First is given a description of a vacuum spectrograph for use in the extreme ultra-violet and its modification for observing long x-rays which overlap the shortest optical wave lengths. Second, the collected results obtained by the new methods are presented, including (1) wave lengths in the K-series of O, N, C and B, the L-series of Fe, the M-series of Mo and the N-series of Ta, W, Pt and Au (cf. Thibaud and Soltan, *C. A.* **22**, 26, 1539); (2) description of continuous x-ray spectra of elements of high at. wt. and measurement of the K absorption limits of C, N and O (*C. A.* **22**, 1277); (3) comparison of results obtained with gratings and fatty acid crystals and detn. of refractive indices of crystals for x-rays; (4) proposed application of the grating method to measurement of γ -rays, and de Broglie waves.

C. C. KIESS

Fine structure in the k-series of copper and nickel and the width of spectral lines. HARRIS PURKS. Columbia Univ. *Phys. Rev.* **31**, 931-9 (1928).—High resolving power was obtained by means of the double x-ray spectrometer. The min. width of slits was 1.75 mm. Wide slits made possible the study of the lines after second-order reflection from two calcite crystals. Ionization currents were measured with a Compton-type electrometer. At 40 kv. and in the first order the widths at half-max. of the lines (in X. U.) were found to be: Ni $K_{\alpha_{1,2}}$, 0.66; Cu $K_{\alpha_{1,2}}$, 0.63; Mo $K_{\alpha_{1,2}}$, 0.47; Ag $K_{\alpha_{1,2}}$, 0.43; Mo $K_{\beta_{1,2}}$, 0.43; Ag $K_{\beta_{1,2}}$, 0.40. In the second order the estd. width of the components of Ni $K_{\alpha_{1,2}}$ and Cu $K_{\alpha_{1,2}}$ was 0.4 X. U., which was also the estd. width of Ni $K_{\beta_{1,2}}$ and of Cu $K_{\beta_{1,2}}$. Structure of the lines of Ni and Cu was clearly indicated by the shapes of the curves. The first-order curves of the K_{α} lines of Ni and Cu showed an asymmetry on the long-wave-length side which was checked as regards position and intensity by the second-order curves. The lack of symmetry could be explained by the presence of weak lines at displacements 0.42 and 0.35 X. U. from Cu K_{α_1} and Cu K_{α_2} , resp., and 0.45 and 0.38 X. U. from Ni K_{α_1} and Ni K_{α_2} , resp. The K_{β} doublets of Mo and Ag were clearly resolved after first-order reflection from two crystals. Their sepns. were for Ag $K_{\beta_1} - K_{\beta_2}$, 0.63 X. U. and for Mo $K_{\beta_1} - K_{\beta_2}$, 0.58 X. U. The doublets for Ni and Cu were not resolved after second-order reflection. However, the shapes of the curves permitted a soln. of the problem of intensities and displacements. Their sepns. were 0.32 X. U. and 0.29 X. U. for Cu $K_{\beta_1} - K_{\beta_2}$ and Ni $K_{\beta_1} - K_{\beta_2}$, resp. The slopes of the K_{β} curves of Ni and Cu showed evidence of the spark line $K_{\beta'}$ and the curve of Cu showed evidence of a line corresponding to the $K_{\beta'}$ line for Ca, K, Cl found by Hjalmer (*C. A.* **16**, 2259). Curves showing a variation of width of the K_{α} lines with voltage were obtained. The widths increased with increasing voltage but seemed to approach a limiting value at 40 kv. The width at the excitation potential was about $\frac{1}{2}$ the width at 40 kv. The variation is explained as due to the successive appearance of spark lines.

BERNARD LEWIS

An attempt to add an electron to the nucleus of an atom. WILLIAM D. HARKINS AND WEBSTER B. KAY. Univ. of Chicago. *Phys. Rev.* **31**, 940-5 (1928).—Electrons with a velocity corresponding to 138,000 to 145,000 v. were caused to strike the surface of liquid Hg. The Hg served as an anticathode in an x-ray tube. (This work was done before the Coolidge electron tube was available.) It was not expected by H. and K. that positive results would be obtained, since either the voltage may be too small

or the no. of electrons shot into the surface (4×10^{21}) too small. The addn. of an electron to the nucleus of an atom of Hg should give an atom of Au. Since no Au was found in the exceedingly sensitive tests used, it is shown that either less than one in a million of the electrons attached itself to an atom nucleus or else all or a part of the nuclei produced were not sufficiently stable to endure for the period (24–28 hrs.) of the tests.

BERNARD LEWIS

Multiplet separations for equivalent electrons and the Röntgen doublet law. S. GOUDSMIT. Univ. of Mich. *Phys. Rev.* **31**, 946–59(1928).—Expressions are derived for the sepn. of multiplets arising from configurations of equiv. electrons. It is explained why the Röntgen doublets obey the Sommerfeld formula, although the latter was formerly for a single electron only. The sepn. of more complicated multiplets are proved to be connected also with the Sommerfeld formula. The multiplet sepn. can be characterized by factors, designated by Γ , which give the displacement of each level from the center of gravity of the whole multiplet level. The properties of these Γ factors are studied in this paper. They are analogous to the properties of the magnetic sepn. factors g , introduced by Landé (*C. A.* **18**, 938) for the explanation of the Zeeman effect. There is a sum rule corresponding to the g sum rule, stating that for given quantum nos. of the electrons the sum of the Γ values belonging to a certain total moment j is a const., independent of the type of coupling of the electrons. This rule makes it possible to obtain expression for the multiplet sepn. in general cases. B. L.

Multiplet separations. S. GOUDSMIT AND C. J. HUMPHREYS. Univ. of Mich. *Phys. Rev.* **31**, 960–6(1928).—Formulas for the sepn. of normal multiplets arising from general configurations, are derived by reasoning from the fundamental assumption that they are due to the interaction energy between spin and orbital magnetism of the electrons. The sepn. are known for multiplets, arising from groups of equiv. electrons, from considerations given in the preceding abstract. It is shown in this investigation, by a simple treatment of the vector model, that the interaction for other configurations may be found in terms of the equiv. group and the interaction energy of the electron or group of electrons added, provided the quantum vectors of the original configuration remain unchanged. This treatment applies only to agreement with the interval rule. Examples are illustrated from the data on Fe and O^+ . Calcd. results indicate the validity of G. and H.'s formulas to the extent permitted by agreement of data with the interval rule.

BERNARD LEWIS

Series spectrum of sodium NaII. I. S. BOWEN. Cal. Inst. Tech. *Phys. Rev.* **31**, 967–8(1928).—Seventy-four lines in the Na spark spectrum are classified as combinations between 23 terms of NaII. The ionization potential of NaII is fixed at 47.0 ± 0.5 v.

BERNARD LEWIS

The spectrum of gold chloride. W. F. C. FERGUSON. N. Y. Univ. *Phys. Rev.* **31**, 969–72(1928).—The spectrum of AuCl vapor excited by streaming active N was photographed. It consists of 43 bands, comprising, for each isotope of AuCl, two intermingled systems in the green region. All the bands are shaded toward the red. No other bands were found between $\lambda 7000$ and 2000 . The band heads of each system were measured and equations are given representing their positions. Agreement with theory was found for the isotopic displacement of the band heads due to the Cl isotopes. The vibrational intensity distribution agrees with that theoretically expected from the observed relative values of the initial and final vibrational frequencies. Attempts to excite the spectra of AuBr and AuI in a similar manner were without success. B. L.

Stark effect and series limits. H. P. ROBERTSON AND JANE M. DEWEY. Princeton. *Phys. Rev.* **31**, 973–82(1928).—The energy of a conditionally periodic orbit in a hydrogen-like atom under the influence of a homogeneous external field F must be less than $-(3/2) [eFp_0/m^{1/2}]^{2/3}$. Aperiodic orbits of less, as well as of greater energy than this value can exist, and in one class of these the electron may approach the nucleus within distances comparable with the dimensions of periodic orbits. The lower limit of the energy of these orbits is approx. $-2c (eF)^{1/2}$. Since the energy of an aperiodic orbit can assume any one of a continuum of values, it is concluded that the line spectrum of such an atom must end at a point on the long-wave length side of the N series limit, and that the continuous spectrum, arising from transitions involving an aperiodic orbit, may extend even further within the N series limit. Application to the mean field in actual gases gives the position of the max. of the continuous spectrum in good agreement with the observed values. Further expts. for checking the theory are described.

BERNARD LEWIS

The Zeeman pattern of the hyperfine structure lines of the resonance line of mercury. WALTER A. MACNAIR. Bur. Standards. *Phys. Rev.* **31**, 986–96(1928);

cf. C. A. 21, 2844.—The Zeeman pattern of each of the 5 hyperfine structure lines of 2537 ($1'S_0 - 2^3P_1$), the resonance line of Hg, has been obtained in fields from 0 to 7 kilogausses. With certain very significant exceptions each one forms a $3/2$ normal Zeeman triplet, and is independent of its neighbors; that is, no Paschen-Back effect appears. The parallel branch of one of the 5 lines actually shifts its position with changes in the field strength. Each one of the 5 lines has two $3/2$ normal perpendicular branches. In addn. 3 of them have 1 or 2 extra perpendicular components. Attention is called to the relation between these results and expts. on the *polarization of Hg resonance radiation*. McN. warns against a theoretical explanation of the latter phenomenon until more is known of the hyperfine structure of the energy levels of Hg. A quartz Limmer-Gehrcke plate was used for the analysis. A rather unusual method of employing it is described.

BERNARD LEWIS

The resonance line of the iodine atom and the optical dissociation of iodine molecules. L. A. TURNER. Princeton Univ. *Phys. Rev.* 31, 983-5(1928).—The resonance line of the I atom is most probably that of wave length 1830.4 Å., corresponding to a resonance potential of 6.75 v. Light of that wave length is absorbed by a cell contg. I vapor more strongly when it is illuminated by concd. light from a C arc than when it is not so illuminated. The increased absorption is attributed to I atoms produced by the illuminations in accord with Franck's theory (C. A. 20, 548) of optical disson.

BERNARD LEWIS

Theory of the excitation of spectra by atomic hydrogen. JOSEPH KAPLAN. Princeton Univ. *Phys. Rev.* 31, 997-1002(1928).—An explanation is proposed for the results of Bonhoeffer (C. A. 19, 2915) and of Mohler (C. A. 22, 1279) on the excitation of spectra by at. H. The theories advanced by these authors do not completely explain the exptl. results. The theory presented here is based on the hypothesis that in a 3-body collision 2 H atoms can form a mol. in any one of the vibration states of its N electronic level. The principle is used, that the probability of excitation increases as the energy of the exciting body and the energy necessary for excitation approach each other. This is done by postulating that the probability of the excitation of the third body is greater, the nearer the energy required is to be the difference between the energy of recombination and the energy retained by the H_2 mol. in one of its vibration states. The theory is applied successfully to the excitation of Na, K, Cd, Zn, Cs and Mg by at. H. The excitation of the 2537 Hg line, which requires more energy than that available from recombination, is explained on the basis of Bonhoeffer's observations.

B. L.

Absorption of linearly polarized infra-red radiation by calcite ($2\mu-16\mu$). FRANK MATOSSI. *Z. Physik* 48, 616-23(1928).—The transmission of calcite for linearly polarized light was measured in the infra-red between wave lengths 2μ and 16μ . The source was a Nernst glower and the intensity of the radiation was measured with a microradiometer. Four crystals, of thicknesses 0.09 mm., 0.34 mm., 0.9 mm. and 4 mm., and arranged with optical axes parallel to the elec. vector, were examd. A strong absorption band, corresponding to the fundamental frequency of the CO_2 ion, was measured at 11.55μ . In the neighborhood of this band the reflecting power of the crystal was also measured. The bands due to the characteristic vibration frequencies of the crystal for the ordinary ray were measured at 7.14μ and 7.40μ . The other bands which were measured are tabulated and illustrated graphically, and are shown to be harmonics of, or combinations between, the frequencies $\nu_1 = 7.40$ and 7.14μ , $\nu_2 = 14.0\mu$, $\nu_3 = 9.10\mu$ and $\nu_4 = 11.55\mu$. Formulas are given for calcg. the characteristic frequency from the optical consts. found from the absorption measurements.

C. C. KIESS

Broadening of the Debye-Scherrer lines of cold-worked tungsten wire and ribbon as a function of the glow temperature and the duration of the glow. A. E. VAN ARKEL and W. G. BURGERS. *Z. Physik* 48, 690-702(1928).—The broadening effect on the K_α line of Cu was studied for (a) cold-drawn W wire contg. less than 1% total impurities; (b) cold-drawn W wire contg. 1.5% ThO_2 ; (c) cold-rolled W ribbon contg. about 1% ThO_2 . These materials were examd. by either the Debye-Scherrer or the de Jong method at glow temps. of 600, 900, 1200, 1500 and $1900^\circ K.$, the duration of the glow period extending from 2 to 240 min. Accurate measurement of the photographs with a microphotometer showed that for both wire and ribbon of the same material the sharpness of the doublet increased rapidly with temp. At temps. for which recrystn. does not occur the sharpness reached and maintained a steady state.

C. C. KIESS

Notes on the relativistic interpretation of the theory of the fine structure of the spectral lines of the hydrogen atom. S. MOHOROVIĆIĆ. *Archiv. hem. farm.* 2, 6-14 (1928).—The introduction of a special relativity theory and the general theory cannot define precisely the orbit of the electron around the proton (cf. M., *Optik bewegter Körper*, Leipzig, 1928). The close connection between the Lorentz and the Galileo

transformation equation (cf. *Ann. Physik* **67**, 320-4(1922)) is shown to be correct.

JAROSLAV KUČERA

Some methods of estimating the intensities of spectral lines. W. H. J. CHILDS. *Proc. Phys. Soc. London* **40**, 132-48(1928).—The application of several methods of photometry to the problem of detn. intensities of spectrum lines is described. The limitations of the various wedge methods are pointed out and it is shown that for a spectrum contg faint lines, like that of He, a densitometer method of obtaining intensities from a calibrated spectrogram, is to be preferred. Four densitometer methods are described. An extensive bibliography covering densitometers, microphotometers and spectral photometry is given.

C. C. KIESS

Extension of the irregular doublet law to complex spectra. MEGHNAD SAIHA AND PROTAP K. KICHLU. *Indian J. Physics* **2**, 319-42(1928).—The extension of the irregular law to complex spectra previously announced (*C. A.* **22**, 1729) is here illustrated in detail with all the available spectroscopic data, and predictions are made regarding the spectra of certain elements which are yet unknown.

C. C. KIESS

A note on the regularities in the spectra of six-valence electrons. DATTATRAYA S. JOG. *Indian J. Physics* **2**, 343-4(1928).—The extended irregular doublet law (cf. preceding abstract) has been used to identify the lines $^5S - ^6P$ and $^3S - ^3P$ of F and Ne^+ analogous to those of O.

C. C. KIESS

The spectrum of ionized sodium. KANAKENDU MAJUMDAR. *Indian J. Physics* **2**, 345-54(1928); cf. *C. A.* **22**, 1908. From the known lines of F and Ne^+ which are 7-valence electron systems, and of Na, Mg^+ and Al^{++} which are 1-valence electron systems, the lines arising from the corresponding electron transitions of the intervening systems Ne, Na^+ and Mg^{++} . . . can be interpolated as shown by the extension of the irregular-doublet law to complex spectra. The fundamental lines of Na⁺ are $^1S_0 - ^1P_1$ at 372.3 A. U. and $^1S_0 - ^3P_1$ at 376.6 A. U. The value of 1S_0 is detd. approx as 380,300, which is equiv. to an ionization potential of 47 v. A table contains the lines from 3711 A. U. to 372 A. U. which have been classified.

C. C. KIESS

Intensity measurements in the secondary spectrum of hydrogen. L. S. ORNSTEIN, W. KAPUSCINSKI AND MISS J. G. EYMERS. *Proc. Roy. Soc. (London)* **A119**, 83-91(1928).—The intensities of lines in the secondary spectrum of H between 4891 A. U. and 4487 A. U. have been measured by means of the method of photometry developed at Utrecht. Many of the lines have been found to be double and their wave lengths have been detd. Comparison of the new results with those obtained by McLennan (*C. A.* **22**, 37) shows that the real values of the intensities are not the photographic densities given by him.

C. C. KIESS

Precision measurements in the K-series of the element tin. JOHN STENMAN. *Z. Physik* **48**, 349-57(1928).—The new tube spectrometer of Siegbahn at Upsala was used in photographing the K-series of Sn. The following wave lengths were measured $\alpha_2 = 494.016$, $\alpha_1 = 489.572$, $\beta_3 = 434.947$, $\beta_1 = 434.297$ and $\beta_2 = 424.992$, all expressed in X units. The wave length of the K absorption limit of Br was also found to be 918.091 X. U.

C. C. KIESS

Precision measurements in the K-series of the elements chromium to nickel. SIGURD ERIKSSON. *Z. Physik* **48**, 360-9(1928).—New wave-length measurements of the lines α_2 , α_1 , β_1 , β_2 in the K-series of Cr, Mn, Fe, Co and Ni are presented. They were obtained with the improved tube spectrometer of Siegbahn. In order to sep. fully the lines α_1 and α_2 the second-order spectrum was used.

C. C. KIESS

Investigation on the structure of some spectra in relation to recent theoretical considerations. T. L. DE BRUIN. *Arch. néerland. sci.* **11**, 70-153(1928). (In French).—New wave-length measurements have been made of lines in the arc and spark spectra of K and F. The source employed was the electrodeless discharge, which permits the isolation of the spectra corresponding to various stages of ionization of the atom. Analysis of the spectrum K II shows that its structure is similar to that of Ne I. The fundamental term 1S_0 arising from the electron group s^2p^6 has not yet been established. The higher terms which arise from the configurations s^2p^5d , s^2p^5s and s^2p^5p , which correspond to excited states of K^+ , have been established and are tabulated in order of relative value; whence it is shown that the configuration s^2p^5d is more stable than s^2p^5p . Similar analyses have been made for F I and F II. The lowest term of F I is 2P with approx. value 135,000, which corresponds to an ionization potential of 16.7 v. Triplets with the same frequency differences have been found in F II, which indicates a structure for the spectrum similar to that of O and S. A classification of the lines belonging to Ne II is given and the structure is shown to be similar to that of F I. Finally certain lines of Ne III are shown to be similar to those found in F II.

C. C. KIESS

The band spectrum of mercury excited by a high-frequency discharge. J. G.

WINANS. *Nature* 121, 863-4(1928).—The Hg bands with max. at 4850, 3300, 2540, and 2345 Å. U. were observed, together with the arc spectrum, in a quartz tube contg. distg. Hg vapor excited by a high-frequency discharge; but when the vapor was stagnant the discharge excited only the arc lines. Heating the middle of the tube caused the disappearance of the 4850 band, and weakened that at 2345 Å. U. It is concluded from the expts. that each of the bands is emitted from sep. initial states, but that the final states for the 2345 and 2540 bands must be the same. C. C. KIESS

The molecular spectra of sulfur. B. ROSEN. *Z. Physik* 48, 545-55(1928).—The absorption spectrum of S was photographed under various temp. conditions. In the blue-violet region 104 band heads were measured, many of which are approx. represented by the formula given in an earlier paper (*C. A.* 21, 2846). In the ultra-violet 27 band heads were measured, all of which are satisfied by the formula. When the absorption bands are compared with those emitted by a discharge tube or in fluorescence certain striking intensity differences are noted which cannot very well be explained as temp. perturbations. Some unknown factor is supposed to operate which makes the probability of transition from the initial energy state to a higher state, in absorption, greater than the probability of the return to the initial state, in emission. C. C. KIESS

Structure of the second-order spectrum of sulfur. J. GIVÈS. *Compt. rend.* 186, 1354-5(1928).—Additional multiplets of the quartet system of S II are presented. They involve transitions between the S, P, P' and D terms previously announced (*C. A.* 22, 2325). C. C. KIESS

The Swan band spectrum of carbon. W. E. PRETTY. *Proc. Phys. Soc. London* 40, 71-8(1928).—Two methods of producing the Swan spectrum were (1) discharge through CO at low pressure, (2) spark between C electrodes in various gases at atm. pressure. The utmost care was taken to remove all traces of H from the sources. From the expts. with C electrodes in gases free from O the only conclusion consistent with the exptl. results is that the emitter of the bands is purely C. Theoretical considerations based on analysis of the Swan bands indicate that the emitter is a symmetrical diatomic mol. such as C₂ which has a moment of inertia of the same order as that derived from analysis of the bands. C. C. KIESS

Stability of isomers compared with their absorption spectra. MME. RAMART-LUCAS. *Compt. rend.* 186, 1301-3(1928).—A study was made of the absorption spectra of compds. susceptible to change under the influence of heat, radiations or catalysts, including 500 tests on 100 different substances, made by the author. Two rules are formulated: (1) When the two substances can be transformed into one another, the rate of change to the isomer of lower frequency is proportional to the frequency if the coeff. of absorption is the same. (2) If the change is accompanied by a loss of water, acid or salt, and if both isomers are made from the same unstable intermediate compd., it is usually possible to obtain either isomer voluntarily, if the form of the absorption curve is known. This has been done by expt. AMY LEVESCONTE

Photochemical iron chloride studies. MAX SCHNEIDER. *Z. physik. chem. Unterrichts* 39, 271-8(1927).—A method is given for measuring the oxidative action of FeCl₃ potentiometrically. Studies are made of the conditions for the formation of Turnbull's blue from FeCl₂ and K₃Fe(CN)₆. The self-reduction of FeCl₃ under the influence of white, blue and yellowish red light is studied. Its cause is discussed. Studies on blue-printing are made and the essential conditions for good prints are given. B. L.

The photolysis of benzaldehyde. MARC DE HEMPTINNE. *Compt. rend.* 186, 1295-7(1928).—The absorption spectrum of BzH shows 3 regions. Two of these can be explained by an increase of the at. vibrations and mol. rotation. The third, a fluted band, between 2200 Å. U. and 2500 Å. U. can only be due to a dissociation, of the mol. This was detd. by expt. Light from a Hg-vapor lamp through quartz caused decompn. into benzene and CO. When rays below 2700 Å. U. were intercepted there was no decompn., but light contg. only rays between 2600 and 2405 Å. U. had an effect. Increase in temp. to 208° and decrease in pressure changed the spectrum, giving fluted bands with rays between 2966 and 2610 Å. U. Rays of this length caused decompn. under these conditions. Increase in temp. alone had no effect. AMY LEVESCONTE

Photochemical studies. VI. The photochemical reaction between oxygen and mercury vapor at relatively low pressures. W. ALBERT NOYES, JR. *J. Am. Chem. Soc.* 49, 3100-6(1928).—The photochem. reaction between O and Hg vapor is largely due to the reaction between Hg vapor and O₂. It is not possible to assume that O₂ is formed by both the sensitized and unsensitized reactions and that the effects are additive. It is suggested that a complex (relatively unstable) may be formed between excited Hg and O and that this complex may give O₂ through collision with O₂ mols, or perhaps a larger amt. of O₂ through collision with activated O₂ or O₃ mols. A. L. H.

Photooxidation of certain organic substances in the presence of fluorescent dyes. C. W. CARTER. Univ. Oxford. *Biochem. J.* **22**, 575-82(1928).—Aliphatic compds. are inactive. The introduction of OH or an NH_2 group into a benzene deriv. renders the compd. susceptible to photooxidation. Side chains in which the groups $-\text{NH}_2$ and $-\text{CH}=\text{CH}-$ occur were oxidized. Other ring compds., as α -naphthol, tryptophan, thiophene and purine derivs. were oxidized. Iron salts do not accelerate the reaction and KCN does not inhibit it. H_2O_2 is not formed in the reaction. BENJAMIN HARROW

The influence of radiation on thermal unimolecular reactions. JOSEPH F. MAYER. *J. Am. Chem. Soc.* **49**, 3033-46(1928).—The absorption coeff. for black-body radiation of low temp. has been measured for N_2O_4 . The rate of activation of N_2O_4 by radiation alone is of insufficient rapidity to account for the observed decompn. rate. Radiation alone does not produce racemization in a monomol. stream of pinene. A theory involving both mol. collisions and radiation as necessary for the observed rates of activation is conceivable and not incompatible with the exptl. results, although radiation alone could not be important in either of the 2 reactions studied. A. L. HENNE

The theory of chemical action in electrical discharge. S. C. LIND. *Science* **67**, 565-9(1928).—The present status of knowledge of chem. effects in elec. discharge is discussed. The 3 theories proposed to date to account for chem. action due to gaseous discharges are: (1) The photochem. theory, wherein it is assumed that the radiations produced during discharge are responsible for the chem. action produced, (2) the static-ion theory, wherein it is assumed that the ions serve as clustering centers and that chem. effects are produced on neutralization of the clusters using part or all energy of ionization as activation energy, and (3) the kinetic-ion theory, wherein it is assumed that the ions impart kinetically a crit. activation energy to the mols. which react. Reasons are advanced in support of this static-ion or clustering theory. GEO. GLOCKLER

Spectrographic studies of complex cyanides of iron (CAMBI, SZEGÓ) 6.

Electron-emission material. H. C. RENTSCHLER and C. T. ULKEY. Can. 280,167, May 15, 1928. An electron-emission material is formed of substantially pure U.

4—ELECTROCHEMISTRY

COLIN G. FINK

Electric steel manufacture. F. T. SISCO. *Fuels and Furnaces* **6**, 589-600(1928).—A discussion of induction and arc furnaces for melting steel together with a review of the acid and basic practice, their application and chem. reactions during melting and refining. A. D. S.

Simple high-frequency vacuum furnace for laboratory purposes. E. W. FELL. *Arch. Eisenhüttenwesen* **1**, 659-61(1927); *Stahl u. Eisen* **48**, 661-2(1928).—A high-frequency lab. vacuum furnace—3.6 kw. at 8000 cycle—with a capacity of 1 kg., allowing the addn. of solids or gases during the melting and affording an easy reading of the temp. by means of an optical pyrometer, is described. J. A. SZILARD

The electrochemical and electrometallurgical industry of Norway. F. HANAMAN. *Archiv. hem. farm.* **2**, 86-95(1928).—An outline of the Norwegian industry and its development. JAROSLAV KUČERA

The fundamental chemical reaction and the electromotive force of the lead accumulators. NAOTO KAMEYAMA. *J. Soc. Chem. Ind. (Japan)* **31**, 337(1928); *Suppl. binding* 81B(1928). (In English.)—K. discusses the double-sulfate theory and Fery's theory from the activity standpoint. According to the former, the e. m. f. E at 25° should be $E = E_0 + 0.05915 \log a_{\text{H}_2\text{SO}_4}/a_{\text{H}_2\text{O}}$, while according to the latter $E = E'_0 + 0.05915/2 \log a_{\text{H}_2\text{SO}_4}/a_{\text{H}_2\text{O}}$, A being activity and E_0 and E'_0 consts. The exptl. E values of Thibaut were plotted against $\log A_{\text{H}_2\text{SO}_4}/a_{\text{H}_2\text{O}}$, which were calcd. from known data. The re-

sult was distinctly for the double-sulfate theory and against Fery's theory. E_0 was found to be 2.0183 v. as the mean of 15 values. SHUMPEI OKA

Electrolytic refining of copper: using solutions of complex salts of cuprous chloride. I. NAOITO KAMEYAMA AND TOKICHI NODA. *J. Soc. Chem. Ind. (Japan)* 30, 773 (1927); *Suppl. binding* 198B. (In English.)—The electrolyte was an aq. soln. of KCl nearly satd. with Cu_2Cl_2 . It was found advantageous to work at 50–75°, with a soln. contg. about 4% of Cu, a little gelatin and about 2% of HCl being added. N_2 was bubbled through the soln. for the purpose of stirring and exclusion of air. About 3 amp. per sq. dm. was possible with high current efficiency and without getting poor cathodic deposits. Most of the expts. were with anodes of pure Cu. In one of the expts. crude Cu (purity 98.8%) was tried as anode and a cathode Cu of purity 99.92% was obtained. II. *Ibid* 31, 343 (1928); *Suppl. binding* 82B. (In English.)—Aq. solns. of NaCl and CaCl_2 were used for the soln. of Cu_2Cl_2 and the solns. obtained were used as electrolyte for the refining of Cu. These electrolytes were as good as KCl (see above). When high concns. of Cu are desired NaCl and CaCl_2 are better than KCl. SHUMPEI OKA

Electrolytic method for a stationary nickel catalyst for a continuous hydrogenation process. A. SVIZUIN. *Masloboino-Zhirovoye Delo* 1928, No. 3, 25–7.—S. suggests using Fe wire which has been properly prepd. for a galvanic Ni bath. The Ni is pptd. on the wire, current of a very low d. being used to obtain a very uniform and smooth cover. After this cover is obtained the c. d. is increased gradually and tree-like configurations are obtained, the Ni surface being increased. The Ni is further oxidized in a caustic bath, very thoroughly washed after this operation and the catalyst so obtained is ready for use. S. uses screen from this wire which is placed in the autoclaves in the shape of spirals. A. A. BOEHLINGK

Distribution of current density in lead accumulators. JOHN TEARE CRENNELL AND FREDERICK MEASHAM LEA. *J. (Brit.) Inst. Elec. Eng.* 66, 529–36 (1928).—The cells studied contain 37 plates, 77.5 cm. high by 28.9 cm. wide, the positive 0.63 cm. thick and the negative 0.475 cm. thick. The space between plates is 0.5 cm., with no free electrolyte at the sides of the plates and a 9-cm. space below. The capacity is 4000 amp. hr. at 500 amp. discharge rate. Such a cell is designated type X. The factors detg. the value of c. d. at any part of a plate are plate resistance, electrolyte resistance and plate polarization, and these are studied. Assuming lines of current flow in the electrolyte to be normal to the plate, the path of current in the plates to be vertical, edge corrections to be negligible and initial concn. of acid to be uniform over the length of the plate, the authors derive the equation $P + P' = (r + K) \delta I$ (1), in which P and P' are differences in potential in the body of the plate due to plate resistance, r is the electrolyte resistance between plates in ohms/sq. cm. of the electrode area, K is a const. and δI is the c. d. over the surface of the plate at a particular level. By use of a HgSO_4 electrode, plate potentials vary with acid concn. as follows: with acid of sp. gr. 1.154, positive e. m. f. is 1.0580 v., —negative 0.9430 v.; with acid of sp. gr. 1.222 — positive 1.0945 v., negative —0.9640 v., sp. gr. 1.308 — positive 1.1485 v., negative —0.9900 v. Smaller plates being used to check calcs. it is found that with the positives, the resistance of the plate may be assumed to be that of the grid alone, while with the negative there is the addnl. conductance of the paste, which will be affected considerably by its d. Plate polarization is studied on small plates with a paste area of 1.2×1.3 cm. and 0.6 cm. thick, available paste area being 3.12 sq. cm., the polarization cells being charged and discharged at 19.5, 39.0 and 78.0 ma. at 18° and 25°. The value of K as detd. from the polarization curves is given in v. per amp. per sq. cm. at different intervals after the start of discharge as follows: $\frac{1}{4}$ hr. — 1.40, 1.0 hr. — 1.60, 2 hr. — 3.30, 3 hr. — 5.54, 4 hr. — 8.80. Taking the above factors into consideration the authors derive the following expression for c. d. I at any point on a plate in a cell of type X discharging at 500 amp.: $I = aB / (e^{ax} - e^{-ax}) (e^{ax} + e^{-ax})$ in which $a = \sqrt{2(\rho + \rho') / (k + r)}$. In these equations ρ and ρ' are the resistance of the positive and negative plates per unit length, l is the length of the plates, x is the distance from the bottom of the plate of the point in question, and B is 0.467 amps. Values of I at intervals of 10 cm. over the length of the plate are given for various times of discharge, and curves are plotted. Thus after $\frac{1}{4}$ hr., I in amp. $\times 10^{-3}$ at the bottom of the plate is 3.94 and at the top 10.70; after 1 hr. it is 4.08 at the bottom and 10.45 at the top; after 4 hr. 5.36 at the bottom and 7.39 at the top, and the data show that the values at all points gradually approach 6.03×10^{-3} amp. per sq. cm. which is the mean c. d. over the whole plate. Approx. values of the amp. hr. capacity at each level during the entire discharge (8 hr.) are obtained by extrapolation and give at the bottom of the plate 40.79×10^{-3} amp. hr. per sq. cm., and at the top 63.86×10^{-3} amp. hr. per sq. cm. H. SROGER

The reversibility of a reaction caused by a current or an electric spark. PIERRE JOLIBOIS, HENRI LEFEBVRE AND PIERRE MONTAGNE. *Compt. rend.* **186**, 948-50 (1928).—When sparks from a condenser of 0.1 mf. capacity were passed through CO_2 at 17 mm. 74% decompn. was obtained. Passing the sparks through a mixt. of $2\text{CO} + \text{O}_2$ at 25 mm. resulted in 26% combination. By using a continuous current of 350 microamps. and CO_2 at 9 mm. or $2\text{CO} + \text{O}_2$ at 15 mm. equil. is reached when CO_2 is 33% decompd., or when combination is 67%. The spark and current act both as a catalyst and as a source of energy. E. G. VANDENBOSCHE

Electrodeposition of rubber (Brit. pat. 279,474) **30**. Apparatus for dehydrating petroleum emulsions or similar emulsions by electric treatment (U. S. pat. 1,674,242) **22**. Purifying Zn solutions (Brit. pat. 278,851) **18**. Purifying alumina (Can. pat. 277,526) **18**.

Primary electric battery. M. L. MARTUS and E. H. BECKER. U. S. 1,674,198, June 12. A self-depolarizing primary cell has an electrolyte of caustic alkali and a negative element of activated C extending above the normal electrolyte level. Various other structural details are described.

Electric battery. T. A. HODGKISS and W. E. SMITH. Brit. 278,903, Nov. 13, 1926. Structural features.

Electric batteries. W. E. STICHLING. Brit. 279,228, Sept. 27 1926. Structural features.

Electric dry cell batteries. H. M. R. DAM (to Joseph Block). U. S. 1,673,400-1, June 12. Structural features.

Electric dry cell batteries. HENRY M. R. DAM (to Premo Electrical Corporation). U. S. 1,673,402-3, June 12. Structural features.

Storage battery. W. E. HOLLAND (to Philadelphia Storage Battery Co.). U. S. 1,673,677, June 12. Structural features.

Storage battery. E. J. PETRIE and G. R. HANNAN. U. S. 1,673,421, June 12. The electrolyte is absorbed in diatomaceous earth or similar material which is preliminarily purified by heating to a temp. (suitably about 1100°) at which org. matter is destroyed and volatile substances are expelled but which is not sufficient to destroy the cells of the material or to fuse them together.

Separator for storage batteries. H. B. LINDLEY (one-half to Adrian K. McInnis). U. S. 1,673,835, June 19.

Storage battery separator plates. W. L. GILL, J. O. MIDGETT and A. B. BENNETT. U. S. 1,674,284, June 19.

Storage battery separator or wood and glass-felt. H. J. HAMPTON (to Electric Storage Battery Co.). U. S. 1,674,594, June 19. Structural features.

Forming wood storage battery separators. E. P. FAY. U. S. 1,673,669, June 12. Mech. features.

Electrolytic cell. E. ROMANELI. Can. 277,857, Feb. 14, 1928. Zr is specified as a film-forming conductor for electrolytic cells. Cf. C. A. **22**, 259.

Electrolytic cell (surge absorber for use with direct current). H. G. BRINTON (to General Electric Co.). U. S. 1,674,497, June 19. Structural features.

Electrolytic condenser. H. N. MILLER (to Fansteel Products Co.). U. S. 1,672,809, June 12. Filmed Al plates are used in an electrolyte including a gelatin-glycerol compn. contg. NaHCO_3 . Cf. C. A. **22**, 2517.

Electrolytic condenser. E. F. ANDREWS (to Andrews-Hammond Corporation). U. S. 1,673,434, June 12. A condenser adapted for use with a. c. comprises a positive electrode of an alloy of Ni and Fe, which may be used with a negative electrode of similar metal and an electrolyte of alkali metal hydroxide. Cf. C. A. **22**, 1285.

Separating cobalt from nickel. W. J. HARSHAW. Can. 279,454, Apr. 17, 1928. A soln. of Ni and CO salts is electrolyzed with metallic Pb anodes. The anodes are thereby oxidized to Pb oxide, and this reacts upon the Co to form $\text{Co}(\text{OH})_2$.

Printing-surfaces of steel electroplated with chromium. K. W. SCHWARTZ (to United Chromium, Inc.). U. S. 1,673,779, June 12.

Colloidal carbon. ASAHI GLASS CO., LTD. Jap. 69,055, Aug. 7, 1928. A C electrode is electrolyzed in a soln. of HClO_4 , perchlorate or a mixt. of these.

Rectifier for electric current. LER. P. BENSING. Brit. 279,259, Nov. 12, 1928. Electrodes for rectifying a. c. of low voltages and low frequencies are formed of Si or an alloy of Si with Fe, Cu or Ni or are coated with Si. If the rectifier is of the electrolytic type, the electrolyte may be a soln. of a fixed alkali hydroxide, a boride, fluoride, phosphate or carbonate or an acid such as H_2SO_4 , HNO_3 , HCl or HOAc . A depolarizer

such as FeSO_4 may be used with H_2SO_4 . In a rectifier of the dry type the second electrode may consist of an oxide or sulfide, and, in an electrolytic rectifier, of an inert element of the fourth group, e. g., C or Pb.

Rectifiers and similar electric discharge devices. SIEMENS & HALSKÉ A.-G. Brit. 279,497, Oct. 23, 1926. An incandescing cathode of material of high m. p. such as W or Mo, mounted on supports of lower m. p., has end portions of larger cross-section than the middle portion so as to prevent movement of the arc.

Rectifier for alternating currents. L. LEVY. Brit. 279,461, Oct. 20, 1926. Structural features are described of rectifiers of the general type specified in Brit. 265,652 comprising Al and cuprous sulfide electrodes in a sulfuretted atm.

Rectifier for alternating current. S. RUBEN. Brit. 278,776, June 9, 1926. The electropositive elements preferably consist of Al amalgam formed by immersing Al plates in a satd. HgCl_2 soln. The electronegative elements are preferably of CuS formed by heating Cu disks of about 5 mm. thickness in S vapor at 150–500°. Cf. C. A. 22, 2518

Electric resistance furnace. R. WIRZ (to Aktiengesellschaft, Brown, Boveri & Cie., of Switzerland). U. S. 1,673,543, June 12

Rotary electric resistance-heated furnace suitable for treating lead and zinc ores, etc. L. TOCCO and M. LANDI. Brit. 278,774, June 8, 1926

Electric control system for heat-treating furnaces. J. C. WOODSON (to Westinghouse Electric & Mfg. Co.). U. S. 1,673,544, June 12.

Heating system for electric ovens controlled by a pyrometer. H. H. F. DANGER and O. DANGER (trading as the firm of H. Danger). Brit. 279,416, Oct. 22, 1926.

Electric heater adapted for laboratory use in distillations. F. H. BUNGE. U. S. 1,673,225, June 12.

Apparatus for tempering metal articles in electrically heated baths. L. P. HYNES (to Hynes & Cox Electric Corporation). U. S. 1,673,567, June 12.

Lead peroxide accumulator. A. MIOLATI. Can. 278,224, Feb. 28, 1928. An accumulator comprises an electrolyte contg. H_2SO_4 and ZnSO_4 , a positive plate composed of chemically pure Pb and PbO_2 and a negative plate formed of a metal other than Zn, the electrolyte being free of any traces of impurities electronegative relative to Zn.

Electric arc apparatus for nitrogen oxidation or for producing other gas reactions. J. M. WHEE (to General Electric Co.) U. S. 1,673,654, June 12. Gases under pressure are supplied to a space external to a wall of Al_2O_3 , S.C or other porous refractory material surrounding the arc chamber so that the gases pass through the porous wall and reaction products are led away from the chamber.

System for coating electric conductors or other cores with paper while moistening and felting the fibers. H. F. ALBRIGHT (to Western Electric Co.). U. S. 1,672,973, June 12. An app is described.

Loaded electric conductor. W. FONDILLER (to Western Electric Co.). U. S. 1,672,979, June 12. A core of elec. cond. material is coated with Fe or Fe-Ni alloy or other suitable magnetic loading material in finely divided condition and with a second coating of insulating material.

Mercury vapor lamp. D. M. LUMSDEN. Brit. 278,795, July 10, 1926. Structural features.

Mount wires for incandescent electric lamps. R. A. PRICE (to Western Electric Co.). U. S. 1,673,267, June 12. An alloy of Au and Ag is used; preferably, Au 70 and Ag 30%.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Experiments on the complex chemical behavior of beryllium. VI. R. FRICKE AND F. RÖBKE. *Z. anorg. allgem. chem.* 170, 25–34 (1928); cf. C. A. 21, 3846.—*N*-Butylamine forms 2 compds. with BeCl_2 in the mol. ratio 1:2 and 1:4 Be salt to amine. The latter has a tendency to decomp. on washing with ether. $\text{BeCl}_2 \cdot 2$ diethylamine is the only complex obtained with this amine. The triethylamine complex is an oily liquid which does not crystallize and was studied no further. The compd. $\text{BeCl}_2 \cdot 2(p)$ -toluidine is easily sol. in H_2O , alc., acetone and *p*-toluidine but weakly so in benzene, benzine, gasoline and ether. $\text{BeCl}_2 \cdot 2$ -lepidine is very hygroscopic, decomps. rapidly in moist HCl vapor. It also decomps. in H_2O . Alc. dissolves it readily while it is slightly sol. in ether, benzene, benzine and gasoline. $\text{BeCl}_2 \cdot 2$ -benzophenone is sol. in ether and warm benzophenone but only slightly so in benzene and gasoline.

It decomps. in water. BeCl_2 -2-cinnamaldehyde evaps. in air, dissolves readily in benzene and cinnamaldehyde but weakly in ether, benzene and gasoline. It decompd. in water. The complex with anisole is not definitely BeCl_2 -2-anisole. The crystals are very hygroscopic and dissolve in water, benzene and ether. It is slightly sol. in benzene and gasoline. The m. p. of BeCl_2 -pyridine was found to be 152° . A eutectic of the system BeCl_2 -2-benzylcyanide-benzylcyanide is obtained at 97.9% of the latter. The Be salt was added to aminoacetic acid soln. but no inner complexes were detected. Be behaves here as it does in the presence of oxyacids and polyphenols. R. H. L.

Spectrographic studies of complex cyanides of iron. I. L. CAMBI AND L. SZEGÖ. *Gazz. chim. ital.* 58, 64-7(1928).—Sec C. A. 21, 3021. II. The reaction between nitroprussiate and alkalis. *Ibid* 71-6.—Sec C. A. 21, 3323. C. C. DAVIS

The composition of crystals obtained from solutions containing sodium sulfate and iodides. II. EMMA FABRIS. Univ. Pisa. *Ann. chim. applicata* 18, 115-22(1928); cf. C. A. 21, 3326.—Solns. contg. (1) Na_2SO_4 and KI at $16-25.5^\circ$, (2) Na_2SO_4 and NaI at $16-17.5^\circ$ and (3) Na_2SO_4 and NH_4I at $16-25^\circ$ were crystd. and the crystals and the mother liquors analyzed in the same way as before. The data, recorded in tabular and graphical form, show that with increase in the concn. of the iodide, the I content of the $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ crystals increases progressively. For a given concn. of NaI, KI or NH_4I accompanying the Na_2SO_4 , the highest I content in the crystd. $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ is found with NH_4I and the lowest I content with NaI, the differences being notable. The data include from 15 to 30% NaI, KI and NH_4I based on the Na_2SO_4 , and are thus an amplification of the earlier expts. From the results can be calcd. the concns. necessary to obtain $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ crystals with a definite I content from 0 to 0.3893% by the use of NaI, 0 to 0.5029% by the use of KI and 0 to 0.6358% by the use of NH_4I . C. C. DAVIS

Formation of crystallized gold. G. I. COSTEANU. *Bul. chim. soc. română stințe* 30, 35-7(1928).— SnBr_4 is added to an aq. soln. of AuBr_3 ; the mixt. is kept in a vacuum desiccator. After 4-5 days microscopical Au flakes come floating on the surface; they are hexagonal leaflets. If HBr is added to a soln. of SnBr_4 and AuBr_3 , and the mixt. is slowly evapd., $\text{AuBr}_4 \cdot \text{H}_4\text{H}_2\text{O}$ crystals ppt. first, then redissolve. Finally Au leaflets sep. A. L. HENNE

Formation of sulfur trioxide under the action of α -particles. J. E. MAISON. *Ann. soc. sci. Bruxelles* 47B, i, 172-7(1927).—The oxidation of SO_2 by O in presence of Rn has been followed manometrically. No evidence for the existence of persulfuric anhydride was obtained, SO_3 being apparently the principal reaction product. The ratio of the no. of mols. disappearing from the gaseous phase to the no. of pairs of ions produced is about 1.5. Assuming the simple reaction $2\text{SO}_2 + \text{O}_2 = 2\text{SO}_3$, this result indicates that each pair of ions produces one mol. of SO_3 . B. C. A.

New binary azeotropes. IX. MAURICE LECAT. *Ann. soc. sci. Bruxelles* 47B, i, 149-58(1927); cf. C. A. 22, 1265.—A further list of binary azeotropic mixts. and non-azeotropic systems is given. B. C. A.

Appearance of visible impurities in chemical preparations with lapse of time. G. KASSNER. *Festschr. A. Tschirch* 1926, 80-4.—The cause of a white prepn. of Bi(NO_3), becoming gray after 1 year proved to be the sepn. of Te effected by decompn. products of the cellulose of the filter paper employed. B. C. A.

Gmelins Handbuch der anorganischen Chemie. System No. 19. Wismut und radioaktive Isotope. 8th ed., revised. Published by the Deutschen Chemischen Gesellschaft. Edited by R. J. Meyer. Berlin: Verlag Chemie. 229 pp. M. 33; subscription price, M. 25.

SUTHERLAND, M. J.: Text-Book of Inorganic Chemistry. X. The Metal-Amines. Edited by J. Newton Friend. London: Charles Griffin & Co., Ltd. 260 pp. 18s. net. Reviewed in *Chem. News* 136, 318; *Chem. Trade J.* 82, 559(1928). Cf. C. A. 21, 2856.

7—ANALYTICAL CHEMISTRY

W. T. HALL

Sensibility of the thermobalance and analysis of hydrated lime by the balance. T. SOMIYA. *J. Soc. Chem. Ind. (Japan)* 31, 217-23; *Suppl. binding* 59-60B(1928). (In English).—Various improvements in the thermobalance invented by Honda are suggested whereby its accuracy becomes equal to that of the analytical balance even at temps. above 1000° . Hydrated lime was analyzed by this thermobalance. The sample suspended

from one end of the beam in an electric furnace was weighed continuously and the temp. was plotted against loss in wt. The $\text{Ca}(\text{OH})_2$ content was calcd. from the amt. of H_2O given off at 400–500° and that of CaCO_3 from the amt. of CO_2 evolved at 500–950°. The $\text{Ca}(\text{OH})_2$ detd. by this method was about 2.1% too low, but the CaCO_3 was correct.

Y. TOMODA

The determination of bismuth in lead ores. HESSLING. *Metall u. Erz* 25, 132–3 (1928).—The method given by the *Gesellschaft deut. Metallhütten- und Bergleute* ("Mitteilung," vol. 1, p. 37) for the detn. of Bi does not hold for ores which contain Sn, Sb, As or Cu. Satisfactory results are obtained by first decomp. the ore, irrespective of its nature, with Na_2O_2 , this treatment allowing the metals of the H_2S group to be detd. at the same time.

J. BALOZIAN

Microchemical sodium determination. LEIF T. POULSSON. *Biochem. Z.* 193, 423–5 (1928).—Barrenschen-Nessiner's method is improved by substituting filtration for the centrifuging.

S. MORGULIS

A note on v. Fellenberg's iodine determination. ERICH JOCHMANN. *Biochem. Z.* 194, 454–60 (1928).—Errors of the detn. are avoided by a few modifications of the original procedure. The alc. ext. is collected in Ni crucibles instead of Pt dishes, to this are added 10 drops of 5% NaNO_3 , and after evapn. of alc. the crucible is heated at 600° in an elec. oven.

S. MORGULIS

A study of the adsorption method of titration. R. KH. BURSTEIN. *J. Russ. Phys.-Chem. Soc., Chem. Part* 59, 521–36 (1927).—The titration of halides with AgNO_3 according to Fajans is reviewed. The author concludes that a sharp color change takes place only when the Ag halide is less sol. than the Ag salt of the indicator. Gelatin in concns. 0.001–0.01% does not prevent the pptn. of the Ag sol before the turning point, while 0.05% leads to abnormally large results. Albumin behaves similarly. $\text{K}_3\text{Fe}(\text{CN})_6$ cannot be titrated with AgNO_3 because the sol of $\text{Ag}_3\text{Fe}(\text{CN})_6$ coagulates before the equiv. point. In the case of C_2O_4 ions the color change takes place immediately upon the addn. of AgNO_3 , probably because Ag fluorescein is less sol. than $\text{Ag}_2\text{C}_2\text{O}_4$. $\text{K}_3\text{Fe}(\text{CN})_6$ can be accurately titrated with $\text{Pb}(\text{NO}_3)_2$, Na alizarinsulfonate being used as the indicator, the best results being obtained with 0.03–0.05 *N* solns. This indicator was successfully used in the titration of $\text{Na}_2\text{C}_2\text{O}_4$ with $\text{Pb}(\text{NO}_3)_2$.

BASIL C. SOYENKOFF

The colorimetric determination of perchlorate in chlorate. O. S. FEDOROVA. *J. Russ. Phys.-Chem. Soc., Chem. Part*, 59, 509–20 (1927).—Hahn's (cf. *C. A.* 20, 1967) method is modified as follows. To a mixt. of 0.1–0.2 cc. of the unknown and 0.1 cc. of 40% KNO_3 made up to 0.3 cc. with H_2O is added 5 cc. of Hahn's strong reagent. If the concn. of chlorate does not exceed 0.9%, 0.0012% of the perchlorate will change the color to lilac in 2–3 min. and 0.0025% to an instant purple. When the ultrareagent is used and the total vol. made up to 6 cc., 0.001 to 0.002% of the perchlorate can be detected in the presence of 1% chlorate although the color differences are less sharp. The detn. of perchlorate in electroplating baths is preceded by the pptn. of chromate; a slight excess of $\text{Pb}(\text{OAc})_2$ does not affect the results. When the concn. of chloride is not over 0.5 that of the chlorate, 0.1% of perchlorate in the latter can be detd. With concn. of chloride twice that of the chlorate, the limit of precision is 0.4%.

BASIL C. SOYENKOFF

Volumetric method of determining sulfate ion. FREDERICK G. GERMUTH. *J. Am. Water Works Assocn.* 19, 607–9 (1928).—The method of Wildenstein using 0.02 *N* BaCl_2 and 0.02 *N* K_2CrO_4 is described and recommended as accurate and rapid.

D. K. FRENCH

Qualitative analysis for cations without the use of hydrogen sulfide. D. STROHAL. *Archiv. hem. farm.* 2, 77–85 (1928).—The procedure recommended involves, for the most part, the same chemical reactions that are used in most schemes of analysis but the order in which the tests are applied is quite different. After the removal of the AgCl group, the oxidized filtrate is treated with NH_4Cl and NH_4OH instead of with H_2S . The tests are good and the procedure ought to give satisfactory results when only a rough qualitative analysis is desired. The original paper should be consulted for details.

JUROSLAV KUČERA

Determination of oxide inclusions in pig iron and steel. P. OBERHOFFER AND E. AMMANN. *Stahl. u. Eisen* 47, 1536–40 (1927).—The detn. of MnO and FeO in pig iron and steel by the Br method is not reliable, because the soln. of the oxides depends on the concn. and temp. of the Br soln. Good results for the detn. of the total SiO_2 were obtained by the following method: Dissolve 100 g. of KBr and 160 g. Br_2 in 1 liter of H_2O and filter. In this soln. dissolve 20 g. of the steel borings by shaking mechanically for 0.5 hr. Dil. to 2 l. and filter through a *Cella alkali-resistant* membrane, filter and wash first with cold and then with hot H_2O , next with 600 cc. of a hot 3% Na_2CO_3 .

then again with hot and cold H_2O , 50 cc. cold 5% HCl and finally with cold H_2O . Ignite the residue and det. Si by the HF method. The Al in the residue can be detd. by fusion with pyrosulfate.

J. A. SZILARD

Determination of oxides in steel. FRANZ WILLEMS. *Arch. Eisenhüttenwesen* 1, 605-8(1927); *Stahl u. Eisen* 48, 603-4(1928).—The oxide detns. in steel give only the O present as SiO_2 and Al_2O_3 . FeO and MnO are dissolved by a $Br-BrK$ soln., the solvent used by Oberhoffer and Ammann (cf. preceding abstract). The detn. of MnO is of importance in the elucidation of the deoxidation phenomena. A cold satd. soln. of twice-sublimed I in abs. alc., filtered through a Cella membrane, is used to dissolve the borings in a closed flask in a N atm., to prevent the formation of basic salts. To facilitate soln. the flask is shaken on the shaking app. of Wagner for 30-40 min., then filtered through a Cella membrane, which is not attacked by org. solvents. The MnO and other oxides are detd. from the residue by the usual manner and compared with results obtained by other methods.

J. A. SZILARD

The use of microanalysis in metallurgical and smelting laboratories. A. BENTDETTI-PICHLER. *Metall u. Erz* 25, 206-8(1928).—In detg. Ni, microanalytically, either the "filtering tubelet" of Emichschen (*Mikrochemisches Praktikum*, Munchen 1924, p. 63) or the "filtering cup" of Schwarz-Bergkampff (*C. A.* 21, 514) may be used, with dimethylglyoxime as the precipitant. With E.'s device, the pptn. is carried out in a microflask (cut from a small test tube) and the filtration in the tubelet under suction. In the "filtering cup," the microflask and the tubelet are attached, forming one closed piece, and so constructed that liquids may be introduced and the ppt filtered after turning slightly. Brunck's method of dissolving and pptg. is used, other analytical details being as usual. The av. of 5 detns. of Ni in $NiSO_4 \cdot (NH_4)_2SO_4$ gives 14.81% (theoretical 14.86%), the time required for a detn. being about an hr. Small amts. of various metals may be detd. by electrolytic deposition, the app. of Pregl being used. In a detn., 4-5 cc. of soln. are used, 10-25 min. being required for complete deposition of Cu. As no particular skill is necessary for carrying out microanalyses, its methods are applied in various other detns.

J. BALOZIAN

Volumetric estimation of carbon dioxide. L. LESCOEUR AND (Mlle.) S. MANJEAN. *Bull. soc. chim. biol.* 10, 523-36(1928).—The process is carried out in a closed system consisting of a wash-bottle A holding the air or substance yielding CO_2 , an Erlenmeyer flask B contg. approx. 0.02 N $Ba(OH)_2$ to which $BaCl_2$ has been added at the rate of 50 g. per l., and a circulating app. C connected to both A and B, which insures a continuous circulation of gas in the system from A to B by means of a falling jet or drops of Hg. The $BaCO_3$ formed by absorption of CO_2 is titrated with 0.02 N HCl , phenolphthalein being used as indicator. The special point of this process is the absence of error by contact with air.

L. W. RIGGS

A new method for the simultaneous determination of minute amounts of carbon dioxide and oxygen. W. O. FENN. *Am. J. Physiol.* 84, 110-8(1928); cf. *C. A.* 22, 99.—The detn. of CO_2 depends on the change in cond. of $Ba(OH)_2$ soln. due to the absorption of CO_2 (cf. Cain-Maxwell, *C. A.* 12, 1687). The app. is essentially a differential volumeter. Absorption of O_2 is indicated by movement of an index drop in a capillary tube which connects the 2 flasks of the app.

J. F. LYMAN

Method for the quantitative analysis of lead in organic compounds. HENRY GILMAN AND JACK ROBINSON. *J. Am. Chem. Soc.* 50, 1714-6(1928).—Directions are given for decomposing org. substances with concd. HNO_3 and H_2SO_4 and detg. the Pb as $PbSO_4$.

C. J. WEST

Determination of acetaldehyde according to different methods. JOACHIM WAGNER. *Biochem. Z.* 194, 441-52(1928).— AcH (a) in bisulfite combination ($CH_3CHOH.SO_3Na$), H_2O , (b) from Zn *dl*-lactate by oxidation with $KMnO_4$, (c) from purest acetaldehyde-thiosemicarbazone or exactly measured from freshly distd. purest aldehyde was analyzed by the titration method of Ripper, by the Hg method of Langedijk or by Newberg's hydroxylaminesulfate. The former (sulfite titration) method gave sufficiently accurate results even with small concns. of aldehyde.

S. MORGULIS

The determination of soluble carbohydrates. C. O. APPLEMAN, W. E. LOOMIS, T. G. PHILLIPS, W. E. TOTTINGHAM AND J. J. WILLAMAN. *Plant Physiology* 2, 195-204(1927).—Section 3 of the report of the comm. on methods of chemical analysis of the Am. Soc. of Plant Physiologists (*C. A.* 21, 3931; 22, 1933). Methods of extrn. clearing and extrn. of sol. carbohydrates in plant material are described and discussed. An extensive bibliography is given. II. **The determination of nitrogen in relatively simple compounds.** *Ibid* 205-11.—Section 4 of the report. Methods for the detn. of total N, amino N, ammonia N, amide N, nitrate N, humin N, basic N and proteose N are described. A bibliography is given.

WALTER THOMAS

Determination of sugar with Fehling's solution and centrifuging. W. S. ILJIN. *Biochem. Z.* 193, 322-5(1928).—The detns. of glucose and maltose are carried out by Bertrand's method substituting centrifuging for the filtration. Tables are given for quantities of glucose 1-25 mg. and for maltose 1-45 mg. S. MORGULIS

Determination of two sugars in one solution. W. S. ILJIN. *Biochem. Z.* 193, 326-33(1928).—In a mixt. of 2 sugars (e. g., *d*-glucose and maltose) the quantity of each can be detd. in the following manner. The entire sugar content is detd. by Bertrand's method, and the amt. of Cu corresponding to this is marked *M*. From the tables the mg. glucose and maltose corresponding to *M* are found (p_1 and p_2), so that M/p_1 and M/p_2 is the amt. of Cu per mg. glucose and maltose, resp. Assuming their concns. in the soln. to be C_1 and C_2 , $M = M/p_1 \cdot C_1 + M/p_2 \cdot C_2$ or $C_1/p_1 + C_2/p_2 = 1$. C_1 being known, and *M* detd. analytically, C_2 is easily calcd. When the concn. of both sugars is unknown it is also necessary to make a polarimetric detn., and from the data of both detns. the amt. of each sugar can be calcd. The original should be consulted for details. S. MORGULIS

The estimation of hexamine. J. RAE. *Pharm. J.* 120, 71(1928); cf. *C. A.* 12, 1907, 22, 1302.—To 10 cc. of a soln. of 1 g. hexamine in sufficient H_2O to make 100 cc., add 25 cc. $N K_2Cr_2O_7$ and 10 cc. concd. H_2SO_4 , heat on a water bath for 1 hr., shaking occasionally, allow to cool and dil. with H_2O to 250 cc. To 25 cc. of this soln. add 1 g. KI and titrate the liberated I with 0.1 *N* $Na_2S_2O_3$. Deduct the no. of cc. consumed from 25; the result multiplied by 5.833 gives the % of hexamine in the sample, based on complete oxidation of CH_3O to CO_2 and H_2O . S. WALDBOTT

Determination of hydroxylamine. JAKOB BLOM. *Biochem. Z.* 194, 385-91 (1928).— NH_2OH can be detected by a variety of methods with the following degree of sensitivity: (1) Na nitroprusside, 0.1 NH_2OH per l.; (2) $C_6H_5COCl + FeCl_3$, 0.005 g. per l.; (3) diacetyl monoxime + Ni, 0.002 g. per l.; (4) $(NH_4)_2S + NH_4OH + alc.$, 0.002 g. per l.; (5) $(NH_4)_2S + NH_4OH + MnS$, 0.00047 g. per l.; (6) *p*- $BrC_6H_4NO + \alpha$ -naphthol, 0.0001 g. per l.; and (7) with Griess, reagent, 0.000003 g. per l. Of these various reactions the 5th was chosen for a quant. method. The solns. required are: a $M/500$ *p*- BrC_6H_4NO contg. 0.37 g. of the substance in 1000 cc. 96% alc.; a $M/500$ α -naphthol-soln. contg. 0.29 g. of the substance in 1000 cc. H_2O acidified with 5 drops HCl; a 0.5 *N* NaOH soln.; and a dil. soln. of a Mg salt. The NH_2OH -contg. soln. (20 cc.) is neutralized and mixed with 2 cc. 0.5 *N* NaOH. To this is added a fresh mixt. of 3 vols. of *p*- BrC_6H_4NO and 2 vols. of the α -naphthol soln. when an orange-yellow color appears even in the presence of minute traces of NH_2OH . The reaction becomes more distinct and sensitive when 1-2 drops of a Mg salt soln. is also added, the color changing more to a red. The red coloring matter is adsorbed by the $Mg(OH)_2$ and forms a red ppt. sharply demarcated from the yellow supernatant fluid. In the absence of NH_2OH the $Mg(OH)_2$ ppt. is yellowish. S. MORGULIS

Improved method for phenol determinations. JOHN R. BAYLIS. *J. Am. Water Works Assoc.* 19, 597-604(1928).—Describes a method suggested by Gibbs using 2,6-dibromoquinonechloroimide. This reagent is sensitive to 5 parts per billion. Full details of prepn. of the reagent are given as well as a method for concg. the phenols for the detn. of very small quantities. There are few interfering compds. D. K. F.

Determination of the active sulfur in commercial benzene and of the hydrogen sulfide in raw benzene. R. KATTWINKEL. *Teer. u. Bitumen* 26, 265-7(1928); cf. *C. A.* 22, 677.—The following combination and modification of known methods is recommended. The H_2S is extd. from 100 cc. benzene by shaking with 50 cc. *N* NaOH followed by 25 cc. water, which leaves the free S in the benzene, and detd. in K.'s app. This consists of an Erlenmeyer flask with a special ground-glass stopper contg. a trap, for washing the liberated H_2S through hot water, a dropping funnel, which also serves as a gas inlet tube, and a delivery tube which conducts the gas into a single ordinary wash-bottle, which was found sufficient for complete absorption. Fifty cc. concd. HCl is run into the sulfide soln. in the flask, after the app. is flushed with H_2 . The H_2S is driven out by boiling, and passing H_2 until cold, into the wash-bottle contg. a 2.5% cadmium acetate soln. in 20% acetic acid. The CdS may be titrated directly in the absorbing soln., with 0.1 *N* I_2 or converted into CuS by adding $CuSO_4$ soln. to permanent blue. The CuS is ignited in air, finally covered and heated strongly to decompose $CuSO_4$ and weighed as CuO . The free S in the benzene, by shaking with Hg, is converted into HgS , which is filtered off and decomposed with concd. HCl in the above app. H_2S detns. on various specimens indicated contamination from the wash oil. F. S. GRANGER

The reaction of starch with iodine (STAIGER) 2.

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

Separation of fossils and other light materials by means of heavy liquids. MARCUS A. HANNA. *Econ. Geol.* **22**, 13-7(1927).—Bromoform and benzene mixts. are applied in obtaining concentrates of fossils from sands. E. J. ROBERTS

Intergrowths of chalcopyrite and cubanite. G. M. SCHWARTZ. *Econ. Geol.* **22**, 44-61(1927).—Microscopic and x-ray analyses show that cubanite (CuFe_2S_3), which is chemically intermediate between chalcopyrite and pyrrhotite, generally occurs intergrown with chalcopyrite, and that above 400-450° a homogeneous solid soln. of the 2 exists which unmixes to an intergrowth on slow cooling. Thus any intergrowth of the 2 indicates an initial temp. > 400-450°. E. J. ROBERTS

Changes in the oxidation of iron in magnetite. LILLIAN H. TWENHOFEL. *Econ. Geol.* **22**, 180-8(1927).—The oxidation of magnetite and the inversion of this oxidized magnetite to hematite are not dependent on temp. alone, but are also functions of time and source of material. The O atoms which are added when oxidized magnetite is formed are irregularly spaced within the magnetite crystal structure and their actual positions cannot be definitely detd. E. J. ROBERTS

The hydrothermal alteration of certain silicate minerals. R. J. LEONARD. *Econ. Geol.* **22**, 18-43(1927).—A study of the effect of water with various chemicals at different temps. and pressures on certain feldspars and spodumene is presented. Alunite was produced at 20°, 65° and 100° at 1 atm. and at 200° at 15 atm., but not at 350° at 1 atm., by the action of H_2O plus $\text{Al}_2(\text{SO}_4)_3$, + either H_2SO_4 , K_2SO_4 or Na_2SO_4 on microcline, albite and bytownite. Zeolites were formed by the action of H_2O + K_2CO_3 or Na_2CO_3 at 200° and 15 atm. on the feldspars, and probably by action of H_2O + K_2F_2 and Al_2F_6 at 350° and 1 atm. Cryolite was formed by action of H_2O + Al_2F_6 + Na_2SiF_6 at 350° and 1 atm. and at 400° and 575° at 8 and 10 atm., resp. Leverrierite (probably) was formed from feldspars by the action of H_2O + AlCl_3 or by H_2O + AlCl_3 + NaCl or KCl at 350° and 1 atm. or by H_2O + K_2CO_3 or H_2O + K_2F_2 + Na_2SiF_6 at 575° and 10 atm. Kaolin and sericite were looked for in all expts. but no definite evidences of their formation were obtained. Dil. HCl and H_2SO_4 at high temps. merely result in decompn. of mineral, generally with the production of SiO_2 . E. J. R.

Crystalline forms of curite and ianthinite. ALFRED SCHOEP. Univ. Gent. *Natuurwetenschap. Tijds.* **9**, 1-3(1928); cf. *C. A.* **21**, 2242.—For ianthinite, the values of φ and ρ have been measured for (110), (310) and (100). They are, resp., 21°05' and 90°, 49°11½' and 90°, 90° and 90°. The ratio $a:b = 2.59381$. The values for curite correct those previously given. The value 104° given for the angle (011)(011) is to be referred to an angle (111)(111) and has a value 107°59'42". The various values for φ and ρ have been detd.: $a:b:c = 0.9553:1:0.6535$. The plane of cleavage is undetd. A. L. H.

Some relations between oxygen minerals and sulfur minerals in ore deposits. B. S. BUTLER. *Econ. Geol.* **22**, 233-45(1927).—A table showing the relative temp. of deposition in both hypogene and supergene deposits of the O and S minerals of Fe, Mn, Zn, Pb, Cu, W and Sn is given and discussed. E. J. ROBERTS

Coincident variations of types of mineralization and of Coast Range intrusives. A. F. BUDDINGTON. *Econ. Geol.* **22**, 159-79(1927).—Certain pyrrhotites show 0.1 to 0.2% Ni and a trace of Co. E. J. ROBERTS

Zonal distribution of ore deposits in Central Europe. GEORG BERG. *Econ. Geol.* **22**, 113-32(1927).—It is not possible to introduce the pyritic, arsenopyritic, quartz-Au veins at any point into the customary order of deposits: Sn, Bi, Cu, Zn-Pb, Ag-Sb, Hg. The rich Au-Ag deposits, the enargitic Cu deposits, and others of the volcanic type were derived from magma that filled volcanic necks. E. J. ROBERTS

Tin ores of Chocaya, Bolivia. M. J. BUERGER AND JESSE L. MAURY. *Econ. Geol.* **22**, 1-13(1927).—The type of mineralization contrasts strongly with that of the hypothermal replacement tourmaline deposits of Caracales, described by Lindgren (*C. A.* **21**, 1949). E. J. ROBERTS

Minerals in relation to possible development in the Far East. H. FOSTER BAIN. *Econ. Geol.* **22**, 213-29(1927).—With the exception of W, Sb and Sn deposits, the Far East is deficient in those minerals necessary for a development of a type of civilization similar to ours. E. J. ROBERTS

Magnesite deposits of Manchuria. K. NIINOMY. *Econ. Geol.* **22**, 195-9(1927); cf. C. A. 21, 1427.—A no. of analyses of magnesites and dolomites are given showing the gradation from one to the other indicating replacement. E. J. ROBERTS

Origin of the Vermont talc deposits. JOSEPH L. GILLSON. *Econ. Geol.* **22**, 246-87 (1927).—These talc deposits were formed by the action of hot, alk. solns. low in SiO_2 and toward the last rich in MgO and CO_2 , on serpentinite rocks and certain schists and gneisses. The serpentinite was replaced by the talc either directly or with an intermediate stage of chlorite formation. The latter always took place when the parent rock was a gneiss or schist. A review of other talc deposits leads G. to believe that talc deposits in general are replacement deposits in limestone, schists, gneisses and in altered basic intrusions, the reagent solns. being of the type described above. E. J. R.

Origin and organization of coal. E. C. JEFFREY. *Mem. Am. Acad. Arts Sci.* **15**, 1-52(1924).—The effect of coal resources on the rise and decline of nations, as measured by the certain gage of increasing or decreasing populations, and some previous chem., macroscopic and microscopic studies of coals are briefly discussed. Various expts., chemicals, app. and procedures which were tried out in an extended investigation to ascertain the best method for softening, embedding and cutting sections of coal for microscopic examn. are described in detail. The problem as to the origin of coal, difficulties encountered, factors involved and conflicting theories, are outlined. Better methods for making micro-sections of coals have added much to the knowledge of the structure, compn. and origin of coal. This is evidenced by 10 photographs, 62 photomicrographs (14 of them beautifully colored) and descriptions of samples of different kinds of coals collected from all parts of the world. Types of coals studied were: sporcoals, oil-shales and cannel; bituminous coals, coking and non-coking; and anthracites. From this exhaustive investigation J. draws these conclusions: the structure of all ranks of coal and of every geological age have now been revealed and show that coals are the result of allocthonous sedimentation in open water and not from autocthonous or *in situ* deposition: the so-called sapropelic coals are not the consequence of extreme disintegration of vegetable materials under water, but are derived from fine materials deposited under tranquil conditions of sedimentation in open water; hence the sapropelic hypothesis of the origin of coal has to be rejected: algae are not an important constituent either of existing open water deposits or of the so-called sapropelic coals, such as oil-shales and cannel; objects previously interpreted as being algae in these latter coals are undoubtedly spores of vascular cryptogams, etc.: bituminous coals are the result of aquatic transport and deposition, shown by their usually large content of spores and the frequent occurrence in their substance of scattered fragments of fusain: anthracites represent only a further stage of devolatilization in bituminous coals and were formed under similar conditions: fungal organisms have played little or no part in the elaboration of the raw materials of coals: in the present state of our knowledge, hydrolysis, pressure, and temp. exercised in varying lengths of time and in varying degree account for the origin of the different ranks of coal, namely, brown, bituminous and anthracite; coking coals are predominately of woody origin and their quality depends in large measure on the proportion of wood present. A large no. of references to the literature on compn. and constitution of coal and acknowledgments for cooperation in this research are given. W. W. HODGE

New observations on the origin of fusite (mineral charcoal). H. BODE. *Braunkohle* **27**, 443-5(1928).—A review and discussion of the conclusions of various investigators. F. S. GRANGER

Fractionation and decomposition of petroleum during capillary migration. CHAS. W. COOK. *Econ. Geol.* **22**, 230-2(1927).—Alteration of petroleum may occur during capillary migration, either by fractionation or decompn., which actions may occur at relatively low temps. and pressures. E. J. ROBERTS

Preliminary report on the origin of California petroleum. JUN-ICHI R. TAKAHASHI. *Econ. Geol.* **22**, 133-57(1927).—Diatoms were not the principal source of the oil. Analyses of muds from Shioyama Bay for water-sol., HCl -sol., Na_2CO_3 -sol., chloroform-sol., benzene-sol. and distillable components are given. E. J. ROBERTS

The insulation of open-hearth furnace regenerators. L. B. MCMILLAN. *Iron Steel Eng.* 5, 257-62(1928).—A series of charts shows the heat losses through various thicknesses of brick walls and roofs and for various thicknesses of insulation. The benefits derived from insulation of open-hearth checker chambers are discussed. D. G.

The behavior of titanium in the titanium-bearing slags (with special reference to titanium monoxide). C. W. CARSTENS. *Z. Krist.* 67, 260-78(1928).—Ti occurs in some slags as crystd. Ti-augite. In intermediate to more basic slags, at moderate temps., as in blast-furnace operations, the Ti occurs as "deoxidized" rutile. The degree of deoxidation is a function of the temp. In such cases the pig iron is almost completely Ti free. In ultra-basic slags, with higher temp. and greater reducing conditions (as in the elec. furnace) the Ti occurs as dendritic crystals of the Ti monoxide, fulvite. Several analyses are given. L. S. RAMSDELL

Blast-furnace slag as ballast. H. BURCHARTZ and G. SAENGER. *Stahl u. Eisen* 47, 1663-4(1927).—The compn. of slag from Fe blast furnaces in Germany varies within the following percentage limits: SiO₂ 30.8-35.6, Al₂O₃ 9.1-12.0, FeO 0.3-0.8, MnO 1.3-3.5, CaO 35.9-43.4, MgO 3.7-10.2, SO₃ 0.1-0.3, S 1.1-1.8 and P 0.0-34%. It has d. 3.0, apparent sp. gr. 1.14-2.95 and absorbs 1.1-2.8% of its wt. of water. Its resistance to frost and to shattering during use as railway ballast is equal to that of granite, but slightly poorer than that of basalt. During the first year on the track it tends to accelerate the rusting of Fe, but subsequently becomes inert. B. C. A.

Apold-Fleissner process of roasting (iron ores in shaft furnaces). R. BRANHOFFER. *Stahl u. Eisen* 47, 2061-6(1927).—In the Apold-Fleissner method of roasting spathic Fe ore, the ore is passed downwards in a continuous stream through a shaft furnace, through which is passed a current of hot air or flue gas with a low content of CO₂, while a current of cold air passes upward through the lower part of the shaft below the hot-air tuyères, this part acting as a cooling chamber for the ore and a preheating flue for the air which rapidly and completely oxidizes the FeO formed in the upper zones of the furnace. The quantity and temp. of the hot gases and cold air used are carefully regulated so as to keep the CO₂ content of the flue gas at a min. and thereby ensure a thorough roasting of the ore at the lowest possible temp. Diagrams of the furnace used and calcs. of the heat balance are given. It is claimed that a furnace roasting 200-450 tons/day requires about 160,000-200,000 kg.-cal./ton with a heat efficiency of 73%. B. C. A.

Temperature and velocity of casting. FRITZ BEITTE. *Stahl u. Eisen* 48, 577-83(1928).—A lecture, followed by discussion. J. A. S.

Modern galvanizing ovens. A. BRESSER. *Korrosion u. Metallschutz* 4, 33-4(1928).—Sketches and descriptions are given of 3 types of modern galvanizing ovens. J. K. ROBERTS

Galvanizing with electric heat at Gary. EUGENE A. LONGGOOD. *Elec. World* 91, 1021(1928); 1 illus. C. G. F.

White metal for bearings, its treatment and microstructure; treatment in melting, casting temperature, construction of foundations and oiling of fixed bearings. STYRIE. *Apparatebau* 40, 109-11(1928), 6 photomicrographs. J. H. MOORE

Hardness of alloys. A. MALLOCK. *Nature* 121, 827(1928); cf. C. A. 21, 2654.—Curves showing the relative hardness of Pb alloys with Sb, Sn and Bi, resp., are given. The hardness was tested by measuring the flattening of an alloy cone by a given pressure. The Sn-Pb curve was straight; the hardening effect of Bi was slight below 70%, but greater above; the Sb-Pb curve showed a max. at about 60% Sb. G. F. C.

Acid-resisting metals and alloys. W. ROHN. *Korrosion u. Metallschutz* 4, 49-53(1928); cf. C. A. 22, 211.—A qual. presentation of the acid-resisting properties of the elements in the periodic table in which the resistance to mineral acids and foodstuff acids is indicated. The acid-resisting properties of Fe, Cr, Ni and Mo alloys to 10% solns. of HNO₃, H₂SO₄ and HCl are also discussed. J. K. ROBERTS

Equilibrium diagram of the copper-rich side of the copper-tin system. TSUTOMU

MATSUDA. *Sci. Repts. Tôhoku Imp. Univ.* 17, [1], 141-61(1928).—By thermal analysis and elec. resistance measurements it is established that a transformation takes place at 590° in alloys contg. 15-25% Sn. The transformation is considered a eutectoid change, the eutectoid contg. 26% Sn. No change was observed in the α -solid soln. The transformation at 520° was confirmed. The results, together with those of previous investigators, are used to construct a new temp.-equil. diagram up to 45% Sn. The effects of the transformations upon the forgeability and hardness have been detd. Photomicrographs of several alloys are included.

WILLIAM F. EHRET

The influence of nickel on iron-carbon-silicon alloys containing phosphorus. ARTHUR B. EVEREST AND D. HANSON. *Iron Steel Inst.* (advance copy), May, 1928, 23 pp. —Washed metal contg. 3.5% C was mixed with 97% Si and 20% ferrophosphorus to give alloys contg. 1.2 or 2.5% Si, and 0.2, 0.5 or 1.2% P. From each melt, castings contg. 0-3% Ni were poured, Ni addns. being made between each pouring. A step-casting varying from $\frac{1}{8}$ in. to 1 in. in thickness was poured to det. the chill. P increased the chill of the low-Si alloys, but Ni counteracted that effect, and it was not strongly marked with higher Si. P impaired the machinability, which was slightly improved by Ni. With low P increasing Ni hardened the alloys; it hardened the matrix in all cases, but also tended to reduce the chill. Ni tended to graphitize the alloys, and to make the graphite finer in most cases. The phosphide network in high P alloys was refined by Ni, which also made the pearlite more sorbitic. With high P, Ni made both cementite and pearlite finer-grained. Ni up to 3% was also added to a com. Fe contg. 3.05% C, 1.87% Si, 0.75% Mn, 0.09% S and 0.24% P, and to the same alloy with higher P. Results of tests on these alloys confirm those noted above. P had a smaller effect on Brinell hardness than on machinability. The max. refinement of the graphite was obtained with 2% Ni. P reduced the influence of Ni so that with high P, more Ni was required for a desired effect.

GEO. F. COMSTOCK

Chromium steel rails. THOMAS SWINDEN AND P. H. JOHNSON. *Iron Steel Inst.* (advance copy), May, 1928, 14 pp.; *Iron Steel Can.* 11, 174-6.—The practice of securing harder rails by increasing the C only is questioned, and Mn up to 1% is suggested as a possible improvement over the present specification of 0.8% max. Acid Bessemer steel contg. about 0.5% C and 1% Cr was made for crossings and switches, and gave good results in the drop tests. Reheating and air-cooling, as in hot-bending, gave improved ductility. Increased C content in acid open-hearth steel rails gave less ductility. Rapid air-cooling of the head from 950° increased the hardness. The sorbitic microstructure of the Cr steel is illustrated. Test results of British rail steel are tabulated. Track crossings of the Cr steel showed better wear resistance and toughness in service. The use of Cr steel fish plates gave stronger and stiffer joints.

G. F. C.

The rate of solution of graphite in molten iron carbon alloys. F. SAUERWALD AND A. KORENY. *Stahl u. Eisen* 48, 537-40(1928).—The rate of soln. of graphite in Fe-C alloys was detd. at 1250° and 1350°. A melt was prep. which solidified white and had the following compn.: C 3.62, Si 0.16, Mn 0.78, P 0.61 and S 0.05%, the rest being Fe. Small samples—10 to 12 g.—of this Fe were shaken with known quantities of graphite in an evacuated quartz flask and then heated for various lengths of time at 1250° in a salt bath placed in a Tamman furnace. The expts. at 1350° were carried out without a salt bath in the Tamman furnace. The flask was evacuated by a high vacuum pump and kept in motion during the test. The amt. of graphite dissolved increases with increasing temp. and also with increasing time. The results obtained by the expts. were calcd. with a fair degree of accuracy, assuming with A. A. Noyes, W. R. Whitney and W. Nernst that the rate of soln. is proportional to the surface and the degree of satn. of the liquid melt. It is emphasized that the data given for the soly. of graphite in tech. Fe are of value only if the form and vol. of graphite, the various C contents of the melt, the time, temp. and the grade of agitation of the melt are given. The order of velocity of soln. is such, that the complete soln. of graphite in cast Fe, especially at lower temps., takes a very long time.

J. A. SZILARD

Graphite in gray cast iron and its effect on the tenacity. PETER BARDENHEUER AND KARL L. ZEYER. *Stahl u. Eisen* 48, 515-9(1928); cf. C. A. 22, 373.—The soln. of graphite in gray cast Fe was investigated as a function of the temp. of overheating and the chem. compn. of the metal. In general the higher the C content, the higher the temp. required to obtain a complete resolu. of the graphite. With 3.69% C, there is considerable graphite present in sample heated to 1200° and 1300°. The sample was free from graphite only after a heat treatment at 1700°. With 2.95% C, the sample is free from graphite at about 1300-1400°. All test pieces showed with increasing temp. of overheating a displacement of the coarse graphite lamellae by the fine eutectic. This refining of graphite is more noticeable and occurs at lower temp. of overheating if the

melting is carried out in vacuum. The tendency of graphite formation decreases with increasing temp. Above 1500° white carbide particles appear. Even if melted in vacuum, cast Fe forms a gray structure, through the nuclei action of the crucible walls. At higher temp. this effect of the crucible material increases and this explains the increased graphite formation at 1500°, the so-called inversion point of Piwowarsky. The tensile strength of test pieces from annealed chill mold castings is higher than that of the corresponding test pieces from sand-castings, with pearlitic structure. The influence of the casting temp. on the strength and graphite formation was also investigated. The highest tensile strength was obtained at a casting temp. of 1300°. J. A. S.

Boiler plates. ANTON POMP. *Stahl u. Eisen* 48, 681-9(1928).—The harder plates especially the Ni-steel plates are better than the low C-plates, at higher temp. in their mech. characteristics, resistance to fatigue and tendency to recrystallize.

J. A. S.

Nitrogen-treated special steels. LEON GUILLET. *Compt. rend.* 186, 1177-80 (1928); cf. *C. A.* 22, 750. —An outline is given of the process whereby special steels are given an extremely hard surface. N treatment (nitride formation) gives a steel especially suited for motor cylinders and crankshafts. Expts. with cylinders made of N-treated steel show that its use reduces both wear on the metal and the consumption of oil. Al- and Mg-base pistons may be used. Crankshafts made of N-treated steel take such a high polish that they may be used directly with Al cranks without the use of bronze or anti-friction bearings. The resulting reduction in frictional loss adds materially to the power and speed of the motor.

WILLIAM F. EHRET

Basic Siemens-Martin ingot steel plates. ERNST POHL. *Stahl u. Eisen* 48, 649-56(1928). The limit of elasticity, breaking strength, elongation, reduction in area and impact strength of a basic Siemens-Martin ingot steel plate with a tensile strength of 46.8 kg. sq. mm. were detd. between 20° and 500°; also the effect of stretching between the same temps on the mech. characteristics at corresponding temps and at room temp. A stretching of the plates below their limit of elasticity has no effect on the mech. characteristics, but above the limit of elasticity a hardening occurs, with a corresponding decrease in the tenacity. Between 200° and 300° the capability of deformation of ingot steel plates decreases, as compared with higher or lower temps. The impact strength of ingot steel plates, stretched or overloaded between 20° and 500°, is at boiler temp. the same as that of normal plates, but considerably lower at room temp. The suggestion is advanced to construct the boilers in such a manner that the temps. to which the plates are subjected should range from 350° to 400°, rather than from 200° to 300°.

J. A. SZILARD

Manufacture of some foreign rails. C. W. GENNET, JR. *Am. Inst. Mining Met. Eng., Tech. Publ. No. 47*, 16 pp.; *Blast Furnace & Steel Plant* 16, 361-7(1928). —Inspectors were sent over to the Rheinhausen Works of Messrs. Fried. Krupp to inspect a shipment of 15,000 tons of basic open-hearth steel rails being shipped to the Boston & Maine R. R. Co. The paper describes the method of mfg. the ingots from which the rails were rolled and the results of tests made upon the finished rails. No x-rails were found. The rails were bottom cast and straightened in a roller straightening machine. The temp. of straightening varied from cold to warm and the time occupied about 15 sec per rail. From 10 to 20% required gag press treatment to remove kinks near the end of the rail. Tables giving the chemical compn. of the rails, rolling and test results, no. of heats with C content, sulfur prints, graphs of deflection and ball indentation tests accompany the paper.

J. W. SHIPLEY

Two kinds of martensite. KOTARO HONDA AND SINKITI SEKITO. *Nature* 121, 744(1928).—Resistance-temp. curves, magnetization-temp. curves and x-ray analysis are shown to lead to the conclusion that α - and β -martensite exist. β -Martensite is the more stable and is found in the interior of martensitic steels. It is body-centered cubic. α -Martensite is body-centered tetragonal with axial ratio $c/a = 1.06$ and is found in the surface layer. The probable mechanism of formation of these martensites from austenite is given. The transformation noted at 170° in martensitic steels is said to be due to $\alpha \rightarrow \beta$ -martensite.

WILLIAM F. EHRET

Twin-like crystals in annealed α -iron. HUGH O'NEILL. *Iron Steel Inst. (advance copy)*, May, 1928, 9 pp.—In examg. with the microscope a coarse-grained high-purity decarburized steel plate, strained and annealed, a grain that looked like a twin was found near a sclerometer scratch on a ferrite crystal about $\frac{3}{8}$ in. square and $\frac{1}{8}$ in. thick. Pressure figures and etch pits were made on both large crystals, and small embedded grains in this sample. Cu NH_4 chloride was preferred to HNO_3 for this kind of etching. Measurements of the angles so obtained showed that the straight grain boundaries were parallel to traces of (112) planes. The structure is shown to be consistent with the fluorite

type of twinning. The twins were probably true annealing twins, rather than unabsorbed grains, or remnants of twinned γ -Fe. Other work on this subject is reviewed and discussed. Single crystals of Fe produced by straining and annealing may contain internal twins, which may affect their tensile values. GEO. F. COMSTOCK

Orientation of crystallites in stretched or compressed metals and the crystallographic explanation of slip phenomena in stretched, compressed or rolled metals. G. TAMMANN AND A. HEINZEL. *Stahl u. Eisen* 48, 693-4(1928); *Arch. Eisenhüttenwesen* 1, 663-7(1927).—The orientation of crystallites in cast, worked or recrystd. metals can be detd. either by means of x-rays or by detg. the angle of max. brightness of the crystallites on a polished and etched surface (cf. *C. A.* 20, 2640; 21, 1615). During cold working the originally irregular orientation changes, and this change can be detd. if the grain size is not below 0.008-0.004 cu. mm. During stretching of a metal slip will occur on that slip plane, which receives the greatest shoving component. The increasing friction during slip causes a turning of the slip plane in such a way that, 2, 3 or 4 planes are in a sym. orientation around the force causing the slip. It can be shown that pulling forces (tension) effect such a sym. orientation of the slip planes, that the max. shoving components are in the direction of the slip planes; whereas pressure effects an orientation, where the max. pressure components are in the direction of the slip planes. During the rolling of metals 2 phases can be distinguished in the change of the orientation of crystallites, there is only 1 phase in case of stretching or compressing. In the first phase of rolling the changes in orientation are similar to the changes during stretching; the rotating and stretching forces of the rolls are predominant. In the second phase the changes are more such as observed during compressing, because the weight of the rolls has the greatest influence at that stage, in changing the orientation of crystallites. J. A. SZILARD

An example of the examination of metallic material by means of a metallographic method. F. HANAMAN. *Archiv. hem. farm.* 1, 236-42(1927).—The cause of the explosion of a water-tube boiler was explained by a metallographic investigation where chem. analysis and mech. examn. failed to show any error in the quality of the material. On metallographical examn. it was shown that the edges of the fissure which in the normal state had the structure of the homogeneous hypoeutectoid steel were transformed into martensite at a temp. not less than 850° and then probably soaked by water vapor. On reheating at 750° the iron regained its previous structure. The unaltered material soaked at 850° and 900° with water vapor took a structure analogous to that of the edges of the fissure, confirming the conclusions. JAROSLAV KUČERA

Cadmium deposits as rust preventatives. W. PFANHAUSER. *Korrosion u. Metallschutz* 4, 58-9(1928); cf. *C. A.* 22, 1566.—A discussion of the merits of the cyanide process for Cd plating as compared to the insol. anode process, and of the method of removal of adsorbed H, when Ni or Cr is placed over a Cd deposit, by exposure in vacuum of the newly plated metal to the electrode-pulverizing action of a high-tension a. c. J. K. ROBERTS

Cadmium deposits as corrosion preventatives. UDYLITE, G. M. B. H. *Chem.-Ztg.* 52, 292-3(1928).—It is claimed that the Udylite process gives a cathode efficiency of 85-95% with min. H₂ liberation and hence non-porous deposit. The anode efficiency is close to 100%. The simultaneous use of sol. and insol. anodes prevents enrichment of the metal content of the bath. The process yields a small-grained non-porous, silvery deposit while cyanide processes give grayish ones not as good for rust prevention. The process is very good for plating irregular surfaces due to the high distributing power. No increase in temp. of the bath is necessary. J. K. ROBERTS

Cadmium as corrosion protection for light metals. J. DORNAUF. *Korrosion u. Metallschutz* 4, 97-102(1928).—Al plated with Zn and Cd were immersed in a 3% NaCl soln. for 50 days. The Zn-coated material was much more rapidly attacked. Cd showed itself superior to Ag, Sn, Cu and Pb as a protective coating in salt solns. Cd was found effective in protecting Duralumin, Silumin and Mg-Al alloy. Cd afforded considerable protection to Al in Hg salt solns. Methods of coating the Al with Cd are mentioned. Cd is sol. in Al to the extent of about 2-3%. J. K. ROBERTS

The value of lead paints for purposes of protection of iron. A. EIBNER AND W. LAUFENBERG. *Korrosion u. Metallschutz* 4, 107-10(1928).—Imperviousness of linseed oil films to water increases with increasing linseed oil-Pb compd. content. The compds. formed are Pb soaps and Pb glycerol combinations. Linseed oil films are not completely sol. in ether, petroleum ether, CHCl₃, C₆H₆, H₂O but on subjecting to boiling in benzene under pressure the films are found to be completely sol. This was not true of Pb compd.-linseed oil films. Pb paint films 16 months old were boiled in an autoclave and agitated and the quantity of linseed oil film dissolved was measured. The

residue was treated with mineral acids and ether to det. the quantities of Pb soaps present. The Pb compds. stable in the film were detd. by difference, the compn. of the original film being known. Conclusion: The phys. state as well as the chem. nature of the pigment can influence the stability of the protective film. J. K. ROBERTS

Report of Committee A-5 on corrosion of iron and steel. J. H. GIBBONEY, et al. *Proc. Am. Soc. Testing Materials Reprint No. 13*, 1-4, June, 1928.—The rept. covers: Cu and non-Cu bearing sheet steel and Fe atm. tests at Ft. Sheridan and Annapolis; total immersion tests at Washington and Annapolis, which are near completion, and the Key West and Portsmouth tests which have shown few failures; ship plates and rivet tests at Key West, Portsmouth and Port Arthur. Immersion tests indicate that the Cu content of steel or Fe has little or no effect on this type of corrosion. Tentative specifications for zinc-coated wire are given. Activities of sub-committees on testing coatings and corrosion and on field tests for metallic coatings include brief reports. J. K. ROBERTS

The problem of metal corrosion. J. HAUSEN. *Korrosion* 3, 17-8(1928).—H discusses the papers of Grünfeld (C. A. 21, 3197), Maass and Liebreich (C. A. 18, 1971; 19, 1397), Vernon (C. A. 18, 964; 21, 48, 1623; 22, 375) and Masing and Koch (C. A. 20, 2973) on the corrosion of brass and concludes that the results of lab. expts. are not very reliable and that decisions must be based on practical trials. J. H. MOORE

Coating formed on iron electrodes in corrosion tests. W. VAN WULLEN SCHOLTEN. *Korrosion Metallschutz* 4, 73-4(1928).—S. titrates an $\text{Fe}(\text{OH})_2$ soln. with an alk. hypochlorite soln., and a FeSO_4 soln. in an acid hypochlorite soln. and concludes that $\text{Fe}(\text{OH})_2$ exists as a solid soln. in $\text{Fe}(\text{OH})_3$. J. K. ROBERTS

Action of salts upon metals at high temperatures. BERNWARD GARRE. *Korrosion Metallschutz* 4, 53-5(1928); cf. C. A. 22, 372. —Reactions can take place between salts and metals if there is a free energy decrease. A layer of reaction products builds up between the reacting substances, decreasing the reaction rate unless some of the products are broken off the surface. The grain boundaries of metals are usually attacked first because the m. p. of the impurities there is lowest. J. K. ROBERTS

Resistance of over-stressed wrought irons and carbon steels to salt water corrosion. J. NEWTON FRIEND. *Iron Steel Inst.* (advance copy), May, 1928, 12 pp.—Test bars of steel and wrought irons of various C content strained, compressed or annealed, were exposed to salt water corrosion (in tank, approx. 3% soln.) for 1-3 yrs. Losses of weight were taken as a measure of corrosion. Conclusion: For wrought iron and steels contg. up to 0.11% C, stretching to rupture, 45° torsion or compression do not enhance corrosion. For 0.20% C steel, compression and torsion increase corrosion slightly. These results are for Fe and steel at rest, not under load. J. K. ROBERTS

Metallic coatings. MAX SCHLÖTTER. *Korrosion Metallschutz* 4, 74-82(1928); cf. C. A. 22, 211.—A comprehensive discussion of coating of metals with respect to (a) prepn. of the metal by pickling and sandblasting, giving advantages and disadvantages of HCl and H_2SO_4 , embrittlement due to pickling, the causes thereof, and the use of inhibitors; (b) mech. methods of coating, dipping, tinning, sherardizing, schooping; (c) electroplating methods with special reference to the influence of the effect of the cryst. nature of the metallic salt used upon the nature of the crystals formed and their protective influence, also the effect of soly. of H in the metal on the adhesive properties of the deposit formed. J. K. ROBERTS

Pickling of metals when using inhibitors. W. H. CREUTZFELDT. *Korrosion Metallschutz* 4, 102-7(1928).—Weight loss measurements were made on annealed and oil-quenched steels varying in C (0.10 to 0.67%) in 5.3 N H_2SO_4 and in HCl. The attack increased qualitatively with the C content. Annealed, air-quenched and oil-quenched steels were exposed to 5.3 N H_2SO_4 , the steels contg. 0.10 C being attacked to the same extent, but at higher C concns. the attack increased in the order of treating mentioned. Addns. of salts of noble metals to the acid and of certain org. materials decreased the attack. Colloidal C effects no decrease and in some cases increases the attack. The inhibitors tested were useless with HNO_3 . The effects on other metals were studied with the conclusions that: (1) The greatest decrease in attack occurred with Fe. (2) Ni, Al and Sn were quite well protected. (3) No definite action could be established for Zn. Substances with free valences best lent themselves to use as inhibitors. The marked increase in activity of HCl on increasing temp. as compared to H_2SO_4 led to the conclusion that pickling should be done hot in H_2SO_4 and cold in HCl. The inhibiting phenomenon is explained by formation of an insulating film on the metal surface. J. K. ROBERTS

Influence of corrosion accelerators and inhibitors on fatigue of ferrous metals. F. N. SPELLER, I. G. MCCORKLE AND P. F. MUMMA. *Proc. Am. Soc. Testing Materials*,

Reprint No. 42, 9 pp., June, 1928.—A corrosion fatigue study on steel showed that sufficient $\text{Na}_2\text{Cr}_2\text{O}_7$ to stop corrosion will prevent the reduction of air fatigue limit by corrosion simultaneously with cyclic stress. Tests made with painted bands and with washers on the test pieces indicate that such external factors tend to localize corrosion and det. the point of failure in corrosion fatigue. J. K. ROBERTS

A rotating tube drying furnace (ORTLEPP) 1. The thermal investigation of metallurgically important reactions (TOTH, CHALL) 2. Washing coal, separating ore constituents by upward currents of water (Brit. pat. 279,447) 21.

Cémentation par le cyanure de sodium. Paris: Société d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine. 48 pp.

GRENET, L.: Trempe. Recuit. Cémentation et conditions d'emploi des aciers. 3rd ed., revised and enlarged. Paris and Liège: Ch. Beranger.

Ore flotation. C. P. LEWIS. Can. 280,568, May 29, 1928. A Zn ore contg. also another value is concd. by agitating a pulp of the ore with xanthate and with a mineral frothing agent to produce a mineral-bearing froth relatively rich in the other value. The froth is then sepd., and sufficient lime is added to render the pulp alk., after which a Cu salt and further xanthate are added. The pulp is then again agitated to produce a mineral-bearing froth relatively rich in Zn, and the froth is sepd. Cf. C. A. 22, 2136.

Concentrating minerals by flotation. W. A. DOUGLASS (to E. I. duPont de Nemours & Co.). U. S. 1,674,166, June 19. Alkyl ester xanthogenamides or similar substances are used to facilitate flotation with pine oil or other frothing agents. Cf. C. A. 22, 1319.

Apparatus for separating ore constituents by flotation. W. C. EGGERT. U. S. 1,673,188, June 12.

Preparing ore fines for sintering. H. J. STEHLI. U. S. 1,673,891, June 19. A mass of wet fines is divided into lumps and the lumps are coated with powd. material, e. g., dry ore or flux dust or lime, to prevent them from adhering to one another and provide air passages between the lumps when in a mass. An app. is described.

Cyaniding apparatus for treating gold ores. R. KANDA. U. S. 1,673,982, June 19.

Treating sulfide ores. H. E. WETHERBEE. U. S. 1,674,491, June 19. Sulfide ore such as that of Fe and Cu is heated, while controlling exothermic action, to about 385° to drive off loosely combined S, and the sulfides are then heated to about 540° to produce max. sulfation and then further heated to about 650° to decomp. the remaining Fe sulfates; the changes in temp. between the stages of heating are relatively abrupt.

Zinc from sulfide ore. J. ALLINGHAM. U. S. 1,674,030, June 19. Zn is dissolved as ZnSO_4 by treating a pulp of roasted ZnS ore with SO_2 gas, the ZnSO_4 is reduced to Zn and a compd. of S such as CaS or FeS and the S compd. thus formed is used to produce SO_2 for further use in the process. An app. is described.

Treating zinc ores. H. WITTEK. Brit. 279,370, Oct. 23, 1926. Reduction of Zn ores is effected by cathodes in the presence of an inert gas such as N. With sulfide ores, Ca or Ba sulfides may be obtained as by-products and these may be used with C for making carbides.

Treating titaniferous slag. C. A. KLEIN and R. S. BROWN. Brit. 279,219, Sept. 17, 1926. Titaniferous slag obtained in the reduction of Fe in ores contg. Ti is subdivided while heated to facilitate elimination of metallic Fe from the slag. A jet of steam under high pressure may be used for this purpose and the dry subdivided slag may be subjected to magnetic sepn.

Ingot-mold set-up. W. H. RAMAGE (to Valley Mould & Iron Corporation). U. S. 1,673,778, June 12.

Apparatus for casting closed-bottom ingot molds. J. E. PERRY (to Valley Mould & Iron Corporation). U. S. 1,673,586, June 12.

Producing and working ingots. P. EVERMANN (to I. McCreight and R. Peale, Jr.). U. S. 1,672,999, June 12. Mech. features.

Die-casting apparatus. N. LESTER. U. S. 1,673,832-3, June 19.

Metal-casting apparatus. P. ROSENBERGER. U. S. 1,673,054, June 12.

Apparatus for casting metals under pressure. E. JORGEN-JENSEN. Brit. 279,345, March 22, 1927.

Casting aluminum. J. ZUBLIN. Brit. 279,061, Oct. 13, 1926. Mech. features.

Hardening faces of iron, steel or other castings. W. T. HULSIZER. U. S. 1,673,-

873, June 19. A corrugated Al sheet is attached to the face of a mold cavity and a flat Al sheet is attached to another face of the cavity; molten metal such as Fe, steel or alloy is poured into the cavity and the Al sheets fuse onto the metal casting produced. The corrugated Al sheet used is thicker than the flat sheet.

Composition for permanent molds for casting metals. H. TODD. U. S. 1,674,232, June 19. Molds are formed of a mixt. of sillimanite 45, monazite sand 25, coke dust 10, cow hair 2, plaster of Paris 5, china clay 3 and ganister 10 parts or from similar mixts. Cf. C. A. 21, 561.

Core binder. HENRY B. HANLEY (to Whitehead Bros. Co.). U. S. 1,673,356, June 12. A binder for use in *metal founding* comprises a concd. waste sulfite liquor prepn., oil and bentonite or similar materials. U. S. 1,673,357 specifies the use of dextrin, oil, water and bentonite or glue.

Pickling metals. J. H. GRAVELL. Can. 280,271, May 22, 1928. A pickle regulator for selectively controlling the action of metal-pickling baths comprises the portion of the distillate from proteins which is insol. in H_2O and is sol. in HCl and in equal vols. of H_2O and H_2SO_4 .

Metal precipitation. C. MULLER, L. SCHLECHT and W. SCHUBART. Can. 279,989, May 8, 1928. Metals are pptd. (e. g., Cu from ammoniacal solns. of Cu compds.) by treating the soln. with a reducing gas under elevated pressure and temp. so as to effect a substantially complete sepn. of the heavy metals.

Extracting non-amalgamable metals of the platinum group. A. R. POWELL, E. C. DEERING and JOHNSON, MATTHEY & Co., LTD. Brit. 279,156, July 19, 1926. Material such as ores contg. a high proportion of basic substances with non-amalgamable metal such as Cu, Sn or Ag, from an alk. soln. contg. also a substance which prevents pptn. of the hydrate of the coating metal such as NH_3 , cyanides, tartrates, citrates and sugars, and the treated material is then subjected to treatment with Hg (supplied as such or from an amalgam or Hg salt) to recover the metal. The metal coating may be deposited from the alk. soln. electrolytically or by the action of a reducing agent.

Apparatus and method for hydraulic separation of minerals to recover metals and precious stones from associated materials. G. C. F. F. HANCIAU. U. S. 1,673,675, June 12.

Metal-heating furnace and associated gas-producer construction. BRITISH FURNACES, LTD., AND E. W. SMITH. Brit. 279,317, March 22, 1927.

Open-hearth furnace. A. G. EGLER. U. S. 1,674,167, June 19. Structural features.

Wire-annealing furnace. F. W. MANKER (to Surface Combustion Co.) U. S. 1,674,407, June 19.

Recuperator for furnaces. C. P. MILLS (to Duraloy Co.). U. S. 1,673,122, June 12. Structural features.

Tuyère for blast furnaces. S. OHRA. U. S. 1,673,053, June 12.

Rotary kiln for burning, roasting and sintering mineral materials. F. LUTHER (to Firm of G. Polysius). U. S. 1,673,051, June 12. A cooling drum is arranged to receive material from the kiln and is provided at its delivery end with a hood and with means for introducing air.

Crucible for brass melting, etc. E. L. HAUMAN. U. S. 1,673,115, June 12. Structural features.

Alloy for sealing hard glass. W. B. GERO. Can. 279,434, Apr. 17, 1928. A seal for hard glass consists of an alloy contg. approx. 80% W and approx. 20% Mo.

Hard alloys. F. KRUPP A.-G. Brit. 279,376, Oct. 25, 1926. W may be ground in a ball-mill to less than 10^{-1} mm. and converted into carbide by heating in an oxidizing atm. in a gas-heated furnace with a slight excess of C and the resulting carbide then ground to a similar size and mixed with 5% of Co or with another metal such as Fe or Ni, similarly ground, the mixt. still further ground, pressed, sintered at $700-1100^\circ$, worked and further sintered at $1300-1600^\circ$.

Hard alloys for tools, etc. F. KRUPP A.-G. Brit. 278,955, Oct. 25, 1926. W carbide free from graphite is used together with other metals such as Fe, Ni or Co.

Low-carbon alloys of iron with tungsten and molybdenum. W. P. SYKES (to British-Thomson-Houston Co., Ltd.). Brit. 279,490, Oct. 22, 1926. In making various alloys of Fe, W and Mo with each other, a body of the metals, which may be prepd. by pressing together the powd. metals or by melting and casting, is heated to a temp. which will effect solid soln. of one metal in another, then rapidly cooled and afterward heated to an intermediate temp. An alloy of Fe 78 and Mo 22 parts contg. less than 0.02% C may be prepd. by reducing the mixed oxides with H, pressing the metal powders into a bar and heating the latter to about 1410° in H for 1 hr., quenching in

water and heating for 60 hrs. at about 600°. Alloys are also referred to which contain Fe 70-90 and Mo 10-30%; Fe 60-90 and W 10-40%; and Fe 70-75, Mo 5-25 and W 5-20%.

Copper-nickel-beryllium alloys. M. G. CORSON. Brit. 279,425, Oct. 20, 1926. Alloys contg. Cu together with Ni and Be (*e. g.*, Be 0.1-2.0 and Ni up to 40%, or Be 0.3 and Ni about 4%) are heated to above 900° and then hardened either by quenching and then reheating to 350-700° or by allowing them to cool slowly or by cooling in the air or in the furnace.

Ferrous alloy. J. T. HAY. Can. 279,814, May 1, 1928. A corrosion-resistant ferrous alloy contains 0.20-0.50% Cu, up to 0.10% Mo and less than 0.05% C.

Iron alloys for chill castings. P. D. MERICA, J. S. VANICK and T. H. WICKENDEN (to International Nickel Co.). Brit. 279,414, Oct. 21, 1926. Alloys are formed contg. C 2-4, Si 0.25-2.0, Mn 0.25-2.0, Ni 2-10 and up to 4% of Cr, with or without other metals such as Mo, W, Ti or Cu. The Ni content is greater than the Cr content (suitably about 2.5 times the quantity of Cr). P and S may be present in the usual proportions as found in cast Fe. Brit. 279,415 specifies a "wear-resisting" gray iron of generally similar compn. but contg. Ni 1-12% and a max. of 3% of Cr. Cf. C. A. 21, 1961.

Nickel alloys. N. V. HYBINETTE. U. S. 1,674,438, June 19. A Ni-contg. bath after subjection to an oxidizing treatment such as in a reverberatory furnace is deoxidized with a material such as Al which forms a non-gaseous oxide and alloying metals such as ferro-Cr are then added to the deoxidized bath.

Thorium alloys. KEMET LABORATORIES CO., INC. Brit. 279,274, Dec. 17, 1926. Alloys of Th with W or Mo or both, suitable for use in electron-emitting devices, are made by heating in H a compacted mixt. of Th hydride and the alloying metal, to decomp. the hydride, and then further heating in H to effect sintering and completion of the alloy. Numerous details are given.

Case-hardened alloy steel rolls for rolling metals, etc. F. D. CORBIN, LANELLY FOUNDRY & ENGINEERING CO., LTD., AND R. NEVILL & CO., LTD. Brit. 279,149, July 7, 1926. Rolls are made of alloy steel with their case-hardened portion of a martensitic, troostitic, cementitic or similar structure and the remaining portion of a soft pearlitic or like structure. The proportion of C in the carburized zone is regulated so that the relative proportions of C and the alloying elements are such that the carburized zone shall remain in the martensitic or similar state even after slow cooling and that this zone shall not assume the austenitic state when Ni or Mn is present. A suitable steel may contain Ni 5 and C 0.9-1.25%; Cr 7 and C 1.4%; W 4 and C 1.25%; Mo 1.25 and C 1%; V 0.75 and C 1%; Mn 3.5 and C 0.9-1.1%; or Ni 5, Cr 0.8 and C 0.2%. Details of heat-treating and case-hardening are given.

Refining nickel-copper mat. F. E. LATHE. Can. 279,756, May 1, 1928. Ni-Cu mat is refined by retaining in the mat a substantial amt. of FeS and rapidly cooling the mat to increase the rate and completeness of soln. in acid of the Ni sulfide constituent thereof, and leaching the mat with acid to dissolve the Ni sulfide.

Hardening chrome iron. W. E. GRIFFITHS. Can. 279,295, Apr. 10, 1928. Chrome iron contg. upward of 10% Cr is hardened by heating the metal in contact with a hydrocarbon gas to a temp. not below 950° until the C content at the surface of the metal is materially increased.

Ferro-boron and boron steel. T. MIYAGUCHI. U. S. 1,674,119, June 19. Molten Fe or steel is subjected to the action of gases evolved by heating a mixt. of NaCl and a B compd. such as B₂O₃. An app. is described.

Drying and removing gases from metallic powders. E. SEYFFERTH (to Fulmit G. m. b. h.). U. S. 1,674,230, June 19. Finely pulverized material is pressed into a block, alc. is allowed to percolate through the block to remove water present and the retained alc. is allowed to volatilize.

Composition for preventing and removing rust. H. J. ROGERS (to Westernfield Pharmacal Co.). U. S. 1,673,951, June 19. A compn. suitable for use on metals before painting is formed from EtOAc 69, H₃PO₄ 24, AmOAc 3, acetone 3 and "soluble cotton" 1 part.

Heat treatment of magnetic material. A. F. BANDUR (to Western Electric Co.). U. S. 1,673,790, June 19. An Fe Ni alloy or similar magnetic material is given a relatively high initial permeability and relatively const. permeability over a selected range of magnetizing forces, by heating the material at a temp. lower and for a shorter period of time than is required completely to anneal the material.

Treating treads of railway rails. EISENWERK-GES. MAXIMILIANSHÜTTE. Brit. 279,387, Oct. 21, 1926. The hot rail after rolling is plunged with its head into water for a sufficient time that on removal the temp. of the head does not exceed 450° and the

time of immersion of the head decreases with increase of the C content of the rail; a rail contg. 0.40-0.45% C may be immersed for about 45-75 sec.

Coating metallic and other articles with aluminum. W. SMITH. Brit. 279,273, Dec. 14, 1926. In coating ferrous metal articles, firebricks or other materials with Al, the material is first coated with Cd (suitably electrolytically) and then coated with Al or an Al alloy by immersion in the molten coating metal or by exposure to vapors of the coating metal. Suitable alloys are: Al 94, Cd 1.5, Zn 2, Fe 1.5 and Cu 1%; Al 97, Ni 1 and Cu 2%; and Al 98, Cu 1.5 and Mn 0.5%.

Coating wire with aluminum, etc. G. H. HOWE (to General Electric Co.). U. S. 1,673,624, June 12. An app. is described in which a wire may be passed downward into a bath of molten Al and thence out of the bath upwardly; a baffle is provided to set up a circulation of the molten Al and the surface of the bath is heated by a H burner adjacent the point where the wire emerges, to prevent deposits of dross.

Coating small articles with tin or other metal by dipping. C. E. JONES (to British Thomson-Houston Co., Ltd.). Brit. 279,092, Oct. 13, 1926. The articles while still hot are subjected to an air blast to prevent them from sticking together. An app. is described.

Coating with zinc. H. C. BAKER and J. G. FITZGERALD. Can. 278,547, Mar. 13, 1928. Ferrous metal is zinc-coated in a molten spelter bath. The cooling of the coated metal is controlled by predetd. graduations of temp. uniformly throughout its surface.

Annealing metal articles. C. R. G. STEWART (to Western Electric Co.). U. S. 1,673,271, June 12. In annealing "electrolytic iron dust and other assembled materials of different character, the assembled materials are subjected to a sufficiently high temp. to anneal both materials simultaneously and to cause one of the materials to evolve a gas which interacts with the other material

Container for cooling metal articles after annealing. F. GIESECKE. U. S. 1,674,431, June 19. A protective gas is supplied to the container by a device controlled by the vacuum in the container.

Electrodes for electric welding. R. E. POWELL (to Western Electric Co.). U. S. 1,673,020, June 12. An insulating jacket contg. Fe phosphate is used with an electrode holder also having an insulating jacket contg. Fe phosphate.

Electrode for use in welding. A. P. STROHMENGER (to The Quasi-Arc Co., Ltd.). U. S. 1,674,576, June 19. See Brit. 259,365 (C. A. 21, 3344).

Welding electrode. G. A. WHITING and R. A. HOLLAND. Can. 277,870, Feb. 14, 1928. An elec. arc welding electrode has a metallic core and a coating or covering which is decompd. in the heat of the arc to liberate H₂.

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

Two constitution rules. F. WRATSCHKO. *Pharm. Presse* 33, 11-4(1928).—Two rules are enunciated for detg. the skeletal structure of org. compds. in the event that the empirical formula is known. (1). *Bond rule*.—The sum of all ring closures and double bonds is equiv. to 0.5 the refractive index augmented by 2. $\sigma = (r + 2)/2$, in which r = refractive index, σ = Σ double-bonds + ring closures. (2). *Nucleus rule*.—If the structure formula of the compd. in question be erected on a basal line in such a way that each independent ring-system has 2 points common with that line, then the no. (q) of nuclear elements outside the line is obtained from the expression: $q = [73 - (R) + 5r]/7.5$, in which R is calcd. from the vol.-chem. basic formula. Numerous examples are given illustrative of the rules. W. O. E.

Volume chemistry. III. Oxygen compounds. F. WRATSCHKO. *Pharm. Presse* 33, 36-9, 61-3, 73-6, 92-4, 109, 124-6, 138-9, 160(1928); cf. C. A. 22, 1514.—Recourse should be had to the original for a proper consideration of the numerous calcns. involving compds. of the general types $C_mH_{2m-2}O_2$, $C_mH_{2m-4}O_2$, $C_mH_{2m-10}O_2$, $C_mH_{2m-4}O_1$, acyclic ethers of the type $C_mH_{2m+2}O$, $C_mH_{2m}O$, $C_mH_{2m-2}O$, $C_mH_{2m+2}O_2$, $C_mH_{2m-2}O_2$, $C_mH_{2m-4}O_2$, $C_mH_{2m-2}O_2$, $C_mH_{2m+2}O_4$ and cyclic ethers. IV. **Mixed oxygen compds.**—The values for $\Sigma E_{(CO_2H)}$ in the mono-CO₂H series have been calcd. and compared in tabulated arrangement. Similar calcns. also were made of cyclic, tri-, tetra- and penta-CO₂H esters. W. O. E.

Thermochemical magnitude as a basis for the construction of structural formulas. A. ZNAMENSKII. *J. Russ. Phys.-Chem. Soc.* 58, 909-45(1926); *Chem. Zentr.* 1927,

PhMe and AcOH, also in concd. H_2SO_4 with evolution of heat; in gaseous form it is eagerly absorbed by alc. and Et_2O , also quite well by cold H_2O ; its mol. wt. (Victor Meyer method) is 68. $SnCl_2$ reduces it to MeOH. The weakness of its oxidizing properties is remarkable; it only slowly liberates I from acidified KI solns., does not oxidize $p\text{-}C_6H_4(OH)_2$ or $(PhNH)_2$, reacts vigorously with $TiCl_4$ with evolution of heat (only incompletely (80%) in gas form mixed with CO_2 but almost quant. (97%) when a weighed quantity of the liquid form, mixed with Et_2O , is shaken with standard $TiCl_4$ soln.). Unlike Et_2O , I is exceedingly explosive. Often, especially in gaseous form, it decomps. suddenly with violent detonation. It is much more sensitive to shock than to heat. Light does not seem to influence the spontaneous decompn. particularly. Its vapors can be made to explode by merely shaking with an indifferent gas. In the absence of an indifferent gas, a yellow flame always accompanies the explosion. Considerable quantities of HCHO are formed in the explosion. C. A. R.

Hydroxycitronellal and its derivatives. R. SORNET. *Rev. chim. ind.* 37, 74-8, 110-3(1928).—A brief review, followed by an account of S.'s work on the prepn. of *hydroxycitronellal acetal* (new) and of *dihydroxycitronellal*. A 70% yield of the Me acetal was obtained as follows: to 500 g. 99% MeOH contg. 5 g. anhyd. HCl gradually add 250 g. hydroxycitronellal, keeping the temp. at $5-10^\circ$, let stand 24 hrs., make distinctly alk. to phenolphthalein with NaOH, evap. the MeOH on the water bath, dil. with an equal vol. of a suitable solvent (nature not specified), wash with water, thrice with $NaHSO_3$ (contg. no free SO_2) at not over $25-30^\circ$, with H_2O , with Na_2CO_3 and finally with H_2O , dry over Na_2SO_4 , evap. the solvent and rectify in a vacuum over a little $CaCO_3$, giving the Me acetal, $b_{12} 131-3^\circ$, $d_{20}^{20} 0.931$, $\alpha_D^{20} 3.29^\circ$ (10-cm. tube), $n_D^{20} 1.4419$, unaffected by hot alc. alkalies, sapond. with almost complete decompn. by strong acids, quant. sapond. to hydroxycitronellal by refluxing with very dil. AcOH (10-20 drops per 100 cc. H_2O). The Et acetal, similarly prepd., $b_8 136.9^\circ$ and has $d_{20}^{20} 0.915$. Though tertiary alcs. are generally considered to be dehydrated at 218° , hydroxycitronellal Me acetal $b_{760} 265-70^\circ$ unchanged. Oxidation with alk. $KMnO_4$ is too rapid and too complete to give a semi-acetal. Passing at $300-10^\circ$ over Cu previously reduced at $270-80^\circ$ gives decompn. products contg. an amylene hydrocarbon, proving the presence of a tertiary alc. function. On distn. of hydroxycitronellal, most of it passes over within a 5° range; the temp. then rises about 10° with increase in the d. and viscosity of the distillate, after which there is a more marked rise in temp. S. therefore suggests that in the hydration of citronellal the H is mostly fixed on the least hydrogenated C atom of the ethylene group, but to some extent also on the more hydrogenated C atom. Oxidation of citronellal Me acetal (cf. Harries and Schauwecker, *Ber.* 34, 2981) by alk. $KMnO_4$ gives the glycol acetal, or *dihydroxycitronellal Me acetal*, $b_8 145-50^\circ$, $b_9 151-3^\circ$, d. 0.950, sapond. by dil. AcOH and treated with $NaHSO_3$ gives an aldehyde having an entirely different odor from that of hydroxycitronellal, which S. considers to be dihydroxycitronellal.

A. PAPINEAU-COUTURE

Innovations and improvements in the manufacture of acetic acid and its derivatives. I-IV. EGDIVUS TERLINCK. *Chem.-Ztg.* 52, 249-50, 270-2, 307-9, 326-8 (1928).—*Barium acetate*.—A study of $Ba(OAc)_2$ has been carried out to det. the possibility of using it, particularly in the wood-carbonization industries, in the manuf. of HOAc derivs. The efflorescent monohydrate loses its water of crystn. at 41° , giving an anhyd. salt which does not readily take up water from the air. Concn. of $Ba(OAc)_2$ soln. yields fine crystals of the acetate which sink to the bottom of the container, hence care must be taken that it is not excessively superheated, though it is stable at 250° without loss of wt. or change of color. A special app. is designed to allow the supernatant liquid to be heated to a temp. (160°) higher than the temp. of the crystals (100°), to avoid decompn. by superheating during concn. Pure $Ba(OAc)_2$ is prepd. from crude $Ca(OAc)_2$ by pptn. of Ca as $CaSO_4$ with H_2SO_4 , pptn. of the excess H_2SO_4 with $Ba(OAc)_2$, filtration, neutralization with $BaCO_3$ and partial concn. to ppt. insol. resins. The clear soln. so obtained is then concd. to yield the pure salt. The prepn. of $Ba(OAc)_2$ direct from various grades of pyroligneous acid and com. HOAc is discussed. A small lab. app. is illustrated in which HOAc is continuously distd. from pyroligneous acid into a hot suspension of $BaCO_3$ from which uncombined HOAc dists. into a hot alk. trap which also hydrolyzes esters and resinifies the aldehydes. By this method, with small fuel consumption a highly satd. soln. of pure $Ba(OAc)_2$ results, representing 90% of the crude. *Na acetate*.—Economy of time and product is achieved by prep. NaOAc from $Ba(OAc)_2$ by pptn. in soln. with Na_2CO_3 , instead of the usual direct method. The product so obtained is pure without recrystn. *Ca acetate*.— $Ca(OAc)_2$ is prepd. by passing CO_2 into an ammoniacal soln. of $Ba(OAc)_2$, filtering and

regenerating NH_3 with CaO , thus producing a pure soln. of $\text{Ca}(\text{OAc})_2$. In the same manner NH_4OAc , $\text{Mg}(\text{OAc})_2$ and $\text{Zn}(\text{OAc})_2$ may be obtained. *Acetic acid*.—Pure, anhyd. acid is prepd. from the Ba salt by treating the finely divided solid with HCl gas, the heat of reaction being sufficient to distil much of the HOAc from the reaction mass. The Ba salt may also be dissolved in dry HOAc for treatment with HCl to advantage. *Acetic anhydride*.— Ac_2O is prepd. by the action of COCl_2 on $\text{Ba}(\text{OAc})_2$ either dry or in inert solvents. $\text{Ba}(\text{OAc})_2$ may be dissolved in Ac_2O and treated with COCl_2 , gaseous or in soln. in Ac_2O or other solvent. Complete fractionation of the resulting mixt. of COCl_2 , AcCl and Ac_2O is readily accomplished. A review of the methods of prepn. and recovery of the reagents used in these several processes is included in the paper.

A. S. CARTER

The constitution of eleostearic acid. JOHANNES SCHEIDER. *Farbe Lack* 1927, 646-7.—A brief review of the literature on the structure of eleostearic acid. S. agrees with Böseken and Ravenswaay that there are 3 double bonds located in the 5,6-, 7,8- and 9,10-positions. Twenty-one references are given.

G. G. SWARD

Walden inversion. XII. The oxidation of β -mercaptovaleric and of γ -mercaptovaleric acids and its significance in connection with the Walden inversion. P. A. LEVENE AND T. MORI. Rockefeller Institute. *J. Biol. Chem.* 78, 1-22 (1928); cf. C. A. 22, 1953.— l - β -Mercaptovaleric acid on passing from the undissociated acid to the univalent ion $\text{R}(\text{SH})\text{CO}_2^-$, shows a change of rotation to the right, and the latter on passing to the bivalent ion $\text{R}(\text{S}^-)\text{CO}_2^-$ shows a change of rotation to the left. The corresponding sulfo acid is l -rotatory and changes its rotation to the left on passing to the ion $\text{R}(\text{SO}_3^-)\text{CO}_2\text{H}$ and to the right on further ionization to $\text{R}(\text{SO}_3^-)\text{CO}_2^-$. Analogous changes occurred with l - γ -mercaptovaleric acid. The halogenation of HO acids or the substitution of the halogen by a mercapto group is thus accompanied by a Walden inversion. The behavior of β -mercapto- and β -sulfobutyric acids remains the only exception. The following compds. were prepd. and their properties described: l - β -hydroxyvaleric acid, l - β -chlorovaleronitrile, Et l - β -hydroxyvalerate, Et d - β -chlorovalerate, Et d - β -bromovalerate, d -free acid, Et l - β -thiolvalerate, free acid, l - β -sulfovaleric acid, Et l - γ -chlorovalerate, free acid, Et d - γ -thiolvalerate, free acid, lactone and l - γ -sulfovaleric acid.

ARTHUR GROLLMAN

Action of chlorinated aldehyde upon the mixed dimagnesium derivatives of acetylene. Acetylenic glycol and erythritol. R. LESPIEAU. *Bull. soc. chim.* 43, 199-210 (1928); cf. C. A. 22, 222.—A stream of C_2H_2 was passed through EtMgBr in Et_2O and CH_2ClCHO added to this soln. gave the *chlorohydrin* (I), $\text{CH}_2\text{ClCH}(\text{OH})\text{C}\cdot\text{CH}$, b_{760} 157°, b_{14} 62.3°, d_{21} 1.171. Dry KOH added to I in Et_2O gave the *ethylene oxide* (II), $\text{O}\cdot\text{CH}_2\text{CHC}\cdot\text{CH}$, $b.$ 86.7°, $d.$ 0.945. Heating II in a closed tube with H_2O gave the

glycol, $\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{C}\cdot\text{CH}$, $m.$ 39.5-40.5°, which was identified by its *dibromide*, $m.$ 47-8°. The action of CH_2ClCHO upon the di-Mg deriv. obtained as above gave another *chlorohydrin*, $[\text{CH}_2\text{ClCH}(\text{OH})\text{C}]_2$, b_s 165°, d_{23} 1.4096, identified by its *dibromide*, $m.$ 141.2.5°. Using $\text{CH}_2\text{ClCHClOEt}$, with the Mg deriv. of C_2H_2 gave a mixt. of 2 stereoisomeric *chloroethylins*, $[\text{CH}_2\text{ClCH}(\text{OEt})\text{C}]_2$ (III), b_{12} 136-7°. With Br 2 *dibromides* were obtained, 1 $m.$ 107-8°, the other $m.$ 71-2°. Removing the Br with Zn and alc. from these *dibromides*, the 1st gave the *chloroethylin* b_{11-12} 136.7°, d_{21} 1.110, and the 2nd the *chloroethylin* b_{13} 138.9°, d_{21} 1.112. *Distn. in vacuo* of the original reaction mixt. isolated a *dioxide*, $(\text{O}\cdot\text{CH}_2\text{CHC}\cdot)_2$, b_{10} 87.5-8.5°, d_{23} 1.1189, which

gave *dibromides* as *cis-trans* isomers when brominated, 1 $m.$ 57-8°, the other $m.$ 101-2.5°. Attempts to remove the Br from these isomers in order to identify them were unsuccessful. Treating III with AcOH and Ac_2O gave a *di-Et ether*, $[\text{CH}_2(\text{OH})\text{CH}(\text{OEt})\text{C}]_2$, $b_{3.5}$ 125-8°, d_{18} 1.026, on sapon. of the Ac deriv. with NaOEt . The action of MeOH in the presence of H_2SO_4 on acetylene dioxide deriv. gave the *dimethylin* (IV), $[\text{MeOCH}_2\text{CH}(\text{OH})\text{C}]_2$, $b_{3.5}$ 143-3.5°, d_{23} 1.122. Bromination of IV gave the *dibromide*, $[\text{MeOCH}_2\text{CH}(\text{OH})\text{CBr}]_2$, $m.$ 150-1.5°. Erythrol, $[\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{C}]_2$, $m.$ 113-4.5°, was obtained by heating the dioxide of acetylenic ethylene with H_2O in a sealed tube. It was identified by its *dibromide*, $m.$ 184-5°. R. C. ROBERTS

Occurrence of pinitol in redwood. E. C. SHERRARD AND F. F. KURTH. *Ind. Eng. Chem.* 20, 722-3 (1928).—By extn. of air-dried redwood sawdust with water and subsequent purification of the ext. with EtOH , were obtained white rhombic hemihedral crystals, $m.$ 185°, about as sweet as cane sugar, non-reducing with Fehling soln. and having the compn. MeO 15.67, C 43.22 and H 7.40%, corresponding to pinitol, $\text{C}_6\text{H}_4(\text{OMe})(\text{OH})_3$. A new cyclose, very sweet, $m.$ 234°, subliming with little or no decompn.,

and of the tentative formula $C_6H_5(OH)_2CH_2OMe$, was also obtained from the cold-water ext. of redwood heartwood.

W. C. EBAUGH

Epirhamnitol reduction product of epirhamnose. EMIL VOTOČEK AND JOSIP MIKSIC. Czech Polytechnic School, Prague and Zagreb Univ. *Bull. soc. chim.* **43**, 220-4(1928).—Epirhamnose was prepd. by heating *l*-rhamnonic acid with H_2O and C_6H_5N in an autoclave and reducing the epirhamnonic lactone. Reduction of epirhamnose with Na-Hg in dil. H_2SO_4 gave *epirhamnitol* (I) $[\alpha]_D^{20}$ 9.18°, a thick, colorless liquid, which could not be crystd. I and BzOH in 50% H_2SO_4 gave *dibenzylidene derivs.*, (II), m. 193-4°, $[\alpha]_D^{20}$ 32.33° and (III), m. 196°, $[\alpha]_D^{20}$ -36.7°. II and III were identified as dibenzylidene derivs. by forming their hydrazones quant.

R. C. ROBERTS

Isorhodeitol, reduction product of isorhodeose. E. VOTOČEK AND F. VALENTIN. Czech Polytechnic School, Prague. *Bull. soc. chim.* **43**, 216-20(1928).—Of the 16 possible stereoisomeric methylpentitols, only *l*-rhamnitol, rhodeitol and fucitol are known at present. *Isorhodeitol*, a 4th stereoisomer, was obtained by reducing isorhodeose with Na-Hg. Isorhodeose was obtained from the heteroglucoside, convolvulin or rhodeoretin, by hydrolysis with H_2SO_4 . Isorhodeitol is very sol. in H_2O and EtOH, hard to crystallize and in H_2O is feebly *l*-rotatory. The addn. of borax diminishes this rotatory power. It will distil without decompn. in a vacuum. BzH and isorhodeitol, which was not distilled, gave a *monobenzylidene deriv.*, m. 158°. Distd. isorhodeitol and BzH gave a *dibenzylidene deriv.*, m. 196-7°.

R. C. ROBERTS

The ketonic action of α -glucoheptulose. GABRIEL BERTRAND AND GEORGES NITZBERG. *Compt. rend.* **186**, 1172-5(1928); cf. *C. A.* **22**, 2178.— α -Glucoheptulose (I) gave the furfural color reactions when warmed with dil. HCl suggesting it to be ketonic, for aldehydic sugars generally require concd. HCl (*C. A.* **19**, 2350). I was found to be unaffected by aq. Br; hence it probably is a ketone. Reduced with Na-Hg in a slightly acid soln., I gave two alcs. which were fractionally crystd. from EtOH and found to m. 144° and 129-30°, the one being a new alc. called *glucoheptulitol* and the other identical with α -glucoheptitol. The formation of 2 isomeric alcs. also is characteristic of a ketose.

A. S. CARTER

Cleavage of polypeptides containing amino acids whose occurrence in nature is thus far unknown. VIII. Experiments with polypeptides containing α,α' -diaminosuberlic acid. EMIL ABDERHALDEN AND WALTER ZEISSET. *Fermentforschung* **9**, 336-61 (1928).—Attempts to sep. *dl*- α,α' -diaminosuberlic acid (I) into its optical components by fractional crystn. of the brucine salt of the *di*formyl deriv. (m. 209-10°) were unsuccessful. The difficulty may be due to the presence of a considerable quantity of the *meso*- in addn. to the *dl*-acid. By means of the Fischer polypeptide synthesis 3 tri- and 3 pentapeptides were prepd. Treatment of I with $ClCH_2COCl$ and *N* NaOH gave 85% of *di*[*chloroacetyl*]- α,α' -diaminosuberlic acid, m. 215-7° (decompn.), which by the action of NH_4OH and solid $(NH_4)_2CO_3$ was converted into 80% *diglycyl*- α,α' -diaminosuberlic acid (II). The tripeptide crystals with 2 mols. of H_2O and melts above 290° (decompn.). In the same manner I and *dl*- $MeCHBrCOBr$ yielded 60% *di*-[*dl*- α -bromopropionyl]- α,α' -diaminosuberlic acid, m. 207° (decompn.), from which 60% *di*-[*dl*-*alanyl*]- α,α' -diaminosuberlic acid (III) was obtained. This tripeptide crystals with 1 H_2O and melted above 290° (decompn.). Likewise, *di*-[*dl*- α -bromoisocaprolyl]- α,α' -diaminosuberlic acid, m. 208-9° (decompn.), was obtained in 55% yield from I and $Me_2CHCH_2CHBrCOBr$, and converted into 60% *di*-[*dl*-*leucyl*]- α,α' -diaminosuberlic acid (IV), which m. above 290° (decompn.) and crystals with 3 H_2O . The pentapeptides were obtained from the above tripeptides by similar reactions. II + $Me_2CHCH_2CHBrCOBr \rightarrow$ 60% *di*-[*dl*- α -bromoisocaprolylglycyl]- α,α' -diaminosuberlic acid, m. 194-5° (decompn.) \rightarrow 45% *di*-[*leucylglycyl*]- α,α' -diaminosuberlic acid, m. 168-71° with foaming. III + $ClCH_2COCl \rightarrow$ 30% *di*-[*chloroacetyl*-*dl*-*alanyl*]- α,α' -diaminosuberlic acid, m. 202-3°, decompn. 216-8°, \rightarrow 30% *di*[*glycyl*-*dl*-*alanyl*]- α,α' -diaminosuberlic acid, m. 136-8°, decompn. 210°. IV + $ClCH_2COCl \rightarrow$ 70% *di*[*chloroacetyl*-*dl*-*leucyl*]- α,α' -diaminosuberlic acid, m. 170-5°, decompn. 188-90°, \rightarrow *di*[*glycyl*-*dl*-*leucyl*]- α,α' -diaminosuberlic acid, m. 190-5° (decompn.). None of the 3 pentapeptides could be hydrolyzed by yeast maceration. When heated with H_2O under pressure at 160-5° they yielded anhydrides (diketopiperazines) of their simple constituent dipeptides, but the diaminosuberlic acid could not be recovered.

A. W. DOX

Certain derivatives of benzoyl- δ -aminovaleric acid. The synthesis of putrescine. S. I. KANEVSKAYA. *J. Russ. Phys.-Chem. Soc., Chem. Part*, **59**, 639-48(1927).— $Bz-NH(CH_2)_3COCl$ (I) was prepd. by warming the acid with 4 mols. $SOCl_2$, the excess of

the latter being distd. off *in vacuo*; it is a viscous oil, sol. in xylene, decomp. on distn. *in vacuo*. In order to prep. the aldehyde, I from 2.21 g. of the acid was treated with H_2 in boiling xylene in the presence of Pd, according to Rosemund. There resulted, instead, a cryst. product, m. 112° , and giving no depression with benzoylpiperidone; yield 0.95 g. A 60–70% yield of the piperidone was obtained on boiling I in Et_2O . I in xylene yields 85% of the anilide, m. $170-1^\circ$, with an excess of $PhNH_2$. The amide (m. $180-1^\circ$, yield 82%) is similarly prepd. Benzoylputrescine obtained from the amide by the Hoffmann reaction is extracted with $CHCl_3$ and is a viscous non-crystallizable oil which decomp. before distg. *in vacuo*. It dissolves in 2–3% alc. HCl; on the addn. of Et_2O there sep. needles of the HCl salt, m. $169-70^\circ$; yield 85%. The HCl salt heated with 37% HCl for 3–5 hrs. yields the theoretical quantity of putrescine-HCl. A quant. yield of $BzNH(CH_2)_4NHBz$, m. $175-6^\circ$, is obtained from the mono deriv. and $BzCl$ in H_2O .

BASIL C. SOYENKOFF

Polymerization and condensation. III. Autocondensation of dihydroxyacetone. P. A. LEVERNE AND A. WALT. Rockefeller Institute. *J. Biol. Chem.* 78, 23–33(1928).—A quantity of oxanthase which had polymerized was resolved into fractions and a cryst. substance (m. 164°), which had the structure $O \cdot CH_2 \cdot C(CH_2OH)OCH_2C(OH)CH_2 \cdot O$

was isolated. **Conclusion.**— $CO(CH_2OH)_2$ spontaneously condenses through loss of H_2O into substances of higher mol. wt.

ARTHUR GROLLMAN

The reducing power of chemically pure glucuronic acid. GEORG SCHEFF. *Biochem. Z.* 194, 96–104(1928).—The quantity of reduced Cu corresponding to various quantities of glucose, arabinose and glucuronic acid is tabulated.

S. MORGULIS

Reaction of isonitriles and hydrocyanic acid with phenylmagnesium bromide. HENRY GILMAN AND L. C. HECKERT. Ames, Iowa. *Bull. soc. chim.* 43, 224–30(1928).— $PhMgBr$ was treated with HCN , $MeNC$, $EtNC$, tertiary $BuNC$ and $p-MeC_6H_4NC$ separately and the products obtained were hydrolyzed to see if any BzH was obtained. $MeNC$ was the only one to give BzH and in very small quantity. G. and H. do not consider this result a conclusive proof of a bivalent C atom in HCN and the isonitriles.

R. C. ROBERTS

Esters of bromoformic acid. K. W. ROSENMUND AND HERMAN DÖRING. *Arch. Pharm.* 266, 277–80(1928).—Esters of this acid are prepd. by treating $COBr_2$ in dry Et_2O or petr. ether with the resp. alc., and subsequent distn. of the Et_2O layer *in vacuo*. The esters prepd. (Et, Pr, iso-Am and benzyl) are transparent, weakly fuming liquids and in contact with the eyes produce tears. They are only moderately stable under glass seal. *Et bromoformate*, b. 116° ; *Pr*, b. $108-79-80^\circ$; *iso-Am*, b. 58° ; *benzyl*, b. 96° . With 8-hydroxyquinoline $COBr_2$ yields the 2 products 5-bromo-8-hydroxyquinoline, m. $123-4^\circ$, and 5,7-dibromo-8-hydroxyquinoline, m. 190° .

W. O. E.

Dibenzoylarginine. K. FELIX AND K. DIRR. *Z. physiol. Chem.* 176, 29–42(1928).—*Dibenzoyl-d-arginine* (I), decomp. 235° , was prepd. in 70–5% yield from *d-arginine*, $BzCl$ and $N NaOH$ with ice cooling. It forms a *HCl salt*, m. 218° , and an *Et ester HCl salt*, m. 148° . *Dibenzoyl-dl-arginine* H_2O , m. 176° , m. anhyd. 230° , may be prepd. in the same way from *dl-arginine* but the yield is poor. It is best obtained by racemizing the *d*-form by melting its *HCl salt*. Treatment of I with fuming HNO_3 and H_2SO_4 nitrated both Bz groups in the *m*-position and at the same time caused partial racemization. Ac_2O converted I into a hygroscopic *dibenzoylacetylankhydro-arginine*, which was hydrolyzed into β -benzoylamino- α -piperidone, m. $186-7^\circ$, and benzoylacetylurea, decomp. 196° . The 2nd Bz of I must therefore be on the terminal NH_2 of the guanidine group. The prepn. of arginine from proteins by the flavianic acid method of Kossel and Gross is described in detail with certain modifications which bring the yield up to 85% of the quantity present. Salts of arginine for which more accurate detns. are reported are *d-arginine-HCl*, $[\alpha]_D^{20}$ 12.12° , contains no H_2O and is not hygroscopic, sinters 218° , solidifies 225° , m. 235° (decomp.); *monopicrate* $2H_2O$, decomp. 217° when dry; *dipicrate*, sinters 160° , decomp. 190° ; *HCl picrate*, sinters 160° , decomp. 190° ; *dl-arginine-HCl salt + H_2O* is hygroscopic, anhyd. it sinters 200° , decomp. 230° ; *monopicrate*, decomp. 223° ; *dipicrate*, decomp. 196° ; *HCl picrate*, decomp. 196° . The mono-acid salts are in general more sol. than the di-acid salts, and the *d-arginine* salts more sol. than the *dl-arginine* salts. A. W. D.

The influence of the alcohol group in amino acid esters on the velocity of 2,5-diketopiperazine formation and the formation of guanidino compounds by the action of guanidine on various amino acid esters. EMIL ABDERHALDEN AND SHIGEO SUZUKI. *Z. physiol. Chem.* 176, 101–8(1928).—A series of glycine esters was prepd. in order to det. their relative rates of ring closure to glycine anhydride and their relative reactivity

toward guanidine. The ester-HCl salts were prepd. from glycine, excess of alc. and dry HCl, and the free esters by treatment of the salts with NaOH and extn. with Et₂O.

	B. p.	Free ester	Yield	M. p.	HCl salt	Yield
Pr	50-3° at	16-8 mm.	72.7	73-5°		67.3
iso-Pr	52-5°	12-5	64.1	84-6°		70.6
Bu	55-8°	8-11	67.6	64-6°		70.3
iso-Bu	60-3°	8-11	71.4	70-2°		66.7
Am	73-6°	8-11	71.0	118-20°		68.2
iso-Am	78-80°	8-10
benzyl	93-5°	8-11	69.8	126-8°		31.7

Anhydride formation occurs most rapidly with the Me ester, the reaction being practically complete in 2 hrs. at 37°, and least rapidly with the benzyl ester. The Pr reacts more rapidly than the iso-Pr and the Am more rapidly than the iso-Am ester; the Bu and iso-Bu esters show little difference. The formation of glycoeyamidine and NH₃, as measured by NH₃ detn., is most rapid with the Me, then the Et ester. The iso-Pr is more reactive than Pr and the iso-Bu than the Bu ester. A. W. DOX

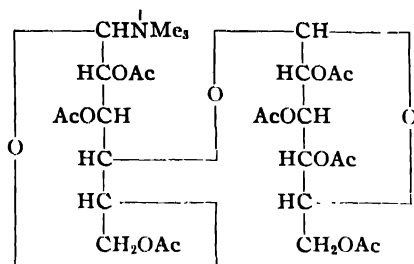

Interpretation of the Rathke guanidine synthesis and the hydrolysis of guanidines (comments on the paper by H. Schotte, R. Prieue and H. Roescheisen). HANS LÖCHER. *Z. physiol. Chem.* **176**, 43-5(1928).—The mechanism of the Rathke synthesis of guanidine from isothioureia and amine as interpreted by Schotte *et al.* (*C. A.* **22**, 1759) is inadequate since it cannot be applied to the synthesis of peralkylated guanidines from peralkylated isothiureas and dialkylamines. The Schenck interpretation, according to which an intermediate addn. product of isothioureia and amine is formed and then mercaptan split out, is applicable to all cases. Schotte's interpretation of the mechanism of guanidine hydrolysis to urea and amine is likewise open to objection, since it cannot be applied to the hydrolysis of peralkylated guanidines to tetraalkylurea and dialkylamine. A. W. DOX

Structure of carbohydrates. WALTER N. HAWORTH. *Helv. Chim. Acta* **11**, 534-48 (1928). (In English).—Lecture at Univ. Neuchâtel on Feb. 25, 1928. Brief review of the work of the Birmingham school during the past few yrs. on the structure of the lactones obtained by Br oxidation of the sugars to the hexonic acids and subsequent ring closure, and on the application of the results so obtained to the determination of the structure of monoses and bioses. C. A. R.

The oxidation of glucose in alkaline solution by oxygen or air: the formation of carbon monoxide. MAURICE NICLOUX. *Compt. rend.* **186**, 1218-20(1928).—The oxidation of glucose in alk. soln. by air or O₂ was found to yield CO. Max. CO production is at 84° in 0.2-0.08 *N* alkali, giving 1.6-1.7 cc. of CO from 0.25 g. of glucose. The ratios of O₂ absorbed to CO and CO₂ formed have been detd.; at 84° the ratio of CO to CO₂ is 1:3.16. A. S. CARTER

Action of trimethylamine on acetobromocellobiose and acetobromomaltose. GÉZA ZEMPLÉN, ZOLTÁN CSÜRÖS AND ZOLTÁN BRUCKNER. *Ber.* **61B**, 927-37(1928).—Karrer, Widmer and Staub obtained from acetobromocellobiose (I) and NMe₃ a halogen- and N-free substance (II) which was presumably a hexaacetylcellobiose anhydride and which, on account of its reducing power, was designated as cellal acetate (*C. A.* **18**, 2132). With the purpose of subjecting II to a more thorough study, it was first attempted to increase the yield by varying the conditions; a whole series of expts. showed that at 70° the yields are smaller and the products of poorer quality and at 85-965° no better yields than Karrer's could be obtained. No intermediate or other cryst. products could be isolated from the reaction mixt. In all cases was obtained a product (III) entirely similar to II in m. p. and rotatory power, in its ability to take up Br in CHCl₃, etc., but which was not II. Sapon. in CHCl₃ with NaOMe gave no insol. NaOMe addn. product, as is always the case with normal acetylated sugars, but, after concn. *in vacuo*, about 50% of pure cellobiose. In CHCl₃ 1 mol. III absorbs only 1 atom Br and in AcOH no HBr is taken up. The cryst. *Br deriv.* (IV) with Ag₂CO₃ in abs. MeOH gave a substance again similar in all its properties to II and contg. no MeO; this was also obtained from IV with AgOAc in anhyd. C₂H₆ or with Ag₂CO₃ in aq. Me₂CO and from IV in CHCl₃ washed with aq. H₂SO₄ and then thoroughly with H₂O. Numerous analyses gave values for C and H about 1 and 0.7%, resp., higher than those calcd. for cellal acetate, while the Ac values agreed, within the exptl. error, with the calcd. value. This led to the suspicion that III still contained the NMe₃ residue and as matter of fact N analyses showed the presence of 2.15-2.28% of N. The formula provisionally

given as best representing all the properties of **III** is that of *heptaacetylcellobiosidotrimethylamine*,

This formula, although it shows an unsatisfied N valance, is the only one which agrees with the analytical results; it also explains the addn. and splitting off again of a labile Br atom and the non-addn. of HBr. Acetobromomaltose with NMe₃ at 70° gives *heptaacetylmaltosidotrimethylamine* (**V**) entirely similar in compn. and properties to **III**; at 90–5° with dil. solns. of NMe₃ is obtained Me₃NHBr and heptaacetylmaltose. **III** (3.5 g. from 17.5 g **I** heated 1.5 hrs at 85–95° with 50 g. of 33% NMe₃ in abs. alc.), m. 205–6° (decompn.), $[\alpha]_D^{10.5} -11.07^\circ$ (CHCl₃). **IV** (8 g. from 10 g. **III**), m. 148–9°, $[\alpha]_D^{18} -7.53^\circ$ (CHCl₃). **V**, m. 165°, decomp. 205°, $[\alpha]_D^{21} 65.59^\circ$ (CHCl₃); the Br deriv. could not be obtained in cryst. form.

C. A. R.

Synthesis of sucrose. AMÉ PICTET AND HANS VOGEL. *Compt. rend.* 186, 724–7 (1928); *Helv. Chim. Acta* 11, 436–42 (1928).—Since Haworth has shown that fructose (**I**) is present in sucrose (**II**) not in the normal or pyran form but in the γ - or furan form it follows that sucrose cannot be synthesized by starting from normal **I**. γ -**I** is not as yet and perhaps never will be known and its Me derivs. cannot be considered for a possible synthesis of **II**, for the Me groups are too firmly held to leave any hope of the possibility of splitting them off after condensation with glucose has been effected. It occurred to P. and V. that this difficulty might be obviated by using the acyl instead of the alkyl derivs. of γ -**I** and they accordingly undertook the prepn. of the 1,3,4,6-tetraacetate (**III**). By hydrolysis of the octaacetate of **II** with concd. HCl and subsequent treatment with Ag₂CO₃ they obtained a mixt. of the tetraacetates of the 2 monoses, but recombination with P₂O₅ and sapon. of the product yielded, not **II**, but an *isomer*, m. 127°, which will be studied further. Ohle (*C. A.* 21, 2463) has recently found that in solns. of **I** an equil. is established between the β - and γ -forms and it seemed possible that the small quantity of γ -**I** present in such solns. might be converted into a stable deriv. (tetraacetate). Normal **I** was therefore treated by the method of Hudson and Brauns with Ac₂O and ZnCl₂ around 0°, poured into H₂O after 1 hr., neutralized with NaHCO₃ and extd. with CHCl₃. On concn. of the CHCl₃ soln. most of the normal acetate crystd. out and was sepd. mechanically from the accompanying thick sirup. This sirup was then repeatedly triturated with absolutely dry Et₂O as long as the Et₂O still dissolved out traces of the normal acetate. There was thus finally obtained a substance, practically insol. in Et₂O, which, although it remained amorphous and glassy even after several weeks *in vacuo* over CaCl₂, was shown by analysis, mol. wt. detns. and its power to reduce Fehling soln. at 40° to be an *isomer* of the normal acetate: C 48.24%, H 5.68%, mol. wt. in freezing C₆H₆ 344, $[\alpha]_D^{20} -2.30^\circ$ (c 6.0784 in CHCl₃), -3.27° (c 3.3664 in EtOH) (for the normal acetate, -83.93° (c 2.9308 in CHCl₃), -82.04° (c 3.6568 in EtOH)). The new tetraacetate is very little sol. in cold, easily in hot H₂O, very difficultly in Et₂O, more in alc. and CHCl₃, insol. in petroleum ether, decolorizes KMnO₄ on gentle warming and is very bitter, these properties indicating that it is truly a deriv. (**III**) of the γ -series. From 100 parts **I** were obtained (av. of several expts.) 6.5 of **III**, indicating that in Ac₂O solns. of **I** an equil. is established between about 97 parts of normal and 3 parts of γ -**I**. On shaking 4 g. each of **III** and glucose tetraacetate in 100 cc. absolutely dry CHCl₃ with a little ZnCl₂ in the cold, then 15 hrs. with 4 g. P₂O₅, decanting, evapg. to dryness *in vacuo*, dissolving the resulting sirup in boiling alc. and allowing to cool there sepd. after several days well formed crystals showing, after recrystn. from alc., all the principal characteristics of **II** octaacetate: mol. wt. in freezing C₆H₆ 686, m. 70° (unchanged by mixing with **II** octaacetate), $[\alpha]_D^{21} 59.4^\circ$ (c 1.516, CHCl₃). The same product was obtained from **I** prepd. either by inversion of **II** or from inulin. Sapon. with NaOMe at a low temp.

according to Zemlén yielded a white powder which, pptd. from a little H_2O with $EtOH-Et_2O$ (5:1) and crystd. from 80% alc., gave crystals with C 42.18%, H 6.61%, mol. wt. in freezing H_2O 344, $[\alpha]_D^{20}$ 66.37° (c 5.07, H_2O), $[\alpha]_D^{20}$ after inversion with 5% HCl —20.6° (c 0.5704). Crystallographic data (by R. GALAPIN): forms observed, 100(a) greatly developed, 110(p) well developed, 110(p') irregularly developed, 011(q) and 011(q') irregularly developed, 101 rare; angles, 110:110 78°42', 100:001 76°28', 001.011 40°52', β 103°32', $a:b:c$ 1.2543:1:0.8782. Both the natural and the synthetic II were found to exist in 2 forms, m. 184–5°, when recrystd. from H_2O or $EtOH$ and 170–1° when crystd. from $MeOH$. In all its other properties (taste, soly., behavior towards Ba, Ca and Sr hydroxides, absence of reducing power) the synthetic product was absolutely identical with natural II. C A R.

Genuine lignin. I. Acetylation of pine wood. WALTER FUCHS. *Ber.* 61B, 948–51 (1928).—The methods of prep. lignin hitherto employed yield products markedly different from the ("genuine" lignin) originally present in the cell wall. It therefore became necessary to study lignin directly in its natural form, especially with respect to those properties which in its isolation undergo changes or lead to alteration (free HO groups, reactive double bonds and labile complexes). The free HO groups can be protected by acetylation. Wood with Ac_2O and H_2SO_4 gives about 1.5 times its wt. of an acetate (I), insol. in the acetylating mixt. and hardly distinguishable in outward appearance from the original pine wood. A wood contg. originally 2.7% Ac gives on 1 acetylation a product with 41% Ac, a value which can be only very slightly increased by repeated re-acetylation. The lignin content of the original wood was 26.6%, that of the I 16.0%, i. e., about 90% of the original lignin was present in the I. The cellulose (60.5%) originally present in the wood remains almost completely in the wood on acetylation, while those substances which by the usual methods are not detd. as cellulose or lignin but as pentosans, hexosans, etc., are for the most part removed, for about 97% of the I consists of cellulose, lignin and $AcOH$. Pine wood contains 4.70% I, 2.95% MeO ; if the total MeO is assigned to the lignin present, the lignin in the original wood contains 17.7%, that in the I 17.2% MeO . Since the well-defined highest acetylation product of cellulose is the triacetate (II) (44.5% Ac) and the most highly acetylated pine wood lignin described in the literature contains 25.5% Ac, then I can consist almost only of II and an acetolignin with about 33% Ac. Although no appreciable quantities of II could be extd. from I with solvents which dissolve II, its presence in the I could nevertheless be proved. When the I was treated by the Cross and Bevan method alternately with Cl and $NaHSO_3$, there remained, not cellulose but an acetylcellulose whose Ac content varied somewhat in different expts., to be sure, but was always very close to that of II. It was only difficultly and incompletely sol. in $CHCl_3$, not at all sol. in Me_2CO and on hydrolysis with cold alc. KOH gave pure, lignin-free cellulose. Moreover, under the conditions under which II dissolves as Me glucoside (heating under pressure with $MeOH$ contg. 0.75% HCl), I dissolves to the extent of 92%, 0.5 of the lignin remaining undissolved and most of the rest being repptd. by H_2O . Before attempting to split the II into its 2 almost exclusive constituents, II and acetolignin, it would seem best, however, to characterize the double bonds in the genuine lignin and prevent undesirable attacks upon them during its isolation. This will be dealt with in a subsequent paper. C A R.

Acetic ester of cellulose xanthate. T. NAKASHIMA. *J. Soc. Chem. Ind. (Japan)* 31, 94–100; *Suppl.* 1928, 31–2B. (In English).—The acetic ester of cellulose xanthate was produced by the treatment of viscose with $ClCH_2CO_2H$, and its properties and method of analysis are given. Y. TOMODA

Action of fuming sulfuric acid on cyclohexane. V. MENSHUTKIN AND M. WOLF. *Neftyanoe Khozyaistvo* 13, 340–2 (1927).—One part by wt. of cyclohexane is completely dissolved when shaken with 27 parts of H_2SO_4 (25% SO_3) at 20–25°. Much heat and SO_2 gas are generated. Benzenesulfonic acids are formed (up to 70%), which proves the dehydrogenation of cyclohexane. Some black pitch is obtained. The benzenesulfonic acids contain 0.9% of $PhSO_3H$ and 0.1% of $C_6H_4(SO_3H)_2$. The action of anhyd. H_2SO_4 is quite similar. A. A. BOEHTLINGK

Aromatic compounds containing the tertiary butyl group. A. E. CHICHIBABIN, S. ELGAZINE AND V. A. LENGOLD. *J. Russ. Phys.-Chem. Soc.* 60, 347–54; *Bull. soc. chim.* 43, 238–42 (1928).—Bromination of $PhCMe_3$ gave the *p*-bromide (I), b. 104–6°. The Mg deriv. of I reacts with $HC(OEt)_3$, giving on acidifying *p*-tert-butylbenzaldehyde (II), m. 245–6°, d_4^{20} 0.9733. Oxidation of II gave the acid, m. 164°, previously prepd. and its constitution proved by its oxidation to *p*- $C_6H_4(CO_2H)_2$. Di-tert-butylidiphenyl, m. 128–9°, b. 190–2°, is obtained as a by-product in the prepn.

of the Mg deriv. of I. Condensation of II with Me_2CO gave a *compd.*, m. 49–50°. $\text{ClCH}_2\text{CH}_2\text{OMgBr}$ was prepd. by treating the $\text{ClCH}_2\text{CH}_2\text{OH}$ with EtMgBr and this combines with the Mg deriv. of I to give on hydrolysis *tert-butylphenylethyl alc.*, $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{OH}$, b_{11} 141–3°, d_4^{20} 0.9782, d_{20}^{20} 0.9749, n_D^{20} 1.5209. R. C. ROBERTS

Phenylpropine. BOURGUEL. *Compt. rend.* 186, 1211–3 (1928).—B. prepd. $\text{PhCH}_2\text{C}:\text{CH}$ (I) and found its d_{20} 0.888 and d_{13} 0.892, checking all other workers on this *compd.* Because of the irregularity of the d of I as compared with $\text{PhC}:\text{CH}$ (II), d_{20} 0.930, and $\text{Ph}(\text{CH}_2)_2\text{C}:\text{CH}$ (III), d_0 0.9375, a study of the products resulting from different methods of prepn. was undertaken. By all of the recorded methods of prepn. including his own, the resulting product (IV) always had d_{20} 0.932 and n_D^{16} 1.563. The chem. and phys. properties of IV were identical with those of I except d . and n and these 2 properties fit with the homologous series including II and III. All means have failed to produce a sample of I with the original d_{20} 0.888 obtained the 1st time. A. S. CARTER

Catalytic hydrogenation of oximes and their transformation into β -hydroxylamines. G. VAVON AND KRAJCINOVIC. Nancy. *Bull. soc. chim.* 43, 231–7 (1928).—Hydrogenation of $\text{Pr}_2\text{C}:\text{NOH}$ with Pt black in alc. HCl gave Pr_2CHNOH , identified by its *oxalate*, m. 115°, and *heptyl-4-benzal nitron*, $\text{Pr}_2\text{CHNOCHPh}$, m. 53–4°, prepd. by adding BzH to the *oxalate*. $\text{Me}_2\text{CHCH}_2\text{CMe}:\text{NOH}$, m. 63°, was prepd. from the ketone or by hydrogenating mesityl oxide. Hydrogenation of this oxime gave the *hydroxylamine* identified by its *oxalate*, m. 132–3°. Hydrogenation of $\text{MePhC}:\text{NOH}$ gave chiefly $\text{PhCH}(\text{NH}_2)\text{Me}$, identified as its *oxalate*, m. 238°. Hydrogenation of $\text{Ph}_2\text{C}:\text{NOH}$ does not take place but benzohydrylamine, Ph_2CHNH_2 , m. 270°, is formed. Hydrogenation of enanthal oxime gave NH_3 and *dihexylhydroxylamine*, m. 74°, its *oxalate*, m. 137°. *Iso-BuCH}:\text{NOH} gave the *secondary β -hydroxylamine* (Me_2CHCH_2) $_2\text{NOH}$; its *oxalate*, m. 167–8°. Hydrogenation of $\text{PhCH}:\text{NOH}$ gave (PhCH_2) $_2\text{NOH}$, m. 123°, and some (PhCH_2) $_2\text{NH}$. Piperonal oxime gave *dipiperonyl- β -hydroxylamine*, m. 123–4°, on hydrogenation and this gives a solid HCl salt. R. C. ROBERTS*

The mechanism of the rearrangement of diazoaminobenzene into aminoazobenzene. II. NAOMICHI YOKOJIMA. *J. Soc. Chem. Ind. (Japan)* 31, 100–8; 32B (1928).—Several methods were tried to effect the rearrangement of $\text{PhN}:\text{NNHPh}$ (I) into $\text{PhN}:\text{NC}_6\text{H}_5\text{NH}_2$ (II) in the absence of PhNH_2 , *viz.*, by heating alone, by heating with paraffin wax, by heating I.HCl either in an open tube or in a sealed tube or by mixing I and HCl in alc. But no II was obtained. By the addn. of PhNH_2 and HCl, a part of I in alc. changed into II. The yield of II increased as the quantity of PhNH_2 increased. Y. concluded that no II could be obtained from I without PhNH_2 . III. *Ibid* 109–16, 33–4B.—From the consideration of the results of expts., either of his own or of other investigators, Y. explains the mechanism of the rearrangement of I into II as follows: In the PhNH_2 soln., HCl combines with I, forming a yellow salt of a form $\text{PhN}:\text{NNH}(\text{HCl})\text{Ph}$. The HCl serves to intensify the basic property of the amino group and accelerates the sepn. of the diazo group from it. The sepd. diazo group replaces H of the amino group of the PhNH_2 or a p -H atom. These 2 replacements occur simultaneously and give II. SHUMPEI OKA

Rearrangement of toluenediazoaminobenzene in aniline solution. M. FUKAMI AND N. YOKOJIMA. *J. Soc. Chem. Ind. (Japan)* 31, 116–7; *Ibid Suppl.* 34B (1928). (In English).—It has been found by analysis that the rearrangement of $\text{MeC}_6\text{H}_4\text{N}:\text{NNHPh}$ in PhNH_2 in the presence of PhNH_2HCl results in the formation of 70% of $\text{MeC}_6\text{H}_4\text{N}:\text{NC}_6\text{H}_5\text{NH}_2$ and 30% of $\text{PhN}:\text{NC}_6\text{H}_5\text{NH}_2$. Y. TOMODA

Dinitrophenol from dinitrochlorobenzene. A. A. KUROCHKIN. *J. Chem. Industry (Moscow)* 4, 994 (1927).—Six g. $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{Cl}$, 10 g. NaNO_2 and 100 cc. were boiled for 3 hrs. in a round-bottomed flask with condenser. The oil gradually entered into soln. and the latter became orange-colored: $2,4-(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{Cl} + \text{NaNO}_2 \rightarrow 2,4-(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{ONa}$. On cooling the contents of the flask 4 g. of dinitrophenolate pptd. in form of yellow crystals. The mother liquors, on being acidified, gave a white cryst. ppt. of dinitrophenol, m. 113°. NaNO_2 acts in the same way as NaNO_3 , but to a lesser extent. BERNARD NELSON

A synthesis of quinone (correction). J. F. DURAND. *Compt. rend.* 186, 1221 (1928); *cf. C. A.* 21, 2487.—Quinone is *not* formed from C_6H_6 and CO in a $\text{C}_2\text{H}_5\text{N}$ soln. of Cu_2Cl_2 , contrary to a previous statement by D. and BANOS. A. S. CARTER

Synthesis of 3,4-dihydroxyphenylalanine. C. R. HARRINGTON. *Biochem. J.* 22, 407 (1928).—A modification of a method already described (*cf. C. A.* 22, 576). To 10 g. azlactone (obtained by condensation of vanillin with hippuric acid) in 100 cc. alc.

was added 10 cc. concd H_2SO_4 ; the soln. was boiled under reflux for 20 min. About 75% of the alc. was distd. off under diminished pressure. The residue was rubbed in a dish with cold water contg. enough $NaHCO_3$ to leave the soln. slightly alk. The ester was sepd with $EtOAc$, the aq. soln. was again extd. with this solvent and the combined $AcOEt$ exts. were dried and evapd. The residue was dissolved in warm alc. and the ester pptd. by the addn. of alc. The ester sepd. first as an oil, which crystd. on rubbing. After standing in the ice-chest for some hrs., the ppt. was filtered and recrystd. from 60-65% alc. This gave 55-60% of the theoretical yield of the pure ester, m. 129° .

BENJAMIN HARROW

Some derivatives of diketopiperazine. Synthesis of *o*- and *m*-tyrosine. HIDENOSUKE UEDA. *J. Biochem. (Japan)* **8**, 397-407(1928).—3,6-Bis-[*o*-acetoxybenzal]-2,5-diketopiperazine was made by condensation of glycine anhydride with *o*- HOC_6H_4CHO . This product was converted to 3,6-bis-[*o*-hydroxybenzal]-2,5-diketopiperazine, and by reduction to *o*-tyrosine anhydride. By preliminary reduction it was converted to diacetyl-*o*-tyrosine anhydride, which was then split into *o*-hydroxyphenyl- α -alanine. Through condensation of glycine anhydride with *o*- $MeOC_6H_4CHO$ 3,6-bis-[*o*-methoxybenzal]-2,5-diketopiperazine was obtained, and with *m*- HOC_6H_4CHO 3,6-bis-[*m*-acetoxybenzal]-2,5-diketopiperazine. The latter by removal of the Ac groups and reduction has been converted to *m*-tyrosine anhydride, or by straight reduction, to diacetyl-*m*-tyrosine anhydride, which on cleavage yielded *dl*-*m*-tyrosine. S. M.

Catalytic reduction of mandelic acid. K. W. ROSENMUND AND H. SCHINDLER. *Arch. Pharm.* **266**, 281-3(1928).—It is shown that acylated mandelic acid and certain of its derivs. yield as the chief product on hydrogenation ($Pd-BaSO_4 + H_2$) $PhCH(CO_2H)CH_2OH$ or derivs. thereof, while the non-acylated mandelic acids suffer no change. The compds subjected to this study were mandelic acid and its *p*- MeO , *o*- HO and *o*- Cl derivs. W. O. E.

Lichen substances. V. A new synthesis of orsellinic acid. ADOLF SONN. *Ber.* **61B**, 926-7(1928).—When dihydroorsellinic esters, readily obtained by the condensation of crotonic esters with $AcCH_2CO_2Et$ under the influence of $NaOEt$, are dehydrogenated with Br, two H atoms are at the same time replaced by Br and the resulting 2,3,5,4,6- $MeBr_2(HO)_2C_6CO_2R$ with H_2 , Pd and $CaCO_3$ readily forms the corresponding orsellinic ester. *Et dibromoorcellinate*, m. $143-4^\circ$, 1.5 g. in 25 cc. 2 *N* $NaOH$ with H_2 and 2 g. of the Busch and Stove catalyst (*C. A.* **10**, 2727) yields 0.8 g. *Et orsellinate*, m. 132° , sapon to the acid after some weeks in excess of 10% $NaOH$ at room temp. C. A. R.

The products of the condensation of homophthalimide with aromatic aldehydes. ANDRÉ MEYER. *Compt. rend.* **186**, 1214-6(1928).—To study the relations of color to constitution in the derivs of homophthalimide (I), M. has prepd. a series of compds. of the general formula $C_6H_4CO.NH.CO.C.CHAr$ by condensing I with $ArCHO$ in

the presence of HCl or Et_3NH . On varying the substituents in Ar , the colors vary from yellow to red. *Homophthalimides*: *p*-methylbenzal (*p*-toluylene), $C_{17}H_{15}O_2N$, dark yellow, m. 199° , red soln. with H_2SO_4 , yellow ppt. with $SnCl_4$; *cinnamylidene*, orange-yellow, m. 223° , violet soln. with H_2SO_4 , orange ppt. with $SnCl_4$; *o*-nitrobenzal, yellow, m. 236° ; *m*-isomer, yellow, m. 273° ; *p*-compd., dark yellow, m. 263° ; *fural*, maroon; green by reflection, m. 210° , red soln. with H_2SO_4 ; *isophthalylidene*, $OHCC_6H_4CH.C_6H_5O_2N$, clear yellow, m. 292° , orange soln. with H_2SO_4 ; *salicylidene*, clear yellow, m. 215° ; *o*-methoxyben, yellow, m. 176° ; *m*-isomer, clear yellow, m. 176° ; *p*-hydroxybenzal, dark orange, m. 238° ; *anisylidene*, orange-yellow, m. 195° ; *o*-vanillylidene, 2 forms, one orange, m. $178-80^\circ$, the other yellow, m. about 165° and passing to the orange with heat; *p*-peromylidene, deep yellow, m. $218-9^\circ$; *p*-dimethylaminobenal, red, m. 195° . With *o*- $H_2NC_6H_4CHO$ the product is a *naphthylridine* of the structure:

The chemistry of camphor. ENDRE BERNER. *Tids. Kemi Bergvesen* **6**, 135-43 (1926).—A review. C. A. ROBAK

A deeply colored dimeric ketene. WOLFGANG LANGENHECK AND HILDE LANGENHECK. *Ber.* **61B**, 938-42(1928).—Very short but very energetic heating of crude $Pb_2C(OH)CO_2H$ (I) gives beautiful violet-black crystals (II); pure I gives a deep red color but no crystals of II. The reason for this is that the crude I always contains traces of the K salt and these traces of alkali catalyze the formation of II; the same effect is obtained by mixing a little Na_2CO_3 with pure I. The purification of the II is rendered difficult by the presence of benzilide, which has the same soly. as II in most

solvents; in CCl_4 , however, benzilide is almost insol. and **II** is relatively easily sol. Analyses and mol. wt. detns. indicate that **II** has the compn. $\text{C}_{24}\text{H}_{20}\text{O}_2$ of a dimeric $\text{Ph}_2\text{C}:\text{CO}$. Detn. of its structure is difficult because it yields resinous products of apparently high mol. wt. with the most varied reagents when it reacts at all (with alc. KOH , alc. KCN , PCl_5 , SOCl_2 , alc. Br , Zn dust and AcOH , EtMgBr , PhNHNH_2); no cryst. deriv. could be obtained. Only oxidation with CrO_3 gave some indication of its structure; this gave 43% of the calcd. quantity (2 mols.) of Ph_2CO . Of the 4 possible formulas (**III**–**VI**) for a dimeric $\text{Ph}_2\text{C}:\text{CO}$, **V** does not explain the deep color, **VI** should represent a very unstable substance (**II** in small quantities can be distd. without decomn. even under atm. pressure) and the compd. **III** is known (Staudinger, *C. A.* 5, 1767); this leaves only the structure **IV** of a 3,3,4,4-tetraphenyl-1,2-cyclobutanedione for **II**. **II** forms no phenylhydrazone and no quinoxaline. The intensity of its color is remarkable. While compds. like Ac_2 , Bz_2 and phenanthrenequinone are only yellow to orange in even concd. solns., **II** is still deep brown-red in much more dil. solns., orange in 10^{-6} *M* and still colored in 10^{-8} *M* solns. Qual. measurements (by LEV and VOLBERT) of the spectrum of a 3×10^{-8} *M* soln. in abs. MeOH in the light of an Auer burner showed absorption only in the blue and violet, apparently extending far into the ultra-violet where the absorption max lies. **II** (0.5 g. from 5 g. $\text{Ph}_2\text{C}(\text{OH})\text{CO}_2\text{H}$ and 0.1 g. anhyd. Na_2CO_3 in a small round-bottom flask with an air condenser 1 cm. in diam. and 20 cm. long heated with a large Teclu burner until the mixt. boils vigorously and brown vapors are evolved—the burner must now be immediately removed and the reaction allowed to proceed of itself to completion, the whole process requiring more than 0.5–1.0 min.), KMnO_4 -like prisms, *m.* 168° , mol. wt. in freezing $(\text{CH}_2\text{Br})_2$ 347–73.

C. A. R.

Arylamine salts of the naphthalenesulfonic acids. V. Acetylation of peri, Laurent and Brønner acids and the arylamine salts of their acetyl derivatives. R. B. FORSTER, T. H. HANSON AND R. WATSON. *J. Soc. Chem. Ind.* 47, 155–7 (1928); cf. *C. A.* 21, 3361.—Peri acid, Laurent acid and Brønner acid (1,8-, 1,5- and 2,6-naphthylaminesulfonic acids, resp.) do not form arylamine salts, because of the inhibiting action of the amino group on the salt-forming properties of the SO_3H group. These acids must therefore be represented by a dipolar formula. Their Ac derivs. readily yield arylamine salts. In the following table, the amine whose salt is formed is given first, the *m. p.* of the salt next and the soly. of the salt in 1% AcOH last. Salts of acetyl-peri acid: PhNH_2 , 273° , 5.26 at 18° ; *o*- $\text{MeC}_6\text{H}_4\text{NH}_2$, 198° , 2.71 at 18° ; *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$, 207° , 1.35 at 18° ; ψ -cumidine, 257° , 0.065 at 19° ; α -naphthylamine, 242° , 0.25 at 19° ; benzidine, decomps. 287° , 0.063 at 19° ; tolidine, decomps. 267° , 0.22 at 19° ; dianisidine, no. *m. p.*, 0.13 at 20° ; *p*- $\text{ClC}_6\text{H}_4\text{NH}_2$, no. *m. p.*, 0.014 at 19° ; *p*-nitro-*o*-toluidine, decomps. 277° , 0.025 at 20° . Salts of acetyl-Laurent acid: PhNH_2 , decomps. 344° , 0.80 at 18° ; *o*- $\text{MeC}_6\text{H}_4\text{NH}_2$, 259° , 0.80 at 18° ; *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$, 255° , 0.53 at 19° ; α -naphthylamine, indefinite, 0.05 at 18° ; β -naphthylamine, 280° , 0.34 at 18° ; benzidine, decomps. 322° , 0.13 at 18° ; tolidine, decomps. 307° , 0.273 at 20° ; dianisidine, decomps. 328° , 0.014 at 20° ; ψ -cumidine, no. *m. p.*, 0.52 at 19° ; *p*- $\text{ClC}_6\text{H}_4\text{NH}_2$, no. *m. p.*, 0.11 at 19° ; *p*-nitro-*o*-toluidine, no. *m. p.*, 0.51 at 19° . Salts of acetyl-Brønner acid: PhNH_2 , 256° , 0.78 at 15° ; *o*- $\text{MeC}_6\text{H}_4\text{NH}_2$, 262° , 0.2334 at 15° ; *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$, 243° , 1.48 at 20° ; ψ -cumidine, 277° , 0.10 at 22° ; α -naphthylamine, 258° , 0.35 at 15° ; β -naphthylamine, 262° , 0.18 at 20° ; benzidine, 246° , 0.23 at 16° ; tolidine, decomps. 315° , 0.082 at 19° ; *p*- $\text{ClC}_6\text{H}_4\text{NH}_2$, 275° , 0.21 at 16° ; *p*-nitro-*o*-toluidine, decomps. 287° , 0.09 at 20° ; *o*- $\text{MeOC}_6\text{H}_4\text{NH}_2$, 230° , 0.98 at 22° ; *p*- $\text{EtOC}_6\text{H}_4\text{NH}_2$, 225° , 0.63 at 20° ; *m*- $\text{BrC}_6\text{H}_4\text{NH}_2$, 249° , 2.18 at 20° ; *p*- $\text{BrC}_6\text{H}_4\text{NH}_2$, decomps. 267° , 0.21 at 19° . VI. Salts of Koch acid, H acid and chromotropic acid. R. B. FORSTER AND D. H. MOSBY. *Ibid* 157–9.—Analyses of the di-Na salts of Koch acid (**I**) chromotropic acid (**II**) and H acid (**III**) showed that in all cases it was the internal arylamine di-Na salt that was stable in dil. acid soln., and there was no tendency to form sultam. Arylamine salts of **I** always consisted of 1 mol. of **I** and 2 mols. of a monoamine or 1 mol. of a diamine. Salts of **III** consisted of 1 mol. of acid and 1 mol. of monoamine, or 2 mols. of acid and 1 mol. of diamine. Salts of **II** consisted of 1 mol. of acid and 2 mols. of monoamine or 1 mol. of diamine. In the following table, the amine whose salt is formed is given first and the decompn. point of the salt next. Salts of **I**: PhNH_2 , 312° ; *o*- $\text{MeC}_6\text{H}_4\text{NH}_2$, 304° ; *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$, 202° ; *m*- $\text{MeC}_6\text{H}_4\text{NH}_2$, 284° ; *o*- $\text{MeOC}_6\text{H}_4\text{NH}_2$, 290° ; *p*- $\text{MeOC}_6\text{H}_4\text{NH}_2$, 287° ; α -naphthylamine, 312° ; β -naphthylamine, 322° ; benzidine, 348° ; tolidine, 345° ; dianisidine, 339° . Salts of **II**: PhNH_2 , 300° ; *o*- $\text{MeC}_6\text{H}_4\text{NH}_2$,

290°; *p*-MeC₆H₄NH₂, 308°; *m*-Me₂C₆H₃NH₂, 307°; α -naphthylamine, 311°; β -naphthylamine, 293°; benzidine, 312°. Salts of III: PhNH₂, 340°; *o*-MeC₆H₄NH₂, 320°; *p*-MeC₆H₄NH₂, 335°; *p*-nitro-*o*-toluidine, 286°; *m*-Me₂C₆H₃NH₂, 327°; α -naphthylamine, 324°; β -naphthylamine, 345°; benzidine, 325°; toluidine, 340°; dianisidine, 345°.

T. S. CARSWELL

Racemization. VII. The action of alkali on casein. P. A. LEVENE AND L. W. BASS. Rockefeller Institute. *J. Biol. Chem.* **78**, 145-57(1928); cf. *C. A.* **22**, 1956.—The rotations and amino-N ratios were detd. for the mixt. of amino acids obtained by hydrolyzing casein with HCl at 125°. Complete hydrolysis was obtained in 4 hrs. when 5.0 *N* acid was used. Similar detns. were made on casein previously subjected to the action of 0.5, 1.0 or 5.0 *N* NaOH at 25° for varying lengths of time. The rates of hydrolysis at 25° of casein and gelatin by 0.5, 1.0 and 5.0 *N* NaOH were compared. The results indicate that casein is not composed of ketopiperazines of the type heretofore studied. When casein is heated with 1.0 *N* NaOH at 125°, complete racemization occurs and under these conditions it is, therefore, impossible to increase the rate of hydrolysis of the ketopiperazines sufficiently to avoid racemization. An investigation of the sol. and insol. fractions of racemized casein showed that racemization preceded hydrolysis.

ARTHUR GROLLMAN

Alizarinsulfonic acid ester—a water-soluble alizarin preparation. E. GEBAUER FÜLNEGG AND ILONA EISNER. *Ind. Eng. Chem.* **20**, 637-8(1928).—Treatment of a mixt. of alizarin and pyridine with ClSO₃H yielded the pyridine salt of alizarinsulfonic acid ester. Clear shades of alizarin red were obtained by padding cotton, impregnated with Ca and Al salts, with a mixt. of the alkali salt of the ester and (CO₂H)₂, followed by drying and steaming in a Mather-Platt.

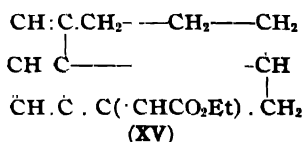

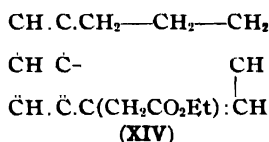

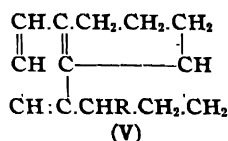

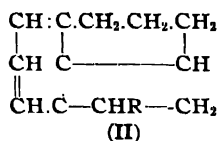

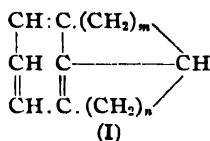

T. S. CARSWELL

Rubrene. VII. Dissociation pressure of rubrene peroxide at ordinary temperature. CHARLES MOUREU, CHARLES DUFRAISSE AND LOUIS GIRARD. *Compt. rend.* **186**, 1166-8(1928); cf. *C. A.* **22**, 961, 2354.—A C₆H₆ soln. of rubrene peroxide (I), when exposed to sunlight or an incandescent lamp in the absence of O, shows the fluorescence of rubrene (II). In the dark or in the air, the decompn. into II is not apparent and upon entrance of air into the exposed O-free tube of I, the fluorescence disappears; hence the formation of I from II is reversible. The critical O dissocn. pressure seems to be about 5 mm. of Hg.

A. S. CARTER

Benzopolymethylene compounds. XIV. Synthesis of tetracyclic compounds and of pyrene. JULIUS V. BRAUN AND ERICH RATH. *Ber.* **61B**, 956-63(1928); cf. *C. A.* **21**, 2683.—In earlier papers it was shown that in accordance with the Sachse-Mohr conception of multiplanar structure of C rings, a 5- and a 6-, a 6- and a 6-, a 5- and a 7- and a 6- and a 7-membered ring adjacent to each other can be added to a C₆H₆ ring to form tricyclic compds. of the general structure I, whereas two 5-membered rings (*m* = *n* = 2) cannot be so added. Further exptl. confirmation of the correctness of the S.-M. view is furnished in the present paper. If in a compd. of type I *n* = 3, it should be possible to add to it a 5-, 6- or 7-membered ring with formation of a tetracyclic compd., whereas if *n* = 2 only a 6- or 7-membered ring can be added according to the theory. To test this point the acids III (II, R = CH₂CO₂H), IV (II, R = CH₂CH₂CO₂H), VI (V, R = CH₂CO₂H) and VII (V, R = CH₂CH₂CO₂H) were prepd. and it was found that, whereas the chloride of III undergoes no intramol. Friedel-Crafts reaction, in the chlorides of IV, VI and VII AlCl₃ closes the ring with the same and, indeed, in part with even greater ease than it does in the analogous reactions in the tricyclic series; the resulting ketones (VIII, IX and X) can then be smoothly reduced to the hydrocarbons 1,2,3,4,5,6,7,8-octahydro-4,5-methylenepheneanthrene (XI), 1,2,3,4,5,6-hexahydro-peribenzoacenaphthene (XII) and decahydropyrene (XIII). All attempts to dehydrogenate XI and XII to the parent hydrocarbons have hitherto failed, but XIII is readily converted into pyrene, this reaction thus adding a 4th to the 3 previously known methods of synthesizing pyrene. Although the steps involved in this synthesis, starting from α -naphthol, are numerous, all the operations proceed so smoothly, under the proper conditions, that the synthesis as a whole is very easy. Tetraphthene ketone reacts with Zn and BrCH₂CO₂Et in C₆H₆ as readily as with α -hydrindone, giving almost 90% of a faintly colored, almost odorless oil, b₁₄ 214-5°, probably a mixt. of the isomeric esters XIV and XV, which with H₂ and Ni in 50% decalin soln. at about 200° yields about 90% of the *Et* ester, thickish, strongly refractive, almost odorless liquid, b₁₄ 196°, of tetraphthylacetic acid (III), m. 108°. Tetraphthylethyl alc. (II, R = CH₂CH₂OH), obtained in 40% yield, together with 55% of free III from the ester of III with Na and alc., rather thick oil, b₁₅ 188°, solidifying completely on long cooling and then m. 53°, converted by heating several hrs. at 130° with fuming HBr into the bromide (yield, about 90%), faintly yellow, b₁₅ 182-5°, gives with KCN 85% of the nitrile, liquid of

faint odor, b_{16} 205°, m. 38°, of the *propionic acid* (IV), m. 97°, whose *chloride*, b_{14} 215–20° (slight decompn. towards the end of the distn.); this with $AlCl_3$ in CS_2 gives the α -*keto deriv.* (VIII) of XI (yield, about 65% when small quantities of the chloride (10 g.) are used, 40% with larger quantities), $b_{6.5}$ 168–70°, m. 104°; *oxime*, m. 213°; *semicarbazone*, m. 266°. XI (70% from VIII by the Clemmensen method), easily volatile with steam, b_{15} 130–2°, b. 238°, m. 47°. α -Keto-hexahydrobenzonaphthene with Zn and $BrCH_2CO_2Et$ gives 80% of a thick, faintly yellow oily *ester* $C_{17}H_{20}O_2$, b_{14} 218–9°, reduced with H_2 and Ni almost quant. to the *Et ester*, thick, almost colorless oil, b_{14} 196°, of *hexahydrobenzonaphthylacetic acid* (VI), b_{13} 220–2°, m. 93°. Its chloride with $AlCl_3$ gives 60% of the *ketone IX*, $b_{6.5}$ 170–2°, m. 98° (*oxime*, m. 199°; *semicarbazone*, m. 256°), reduced with amalgamated Zn to XII, b_{12} 130–2°, m. 29°, easily volatile with steam. Ladenburg reduction of the ester of VI gave, together with 45% of the free acid, 45% of the *alc.* (V, R = CH_2CH_2OH), rather thick oil with a faint odor, b_{12} 192–4°, m. 23–4°, whose *bromide*, having the same b. p. and only about 3% sol. in hot $EtOH$, gives with KCN about 90% of the *nitrile*, b_{12} 212–4°, of the *propionic acid* (VII), m. 118°, b_{12} 238–40°, whose chloride with $AlCl_3$ gives α -*ketodecahydropyrene* (X), $b_{6.4}$ 182–3°, b_{12} 226°, m. 63° (yield, 75%); *oxime*, m. 158°; *semicarbazone*, m. 242°. XIII, b_{12} 151–2°, m. 34°, d_4^{20} 1.0612 (undercooled), n_D^{20} 1.5806; passed in a current of CO_2 over a layer of PbO-pumice at bright red heat it gives 70% of pyrene, m. 150° after 1 crystn. from alc.

C. A. R.

Organic catalysts. II. Strengthening the catalytic effectiveness of isatin by nucleus substitution. WOLFGANG LANGENBECK. *Ber.* 61B, 942–7(1928); cf. *C. A.* 21, 1216.—It was shown in the 1st paper that in the dehydrogenation of NH_2 acids by O or methylene blue isatin and some of its derivs. act as catalysts. In the present paper are reported the results of quant. expts. on the influence of substitution on the catalytic activity of isatin, use being made of the velocity of decolorization of methylene blue under comparable conditions. Substitution of the imide H atom has only a slight influence. *Isatin-1-acetic acid* (I) is a weaker catalyst than isatin itself. On the other hand, introduction of halogen or the SO_3H group into the C_6H_4 nucleus of the isatin increases its activity, when equimol. solns. are compared. Below are, resp., the wt. of isatin deriv. used, the vol. (cc.) of solvent, the temp. and time (min.) required to decolorize 5 cc. 0.01 *N* methylene blue soln. and 5 g. alanine. isatin, 0.15, 5, 40°, 270; I, 0.20, 5, 40°, 360; isatin, 0.07, 10, 70°, 14 5; 5-bromoisatin, 0.11, 10, 70°, 6; 5,7-dibromoisatin, 0.15, 10, 70°, 5; isatin, 0.073, 10, 70°, 13.5; 5-chloroisatin, 0.090, 10, 70°, 5.5; isatin, 0.073, 10, 70°, 17; K isatinsulfonate, 0.141, 10, 70°, 7.5. Some expts. were also made in connection with the mechanism of the Strecker reaction. $Me_2C(NH_2)CO_2H$ with quinone (but not with alloxan or isatin) can be dehydrogenated to Me_2CO , CO_2 and NH_3 . This dehydrogenation cannot take place through an α -imino acid, so in addn. to this latter mechanism, which has hitherto been assumed, there must be another, probably through a radical, $>NCMe_2CO_2H$, with univalent N. I (10 g., together with 5 g. unchanged isatin, from 15 g. isatin in 45 cc. 10% NaOH refluxed 4 hrs. with 17 g. anhyd. Na_2CO_3 in 50 cc. H_2O and 15 g. $ClCH_2CO_2H$), yellow-red, m. 206–7°. 5-Nitro deriv., from I with KNO_3 and H_2SO_4 , golden yellow, m. 207°. *Chloride* of I, from I and $SOCl_2$, radiating crystals. *Amide*, Cu-colored, m. about 260° (decompn.). *l-Menthyl ester*, yellow, m. 122°. C. A. R.

Dioximes. XLVII. L. AVOGADRO. *Gazz. chim. ital.* 58, 191–6(1928); cf. Ponzo and Cerrina, *C. A.* 22, 1971.—To det. whether the reaction of $BzCl$ and $PhC(:NOH)CNO$ and treatment of the $Cl(C_2N_2O)Ph$ with $MeOK$ (cf. *C. A.* 21, 1976) is applicable to other nitrile oxides of the $ArC(:NOH)CNO$ type, the action of $BzCl$

on *p*-MeC₆H₄C(:NOH)CNO (I) (cf. C. A. 18, 1491) was studied. I (10 g.) heated some hrs. on the boiling water bath with BzCl (30 g.), cooled, greatly dild. with water, made alk. with NaOH, steam-distd. and the distillate recrystd. from EtOH, yields 3-chloro-5-*p*-tolylazoxime Cl(C₂N₂O)C₆H₄Me (II), of a characteristic odor, m. 42-3°, very resistant to acids, reacts very slowly with boiling concd. aq. alk. hydroxides, forming IV (see later), reacts instantly with boiling alc. alk. ethylates and methylates, forming VII and VI, resp. (see later). In the same way but with a more energetic reaction, BzBr and I form 3-bromo-5-*p*-tolylazoxime (III), has a characteristic odor, m. 27-8°; its chem. properties are similar to those of II. II or III refluxed some days with 10% KOH in MeOH, evapd., water added, acidified with H₂SO₄, and the ppt. recrystd. from water, yields 3-hydroxy-5-*p*-tolylazoxime (IV), m. 199-200° (decompn.), easily decompd. by HNO₃ (d. 1.4) to *p*-MeC₆H₄CN and CO₂. IV boiled with 1,3,4-xylidene, dil. HCl added and the ppt. recrystd. from EtOH, yields (2,4-Me₂C₆H₃NH₂)₂CO (cf. Ber. 3, 226(1870)). IV heated in abs. EtOH with anhyd. Na₂CO₃, filtered and evapd. yields the Na salt of IV, NaO(C₂N₂O)C₆H₄Me-*p* (V), explodes violently at 205°. Aq. V and aq. AgNO₃ ppt. the Ag salt of IV, AgO(C₂N₂O)C₆H₄Me-*p*. HIO(C₂N₂O)C₆H₄Me-*p*, m. 258° (exploding), slowly decomp. when exposed to light. Aq. V and aq. CuSO₄ ppt. the neutral Cu salt of IV, Cu[O(C₂N₂O)C₆H₄Me-*p*]₂, green, unstable, being transformed into IV and the basic salt *p*-MeC₆H₄(C₂N₂O)OCuOH, light blue, the latter then slowly decomp. to a residue contg. black hydrated Cu oxides. With Cu(OAc)₂ instead of CuSO₄ the blue basic salt is formed initially. Me₂SO₄ and IV in 20% NaOH form 3-methoxy-5-*p*-tolylazoxime (VI), which purified by steam-distn. and crystn. from EtOH, m. 47-8° and has a characteristic odor. It is also formed from II or III and MeONa or MeOK. It is resistant to boiling aq. alk. hydroxides, but is slowly hydrolyzed by MeOK in MeOH. Similarly Et₂SO₄ and 20% NaOH or II (or III) and EtOK (or EtONa) form 3-ethoxy-5-*p*-tolylazoxime (VII), characteristic odor, m. 45°, is not hydrolyzed by aq. alk. hydroxides, but is slowly hydrolyzed by boiling alkali ethylates. I (5 g.) agitated with cold 5% aq. NaOH (50 cc.) until the liquid is turbid yellow, let stand, satd. with CO₂, washed with Et₂O, dild. and acidified with H₂SO₄, the ppt. dissolved in boiling water and Cu(OAc)₂ added, ppts. the Cu salt of IV, while evapn. of the filtrate yields 3-*p*-tolyl-5-hydroxyazoxime (VIII) (cf. C. A. 18, 1490). The H₂SO₄ filtrate made alk. with NH₄OH, Ni(OAc)₂ added, the green Ni salt treated with dil. H₂SO₄, extd. with Et₂O and crystd. from water, or Et₂O or AcMe-CHCl₃, yields *p*-tolylmetazonic acid, *p*-MeC₆H₄C(:NOOH)H, m. 176-7° (decomp. to VIII and *p*-MeC₆H₄CN), its aq. soln. gives an intense cherry-red color with FeCl₃, with Cu(OAc)₂ ppts. a Cu salt, dark green, insol. in dil. AcOH, and with Ni(OAc)₂ in the presence of NH₄OH ppts. a Ni salt, green-yellow. XLVIII. I. DE PAOLINI AND A. IMBERTI *Ibid* 196-202.—In the same way that hydroxyglyoximes RC(:NOH)C(:NOH)OH were prepd. from NH₂OH and α-hydroxyimino acid esters RC(:NOH)CO₂R', expts. were carried out to det. whether the reaction was applicable to the prepn. of hydroxytrioximes, RC(:NOH)C(:NOH)C(:NOH)OH, by the action of NH₂OH on esters of α,β-dihydroxyimino acids, RC(:NOH)C(:NOH)CO₂R'. Twenty % HCl (20 cc.) added dropwise to ice-cold NCC₂H₅COEt (15 g.) and satd. aq. NaNO₂ (8 g.), let stand and recrystd. from C₆H₆ yields pure NCC(:NOH)CO₂Et (I). This is a better method of prepn. than that of Müller (*Ann. chim. phys.* [7], 1, 507(1894), cf. also *Ann.* 280, 331(1894); Conrad and Schulze, C. A. 3, 1176). Alc. I and NH₂OH (3 mols.) in MeOH let stand some days, concd. alc. NH₃ added, filtered rapidly, washed with EtOH and dried *in vacuo* over a drying agent, yields the NH₄ salt of amino-hydroxytrioxime, H₂NC(:NOH)C(:NOH)ONH₄ (II). Additional II (making an almost 100% yield) is recovered by adding BaCl₂ to the mother liquor, which ppts. the Ba salt (III). II (1 g.) added to ice-cold concd. HCl (5 cc.), filtered, the filtrate let stand until crystn. is complete, filtered and washed with glacial AcOH, yields the HCl salt H₂NC(:NOH)C(:NOH)C(:NOH)OH.HCl, m. 156° (decompn.) (cf. 148-52° of Wieland and Hess, C. A. 3, 2166); its aq. soln. gives a cherry-red color with FeCl₃ and an orange color when heated (with sepn. on cooling of IV, see later). III and excess Ac₂O kept at first ice-cold, then warmed gently, water added, and crystd. from EtOH, yields H₂NC(:NOAc)C(:NOAc)C(:NOAc)OAc, m. 179° (cf. 177° of W. and H., *loc. cit.*). II in a min. of water acidified with 20% H₂SO₄, boiled a few min., cooled and recrystd. from water, yields H₂NC-N.O.CO.C(:NOH) (IV), m. 171° (cf.

W. and H., *loc. cit.*, W. and Gmelin, C. A. 3, 2936; W. and Baumann, C. A. 7, 598), gives orange-red solns. in alkali hydroxides which become colorless with excess hydroxide because of formation of salts of H₂NC(:NOH)C(:NOH)CO₂H (V) (see later). Benzoylated by the method of Jacobs and Heidelberger (C. A. 11, 2329), IV forms a *mono*-Bs

deriv. (VI), m. 193° (decompn.), hydrolyzed to IV and BzOH by treating with concd. H_2SO_4 and then dilg. with water. Since IV and VI are orange-yellow and MeC:N.O.CO.C:NOH and its acyl derivs. are colorless, a study is to be undertaken

to see whether the accepted formulas of these compds. are true. Alc. $\text{NCC}(\text{:NOH})\text{-CO}_2\text{H}$ (cf. *Ann. chim. phys.* [7] 1, 521(1894)) let stand several days with NH_2OH (2 mols.) in MeOH, excess alc. NH_3 added, filtered, the residue dissolved in a min. of water, strongly acidified with 20% HCl and recrystd. from water, yields V, m. 170° (decompn.) (cf. W. and H., *loc. cit.*); its aq. solns. are acid, gives a red color with aq. FeCl_3 and an amorphous cherry-red ppt. with aq. $\text{Ni}(\text{OAc})_2$, transformed by warming with Ac_2O into $\text{H}_2\text{NC}(\text{:NOAc})\text{CN}$, m. 137° (decompn.) (cf. W. and Gmelin, *loc. cit.*). Alc. NH_3 added to alc. V, and the ppt. recrystd. from EtOH, yields the *NH*₄ salt of V, $\text{H}_2\text{NC}(\text{NOH})\text{C}(\text{NOH})\text{CO}_2\text{NH}_4\cdot\text{H}_2\text{O}$ (VI), softens around 100°, m. 114–5° (decompn.), loses its H_2O of crystn. when dried *in vacuo*. Dil. aq. AgNO_3 added to aq. V ppts. the Ag salt of V, $\text{C}_3\text{H}_4\text{O}_4\text{N}_3\text{Ag}$. Aq. VI and aq. AgNO_3 give a yellow amorphous ppt. which redissolves in excess NH_4OH , giving a soln. which blackens slowly with sepn. of Ag, a decompn. which is accelerated by warming. C. C. DAVIS

Thio-oxytriazines. J. BOUGAULT AND L. DANIEL. *Compt. rend.* 186, 1216–8 (1928), cf. *C. A.* 22, 1360.—The tautomeric form $\text{RC:N:N:C}(\text{SH})\text{NH.CO}$ is preferred

for the thio-oxytriazines (I) to the original formula RC:N NH.CS.NH.CO to explain

the definite acidity and chem. properties. 6-Methylthio-oxytriazine (II), m. 220°, was prepd. from AcCO_2H . Dihydroxytriazines (III) liberate N_2 with NaOBr ; thus benzylidihydroxytriazine gives N_2 and β -phenyl- α,α -dibromopropionamide, whereas I liberates no N_2 but upon destroying the excess NaOBr with NaHSO_3 , III is obtained. By this method 6-methylidihydroxytriazine has been prepd. from II. A. S. CARTER

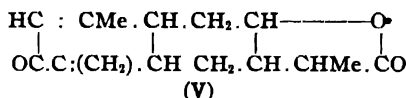

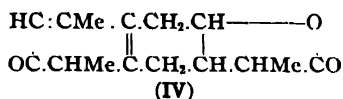

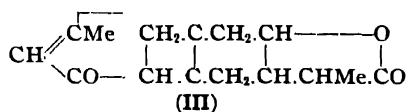

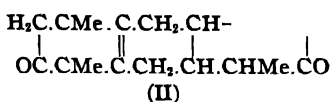

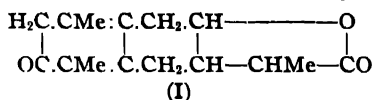

Sparteine I. K. WINTERFELD. *Arch. Pharm.* 266, 299–325(1928).—In order to render the sparteine mol. more susceptible to degradation, expts. were undertaken to introduce 1 or more double bonds through oxidation of 2 or more H atoms, thus changing the satd. mol. to an unsatd. condition. This course was pursued in the hope of obtaining oxidation products which should clearly indicate 1st, whether both N atoms are distributed among 2 different ring systems and 2nd, whether they are of tertiary character. For purposes of dehydrogenation the action of $\text{Hg}(\text{OAc})_2$ on sparteine in dil. AcOH soln. was studied. In the cold a quantity of this reagent was expended on oxidation corresponding to 2 H atoms while a further portion (3 mols. to 1 of sparteine) was utilized in the way of substitution. The dehydrosparteine, $\text{C}_{15}\text{H}_{22}\text{N}_2$, formed is an oily liquid quickly becoming light brown in the air and eventually resinifying. On pouring the free base in alc. into H_2O , it dissolves smoothly therein in contrast to the spartyrine of Willstätter, with which it is isomeric. Both however decolorize KMnO_4 in H_2SO_4 . The dehydro deriv. yields a series of well-defined salts, is optically active, $[\alpha]_D -142.10^\circ$ in CHCl_3 (sparteine, $[\alpha]_D -16.42^\circ$), thus indicating that either a double bond exists in the vicinity of an asym. C atom or that a *d*-rotatory asym. C atom has disappeared. On removal of the dehydrosparteine quant. from the CHCl_3 soln. (used in the optical rotation) by extn. with HCl, followed by reduction with Zn, the base freed by alkali from the HCl soln. had $[\alpha]_D -18.35^\circ$, and yielded in the cold an amorphous Au salt decomp. 166–7° (sparteine chloraurate, m. 193–4°). Accordingly, reduction of the dehydro compd. yields a base isomeric with the mother substance. The conception of dehydrosparteine as a quaternary base, as contrasted with sparteine, finds further justification in that it gives no ppt. with NH_3 , but is extractable with Et_2O in the presence of NaOH. If $\text{Hg}(\text{OAc})_2$ is allowed to react with sparteine in the heat, 4 H atoms are split off with the formation of didehydrosparteine, $\text{C}_{15}\text{H}_{20}\text{N}_2$, which is extd. by $\text{CHCl}_3\text{-Et}_2\text{O}$ only from strongly alk. soln. Neither concd. NH_3 nor dil. caustic soln. effects a pptn. Thus, this compd. must likewise be regarded as a carbinol base. The passage of sparteine to a dehydro- and later to a didehydro-base is indicated by the color changes incident to the operations, the soln. of sparteine being absolutely colorless, while that of the dehydro-base is bright yellow and that of the didehydro-base deep golden yellow. In contrast to dehydrosparteine, the Au and Pt salts of the didehydro-product are amorphous. The HgCl_2 compd. has the compn. $\text{C}_{15}\text{H}_{20}\text{N}_2\cdot 4\text{HgCl}_2\cdot 2\text{HCl}$ and forms a finely cryst. powder. The perchlorate is particularly characteristic. Careful oxidation of the dehydro-base in cold AcMe with KMnO_4 yielded a yellowish sirupy product of acid character. The Me ester therefrom prepd. *via* E. Fischer gave a cryst. Pt salt indicating the base to have the formula $\text{C}_{15}\text{H}_{20}\text{O}_2\text{N}_2$. This compn. was also indicated from the behavior of the base toward acetylation and

the formation of the NO compd. The oxidative scission of a side chain was thus shown, in that one of the N atoms had acquired secondary properties. Of importance in a soln. of the constitution problem was the question whether in the 2nd dehydrogenation the same ring system was involved as in the 1st, or rather was the other ring system affected? The formula of Moureu and Valeur presents a sym. arrangement of the atoms in the 2 N-contg. rings and should apparently favor dehydrogenation simultaneously in both ring systems, whether in the cold or heat. The fact, however, that dehydrogenation takes place on the 1 hand in the cold, and then in the heat, makes the M. and V. formulation of little probability. Rather do the results obtained in degradation with $\text{Hg}(\text{OAc})_2$ lead to the conclusion that both of the N-contg. ring systems are either unsym. with respect to each other, or the more plausible view that they are differently constituted. The oxidation of the didehydro-product with KMnO_4 yielded a di- CO_2H acid, susceptible of esterification like the dehydro-base; its behavior also toward Ac_2O showed the entry of 2 Ac groups. Proof that the 2 N atoms were secondary in character was seen in its NO deriv. Attempts to reduce the CO_2H group to that of a primary alc. were only partially successful. Expts. also (carried out by W. IPSEN) looking to the development of a more basic ring system, by exhaustive methylation, yielded negative results. Among the compds. prepd. and further characterized in the present investigation were: *dehydrosparteine salts*; *chloroplatinate*, $(\text{C}_{15}\text{H}_{24}\text{N}_2)_2 \cdot \text{H}_2\text{PtCl}_6 \cdot 5.5\text{H}_2\text{O}$, m. 255° (decompn.); *chloroaurate*, $\text{C}_{15}\text{H}_{24}\text{N}_2 \cdot 2\text{HAuCl}_4 \cdot 2\text{H}_2\text{O}$, m. $157-8^\circ$; *HgCl}_2* salt, $\text{C}_{15}\text{H}_{24}\text{N}_2 \cdot \text{HgCl}_2 \cdot 2\text{HCl} \cdot \frac{1}{2}\text{H}_2\text{O}$, m. $256-7^\circ$ (decompn.). *Didehydrosparteine salts*: *chloroaurate*, $\text{C}_{15}\text{H}_{22}\text{N}_2 \cdot 2\text{HAuCl}_4$, 147° (decompn.). *HgCl}_2* salt, $\text{C}_{15}\text{H}_{22}\text{N}_2 \cdot 4\text{HgCl}_2 \cdot 2\text{HCl}$, m. 222° ; *chloroplatinate*, $\text{C}_{15}\text{H}_{22}\text{N}_2 \cdot \text{H}_2\text{PtCl}_6$, m. 273° (decompn.); *perchlorate*, $\text{C}_{15}\text{H}_{24}\text{N}_2(\text{ClO}_4)_2$, m. 256° (decompn.), $[\alpha]_D^{25} 44.87^\circ$ (free base optically inactive); *picrate*, $\text{C}_{15}\text{H}_{22}\text{N}_2(\text{C}_6\text{H}_2(\text{NO}_2)_3(\text{OH}))$, m. 178° (decompn.); *chloroplatinate of acid* (by oxidation of dehydrosparteine with KMnO_4), $\text{C}_{15}\text{H}_{20}\text{O}_2\text{N}_2 \cdot \text{H}_2\text{PtCl}_6$; *benzylidene deriv. of hydrazide of acid*, $\text{C}_{27}\text{H}_{30}\text{O}_4\text{N}_4$, m. 207° ; *amine picrate* (from the nitrosourethan of the azide), $\text{C}_{12}\text{H}_{22}\text{N}_3 \cdot 2\text{C}_6\text{H}_2(\text{NO}_2)_3\text{OH}$, m. 187° (decompn.); *Me ester* (of acid arising from the oxidation of didehydrosparteine with KMnO_4), $\text{C}_{16}\text{H}_{26}\text{O}_4\text{N}_2$, sirupy liquid; *Et ester*, $\text{C}_{17}\text{H}_{30}\text{O}_4\text{N}_2$, sirup; *acetylated ester*, $\text{C}_{19}\text{H}_{30}\text{O}_6\text{N}_2$, yellowish brown oil; *benzylidene deriv. of hydrazide (chloroaurate)* (from the di- CO_2H acid via Curtius), $\text{C}_{27}\text{H}_{34}\text{O}_2\text{N}_6$, m. 175° (decompn.); *chloroaurate of benzoylated diamine* (from the dinitrosodiazide of the acid), $\text{C}_{30}\text{H}_{38}\text{O}_4\text{N}_4 \cdot \text{HAuCl}_4 \cdot \text{HCl}$, m. 98° (decompn.).

W. O. E.

The refractive power and dispersive power of santonin and some of its isomers and derivatives. I. Santonin, *p*-santonide and α - and β -*m*-santonin. G. BANCHI. *Gazz. chim. ital.* 58, 77-95(1928).—Measurements of the n values were made for the α , β and γ lines of H and the D line of Na. The following data give the exptl. value of $(n_{H\alpha} - 1)/d$, its calcd. value, the difference between this and the calcd. value, the exptl. value of $P(n_{H\alpha}^2 + 2)d/(n_{H\alpha}^2 - 1)$, its calcd. value, the difference between this and the calcd. value, $H_\beta - H_\alpha$ and $\% [(H_\beta - H_\alpha) - (H'_\beta - H'_\alpha)]/(H'_\beta - H'_\alpha)$, resp., where n is the index of refraction, d is the density and P is the mol. wt.: santonin (2 double bonds) 117.09, 113.4, 3.69, 67.675, 65.240, 2.345, 1.809, 34.60; santonin (1 double bond) 117.09, 111.0, 6.09, 67.675, 63.554, 4.121, 1.809, 48.43; *p*-santonide 116.637, 113.4, 3.237, 67.706, 65.240, 2.466, 1.252, -6.85; α -*m*-santonin 111.61, 111.0, 0.61, 64.864, 63.554, 1.310, 1.469, 14.50; β -*m*-santonin 108.13, 111.0, -2.87, 63.014, 63.554, -0.540, 1.292, 2. The chief source of error in the measurements was evapn. of the CHCl_3 used as solvent, which tended to give high values of the refractive powers. *Santonin*.—An exaltation of 2.435 is not great for a compd. of high mol. wt. in CHCl_3 . In the Francesconi formula (I) the exaltation would depend chiefly upon 3 factors, (1) conjugation of the semicyclic CO_2H double bond with a double bond of the same nucleus, (2) the aromatic character of this nucleus in the hydronaphthalic nucleus and (3) the union of the heterocyclic satd. lactonic nucleus with the hydronaphthalic nucleus. Since this last factor alone gives phenolphthalein an exaltation of 4.56, a value of 2.435 makes this formula of santonin improbable. In formula II only the double bond uniting the 2 ring nuclei is effective in causing a notable exaltation, and with this structure the observed exaltation is within limits which would be predicted. Based on the same kind of reasoning the Angeli and Marino formula (III) is also compatible with the observed exaltation. The observed exaltation is too low to be explained by the Bargellini formula (IV) and the Francesconi and Cusmano formula (V) and these are improbable. Formulas II and III conform best to the observed exaltation, and since II also conforms to the chem. properties of santonin, it is the most probable. *m*-Santonin.—The refractive power of the α -compd. is smaller than that of santonin on account of the difference of position of the double bond, the absence of the naphthalic nuclei, a single Gladstone

atom instead of 2 such atoms and the unsatn. of the heterocyclic nucleus united to the hydronaphthalic nucleus. α -*m*-Santonin has therefore a refractive power conforming to calcns. based on its accepted structure. The refractive power of the β -compd. is not readily explainable. *p*-*Santonide*.—It is possible to explain the high refractive power of this compd. by the presence of a different no. of double bonds from those in its isomers, but further chem. research is necessary before its constitution is established.

C. C. DAVIS

Gossypol. IV. Apogossypol. E. P. CLARK. Bur. Chem., Washington. *J. Biol. Chem.* 78, 159-66(1928); cf. *C. A.* 22, 2141.—Gossypol treated with 40% NaOH for 0.5 hr. on a steam bath is converted to HCO₂H and *apogossypol*, a new substance, in the proportion of 2:1. Apogossypol has the compn. C₂₈H₃₀O₆. It contains 6 OH groups and forms a hexa-Ac deriv. (m. 291°) and a hexa-Me ether (m. 230-40°). Apogossypol is much less toxic than gossypol and differs from the latter in causing acute toxic effects only.

ARTHUR GROLLMAN

The strength of acetamide as an acid (BRANCH, CLAYTON) 2. The relation between the hydrolysis equilibrium constant of esters and the strengths of the corresponding acids (WILLIAMS, *et al.*) 2. The oxidation-catalytic action of Fe (HANDOVSKY) 2. The relation between chemical constitution and x-ray diffraction in liquids (KRISHNAMURTI) 2. Detection and determination of benzene, benzene, alcohol, ether and tetralin in motor fuels (FORMANEK) 21. Iron oxide [reduction of nitro compounds] (Can. pat. 278,167-8-9) 18.

Alcohols. E. E. AYERS, JR. Can. 278,537, Mar. 13, 1928. Monohydric alcs. contg. 4 to 5 C atoms are produced by sepg., from gasoline derived from natural gas, normal butane and the pentanes by rectification under pressure with successive re-fluxing of isobutane, normal butane and normal pentane. The normal butane and pentanes are chlorinated and the alkyl chlorides are hydrolyzed. The alcs. so produced are purified by extn. with H₂O.

Alcohols. I. G. FARBENIND. A.-G. Brit. 278,777, June 10, 1926. The O-contg. org. compds. obtained by the catalytic hydrogenation of C oxides by processes as described in Brit. 227,147 (*C. A.* 19, 2673), Brit. 229,714 (*C. A.* 19, 3093), Brit. 237,030 (*C. A.* 20, 1414) and Brit. 238,319 (*C. A.* 20, 1995) are converted into colorless oils consisting of higher alcs. by catalytic treatment in the vapor phase with H in the presence of a hydrogenation catalyst. The material may be preliminarily purified by treatment with granular SiO₂ and then with NaOH. Ni, Co, Cu or Pt may be used as catalyst and Al(OH)₃, Al phosphate or oxides of Th or W may also be present.

Anhydrous alcohol. J. FLXER. Can. 279,731, May 1, 1928. Commercially anhyd. glycerol is heated to approx. 200°, the water being expelled therefrom, and a considerably less quantity of alc., approx. 65% overproof, is mixed therewith. The mixt. is heated much above the b. p. of the alc., which is vaporized and condensed. The glycerol contg. the withdrawn water is reheated at a much higher temp. for reclaiming any alc. remaining.

Device and reagent kit for testing alcohol to detect denaturants. H. F. TAYLOR (to The Detectol Mfg. Co.). U. S. 1,674,416, June 19. A small portable outfit is described in which a very small sample is at least partially distd. and the condensate then successively treated with (a) a reagent formed from KMnO₄, H₃PO₄ and water; (b) an aq. soln. of H₂SO₄ and FeSO₄; and (c) an aq. soln. of basic fuchsin and Na₂SO₄. A bluish color indicates the presence of denaturant and a whitish color its absence.

Purifying *N*-alkylcarbazoles. F. S. MORTIMER and R. W. HESS (to National Aniline & Chemical Co.). U. S. 1,674,216, June 19. Impure *N*-ethylcarbazole or other similar *N*-alkylcarbazole is extd. with H_2SO_4 of 77–87% strength at a temp. not above about 25°, and the *N*-alkylcarbazole is recovered from the filtrate by diln. with ice water to effect pptn. The crude material may be preliminarily fused with $\text{C}_{10}\text{H}_{18}$.

Alkylcoumaran. H. JORDAN. Can. 278,727, Mar. 20, 1928. The products of condensation of alkylphenols and a ketone are heated to about 300–310° to effect decompn., and the decompn. products are subjected to fractional distn., the alkylcoumarans being collected.

Alkylisopropylenephenol. H. JORDAN. Can. 278,726, Mar. 20, 1928. Alkylisopropylenephenols are produced by heating the condensation product of crude cresol and acetone to about 300–310° to effect distn., and subjecting the distillate to fractional distn. The fraction contg. the methylisopropylenephenols is collected.

Alkyl substitution. A. VERLEY. Can. 279,590, Apr. 24, 1928. An aromatic compd. is made to react with an alkylsulfuric acid, *e. g.*, *p*-cymene is prepd. from toluene by agitating a mixt. of 100 kg. H_2SO_4 contg. 25% $\text{Na}_2\text{S}_2\text{O}_7$ with 5 kg. of iso-PrOH and 25 kg. of toluene, and maintaining the temp. of the mixt. at about 60° for 1 hr. The material is then treated with H_2O and the supernatant layer drawn off. This layer is washed and sepd. into toluene and pure *p*-cymene by fractionation.

Aromatic amino compounds. I. G. FARBERIND. A.-G. Brit. 279,283, April 21, 1926. Reduction of PhNO_2 to PhNH_2 or other similar reductions are effected with Fe and HCl of over 6% concn.; or, if an acid soln. of a salt of the aromatic amine is used instead of HCl this soln. is of a corresponding concn. A finely divided Fe oxide is obtained suitable for use as a pigment. Cf. C. A. 22, 2171.

Purifying aromatic hydrocarbons. A. O. JAEGER (to The Selden Co.). U. S. 1,674,472, June 19. Aromatic hydrocarbons such as crude benzene or solvent naphtha contg. acyclic, alicyclic and heterocyclic impurities are subjected to the combined action of Cl or other halogenating agent and strong H_2SO_4 , using less of the H_2SO_4 than would produce a product of usual desired purity and the amt of active halogen being insufficient to effect substantial nuclear halogenation but sufficient to react with impurities.

Aromatic mercaptans. I. G. FARBERIND. A.-G. Brit. 279,136, Oct. 18, 1926. Mercaptans of the general formula, R.SH , in which "R" stands for a substituted or unsubstituted benzene or naphthalene residue are made by reaction of diazo-aryl compds., contg. no groups which would make them sol., upon a "more highly sulfurized metal than a metal disulfide" and reducing the product of this reaction. An alk. substance such as an alkali carbonate or bicarbonate or silicate, or a metal or salt such as Cu or a Cu salt, acting as a catalyst, may be added. 5-Chloro-2-amino-1-methylbenzene may be diazotized, neutralized and run into a heated Na polysulfide soln. to which Na_2CO_3 and CuSO_4 may be added. Ca polysulfide also may be used.

Esters. F. W. SKIRROW. Can. 279,973, May 8, 1928. Mixed esters are made by treating a mixt. of AcH and butyraldehyde with aluminum ethoxide.

Glycol esters. G. STEIMMIG and H. ULRICH. Can. 278,557, Mar. 13, 1928. Esters of glycols are produced by acting on an org. acid anhydride with an alkylene oxide at an elevated temp. and in the presence of a catalyst.

Extraction of fatty acids. E. RICARD and H. M. E. GUINOT. Can. 279,167, Apr. 3, 1928. Fatty acids contained in dil. aq. solns. are removed in the anhydrous state by treating such solns. by a systematic exhaustion by means of a mixt. of acetic esters.

Halohydrins. H. ESSEX and A. L. WARD. Can. 277,851, Feb. 14, 1928. Dichlorohydrin is pptd. by passing Cl_2 into a mixt. of allyl chloride and a satd. aq. soln. of dichlorohydrin; the dichlorohydrins are collected separately from the mixt.

Halogen-substituted olefin. C. O. YOUNG. Can. 278,157, Feb. 28, 1928. A halogen-substituted olefin is produced by treating an olefin dihalide with an aq. soln. of a caustic alkali at a relatively high temp.

Dihydroxy carbon compound. H. ESSEX and A. L. WARD. Can. 277,852, Feb. 14, 1928. Phenylglycol is produced by passing CO_2 into a mixt. of styrene and an aq. soln. of NaOCl , while the mixt. is kept cool, until all the hypochlorite has been decompd. The resulting mixt. is boiled until the chlorohydrin contained therein is hydrolyzed to phenylglycol.

Catalytic production of hydrocarbons. I. G. FARBERIND. A.-G. Brit. 279,347, May 30, 1927. In producing CH_4 and other hydrocarbons from C oxides and H or gases which split off H, the temp. is prevented from rising too high and the heat of reaction is utilized, by connecting the contact chamber with a generator of high-pressure steam so that

heat exchange is effected. Various structural features are described. Cf. *C. A.* 22, 1594.

Synthetic production of hydrocarbons. M. G. CORSON. *Brit.* 279,095, Oct. 14, 1926. CaC_2 is caused to react with an alc., phenol or Cl deriv. of a hydrocarbon in the absence of carboxyl groups, at 150–300° and under about 12–40 atm. pressure. When EtOH is used, the water present is first decompd. with production of C_2H_2 , which is withdrawn through a reflux condenser. The condenser is then removed and the vessel closed, after which diethylacetylene is formed, which may be further treated with H and a catalyst to produce hexane. When PhCl is used, diphenylacetylene, is formed, which on catalytic hydrogenation yields stilbene or dibenzyl. The dibenzyl may be treated with a reducing metal such as Zn, Mg, Na or Al and HCl to produce toluene. MeOH, PrOH, PhOH, cresol and similar compds. may also be used as starting materials in the process.

Ozonization of hydrocarbons. A. S. RAMAGE. *Can.* 279,396, Apr. 17, 1928. Ozonized air is introduced into a body of liquid hydrocarbons comprising at least about 60% of unsatd. hydrocarbons, and having an initial b. p. of 125° and an end b. p. of not above 250°, until such body attains a density of about 20° Bé.

Unsaturated hydrocarbons. W. O. HERRMANN and E. BAUM. *Can.* 279,622, Apr. 24, 1928. Unsatd. hydrocarbons are prepd. by passing more highly satd. aliphatic hydrocarbons in contact with heated C.

Carbocyclic ketones with more than nine ring members. I. RUZICKA (to Firm of M. Naef & Co.). U. S. 1,673,093, June 12. Ketones such as cyclopentadecanone are formed by heating C and Th salts of tetradecane-1,14-dicarboxylic acid or other normal straight-chain aliphatic dicarboxylic acid salts of the fourth group of the periodic system having a C chain contg. more than 10 C atoms with the COOH groups attached at the ends.

Organic arsenic compounds. ÉTABLISSEMENTS POULENC FRÈRES AND E. FOURNEAU. *Brit.* 279,379, Oct. 21, 1926. *o*-Chloro-*p*-aminoglycinamide-phenylarsonic acid is prepd. by treating diazotized *o*-chloro-*p*-nitroaniline with Na arsenite, reducing the resulting *o*-chloro-*p*-nitrophenylarsonic acid, and treating the product with chloroacetamide. *o*-Chloro-*p*-nitroaniline is made by chlorinating *p*-nitroaniline.

Formaldehyde solution. E. KUSS and G. HAHNEL. *Can.* 279,991, May 8, 1928. Solid condensation products of CH_2O are converted into aq. CH_2O solns. by heating such products together with H_2O to temps. above 100° under a pressure sufficient to keep the water substantially in the liquid state.

Paraformaldehyde. E. KUSS and R. HELLER. *Can.* 278,947, Mar. 27, 1928. $\text{C}_3\text{H}_6\text{O}_3$ is produced by catalytically oxidizing methanol which is substantially free from H_2O , and washing with strong solns. of CH_2O the reaction gases contg. CH_2O and H_2O vapor with an addition of inert gases. Cf. *C. A.* 22, 1982.

Acetic acid. H. SUIDA. *Can.* 279,952, May 8, 1928. Concd. AcOH is recovered from a vapor mixt. of AcOH and H_2O by subjecting such a mixt. to a mixt. of a phenolic compd. having a high b. p. and an org. chlorine compd. having a low b. p.

Acetic anhydride. R. MEINGAST and M. MUGDAN. *Can.* 278,936, March 27, 1928. Ac_2O is prepd. by heating AcOH vapor in the presence of dehydrating catalysts to 400–800° on heat-conducting surfaces composed of alloys contg. Cr which are not attacked by liquid AcOH.

Acetic anhydride. CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE GES. *Brit.* 279,070, Oct. 18, 1926. HOAc vapor is treated with a small quantity of a gaseous catalyst (preferably an acid such as H_3PO_4 , HCl or H_3BO_3 or substances such as P and its volatile compds. which yield acid compds. under the reaction conditions), as by heating in a C tube at 650°. The process may be combined with that of *Brit.* 272,951 (*C. A.* 22, 1783), the HOAc vapor being first heated to the reaction temp. and the catalyst being then added. The app. used may be made of Cr steel, Cu, Si, SiC or quartz and elec. heating may be employed. The process can also be used in combination with those described in *Brit.* 194,719 (*C. A.* 17, 3509), and *Brit.* 230,063 (*C. A.* 19, 3271), the HOAc vapor superheated to 600° being passed through a C tube into a molten mass of equimol. proportions of Na and Li phosphates in a graphite crucible at 700°. At the same time, a soln. of H_3PO_4 in HOAc is sprayed into the C tube.

Purifying acetylene. S. TAMARU and S. KANO. *Can.* 280,609, May 29, 1928. C_2H_2 is purified by passing raw gas over a porous substance acting as a catalyzer in the presence of small but sufficient quantity of O_2 in order to oxidize the impurities contained in the C_2H_2 .

Benzoic acid ester. H. W. MATHESON. *Can.* 280,625, May 29, 1928. BzH is made to react with Al alkoxide.

Butyl butyrate. F. W. SKIRROW. Can. 279,974, May 8, 1928. PrCO_2Bu is manufd. by treating PrCHO with Al(Obu)_3 dissolved in an ester.

Calcium formaldehyde sulfoxylate. M. BAZLEN and E. RIEGER. Can. 280,550, May 29, 1928. Difficultly sol. Ca formaldehyde sulfoxylate is produced by acting on a soln. of an alkali metal formaldehyde sulfoxylate with a sol. Ca salt together with a substance selected from the class consisting of Ca(OH)_2 , NaOH soln. and the corresponding carbonates.

Chlorinating naphthalene. S. BROWN (to Halowax Corporation). U. S. 1,672,878, June 12. Cl_2 is drawn under suction through a chamber contg. molten C_{10}H_8 , so that the chlorinating chamber is maintained under partial vacuum, without causing boiling of the C_{10}H_8 . An app. is described.

Chlorine derivatives of aminodimethylbenzene. I. G. FARBENIND. A.-G. Brit. 278,761, Oct. 11, 1926. 3-Chloro- and 5-chloro- and also 3,5-dichloro-1-amino-2,4-dimethylbenzene are obtained by chlorinating 1-nitro-2,4-dimethylbenzene and reducing the products. Details are given.

Cresol-ketone condensation product. H. H. JORDAN. Can. 278,725, Mar. 20, 1928. A new product is produced by causing condensation of crude cresol and a ketone at a temp. slightly exceeding room temp. and in the presence of a condensation agent.

d-Glucose. C. EBERT, W. B. NEWKIRK and M. MOSKOWITZ (to International Patents Development Co.). U. S. 1,673,187, June 12. "Hydrol" is treated to increase its crystallizable d-glucose content by neutralizing the "hydrol" until coagulation and pptn. of impurities takes place, filtering and then subjecting the filtered liquid to a hydrolyzing operation. Cf. C. A. 22, 2288.

Substituted guanidine. J. P. SCHMITTNÄGEL. Can. 277,565, Jan. 31, 1928. NaCN is treated with Cl_2 in the presence of an inert org. solvent, b. 70 – 100° , and the CNCl soln. thus obtained is treated with a primary amine at a temp. below the b. p. of CNCl . The mixt. is then boiled, whereby a disubstituted guanidine hydrochloride is formed.

Menthol. W. SCHOELLER and H. JORDAN. Can. 278,729, Mar. 20, 1928. Menthol is produced by hydrogenating 3-methyl-6-isopropylphenol at elevated temp. in the presence of a catalyst.

Methanol synthesis. J. C. WOODRUFF and G. BLOOMFIELD (to Commercial Solvents Corporation). Brit. 279,378, Oct. 25, 1926. In prep. catalysts for MeOH synthesis such as those of the general type described in Brit. 271,840 (C. A. 22, 1596), ZnO may be stirred into an aq. soln. contg. Cr nitrate, $\text{Fe(NO}_3)_3$ and ZnCl_2 and the mass evapd. and heated to decomp. the nitrates, the product then crushed and treated with an aq. soln. of ZnCl_2 and allowed to harden spontaneously. Other similar examples also are given and reference is made to the use of oxides of Zn, Mg, Cd, Cr, V, W, U, Zr, Ti, Al, Mn, Mo, Th and Ce (as difficultly reducible oxides) which may be used with more easily reducible oxides such as those of Cu, Ag, Fe, Ni and Co. Cf. C. A. 22, 1783.

Methanol synthesis. J. C. WOODRUFF (to Commercial Solvent Corporation). Brit. 279,377, Oct. 25, 1926. Catalysts are prep. by treating a reducible Ni compd. such as the hydroxide, oxide, nitrate, oxalate or tartrate with H at 300 – 450° (preferably 500 – 600°), suitable after forming into tablets with a binder such as dextrin. MeOH may be produced from C oxides and H by use of the catalysts at 250 – 450° under a pressure of 50 atm. or higher.

Purifying p-nitroaniline. A. MILLER (to Tower Mfg. Co.). U. S. 1,673,154, June 12. In the manuf. of nitroaniline from nitrochlorobenzene with NH_3 , in connection with which by-products are formed which cause a flocculent ppt. upon diazotization, the by-products are reduced by a mild reducing agent such as SnCl_2 .

Thymol. W. SCHOELLER and H. JORDAN. Can. 278,728, Mar. 20, 1928. 3-Methyl-6-isopropylphenol is produced by hydrogenating 3-methyl-6-isopropylphenol at elevated temp. in the presence of a catalyst.

Catalytic oxidation of toluene or other volatile organic substances. W. A. CASPARI. U. S. 1,674,589, June 19. In the production of benzaldehyde from toluene or phthalic anhydride from C_{10}H_8 or in similar reactions, the catalyst, e. g., V oxide, is suspended in finely divided condition in the reacting vapors.

11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

A—GENERAL

FRANK P. UNDERHILL

The antirachitic effect of December sunlight: seasonal variation. F. F. TISDALL AND A. BROWN. *Proc. Soc. Exptl. Biol. Med.* 24, 446-9(1927).—The sun rays in December in the latitude of the City of Toronto produce a definite antirachitic effect on rats fed on a rickets-producing diet. C. V. B.

The antirachitic effect of December skylight and of December sunlight through vitaglass. F. F. TISDALL AND A. BROWN. *Proc. Soc. Exptl. Biol. Med.* 24, 449-51 (1927).—December skylight in the latitude of the City of Toronto produces a definite antirachitic effect on rats fed on a rickets-producing diet. Vitaglass transmitted approx. $\frac{1}{4}$ of the antirachitic rays of December sunlight. Ordinary glass was impervious to these rays. C. V. B.

The antirachitic activity of monochromatic and regional ultra-violet radiations. A. F. HESS AND M. WEINSTOCK. *Proc. Soc. Exptl. Biol. Med.* 24, 759-60(1927).—Two bands of radiations given off by the Hg vapor quartz lamp—those less than 290μ in length and those between 290μ and 313μ —were isolated and their antirachitic properties tested directly by irradiating rachitic rats. Radiations below 290μ , which are shorter than those produced by the sun, were the more potent. C. V. B.

Supposed photoactivity of irradiated substances. O. BECK. *Monatsschr. Kinderheilk.* 33, 320-9(1926).—The observed darkening of the photographic plate is due to ultra-violet rays of relatively long wave lengths. Irradiation of cod-liver oil and milk produces an extension of the absorption spectrum towards the ultra-violet, and that of paraffin oil a contraction. The I value of cod-liver oil, but not of paraffin, suffers a temporary reduction. B. C. A.

Reversibility of the oxidative decomposition of amino acids and its physiological significance. F. KNOOP. *XII Int. Cong. Physiol.* 1926, 90.— α -Ketonic acids and NH_3 , in the presence of mol. H and Pd, yield 70% of the theoretical quantity of amino acids. Ferrous salts and cysteine effect the reduction in the absence of free H and catalysts. B. C. A.

The individuality of casein. Preliminary paper. K. LINDERSTRØM-LANG. *Z. physiol. Chem.* 176, 76-8(1928).—By fractional extn. of purified casein with 20 parts of 60% EtOH contg. 0.002-0.001 N HCl and pptn. of the exts. with NaOH, a no. of fractions were obtained which varied between 0.15 and 1.0% in P content, between 1.4 and 2.3% in tryptophan content and between 3.8 and 6.1% in tyrosine content. Smaller but unmistakable variations were noted in the arginine, amino-dicarboxylic acid and lysine content. The reversibility of the fractionation was shown by exhaustive extn. of the casein, pptn. of the ext. with NaOH and addn. of this ppt. to the residue. The final material was identical in every respect with the original substance. Casein is not an individual substance. A. W. DOX

Glucolysis in the blood of birds following Röntgen irradiation. A. BORNSTEIN AND O. ASCHER. *Z. ges. exptl. Med.* 52, 615-8(1926).—Glucolysis is observed following irradiation. It is more rapid at 37° than at 0° . F. L. DUNN

Experimental studies on the formation of acetone bodies from amino acids. S. WEISS. *Z. ges. exptl. Med.* 52, 707-14(1926).—The amounts of acetone and dextrose derived from seven amino acids are given. F. L. DUNN

Reflections on the chemical senses. E. G. THOMSSON. *Am. Perfumer* 23, 71-3, 161-2(1928).—A discussion of the mechanics and chemistry of taste and smell. Thus, the author considers the importance of the senses in industry, and our limited knowledge of the chem. senses. A survey is made of recent work on taste and smell; the nature and mechanism of the stimuli; classified odor and taste; the conditions upon which quality and intensity of these senses depend; the relation of chem. compn. to odor; the association of odor with memory and pleasure; the practical applications of odor and taste in industry; suggestions for some further means of soln. of the problems raised. W. O. E.

Glycogenase in the fish muscle. I. TAKEO OYA AND KIYOSHI SHIMADA. *J. Imp. Fish. Inst. (Tokyo)* 22, 24-8(1926); (In Japanese; English résumé p. 17) *Biol. Abstracts* 1, 247.—It was found that a pH of about 7 is most favorable for the action of the enzyme in fish muscle of *Scomber japonicus*, *Paralichthys olivaceus* and *Pagrosomus*

mayor. This agrees with the findings of Euler, Myrback and Karlsson for rabbit muscle. H. G.

Amylase in pyloric ceca of *Sariola quinqueradiata*. TAKEO OYA AND KIYOSHI HARADA. *J. Imp. Fish. Inst. (Tokyo)* 22 [1], 28-33(1926); (In Japanese; English résumé, p. 17-8) *Biol. Abstracts* 1, 247.—Fat-free ceca were ground with sand, extd. with H_2O and pptd. with alc., the ppt. being dried over concd. H_2SO_4 . The resultant powder was yellow and insol. in H_2O . A pH of about 7 was most favorable for the action of the amylase, as is the case with pancreatic amylase of rabbit and ox. The optimum temp. was about 43° . NaCl accelerated the amylase action at 0.0125 mols.; above 0.05 mols. it had a retarding effect. KCl had no such effect even at 0.0125 mols. H. G.

Action of heat on serum lipases. G. DI MACCO. *Riv. patol. sper.* 1, 448-54(1926); *Biol. Abstracts* 1, 814.—The activity of lipases in blood serum of dogs is destroyed in a few minutes at 70° . The 2 lipolytic fractions as detd. by quinine are more sensitive to heat. The quinine-resistant fraction loses its activity at a slightly elevated temp., while the quinine-labile fraction, which is relatively thermostable, diminishes greatly in activity at 55° within 5 min. H. G.

The influence of hormones on the chemistry of the cell. J. WOHLGEMUTH Rudolf-Virchow Hospital, Berlin. *Deut. med. Wochschr.* 54, 816-7(1928).—A review of the previous work of W. and his coworkers. ARTHUR GROLLMAN

The relation between protein and urease. HAJIME ISHIBASHI. *Bul. Sci. Fakultato Terakulturu, Kjusu Imp. Univ.* 2, 287-91(1928).—Sumner (C. A. 20, 3301) has obtained urease from jack beans in crystal forms which have the nature of globulin. When repeating S.'s expts., I. never obtained a crystal. His urease was also less active. In order to det. whether the urease is a protein, the action of proteolytic enzymes on a urease-soln. has been studied. Pepsin and trypsin produce some amino acid and decrease the activity of the urease, but the production of amino acid and the diminution of activity are not proportional. There is a close relation between urease and proteins. A. L. HENNE

Studies of metal proteins. G. B. BONNINO AND GARELLO. *Arch. biol.* 1927, 51-5; *Ber. ges. Physiol. exptl. Pharmacol.* 44, 501.—To a 1% gelatin soln. of pH 5.5-5.5 Co powder was added until pH 6.5 was reached. Another gelatin soln. of pH 6.0-6.5 was dialyzed against 0.01 N $CoCl_2$, then against dialyzed water until the cond. reached the value of the 1st soln.: 2.22×10^{-4} . The solns. are identical with regard to viscosity, Co content and the velocity of salt diffusion. MARY JACOBSEN

A study of protein coagulation by the drop method. JAN BEČKA. *Časopis lékařů českých* 66, 1770-9(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 500 M. J.

The cell stimulation problem as applied to medicine and agriculture. METHODI POPOFF. *Fortschr. Naturwiss.* [new series], No. 3, 1-31(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 356. MARY JACOBSEN

Studies in the combination of protein and salts by means of conductometric methods. II. The combination of egg albumin and salt. KINSHIRO ITO. *Kyoto Ikadaigaku Zasshi* 1, 1061-5(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 483.—The decrease of cond. of KCl , $ZnCl_2$ or $CaCl_2$ solns. on the addn. of ovalbumin is attributed to adsorption of the salt. MARY JACOBSEN

Myelins of oleates, soaps and lipoids. A further contribution to the properties of liquid lipid crystals. VINCENZO DIAMARE. *Rend. accad. sci. (Napoli)* 33, 132-49(1927).— H_2O , H_2O_2 , chromates and crystalloids generally are excellent media for the differentiation between oleate and soap myelins on the one hand and lipid myelins on the other, since they dissolve the former and favor the formation and development of the latter, without causing any chem. or morphological change. Pure water is the least favorable "culture" medium. The gray matter of the brain contains a large proportion of a typical lipoidal myelin which may be easily identified in the form of liquid crystals enclosed in the neurokeratogenic colloid. Traces of this myelin may be demonstrated in the telencephalon in the earliest embryonal stage. The embryo contains considerable quantities of a typical lipid myelin already at an age at which its alleged sources (adrenals, etc.) are still at the blastemic stage. It is therefore necessary to assume that it has its origin in the placenta, in the maternal blood or in the yolk. The method also permits the differentiation between various lipoids. Pure com. lecithin and egg yolk myelin differ from nerve myelin. The myelin derived from caseous necrotic foci differs from that of furuncle pus. MARY JACOBSEN

Chemical, colloidal and biological effects of Röntgen rays of different wave length and their relation to air ionization. II. Ferrous sulfate in aqueous solution. HUGO FRICKER AND MOSE STERN. *Strahlentherapie* 26, 749-56(1927); *Ber. ges. Physiol. exptl.*

Pharmakol. **44**, 336; cf. *C. A.* **21**, 3682-3.—A 10^{-3} mol. soln. of FeSO_4 in 0.8 N H_2SO_4 was irradiated with equal doses of Röntgen rays of 0.204, 0.519 and 0.765 A. U. The extent of oxidation to $\text{Fe}_2(\text{SO}_4)_3$ was independent of λ . MARY JACOBSEN

Permeability of human and animal skin for the visible part of the spectrum. W. E. PAULI AND E. DENNIG. *Strahlentherapie* **26**, 761-6(1927); *Ber. ges. Physiol. expil. Pharmakol.* **44**, 336.—The light absorption between 450 and 1000μ which is graphically presented decreases inversely with λ . MARY JACOBSEN

The hydrolysis of octopus muscles. KIYOSHI MORIZAWA. Kyoto Univ. *Acta Schol. Med. Univ. Imp. Kioto* **9**, 299-302(1927).—When 500 g. of dried extd. octopus muscles was hydrolyzed by boiling for 6 hrs. with 1500 g. concd. HCl, the following substances were isolated from the soln.: tyrosine, glycine, *d*-alanine, *d*-valine, *l*-leucine, *l*-proline, glutaminic acid and phenylalanine. Tryptophan could not be isolated but a qual. test was obtained from a CHCl_3 ext. of 300 g. of dried material. N. A. LANGE

Polarized light and starch hydrolysis. JOHN W. M. BUNKER and EDMUND C. H. ANDERSON. Mass. Inst. Tech. *J. Biol. Chem.* **77**, 473-88(1928).—The expts. conducted under very carefully controlled conditions indicate that polarized light has no proved effect upon starch conversion by diastase. "These results are in disagreement with the original reports upon the subject (Semmens, *C. A.* **18**, 87 and Baly and Semmens, *C. A.* **19**, 781) and with 2 reported confirmations of the original reports, although agreeing with one reported failure to confirm them. Being unable to gain access to sufficiently exact data on any previous work, and being entirely unaware of the precision of measurements upon which earlier conclusions were based, we do not know whether conditions in our expts. were comparable to those in earlier work. In order that those interested may repeat the work complete essential data on all expts. are given. In the absence of such data in other reports and in light of the subtle nature of the errors which creep into measurements of enzyme activity, it is felt that the burden of proof lies with those who believe that polarized light, rather than some unchecked error of manipulation or observation, is responsible for the accelerated hydrolysis reported by them." A. P. LOTHROP

The presence of methylglyoxal as intermediate product in glucolysis. CARL NEUBERG AND MARIA KOBEL. *Biochem. Z.* **193**, 464-7(1928).—In glucolysis expts. with dog and horse blood in the presence of glucose and semicarbazide, no methylglyoxal deriv. was found, but only a decompn. product of the reagent, hydrazodicarbamide. S. MORGULIS

The peroxidase properties of leucocyte. K. NIKOLAEV. *Biochem. Z.* **194**, 244-50 (1928).—Leucocyte ext. gives peroxidase reactions, which disappear when the ext. is boiled. The intensity of the oxidation process has no relation to the Fe content. S. MORGULIS

Blood enzymes following extirpation of the adrenals. N. V. PUCHKOV. *Biochem. Z.* **194**, 251-3(1928).—The blood catalase content increases very quickly following the removal of the adrenals. At the time of death of the animal the catalase concn. reaches a max., the catalase index being practically doubled. There was no change in the blood oxidase or esterase. S. MORGULIS

Contribution to the glucolysis problem. W. RAAB. *Biochem. Z.* **194**, 473-6(1928).—Glycogen added to blood *in vitro* causes an increase in the blood sugar, this increase being unaffected by insulin. Glycogen injected intravenously likewise gives rise to increasing blood sugar values. S. MORGULIS

The influence of intravenous injections of hepatocatalase on the catalase and anticatalase content of the rabbit tissues. I. Catalase and anticatalase content of tissues from normal rabbits. I. G. BELKINA, L. L. KREMLEV AND R. V. FALK. *Zhur-nal expil. biol. Med.* **8**, 322-8(1928); cf. *C. A.* **21**, 3973.—The catalase content of the blood and tissues of the rabbit is subject to very great variations, exceeding 400% in some instances. In the order of the catalase content the tissues may be arranged as follows: blood, kidney, liver, spleen, lungs, heart, brain and muscles. The catalase of the blood does not furnish a criterion of the catalase content in the organism generally. The distribution of the anticatalase follows approx. the same order as that of the catalase. II. Changes in the catalase and anticatalase content in blood and tissues following the injection of massive doses of catalase into the blood. I. G. BELKINA AND L. L. KREMLEV. *Ibid* 329-41.—Injected catalase disappears gradually from the blood stream, complete disappearance occurring after 3 hrs. and this is also true for the tissues. The greatest accumulation of the catalase is observed in the kidneys and muscles where the max. is reached in an hr. The changes in the anticatalase content do not follow in any regular manner the changes in catalase, except that in the liver there is always

a diminution. The inactivation by means of the anticatalase apparently occurs in all tissues but most prominently in the liver. S. MORGULIS

The effect of x-rays and of radium on the blood formation during incubation of the chick egg. M. M. FOMENKO. *Zhurnal expil. biol. Med.* 8, 354-9(1928).—X-rays and Ra inhibit the development of the chick egg. Their effect is especially manifest in the morphological changes of the young erythrocytes. The younger the cell the more sensitive it seems to be. S. MORGULIS

The ability to produce work in human muscles at high temperatures. V. A. VOLGINSKII AND A. YAKOVENKO. *Zhurnal expil. biol. Med.* 8, 209-21(1928).—At high temp. mech. work is performed with a greater loss of energy than at moderate temp. S. MORGULIS

The erythrocyte as a colloidal system. III. The permeability of erythrocytes to electrolytes. A. P. KONIKOV. *Zhurnal expil. biol. Med.* 8, 480-7(1928); cf. C. A. 22, 982.—Erythrocytes are permeable to both anions and cations of neutral salts. Apart from the diffusion, however, the ions combine with the cell proteins, especially with the hemoglobin. At $p_H < 6.8$ the anions and at $p_H > 6.8$ the cations of the neutral salt react with the hemoglobin. In studies of the exchange of H and OH ions between erythrocytes and a sucrose soln. of varying p_H it is possible to det. the reaction of the isoelec. point of the erythrocyte. This has been found to be p_H 6.8, which is also the isoelec. point of hemoglobin. The amphoteric nature of the hemoglobin can explain many physico-chemical properties of erythrocytes as, for instance, the predominance of anions in their ash, increased permeability to anions under the influence of CO_2 , etc. IV. Mechanism of hemolysis in hypotonic solutions. *Ibid* 488-501.—The osmotic resistance of erythrocytes varies according to the salt used depending upon the valence. The essential factor in hemolysis is the osmotic condition of the hemoglobin. This conclusion is reached from the observation that either the anion or cation is the effective agent in the hemolysis depending on whether the medium is in the acid or alk. side of the isoelec. point of hemoglobin (p_H 6.8). The osmotic resistance increases with alky., reaching a max. at p_H 9.0. Measured in sucrose solns. the osmotic resistance of the red cell depends upon the previous salt treatment. This indicates that the resistance does not entirely depend upon the medium but the inner state of the erythrocyte. The erythrocyte is regarded as a two-gel system consisting of stroma and hemoglobin. The osmotic pressure of the hemoglobin is detd. by the degree of ionization and follows Donnan's law. Hemolysis occurs as soon as hemoglobin passes from the gel into the sol. condition when it diffuses into the surrounding medium through the stroma gel. The permeability of the latter is likewise affected by the ionization of its proteins but in the opposite direction, the curve of the osmotic resistance of the cells in relation to the p_H of the surrounding medium being the component of these 2 distinct effects. S. MORGULIS

Influence of ultra-violet rays on some physicochemical and biological properties of tuberculin. S. M. MIKHAILOVSKII. *Zhurnal expil. biol. Med.* 9, 12-22(1928).—Ultra-violet radiation causes a shift of the p_H of tuberculin solns. to the acid side, and at the same time the surface tension increases because of the formation of larger ultra-microscopic aggregates. However no definite relationship was found between these 2 phenomena. S. MORGULIS

Role of calcium in biology and therapeutics. GEORGES BOINOT. *Bull. sci. pharmacol.* 35, 239-46(1928).—A review. L. W. RIGGS

Stabilization of albumins by globulins. VL. BERGAUER. *Bull. soc. chim. biol.* 10, 576-80(1928).—The results of this study tend to support the theory of Zsigmondy with reference to the stabilizing action of lecithin upon albumins. L. W. RIGGS

Influence of the p_H on cellular division. R. REDING AND A. SLOSSE. *Compt. rend. soc. biol.* 98, 878-9(1928).—The variations in the p_H of the blood in the course of peptonic shock form the basis of this study. It is concluded that under certain conditions the p_H value regulates the cellular division. L. W. RIGGS

Statistics and calculation of probabilities in biology and medicine. MARCEL DUPOUR. *Compt. rend. soc. biol.* 98, 1139-40(1928). L. W. RIGGS

A perfusion liquid for elasmobranchs. ELEANOR M. KAPP. *Science* 67, 513-4(1928).—Dild. sea water as a perfusion liquid for vertebrate tissues has given only partial success because of its large Mg content. It is possible to ppt. most of the Mg and relatively little of the Ca by the addn. of 12 cc. of 10 N NaOH to each l. of sea water. After standing overnight the liquid is decanted through a filter and the filtrate is adjusted to p_H 8 by the addn. of HCl. This serves as a stock soln. Before use this modified sea water is prepd. by the addn. to each 30 cc. of 10 cc. of a 20% soln. of urea and 60 cc. of distd. water and the acidity is adjusted to p_H 7.4. The removal of more Mg than pro-

vided above is attended with a loss of Ca and an increase in Na which destroys the salt-balance.

L. W. RIGGS

Buffer action as a biological principle. V. BERMAN. *Wochschr. Brau.* **45**, 21-4(1928).—The injurious effects of acids on alkalies produced by biol. processes are checked by buffer action. The cause of poor yeast made from some beet molasses has been traced to a deficiency of org. buffer substances. In the brewing industry buffers are produced during the processes of malting, mashing and fermentation. Buffer substances also affect the flavor of the beer.

A. SCHULTZ

Malt enzyme (cytase) which decomposes hemicelluloses. H. LÜERS AND W. VOLKAMER. *Wochschr. Brau.* **45**, 83-7, 95-9(1928).—A quant. study of the action of cytase was made. The optimum p_H is 5.0 and the enzyme is completely inactivated at p_H 9. Optimum temp. is 113° F. while destruction occurs within 15 min. at 140° F. Xylose, the product of hydrolysis, retards the hydrolytic action of the enzyme. It is purified by adsorption on Al hydroxide at p_H 5 followed by elution with a phosphate of p_H 8.3.

A. SCHULTZ

The oxidation-catalytic action of Fe (HANDOVSKY) 2. The reversibility of various adsorbed compounds and their velocity of reversion (KÖDA) 2.

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

The colorimetric amino acid determination in urine according to Folin. ERNST SCHMITZ AND HANS SCHOLTYSSEK. *Z. physiol. Chem.* **176**, 89-94(1928).—For removal of NH_3 in the Folin method of detg. amino acids in urine, commercial permuteite may be used in place of the much more costly special permuteite. The error due to the higher alk. of the filtrate is then eliminated by substituting at this point the phenolphthalein procedure recommended by Folin for detg. amino acids in blood. NH_3 may be removed also by distn. *in vacuo* with MgO , the amino acids being detd. in the residue by this procedure, and the NH_3 collected in 0.1 *N* acid for sep. detn. Analyses in which Folin permuteite, commercial permuteite and MgO were used show excellent agreement.

A. W. DOX

The intracellular hydrogen-ion concentration. I. Methods. M. SCHMIDTMANN. *Z. ges. expit. Med.* **57**, 123-6(1927).—S. concludes that it is not possible to get more than relative values for the hydrogen-ion concentration of the inside of cells because of the trauma incident to introducing the indicator into the cells. **II. The reaction and permeability of inflammatory and tumor cells.** *Ibid* 127-44.—The reactions were studied by pricking the cells with various indicators and noting quickly the color change. The results are too extensive for abstracting.

F. L. DUNN

A method of obtaining unmixed hepatic blood in animals by a transthoracic puncture of the hepatic vein. GEORGE FRENCKELL. *Z. ges. expit. Med.* **57**, 565-73(1927).—A detailed illustrated description of a method which F. has worked out in cats, and which he considers superior to the methods of London (C. A. **18**, 1323 and of Fischler (*Physiologie und Pathologie der Leber*, Berlin, Julius Springer, 1925).

F. L. DUNN

The colorimetric estimation of the hydrogen-ion concentration of urine. V. C. MYERS AND E. MUNTWYLER. Univ. of Iowa. *J. Biol. Chem.* **78**, 225-42(1928).—A colorimetric method for estg. the p_H of urine is described by using the bicolorimeter and the phthalein dyes. The effect of diln. is stabilized and the loss of CO_2 is minimized by dilg. the urine 1:5 with a saline diluent of definite p_H and making the detn. under oil. The detns. are made at 25° and the following correction factors used to convert the results to 38°: 0.24 for phenol red; 0.20 for bromothymol blue and bromocresol purple; and 0.22 p_H for bromocresol green. With salt concns. above *M*/15, the colorimetric value is greater than the electrometric while with smaller concns. the reverse is true.

ARTHUR GROLLMAN

Colorimetric estimation of the hydrogen-ion concentration of blood. V. C. MYERS AND E. MUNTWYLER. Univ. of Iowa. *J. Biol. Chem.* **78**, 243-55(1928).—Electrometric and colorimetric detns. of the p_H of 103 samples of human blood were made, the former at 38°, the latter at room temp. When a correction of 0.22 p_H was made 85% of the readings by the colorimetric method were within ± 0.04 p_H of the correct value. The av. correction for 10 samples of dog plasma was 0.30 p_H . The major part of the correction for the colorimetric readings is due to the temp. change.

ARTHUR GROLLMAN

Determination of chloride in biological fluids. R. K. CHRISTY AND WILLIAM ROBSON. King's College, London. *Biochem. J.* **22**, 571-4(1928).—After removal of protein and pptn. of chloride with $AgNO_3$, an aliquot portion of the filtrate is mixed

with potassium bi-iodate and sol. starch, and the standard KI is run in from a buret. The reaction is $\text{KIO}_3 \cdot \text{HIO}_3 + 10\text{KI} + 11\text{HNO}_3 \rightarrow 11\text{KNO}_3 + 12\text{I} + 6\text{H}_2\text{O}$.

BENJAMIN HARROW

An application of Pregl's microanalysis to the determination of free phosphates in the blood. ERIK JORPES AND HENNING MAGNUSSON. *Acta paediatr.* 7, 1-14(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 406.

MARY JACOBSEN

Determination of pancreatic trypsin in duodenal juice. FILIPPO PIGNATARI. *Folia clin. micr.* 2, 447-53(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 575; *Boll. soc. ital. biol. sper.* 2, 931-5(1927).—Detn. of the time required to liquefy a certain quantity of gelatin of p_H 7.8-8.4 at room temp.

MARY JACOBSEN

The colorimetric determination of lipid phosphorus in blood. ALVIN R. HARNES. Rockefeller Inst. *J. Biol. Chem.* 77, 405-7(1928).—The lipid P in blood (1 cc.) may be detd. by Brigg's colorimetric method (*C. A.* 16, 3493) without oxidation of the org. substances present. After CHCl_3 extn. it is hydrolyzed by the H_2SO_4 present in Brigg's molybdate soln. into H_3PO_4 and at the same time the blue color of reduced molybdate is developed. The small quantity of lipid material remaining does not interfere with the colorimeter reading. The results obtained are as accurate as those by other methods now in use and there is a great saving of time and material.

A. P. LOTHROP

Colorimetric determination of iron and hemoglobin in blood. II. SAN YIN WONG. Univ. Hongkong *J. Biol. Chem.* 77, 409-12(1928); cf. *C. A.* 17, 2295.—The simple and rapid method described dispenses with heating altogether. The Fe is split off from the hemoglobin by cond. H_2SO_4 and $\text{K}_2\text{S}_2\text{O}_8$. The proteins are pptd. with H_2WO_4 and the Fe in the filtrate is detd. colorimetrically as $\text{Fe}(\text{SCN})_3$. The % of hemoglobin is obtained by dividing the amt. of Fe per 100 cc. by 3.35 since hemoglobin contains 0.0335% of Fe.

A. P. LOTHROP

A simple respiration apparatus for determination of oxygen and carbon dioxide in indirect calorimetry. J. F. McCLENDON, HILDING C. ANDERSON, F. R. STEGGERDA, CLAIRE CONKLIN AND MILDRED WHITAKER. Univ. Minn. *J. Biol. Chem.* 77, 413-20(1928).—The app. is adapted for general student use and has been used to det. basal metabolism in men and women with normal results. The whole app. is immersed in a water bath of such a size that the heat transmitted to the air in the lungs and the heat generated in absorption of CO_2 do not change the temp. of the bath significantly; the spirometer domes when projecting from the H_2O are inclosed in a box so insulated as not to vary the temp. of the H_2O . The app. is kept in a room with ordinary temp. regulation and without large window or outside wall area.

A. P. LOTHROP

A new blood sugar method. OTTO FOLIN. Harvard Med. School. *J. Biol. Chem.* 77, 421-30(1928).—The analysis requires but 0.1 cc. of blood which is obtained by puncturing the skin with an automatic spring lancet. The blood is measured in a special 0.1 cc. capillary pipet which fills automatically in the same manner as the ordinary 0.01 cc. blood count pipets are filled. The protein is pptd. with H_2WO_4 . The sugar in the filtrate is oxidized with alk. $\text{K}_3\text{Fe}(\text{CN})_6$ and the ferrocyanide produced is measured colorimetrically as Prussian blue. The color obtained from 0.04 mg. of glucose in a 25 cc. tube is as deep as that from 0.2 mg. in the Folin-Wu method. The new method gives unmistakably lower values than the Folin-Wu method. Somewhat lower figures are obtained on finger capillary blood by the new method than on venous blood by the Folin-Wu procedure.

A. P. LOTHROP

Titrimetric quinhydrone electrodes. A comparison with the hydrogen electrode for hydron concentration determinations in plasma, whole blood, and other biological fluids. GEORGE H. MEEKER AND JOHN G. REINHOLD. Phila. Gen. Hosp. and Univ. Pa. Med. School. *J. Biol. Chem.* 77, 505-18(1928); cf. *C. A.* 20, 1826.—The balanced titrimetric quinhydrone electrode is a simple and inexpensive app. for H-ion concn. measurements and requires much less equipment than other quinhydrone methods. It is more accurate than indicator methods and is sufficiently trustworthy to permit its substitution for the H_2 electrode with cerebrospinal fluid, edema fluid, urine, milk, gastric contents of infants, and culture media. Agreement in the 2 methods extends an appreciable distance above p_H 8.0 in all the materials examd. It cannot be used with whole blood because of the reaction between hemoglobin and quinhydrone but gives satisfactory results with human serum and plasma and with horse serum. It cannot be successfully used with dog serum.

A. P. LOTHROP

Studies in the metabolism of bile. I. A quantitative Pettenkofer test applicable to the determination of bile acids in the blood. MARTHA ALDRICH AND MARY S. BLANDSON. Mayo Clinic. *J. Biol. Chem.* 77, 519-37(1928).—The Pettenkofer reaction can be used to det. pure bile acids quant. in amts. of 0.1-0.5 mg. with an accuracy of $\pm 5\%$ and the results agree within the limits of error with those obtained by the gasomet-

ric detn. of the amino N liberated by alk. hydrolysis. The method is rapid and easy and can be applied to small quantities of materials. Normal blood yields a Pettenkofer value equiv. to 3–6 mg. of glycocholic acid per 100 cc. and bile acids added to blood are recovered with an accuracy of 90% or more. Alc. is used to ppt. the proteins and ext. the bile acids in 5 cc. of blood and recrystd. glycocholic acid is used as a standard.

A. P. LOTHROP

Lipochromes. III. The quantitative estimation of carotin in blood and tissues. CHARLES L. CONNOR. Harvard Med. School. *J. Biol. Chem.* 77, 619–26(1928).

—The method is essentially a modification of that used by van den Bergh, Muller and Brockmeyer (*C. A.* 15, 255). The pigment is extd. with petroleum ether from the ppt. obtained by mixing 3 cc. of 95% alc. with 3 cc. of blood plasma and compared. in color with 0.04 or 0.02% $K_2Cr_2O_7$ soln. With tissues and organs a more elaborate procedure is necessary and xanthophyll is also detd. Carotin is frequently but not constantly present in normal blood; the amt. is slightly increased after ingestion of carotin in olive oil and is slightly higher in diabetic blood. "Lipochromes are constantly present in the adrenals of adults but are not present in these or other organs of infants, they are present also in the corpus luteum, liver and fat, but were not found in recognizable quantities in other organs except the spleen, where the amt. could be accounted for by that present in the contained blood. The seminal vesicles and heart, in all cases well colored, did not contain pigments demonstrable by the methods used. The adrenal glands of rabbits and guinea pigs contain the greatest amt. of lipochrome in these animals; next to these organs the liver contains the most. There is no carotin present in the blood of these animals even after feeding or injection of comparatively large amts." These pigments are, therefore, not as widely distributed as is generally asserted in textbooks of pathology.

A. P. LOTHROP

The Kramer-Tisdall potassium method. SERGIUS MORGULIS AND ANNE PERLEY. Univ. Neb. Med. Coll. *J. Biol. Chem.* 77, 647–9(1928).—The factor 0.071 used by Kramer and Tisdall (*C. A.* 15, 1912) for converting cc. of 0.01 N $KMnO_4$ to corresponding quantities of K is not const. for different reagents; there is no fixed factor as it varies with the amt. of K analyzed. Each new reagent should be standardized with varying amts. of a known K soln. and curves prepd. for use in analyzing unknown solns. If detns. are confined entirely to the range of 0.2 to 0.3 mg. of K as is usually the case in blood plasma analyses, the factor 0.071 is accurate. P at least in equiv. concn. does not interfere with the K detn. as identical curves were obtained with KCl and KH_2PO_4 solns.

A. P. LOTHROP

The estimation of urea and amino acid nitrogen in animal tissues. VEON C. KIECH AND JAMES M. LUCK. Stanford Univ. *J. Biol. Chem.* 77, 723–31(1928).—The method was developed for use in the analysis of the whole carcass but is probably directly applicable to single tissues and has been used with liver, muscle and fetus. Autolysis is prevented by keeping the material frozen with liquid air. H_2WO_4 is used as the protein precipitant. The urea is detd. gravimetrically as dioxanthidryl urea and the amino acid N in the Van Slyke amino N app. When samples of frozen carcass of the rat were allowed to stand at room temp. proteolysis proceeded with great rapidity as shown by the increased amino N values but the urea values remained const., thus confirming the findings of Hoagland and Mansfield and not supporting Gad-Andresen's theory of rapid ureolysis.

A. P. LOTHROP

Ferricyanometric micromethods in blood analysis. L. FLATOW. *Biochem. Z.* 194, 132–9(1928).— $K_3Fe(CN)_6$ is used in concns. of 0.0025–0.001 N with a five times more dil. soln. of indigo sulfonic acid. The titrated liquid is mixed with $1\frac{1}{2}$ its vol. of 25% KOH and the titration is carried out in diffuse light until the color changes sharply from yellow to blue. Various micro blood analyses can be made by this titration. Uric acid is detd. in the deproteinized filtrate of blood serum by using a 0.001 N $K_3Fe(CN)_6$ soln., 1 cc. of which corresponds to 0.1 mg. uric acid. The method is even applicable to clear serum directly, but in whole blood a preliminary pptn. with Ag is necessary, which causes a loss of 10%. Thiasine and glutathione can be detd. as follows: Pour 10 cc. of blood into 90 cc. 0.005 N AcOH and heat on the water bath until pptn. of protein is complete. About 75 cc. filtrate is obtained. To this add 3.7 cc. of 1.65% U acetate to complete the removal of protein. On refiltering 76 cc. is obtained corresponding to 72 cc. of the original 1:10 diln. To 2.1 cc. filtrate (= 0.2 cc. blood) add 0.4 cc. of 0.3194% $K_3Fe(CN)_6$ and 2 cc. KOH, and titrate; results are usually given which correspond to an apparent 16 mg. % uric acid. Of the remaining filtrate, boil 74 cc. (= 7-cc. blood) with 0.5 cc. 0.1 N HCl over an open flame until the vol. is 4 cc., transfer to a centrifuge tube, add 0.5 cc. 0.1 N NaOH and ppt. with 3 cc. 10% Ag lactate (contg. 5 cc. 85% lactic acid and 5 cc. 10% NaOH per 100 cc.). This throws

down the Ag salts of Cl, uric acid, thiasine and glutathione. Centrifuge the ppt., and ext. with 10% NaCl-0.1 N HCl mixt. which dissolves the uric acid, and wash with H₂O. Decomp. the remaining residue with 1 drop concd. HCl, heating 3 min. in the water bath; shake with 5 cc. H₂O and pour off the supernatant liquid (after centrifuging); make up to 7 cc. In 5 cc. det. the NH₂N by Folin's method and from this calc. the amt. of glutathione. In 0.5 cc. after adding 1.0 cc. K₃Fe(CN)₆ and 1.5 cc. KOH det. the "uric acid equiv." by titration. The reducing action of 1 mg. uric acid is equal to that of 2.73 mg. thiasine or 2.98 mg. glutathione. This allows calcn. of the uric acid equiv. of the glutathione, the difference being due to the thiasine. *Blood sugar* is detd. directly from the amt. of K₃Fe(CN)₆ consumed. Transfer 0.1 cc. blood to a mixt. of 1 cc. 0.1 N NaOH and 2.5% ZnSO₄, and heat to facilitate pptn. Then add 10 drops of 10% Na tungstate, dil. to 10 cc. with H₂O and filter after shaking. To 5 cc. filtrate (= 0.05 cc. blood) add 2 cc. of the 0.0025 N K₃Fe(CN)₆ and 0.1 cc. of a cold satd. Na₂CO₃ soln. Run a blank simultaneously, using 5 cc. H₂O in place of the blood filtrate. Heat the 2 for 15 min. in the water bath, cool and titrate. Calc. the sugar from the formula $V = 2(A - B)/A$, where A = cc. indigo required to titrate 2.0 cc. K₃Fe(CN)₆ (unheated); B = cc. required in the detn. A table is given in which the sugar concn. corresponding to V is recorded. *Copper*.—Cu occurs in blood serum, about 1-3 mg. per l. The detn. of the Cu depends upon the disappearance of cysteine from a standard soln. The procedure is an adaptation of Warburg's gasometric method. The only requirements are 3 test tubes and Cu-free distd. H₂O. Test tube A contains 2.0 cc. Warburg's pyrophosphate mixt. and 0.2 cc. 0.01 N HCl; B contains 2.0 cc. pyrophosphate, 0.1 cc. of a mixt. of equal parts of serum and 0.2 N HCl, and 0.1 cc. 0.01 N HCl; tube C contains in addn. also 0.1 cc. of a 1×10^{-4} mol. Cu soln. in 0.01 N HCl. Add an equal amt. (0.8 cc.) of a cysteine soln. to each tube, remove an aliquot (0.3 cc.) every 10 min., transfer to flasks contg. K₃Fe(CN)₆ and Na₂CO₃, and titrate the excess with the indigo soln. The loss of K₃Fe(CN)₆ is directly proportional to the Cu concn. which can be calcd. from the formula $X = [(B - A)/(C - B)] \times 10^{-4}$, where A , B and C are the amts. of indigo used in all 3 tubes at the same time. The method is now being developed to det. also Fe in blood. S. MORGULIS

A micro-method for the determination of enzyme activity. B. N. SASTRI AND M. SREENIVASAYA. *J. Indian Inst. Sci.* 11A, 31-9(1928).—In a capillary tube of uniform diam. is placed a series of drops of active soln. (substrate and enzyme) alternated with inactivated controls (substrate + boiled enzyme); the tubes are sealed and attached to a microscope slide and then immersed in a small water bath. As digestion proceeds in the active solns., the drops increase in size at the expense of the controls because of difference in vapor pressure. This difference represents a change in the no. of mols. and hence is a measure of enzyme action. The results are comparable with those obtained by standard methods for detg. enzyme activity. The method is useful where only a small amount of enzyme material is available, but is not applicable to any reaction in which gases or volatile liquids are formed. N. M. NAYLOR

The determination of sugar, uric acid, urea and creatinine in one cubic centimeter of blood. EDWARD S. ROSE. *J. Am. Pharm. Assocn.* 17, 41-2(1928).—The Folin and Wu method is used with slight variations. The suction pump is used to obtain as much filtrate as possible after the protein has been pptd. in the usual manner. *Sugar*. Use 1 cc. of filtrate and proceed as directed by F. and W. using 0.1 and 0.2 mg. dextrose for comparison. Dil. all tubes to 25 cc. *Uric acid*.—Use 2 cc. of filtrate. In order to match the colors better 1 cc. of dild. uric acid standard soln. is added to the sample and the proper correction made. For comparison use 2 tubes contg. 2 and 4 cc. of dil. uric acid standard soln. representing 0.008 and 0.016 mg. uric acid, resp. All tubes are brought to the same vol. before adding reagents and finally to 25 cc. when compared. *Urea*.—Use 2 cc. of filtrate. Use NH₃-free H₂O and reagents to avoid errors. To prevent the carrying over of interfering substances a short-neck 200 cc. Pyrex distg. flask is substituted for the large test tube. The suggested, aerated distn. of Butka and Meisner is followed. *Creatinine*.—Place 2 cc. of filtrate in a test tube and in 3 others place 1, 2 and 3 cc. of dil. creatinine soln. (contg. 1 mg. in 250 cc.) representing 0.004, 0.008 and 0.012 mv. creatinine. Add H₂O to make the vols. the same, add 1 cc. satd. picric acid soln. and 1 cc. of 5% NaOH. Mix, allow to stand 10 min., dil. to 25 cc. and compare within 5 min. L. E. WARREN

Preparation of electrolyte-free gelatin (NORTHROP, KUNITZ) 2. Determination of sugar with Fehling's solution and centrifuging (ILJIN) 7. Determination of two sugars in one solution (ILJIN) 7. Simultaneous determination of minute amounts of CO₂ and O (FRNN) 7.

PINCUSSEN, LUDWIG: **Mikromethodik. Quantitative Bestimmung. d. Harn-, Blut- u. Organbestandteile in kleinen Mengen f. klin. u. experimentelle Zwecke.** 4th revised and enlarged ed. Leipzig: G. Thieme. 200 pp. M. 6.

C—BACTERIOLOGY

A. K. BALLS

Relation of the action of microorganisms to the chemical constitution of *p*-hydroxy-*p*-hydrobenzoic acid. TH. SABALITSCHKA. *Apoth. Ztg.* **43**, 670-2(1928).—An address. W. O. E.

Comparative acid production of *B. delbrücki* and the low-temperature lactic acid bacteria, *B. lactis acidii* and *B. cucumeris fermentati*, Henneberg. STAIGER AND GLAUB-ITZ. *Z. Spiritusind.* **51**, 109-10(1928).—Cultures on sucrose, dextrose, maltose and molasses showed that *B. lactis acidii* and *B. cucumeris* produced more acid than *B. delbrücki*. Molasses plus yeast ext. gave the best results. C. N. FREY

Chromolytic study of yeasts. I. The chemical composition of yeasts. K. WATANABE. *Japan. J. Dermatol. Urol.* **27**, 373-85(1927); *Ber. ges. Physiol. expil. Pharmakol.* **44**, 133.—The tabulated results were obtained by the Unna-Schumacher method. The cells of *Blastomyces*, *Debaryomyces* and *Monilia* consist of basic protein, lipoproteins, nucleoproteins, lecithins and free nucleic acid. The Gram stain apparently depends on the lecithins and not on the nucleoproteins since it is abolished by 4 hrs. hydrolysis with HCl, which leaves the cell stainable with methylene blue. M. J.

D—BOTANY

THOMAS G. PHILLIPS

The relation of oxygen to the germination of the chlamydospores of *Ustilago zeae* (Beck) Unger. G. A. PLATZ. Dept. of Botany, Iowa State College. *Iowa State Coll. J. Sci.* **2**, 137-43(1928).—Expts. in O-poor air (down to 1% O) show that the decrease of O below the proportion found in the air causes a decrease in the proportion of these spores which germinate. These spores do not germinate in water and in dil. nutrient solns. contg. gelatin or tomato juice as well as in more concd. nutrient solns. contg. the same solutes. This is not due to lack of nutrient but to sinking deeper in the soln. and presenting less surface for absorbing O₂. F. E. BROWN

Variations of water and dry matter in the leaves of Pima and Acala cotton. R. S. HAWKINS. *Ariz. Agr. Expt. Sta., Tech. Bull.* **17**, 419-44(1927).—The amt. of water in Acala cotton leaves was always greater than that in Pima cotton leaves, the inference being that the water requirement of Acala variety is greater than Pima. Acala cotton suffered more from water stress as evidenced by heavier shedding of bolls than Pima. The leaves of Acala contained more dry matter by wt. than Pima leaves although the actual % of dry matter was less. The amt. of dry matter increased during the day more rapidly in the Pima cotton leaves than in the Acala cotton leaves, when an abundance of soil moisture was available, but the reverse was true during drought. C. R. F.

The asparagus industry in California. H. A. JONES AND W. W. ROBBINS. *Calif. Agr. Expt. Sta., Bull.* **446**, 1-105(1928).—The roots lost much sugar during spear production but the % of other constituents remained nearly const. The shoots had a mean H₂O content of 92%, fat 0.25% and N 2%. Fertilization expts. with N, P and K showed inconclusive results. Asparagus spears stored with their butts in H₂O on wet moss increased in wt. After harvesting there is a loss in reducing substances and in total sugars at all temps. These losses were especially pronounced at the higher temps., the max. rate of loss being during the first 24 hrs. Besides sugars other substances which det. flavor are esters, glucosides, amino acids and proteins. Respiration caused the loss of sugar in shoots during storage. The sugar was transformed to cell-wall material, chiefly lignin. The greatest increase in crude fiber occurred after the asparagus had been cut for 24 hrs. It was least at low temps. The amt. of crude fiber present served to indicate the toughness of the spears. The quality of com. canned asparagus is good because the canneries are located near the fields and the shoots are canned while strictly fresh. C. R. FELLERS

The enzyme content of germinating wheat. N. PROKOPENKO. *Nauchno Agronomicheskii Zhurnal* **4**, 346-54(1927); *Deut. landw. Rundschau* **1**, 824(1928).—The catalase, peroxidase and amylase are studied in early and late ripening varieties of summer and winter wheat, being expressed in terms of N KMnO₄ after the method of Bach and Operin. The catalase and peroxidase are much greater in the early ripening varieties when germinated at 7°. The amylase content is not dependent on the temperature of

germination. The late ripening summer wheat has more catalase and peroxidase than the winter variety and the early ripening summer wheat. GEORGE R. GREENBANK

Seed fats of the Umbelliferae. I. *Heracleum sphondylium* and *Angelica sylvestris*. T. P. HILDRICH AND E. E. JONES. *Biochem. J.* 22, 326-30(1928).—The fatty acids identified in both varieties were palmitic, stearic (?), petroselinic (Δ^6 -octadecenoic), oleic (Δ^9 -octadecenoic) and linoleic. Cf. *C. A.* 21, 2661. BENJAMIN HARROW

Aldehyde oxidase of the potato. FREDERICK BERNHEIM. *Biochem. J.* 22, 344-52 (1928).—To prep. the enzyme, 2 lb of potatoes were minced, the juice was pressed through linen, the liquid satd. with $(\text{NH}_4)_2\text{SO}_4$ and the ppt. filtered. The ppt. contains all the enzyme. The ppt. was washed with $(\text{NH}_4)_2\text{SO}_4$, dissolved in 150 cc. water, the cloudy suspension filtered off, and the enzyme further purified by treating the soln. 4 times with 3 g. charcoal (Merck's medicinal). The resulting soln. contains all the enzyme and 90% of the protein. It is now made slightly acid and 5 g. kaolin is added. All the enzyme is absorbed and eluted by 5% Na_2CO_3 soln. It is neutralized with dil. AcOH and dialyzed for 4 hrs. The soln. has about 5% of its original protein and about $\frac{1}{3}$ of its activity. The soln. was satd. with $(\text{NH}_4)_2\text{SO}_4$, the ppt. centrifuged off and dried in a vacuum desiccator. A gray powder was obtained which was readily sol. in water. Besides nitrate, methylene blue, Clark's dyes and quinone are reduced by the enzyme-aldehyde system. Traces of iron do not affect the activity of the enzyme BENJAMIN HARROW

Biochemistry of plant diseases. X. Fermentation of pentoses by *Fusarium lini*. M. G. WHITE AND J. J. WILLAMAN. Univ. Minnesota. *Biochem. J.* 22, 583-91(1928); cf. *Phytopathology* 16, 941(1926).—When *Fusarium lini* is grown on xylose, arabinose, or rhamnose, the main products are mycelium, CO_2 , $\text{C}_2\text{H}_5\text{OH}$ and a small amt. of organic substance precipitated by lead. Xylose is utilized the most efficiently for alcohol production and arabinose for growth. **XI. *Fusarium lini* and the pyruvic acid theory of alcoholic fermentation.** *Ibid* 592-5.—Each intermediate compd. in the pyruvic acid theory of alc. fermentation is utilized by *F. lini*, the methylglyoxal being represented by its hydroxy deriv. BENJAMIN HARROW

Studies on pectin. II. The estimation of the individual pectic substances in nature. D. R. NANJI AND A. G. NORMAN. Univ. Birmingham. *Biochem. J.* 22, 596-604(1928); cf. *C. A.* 21, 2743.—The principle involved in the estimation is based upon the work of Carré and Haynes (*C. A.* 16, 1994). It consists in pptg. the pectin as Ca pectate, after hydrolysis by alkali, and weighing as such. Results for leaves, cereal grains and fruits are recorded. BENJAMIN HARROW

Chlorination method for macerating woody tissues. W. M. HARLOW. *Bot. Gaz.* 85, 223-7(1928).—Split out material match-stick size; boil to expel air; immerse in strong Cl-water for 2 hrs.; wash; immerse in hot 3% Na_2SO_3 soln. for 15 min.; wash and repeat the treatment with Cl-water until upon mild shaking, sufficient material seeps BENJAMIN HARROW

Experimental researches on vegetable assimilation and respiration. XVII. The diurnal rhythm of assimilation in leaves of cherry laurel at "limiting" concentrations of carbon dioxide. E. J. MARSHALL. *Proc. Roy. Soc. (London)* 102B, 467-87(1928).—In the cherry laurel (*Prunus laurocerasus rotundifolia*), the nocturnal depression in assimilation represents an increased resistance to the diffusion of CO_2 toward the chloroplasts, and is due chiefly to changes in the degree of stomatal opening. **XVIII. The relation between stomatal opening and assimilation—a critical study of assimilation rates and porometer rates in leaves of cherry laurel.** *Ibid* 488-533.—The diurnal and seasonal rhythms of stomatal opening run parallel with those of assimilation rate. The relation between porometer rate and assimilation rate suggests that the rate of apparent assimilation may be regarded as detd. by a potential (the external CO_2 concn.) and a series of resistances (stomatal resistance to diffusion, resistances in the intercellular space system and in the liquid diffusion path up to the chloroplast surface, and in the photochem. and chem. phases of photosynthesis.) **XIX. The effect of variations of carbon dioxide supply upon the rate of assimilation of submerged water plants.** W. O. JAMES. *Ibid* 103B, 1-42(1928).—Comparative studies were made of aq. solns. contg. (1) NaHCO_3 and (2) CO_2 , by using each soln. at several rates of flow. The rate of assimilation was greater with NaHCO_3 at a flow of 400 cc. per hr. in the app. and at a flow of 600 cc. per hr. with high light intensity; this rate was the same with the 2 solns. at a flow of 600 cc. per hr. with low light intensity. The rate of assimilation was not influenced by the rate of flow of NaHCO_3 soln. In solns. of this salt, apparently only the free CO_2 is available for assimilation; such solns. are satisfactory for the detn. of assimilation rate when they are dil. and not too alk. JOSEPH S. HEPBURN

The spike-disease of Sandal (*Santalum album*, Linn). I. Diastatic activity of

the leaves. M. SREENIVASAYA AND B. N. SASTRI. *J. Indian Inst. Sci.* 11A, Part III, 23-9.—The diastatic activity of expressed sap from diseased leaves and stems is higher than that of healthy leaves and stems. No gradient in diastatic activity was found in the diseased leaves while in the healthy plants there was a steady fall in diastatic activity from the growing tip downwards.

H. R. KRAYBILL

Carbohydrate metabolism and its relation to growth in the edible canna. J. C. RIPPERTON. *Hawaii Agr. Expt. Sta. Bull.* 56, 1-35(1927).—A number of tables of analyses of various parts of canna plants are given. Sucrose is the chief sugar of the leaves. The hexose:sucrose ratio is very low in both mature and in rapidly growing leaves. The percentage of hexose is higher in the midribs and sheaths. In the stem proper, hexoses are greatly in excess of sucrose. The sucrose increases and the hexoses decrease toward the apex of the root-stock. Both sugars decrease in the base. The hexoses are thought to be sugars of translocation and the starch in the rootstocks seems to be formed from sucrose. The quantity of hexose in immature stems and of sucrose in immature rootstocks is low, indicating a diversion of food to new leaf growth in the immature plant. Vigorously growing rootstocks are high and mature ones low in hexoses. The sucrose content of the rootstock is lowered when normal growth is halted and if for long it does not again go up and the rootstocks are low in starch. After a prolonged dry spell copious irrigation may increase the sucrose but this increase seems to be due to hydrolysis of starch already formed. Sucrose and starch contents of rootstocks vary directly with each other. Very young rootstocks are low in starch content which increases up to the dormant stage of growth. The increase is accompanied by an increase in sp. gr. A table is given by which the approx. % of starch in the rootstocks may be read off from the sp. gr. Detns. of osmotic pressures are said to confirm the conclusions given regarding carbohydrate metabolism. Sixteen references are appended.

A. L. MEHRING

Lignin and humins in wood decomposition by fungi. C. WEHMER. *Techn. Hochschule, Hanover. Ber. deut. botan. Ges.* 45, 536-9(1927).—A critical discussion.

LAWRENCE P. MILLER

The physiology of the corolla. SERGIUS IVANOV. Mendelyev Inst., Moscow. *Ber. deut. botan. Ges.* 45, 582-7(1927).—The petals from the flowers of eight species of plants were found to have a dry weight between 15 and 20%, of which 3.46 to 20.5% was ash, 10.0 to 46.6% sugar, chiefly monosaccharide and 0.56 to 3.68% nitro-gen. Starch was absent. When the petals drop they still contain considerable moisture and sugar, but in some cases, part of the nitrogen is removed previously.

LAWRENCE P. MILLER

Seasonal course of the carbohydrate content of the fir and pine trunk. ERNST GAUMANN. Eidg. Techn. Hochschule, Zürich. *Ber. deut. botan. Ges.* 45, 591-7(1927).—Each month for 12 consecutive months, detns. of hexosans and water-sol. material in the heartwood and sapwood of the trunk of *Picea excelsa* and *Abies pectinata* were made. The hexosans in the heartwood of the fir varied between a max. of 11% in Sept. and Oct. and a min. of 8.4% in Mar., while in the pine the content varied between 7 and 9%. In the sapwood of both species the hexosans reached a max. in fall, which decreased during the winter, rose rapidly after assimilation began in spring, and decreased again before rising to the fall max. The water-sol. material increased with the spring max. but not with the fall max., indicating a difference in the type of carbohydrates at these periods.

LAWRENCE P. MILLER

Physiological investigation of *Cuscuta monogyna* Wahl. MARIE LILIENSTERN. *Ber. deut. botan. Ges.* 46, 18-26(1928).—The p_H of the plant juice is a factor in detg. its availability as host for *C.* When grown under unfavorable nutritional conditions *C.* shows increased chlorophyll content, increased peroxidase activity, and in some cases, increased diastatic power.

LAWRENCE P. MILLER

Contributions to plant microchemistry. XVII. A red-color-yielding chromogen occurring in cacti species. HANS MOLISCH. Wiener Univ. *Ber. deut. botan. Ges.* 46, 205-11(1928).—Of 29 species of *Cactus* investigated all but one produced a red color when a cut surface was kept moist and exposed to air for 2-5 days. Upon comparison of this colored material with cochineal, obtained from *Coccus cacti*, which feeds on cactus sap, it was found that their properties were quite different, although this does not preclude the possibility of close relationship. M. was unable to crystallize this coloring matter.

LAWRENCE P. MILLER

The excretion of ammonia by plant roots in cases of acid poisoning. D. N. PRYANISHNIKOV. *Biochem. Z.* 193, 211-5(1928).—Peas, beans and oats were studied from the point of view of the NH_3 excretion when the rootlets of the germinating plants were kept in acids of various strengths. The results show that the plant responds to the acid intoxication the same as the animal organism does, by increased NH_3 pro-

duction the latter being directly related to the protein content of the plant (beans produce most, oats least NH_3). This alteration of the metabolism with the production of NH_3 has been observed not only in poisoning with acid, but also with physiological acid salts (NH_4Cl , $(\text{NH}_4)_2\text{SO}_4$), or under the influence of anesthetics, fasting or unbalanced nutrition (excess N).

S. MORGULIS

The energy content and the energy accumulation in plants with regard to their carbon and nitrogen content. A. ZBOROVSKY. *Biochem. Z.* 193, 122-38(1923).—The C/N ratio in legumes of different seasons varies from 9 to 15, and there is a parallelism in the variations of the caloric value and of the C content. Slow drying plants show a relatively greater loss in calories, C or N than those which have been dried quickly at 100° .

S. MORGULIS

A contribution to the zinc problem in plant biochemistry. MIHOVIL GRAČANIN. *Biochem. Z.* 194, 215-30(1928).—Zn plays a different physiol. role in heterotrophic and autotrophic (green) plants, being a typical stimulant for the living processes of many of the former, while having invariably an injurious action on the latter. In certain concns. ZnSO_4 stimulates somewhat the germination of seeds of certain cultivated plants, but this effect is limited only to the early stages until the first leaves break through and the plant obtains the possibility of synthesizing matter through the aid of chlorophyll. By suppressing the activity of the chloroplasts through lack of light, the stimulating action of ZnSO_4 is restored. The stimulating effect on growth of ZnSO_4 increases as the temp. is raised and the light intensity diminished, so that the toxic concn. can be defined only in relation to a definite temp. light combination. Concns. greater than 0.001 M have invariably produced acute injury in *Lanum alba* or in *Glechoma hederecea*, causing rapid death either through wilting or through obvious destruction of the chlorophyll. In lower concns. a chronic type of injury manifested itself in the diminished chlorophyll content with resulting loss of green color. This naturally led to a diminished photosynthetic activity and impaired nutrition of the plant. In *Unium undulatum* and in *Elodea canadensis* the chlorophyll was lost even in very small concns. of ZnSO_4 , and this loss was detd. by the concn., temp. and light intensity, the latter playing the most important role. Thus, *Unium*, which in diffuse light at 10° after 10 days still contained an appreciable amt. of chlorophyll, showed under similar conditions of temp. and ZnSO_4 concn. but in bright sunlight almost complete disappearance of the chlorophyll. In leaves of *Lanum* which have turned yellow it was found that regeneration of the chlorophyll is possible when the leaves are placed on a 0.125 N sucrose soln. Even in some white leaves of *Unium* the reversibility of the chlorophyll could be shown. The fact that Zn, contrary to the effect of Fe, produces chlorosis leads to the conclusion that it is a neg. photocatalyzer for green plant cells, which explains why it does act as a stimulant for vegetative growth of lower plants or for germination of seeds. Soil fertilization with ZnSO_4 does in some instances result in greater yield of plant growth, but when this occurs it is thought to be due not to a direct action upon the plant but through its effect upon the microbiological condition of the soil.

S. MORGULIS

The growth of grapes. IV. Initial changes in acidity. P. R. v. D. R. COPEMAN. *Trans. Roy. Soc. S. Africa* 16, Pt. 2, 103-6(1928); cf. C. A. 22, 1791.—During the development of the grape, 3 definite stages of acidity occur: the production of acid in the sap which is transferred to the berries as formed; the increase in acidity during growth to a max. value; the final decrease in acidity to a min. value at maturity. The 3 varieties of grapes tested show similar acid changes during early stages of growth but differ in actual amount of acid produced. **V. Relationship between sugar and soluble solids in the juice.** *Ibid* 107-13.—After settling, the sp. gr. of grape juice is determined by means of a Balling hydrometer. It is shown that sugar content, to which sol. solids and acidity are closely related, may be calcd. from sp. gr. of juice. The detn. may be used to judge the quality and maturity of the fruit. **VI. The acid : sugar ratio.** *Ibid* 115-20.—This ratio decreases as fruit ripens until at maturity a certain value is reached dependent upon the acidity of the fruit. The values of the ratio at full maturity of grapes examined vary from 0.02 to 0.038, representing a sugar content of 14.2 to 15.6%. The Balling sp. gr. detns. check these calcs.

N. M. NAYLOR

Report on (the determination of) total chlorine in plants. DORIS H. TILDEN. *J. Assoc. Official Agr. Chem.* 11, 209-18(1928).—Methods for the detn. of Cl in plant material that involve direct incineration were found to be as inaccurate and unreliable as other authors have maintained. In direct ashing methods, C compds., as well as S and P, cause loss of Cl by volatilization. The possibilities of a direct method of detg. Cl without incineration in highly colored or possibly colloidal plant materials are not promising. Ashing in presence of a Cl fixative seems to be the only practical method

available. Na_2CO_3 is a feasible and satisfactory Cl fixative, provided the $\text{Na}_2\text{CO}_3:\text{Cl}$ ratio is not less than 5. The present official gravimetric method for detg. Cl does not always give consistent results, possibly because of occlusion and soly. factors; satisfactory results were obtained by a modification based on the use of dil. AgNO_3 (preferably 0.05*N*), pptg. the Cl in the cold, and violently agitating to produce an insol. granular ppt. that can be thoroughly cleaned by washing with a large quantity of cold water. The modified gravimetric, Gay-Lussac and Volhard methods were found equally reliable and accurate for detg. Cl in ashed plant material in quantities ranging from 3 to 100 mg.

A. PAPINEAU-COUTURE

Effects of external factors on wheat rust. R. CASPAR. *Kühn-Archiv*, No. 12, 205-56(1926); *Chimie et industrie* 19, 711(1928).—After a review of the literature, C. studies the method of development of wheat rust, the effects of various factors (aeration, moisture, fertilizers) and the best methods of protection against it. Fertilizers have but little action on the development of wheat rust: kainite favors it, but other K fertilizers have no appreciable effect; of the P fertilizers, superphosphate and basic slag afford some protection; Ca cyanamide is a good protective agent, NH_4NO_3 to a less extent, and NaNO_3 and $(\text{NH}_4)_2\text{SO}_4$ have no effect. Rust develops more readily in soil of av. moisture content than in very dry or very moist soil; well-aerated soil is unfavorable to its development; the tests did not show any effect due to the nature of the soil. Development of wheat rust is hindered by a high germination temp.; but as the max. temp. of germination is 25° and the optimum $16-8^\circ$ the range is small. Rust develops better in the shade than in the sun, when the seed has been buried deep or when it has been sown close. Old seed gives a crop that is less readily attacked, but this effect is not noticeable in seed less than 1 yr. old.

A. P.-C.

The hydron concentration of plant tissues. VII. The buffers of sunflower stem and root. S. H. MARTIN. Queen's Univ., Belfast. *Protoplasma* 3, 273-81 (1928); cf. C. A. 22, 613.—Stems of mature sunflowers (*Helianthus annuus*) were cut off slightly above soil level and the juice of the stem was expressed by pressure. The roots were carefully cleaned and the sap was obtained by pressure. Colorimetric methods were used to det. p_H , which was about 5.8. Inorg. PO_4 detn. were made and expressed as buffer values in terms of $M \text{H}_2\text{PO}_4$. Conclusions: The normal reactions of the sap of mature sunflower stems and roots are buffered as in the hypocotyl of the seedling, by a dil. concn. of inorg. PO_4 present in soln. in the cell sap. **VIII. The buffers of bean stem and root.** *Ibid* 282-301.—The inorg. PO_4 content of the expressed sap of broad bean stem and root were detd. by Embden's method. The buffer value of the expressed sap was detd. by titration with standard alkali and the results so obtained were calcd. in terms of $M \text{H}_2\text{PO}_4$. Stem and root sap exhibited similar phenomena: (1) varying amts. of inorg. PO_4 were present; (2) the amts. of buffer action varied; (3) at all the reaction points the sap of the stem or of the root exhibited a higher buffer capacity than that due to the contained inorg. PO_4 ; (4) in all cases the buffer value of the sap increased as titration towards an arbitrary end point, which was p_H 6.8 in most cases; (5) the differences between H_3PO_4 content and buffer values, at the various reaction points detd., apparently bore no definite relation to the actual amts. of inorg. PO_4 in soln. in the cell sap. About 1.99 g. oxalic and 1.553 g. malic acids were present per l. of sap. The oxalates act as buffers within the reaction range p_H 3.0 to p_H 5.3. Malates buffer between p_H 3.7 and p_H 6.0. The CO_2 content varies from 3 cc. to 7.5 cc. per 100 cc. of sap. In contact with CO_2 of concns. ranging from 5 to 50% the reaction of the expressed sap of the bean was shifted by increasing amts.: 50% CO_2 brought the reaction from p_H 5.8 to p_H 4.8.

M. H. SOULE

An apparatus for controlling the flow of nutrient solutions in plant cultures. E. S. JOHNSTON. Univ. of Maryland. *Plant Physiology* 2, 213-5(1927).—Description, with diagram, of an app. devised for the continuous renewal of culture solns. in studies of plant nutrition. The unique feature is the introduction of an outlet siphon that fits into one of the cork stoppers of the cover of the earthenware culture jar. By raising or lowering this siphon the rate at which soln. flows from the culture jar can be controlled. Since this rate, together with the rate of transpiration, det. the rate of flow into the culture jar from the other units of the app., viz., a large reservoir, a const.-level jar and a sub-reservoir, the amt. of soln. flowing per unit of time from the culture jar is always in excess of the transpiration by an amt. depending on the adjustment of the outlet siphon.

WALTER THOMAS

The behavior of the cyanogenetic glucosides of cherry laurel during starvation. H. GODWIN AND L. R. BISHOP. *New Phytologist* 24, 295(1927); *Pharm. J.* 120, 55 (1928).—The cyanogenetic glucosides represent a fairly large fraction of the stored carbohydrate of the leaves. The glucoside (A) is formed as a necessary result of the

up-grade metabolism of the cherry laurel plant, and is not an intended protective compd. or a definite food reserve. When split by enzyme action, the liberated sugar is used in respiration. The study of the problem of starvation, respiration and yellowing in cherry laurel leaves showed the following main points: (1) During starvation, *A* disappears. (2) The loss begins in early stages and probably before any yellowing can be seen. (3) The end of yellowing shows leaves entirely depleted of *A*. (4) The rate of loss of *A* increases after a time to a max., then decreases. (5) The period of max. loss of HCN appears to coincide fairly closely in time with similar maxima in the rates of CO₂ output and of yellowing. Rosenthaler (cf. *C. A.* 15, 2293) and Treub have shown that in very young leaves at the time of opening of the bud, the % of HCN is very high; this falls later with the period of max. growth to a low value, and disappears at the time of the fall of the leaf. The following explanation is suggested: When the cells are quite young, the protoplasm is in the gel state, hence the available H₂O at enzyme centers may be presumed to be so small that accumulation of *A* results. In the mature stage the protoplasm is balanced between the states of sol and gel. In the senescent state passage to sol condition liberates the hitherto bound conditions of the H₂O and enzymes, so that a rapid attack on the elaborated products ensues, and among others, the glucosides are then rapidly broken down.

S. WALDBOTT

Assimilation of carbon dioxide. K. SCHAEFFER. *Schweiz. Apoth. Ztg.* 65, 537-42 (1927).—A review of the work of Klein (*C. A.* 20, 2519-20, 3447; 21, 2917) based chiefly on that of Wislicenus (*C. A.* 13, 1483) and Neuberg (*C. A.* 14, 3257). By means of *dimedon*, K. had recognized the formation of HCHO as an intermediary product in the plant synthesis of hexose from CO₂ and H₂O.

The determination of soluble carbohydrates (APPLEMAN, *et al.*) 7.

E—NUTRITION

PHILIP B. HAWK

Effect of high-voltage cathode rays on rickets and on the activation of cholesterol. A. KNUDSON AND W. D. COOLIDGE. *Proc. Soc. Exptl. Biol. Med.* 24, 366-9(1927).—With voltages of 100, 200 and 350 thousand, rickets in rats cannot be cured by direct treatment with cathode rays. Cholesterol outside of the body was activated by these rays. Because of the damage done to the animals, it is not possible to give the dose necessary to activate enough of the cholesterol of the skin to bring about cure.

C. V. B.

Contaminating substances as a factor in the activation of cholesterol by irradiation. A. F. HESS AND A. WINDAUS. *Proc. Soc. Exptl. Biol. Med.* 24, 369-70(1927).—Cholesterol purified by being twice sepd. as the dibromide and then recrystd. failed to be activated by ultra-violet rays. Similarly treated phytosterol also failed to be activated. Possibly it is some contaminating substance which acquires this specific property.

C. V. B.

The development of marked activity in ergosterol following ultra-violet irradiation. A. F. HESS AND A. WINDAUS. *Proc. Soc. Exptl. Biol. Med.* 24, 461-2(1927).—Ergosterol, prepd. from yeast, was irradiated with the Hg vapor quartz lamp for 1½ hr. at a distance of 1 foot; it was then suspended in linseed oil and fed to rachitic rats in varying amts. Healing resulted when as little as 0.003 mg *per capita* daily was given. To obtain similar results with irradiated cholesterol approx. 1 mg. daily was required.

C. V. B.

Feeding experiments with plants at different stages of development. III. Synthesis of vitamin in plants. M. KARSHAN, F. KRASNOW AND B. HARROW. *Proc. Soc. Exptl. Biol. Med.* 24, 765-6(1927).—Fifteen rats were kept on a synthetic diet deficient in vitamin A until they became stationary in wt. Groups were then given in addn. to the diet 6 seeds of ungerminated corn, 6 seeds of germinated corn and 6 green seedlings per rat per day, resp., for 81 days. The first 2 groups contracted xerophthalmia and died; the last group gained wt. and were in good health. Vitamin A is synthesized during the course of greenin^g.

C. V. B.

Vitamins A and B in the Chinese litchi nut. A. H. SMITH AND P. P. T. SAH. *Proc. Soc. Exptl. Biol. Med.* 25, 63-4(1927).—The dried litchi nut constitutes an exception among edible fruits in its lack of the 2 food factors, vitamins A and B, which were found present, if at all, in only very small and ineffective amts. The nut is not toxic.

C. V. B.

Further evidence of destruction of vitamin B in evaporated milk. A. L. DANIELS AND L. BROOKS. *Proc. Soc. Exptl. Biol. Med.* 25, 161-3(1927).—Expts. on nursing

rats and on pigeons indicate that the antineuritic vitamin is destroyed in part in evapd. milk. C. V. B.

Vitamin content of barley germ (malt germ). A. SCHNITTENHELM AND B. EISLER. *Z. ges. expl. Med.* 58, 645-61(1928).—Vitamins A, B, D and E were found. Vitamin C was lacking. F. L. DUNN

A study of the effect of feeding creatine on growth and its distribution in the liver and muscle of normal mice. A. CHANUTIN AND H. H. BRARD. Western Reserve Univ. *J. Biol. Chem.* 78, 167-80(1928).—Creatine added to the diet of mice did not influence their growth curve. The feeding of arginine-rich protein did not increase the creatine concn. of the liver or muscle which were 0.035 and 0.367%, resp. Administration of creatine to mice induced its accumulation in the liver and muscle. On its withdrawal from the diet, the concn. in the liver diminished while that in the muscle remained const. ARTHUR GROLLMAN

Vitamin B content of malt extract. A. I. BACHARACH AND EDITH ALLCHOVNE. *Biochem. J.* 22, 313-6(1928).—Several varieties of commercial malt ext. (British manuf.) are rich in vitamin B ("that vitamin which will restore to normal growth rats on a diet devoid of water-sol. growth-promoting factors"). The vitamin is derived from the unmalted flour. BENJAMIN HARROW

Metabolism in scurvy. I. The lactic acid excretion of scorbutic guinea pigs. H. L. SHIPP AND S. S. ZILVA. *Biochem. J.* 22, 408-15(1928).—Studying the lactic acid in the urines of normal and scorbutic guinea pigs, as well as of guinea pigs suffering from general nutrition, the authors were unable to observe any significant change in the percentage of lactic acid (cf. Rosenwald, *C. A.* 20, 2355). BENJAMIN HARROW

Antineuritic yeast concentrates. IV. The further purification of yeast vitamin B (curative). H. W. KINNERSLEY AND R. A. PETERS. *Biochem. J.* 22, 419-33(1928); cf. *C. A.* 22, 2399.—"Yeast vitamin B" is here used in place of "torulin." The material has now been concd. to such a point as to show an activity of 0.027 mg. per day (pigeon dose). Both phosphotungstic and chloroplatinic acids have been used for concg. the yeast vitamin B (which is insol. in CCl_4 , ether, acetone and ethyl acetate). The vitamin is destroyed by 1 hr.'s heating with 0.5 N NaOH; toward oxidizing and reducing agents it is relatively stable. BENJAMIN HARROW

Relation of vitamin B to the growth-promoting factor for a Streptothrix. R. A. PETERS, H. W. KINNERSLEY, JEAN ORR-EWING AND VERA READER. *Biochem. J.* 22, 445-50(1928).—Vitamin B, and the bacterial growth-promoting factor are not identical because sufficient alkali treatment always inactivates the curative properties, but the purer exts. after such treatment still retain growth-promoting activity. BENJAMIN HARROW

Critical examination of methods of evaluating vitamin A by means of the growth of rats. E. M. HUME AND H. H. SMITH. *Biochem. J.* 22, 504-21(1928).—To est. vitamin A it is best to give the test dose from the start of the expt., a dose being sought which produces a given amt. of growth in a given time, taking growth to 300 g. for males and 200 g. for females at 6 months of age as that which an optimum dose ought to give; or to seek such doses as will, after a depletion period, give subnormal growth, graded to the dose, for the first few weeks. BENJAMIN HARROW

Sources of supply of vitamins A and D. O. ROSENHEIM AND T. A. WEBSTER. *Nature* 120, 440(1927).—Liver fat of sheep, calf and ox contain on an av. as much as ten times the amt. of vitamin A found in a good Newfoundland cod-liver oil. The vitamin D can be obtained by irradiating ergosterol which, in turn, can be obtained from yeast. Margarine can take the place of butter if to the former are added appropriate exts. from the liver fat of herbivorous animals and the calcd. quantity of irradiated ergosterol. BENJAMIN HARROW

Feeding of dairy cows and their need for vitamins. E. S. SAVAGE. *Certified Milk Conferences* 1927, 126-31.—A study (with bibliography) of the ration with especial reference to vitamins A, B, C and D. JOSEPH S. HEPBURN

Comparative study of certified and pasteurized milk in infant feeding. M. S. LEWIS. *Certified Milk Conferences* 1927, 203-15.—Each type of milk was used in the diet of over 100 infants. Certified milk produced greater av. gains in wt. and growth and more freedom from rickets. JOSEPH S. HEPBURN

The effect of variations in vitamins, protein, fat and mineral matter in the diet upon the growth and mortality of eastern brook trout. C. M. MCCAY, F. C. BING AND W. E. DILLEY. *Trans. Am. Fish. Soc.* 57, 240-50(1927).—Feeding studies upon 10 groups of 50 fingerlings each are recorded. Rations of purified constituents were fed and the growth curves and mortality rates recorded. The rations contained variable proportions of casein, cooked starch, lard, salt mixt., yeast and cod-liver oil. A ration

of dried skim milk with yeast and cod-liver oil served as a control. No growth was obtained upon a 10% casein ration, demonstrating that this is the protein minimum. After 5 months of stunting upon this low protein a normal growth rate could be resumed if raw liver was fed. If the protein exceeded 10% the fingerlings displayed an initial growth followed by death in 10-12 weeks. Stunted fingerlings lived nearly twice as long as those that grew upon synthetic diets. Some other factor is concerned with the growth of trout which is different from any known vitamin. Dried skim milk plus yeast and cod-liver oil produces a growth rate equiv. to that of raw meat for a period of 3 months, but is followed by sudden death of all fingerlings. High-fat diets are not specifically injurious for limited periods of feeding.

C. M. McCAY

Factor H in the nutrition of trout. C. M. McCAY AND W. E. DILLEY. *Trans. Am. Fish. Soc.* 57, 250-60(1927); cf. *C. A.* 22, 1630.—Nutrition studies upon 20 groups of trout fingerlings are reported. Trout are equally stunted by a low protein level whether the diet contains 3 or 6% mineral matter. Fresh meat contains much thermolabile dietary factor, termed "H," which is essential for life and growth. This is not identical with vitamins A, B, C, D and E. A quantity of raw liver as small as 5% exerts a marked increase in the growth obtained upon dried skim milk. The use of lactose to replace starch in making up synthetic trout rations is of no value. Agar-agar affords no improvement. Artificial dry skim milk lacks factor H. The factor in liver responsible for growth is different from that concerned in blood regeneration. Raw meat combined with dry skim milk is an excellent ration for the practical rearing of trout and produces a better growth rate than raw meat, with very low mortality.

C. M. McCAY

Calcium in the urine and blood during the administration of lemon juice. A. LEVI. *Bull. soc. ital. biol. sper.* 3, 67-9(1928).—The Ca content was detd. in the urine and blood of animals receiving lemon juice for a long time and kept on a const. diet. The Ca in the urine of one rabbit increased from a normal av. of 0.1 g. to 0.28 g. per 24 hrs. in 3 weeks. The Ca in the blood of another rabbit decreased from 100 mg. to 81 mg. per 1000 in 4 weeks and the Ca in the blood of a dog decreased from 90 to 76 mg. per 1000 in 3 weeks.

PETER MASUCCI

Some experiences of endemic, manifest and latent scurvy in Sweden with special reference to new methods of diagnosing latent scurvy. HAROLD ÖHNELL. *Acta Med. Scand.* 68, 176-88(1928).

S. MORGULIS

Specific dynamic action in avitaminosis. IX. Internal secretion and avitaminosis. A. V. ARVAY. *Biochem. Z.* 192, 369-82(1928).—Lack of vitamin A and B causes a diminution in specific dynamic action, whereby the same effect is observed when only B is missing but not when A alone is lacking. It is supposed that the lack of vitamin B diminishes the activity of the thyroid gland and that this induces the disappearance of the specific dynamic effect.

S. MORGULIS

The nutritive value of fat. III. JUNICHI OZAKI. *Biochem. Z.* 192, 428-30(1928); cf. *C. A.* 21, 3939; 22, 802.—The nutritive value of natural fats depends on their chem. constitution. Butter has the highest value among the natural fats. Cod-liver oil is not different in nutritive value from other oils. Oils are better utilized than solid fats, and fish oils are generally poorer than vegetable or animal oils. The fatty acids of cod-liver oil have no special value, so that it is the vitamin content of the oil alone which imparts to it its properties.

S. MORGULIS

Phosphatide metabolism of pigeons in B avitaminosis. ERNST SCHMITZ AND TATSUJI HIRAOKA. *Biochem. Z.* 193, 1-17(1928).—Injection of lecithin does not prevent the rise in blood cholesterol. An increase in the adrenals occurs only exceptionally. In rice-fed pigeons the increase in the adrenal cortex as an avitaminosis symptom develops very slowly. On the contrary, lecithin fed by mouth in the same amts. failed to produce this effect. The most striking influence of the lecithin injections, however, appears in the less pronounced diminution in the number of red cells.

S. MORGULIS

Demonstration of the antirachitic factor in grass grown in the dark on artificial nutritive media. II. W. VÖLTZ AND W. KIRSCH. *Biochem. Z.* 193, 281-4(1928); cf. *C. A.* 21, 3655.—Grass grown to a height of 10-12 cm. in total darkness and on nutritive solns. of a known salt compn. exerts an antirachitic effect. The substance responsible for this action is not taken up by the rootlets but is elaborated by the plant in its cellular metabolism.

S. MORGULIS

A method for the prevention of starvation of pigeons suffering from avitaminosis. R. O. FETTELBERG. *Zhurnal eksptl. biol. Med.* 8, 343-52(1928).—Starvation of exptl. pigeons can be prevented by alternate feeding with polished rice and inactivated barley. The opisthotonos, convulsions and paralysis occur without, however, the animals

undergoing starvation. Pigeons thus fed develop the disease later and lose less wt. than pigeons receiving a monotonous vitamin-free diet. S. MORGULIS

The Imperial (Japanese) Government Institute for Nutrition. GERMAINE SILVESTRE DE SACY. *Bull. soc. hyg. aliment.* 15, 481-504, 524-51 (1927).—A description of the organization of the Institute and of the nature of the work carried out, with summaries of the results so far obtained. **Calorific requirements of Japanese.** TAKAHIRA, KITAGAWA, ISHIBASHI AND KAYANO.—Detns. were carried out with Benedict's app. on 11 primary-school teachers, 10 policemen and 10 chauffeurs, the av. values found for the resp. classes being 22.75, 26.07, 25.54 cal. per kg. per 24 hrs.; and 36.17, 53.58, 37.08 cal. per hr. per sq. m. of body surface. **Basal calorific requirements of Japanese.** TAKAHIRA, KITAGAWA, ISHIBASHI AND KAYANO.—The av. requirements of 73 male and 43 female normal healthy adults were 37.30 and 33.88 cal. per hr. per sq. m. of body surface, resp. **Standard basal calorific requirements of Japanese.** TAKAHIRA.—The following formula is proposed for detg. body area: $S = 127P \times 718/H \times 74.49$, where S = surface, P = wt. and H = height. The basal calorific requirements can be calcd. from height, wt. and age. **Variations in metabolism during fast and on resumption of feeding.** HIRAO TAKAHIRA.—Six men fasted 12-30 days. The rate of loss in wt. was high during the first few days (approx. hyperbolic curve), but after a week became small and practically const. On resumption of feeding there was a tendency to fix a large amt. of N, the metabolism reached a value higher than normal, and the normal wt. was regained in 80-100 days. **Basal metabolism in laborers.** TAKAHIRA, KITAGAWA, ISHIBASHI AND KAYANO.—Expts. with 30 men and 20 women showed the min. value of the basal metabolism of the men was 40.23 cal. per m.² body surface per hr. (7.21% higher than the standard of 37.33) and the av. of the women 36.43 (7.2% higher than the standard of 33.84), the reason for the increase being due to the fact that phys. work increases the metabolism and its effect continues to be felt at the time the measurements are made. **Improvement of the physical condition of badly fed children.** T. KAWAKAMI AND C. TAKANABE.—Observations on 503 underfed children (285 boys and 218 girls) 8-15 yrs. old showed that: increase in body wt. is proportional to the amt. of food taken; the total amt. of food taken increases with age; the total quantity of food taken is proportional to the body wt. but the quantity of food per kg. body wt. taken per day decreases with increase in wt. Standard diets are suggested for underfed Japanese children of different sexes and at different ages. **Parallelism between creatinine excretion and basal metabolism.** TAKAHIRA.—Comparative detns. of basal metabolism and of creatinine in the urine of 31 men and 21 women showed that the so-called creatinine coeff. (ratio of creatinine excreted to body wt.) is related to body surface and to basal metabolism. **Effect of the degree of polishing of rice on its absorption.** SUGIMOTO, HIGUCHI, MOMOYEDA AND TANAKA.—Numerous expts. showed that the degree of absorption increases with the degree of polishing. Investigation of the variation in the compn. of rice with polishing showed that: (1) N decreases slightly while fat, ash and fiber decrease considerably during polishing; (2) none of the constituents of rice is completely eliminated by polishing; (3) the compn. of different varieties of rice which have been polished to the same extent varies considerably; (4) the P content of rice varies considerably in different varieties; (5) use of rice which has been 70% polished is recommended on both economic and physiol. grounds. The difference in p_H values of the isoelec. points of *oryzanin* from common and from glutinous rice is 0.07-0.52, the glutinous rice proteins having the higher acidity. The oryzanin of common rice is more difficultly sol. in alkalies, has a slightly higher n and α , contains about 1% more N (with predominance of NH_2 , lysine and arginine, as compared with predominance of monamino-N, histidine and cystine in glutinous rice) and has a higher free amino-N content than that of glutinous rice. The ratio of lysine in the oryzanin of common and of glutinous rice is 100:57. **Influence of methods of cooking on the absorption of rice.** SUGIMOTO, FUJIMAKI, MOMOYEDA, TANAKA AND YASUDA.—The expts. show that: (1) polished rice is absorbed better in the form of pudding (the rice is washed with water, sun-dried, ground to a flour, 1200 g. are made into a dough with 650 cc. H_2O and a certain quantity boiled with 400 cc. H_2O in an enameled mold) than merely boiled; (2) the degree of absorption of unpolished rice pudding is intermediate between that of boiled polished rice pudding and boiled unpolished rice, but the fat of unpolished rice pudding is as easily absorbed as that of boiled polished rice; (3) ingestion of polished rice in the form of "gruel" (prepd. by boiling 8 g. salt, 3 l. H_2O and 3 "measures" (8 "measures" = 1200-1300 g.) of rice) decreases the degree of absorption of total N, carbohydrates and fat, and increases that of inorg. constituents; (4) with "Ojiya" polished rice (wash 5 "measures" of rice with 4 l. H_2O , boil, add 80 g. of bean meal and boil again) the absorption of total N and carbohydrates decreases and that of fat and inorg. constituents increases; (5)

ingestion of "Suchi" polished rice (boiled rice flavored with vinegar) slightly increases absorption of all the constituents; (6) the absorption of all the constituents (except carbohydrates) of polished rice boiled with red bean juice (prepd. by boiling 1470 g. red beans with 10 l. H_2O and filtering through gauze) was considerably higher than that of polished rice boiled merely with H_2O ; (7) the absorption of "Okawa" (a mixt. of 7 "measures" polished glutinous rice and 3 "measures" ordinary polished rice is washed, soaked overnight in H_2O , drained and boiled 45 min. in 350 cc. H_2O) gives lower total N, fat and ash absorption than boiled polished rice, but higher carbohydrate absorption; (8) absorption of all the constituents of rice are higher in the case of "Mochi" (wash 18 l. of rice, soak overnight in an equal vol. H_2O , drain and cook as for "Okawa") prepd. from glutinous rice than in the case of "Okawa". **Chemical investigation of rice: oxidase.** HIGUCHI.—Qual. tests on 160 samples unpolished and 60 samples polished rice harvested in 1919–23 showed that the reactions for catalase and peroxidase are parallel to that of oxidase. The following *quant. method for catalase* was devised: suspend 100 grains of ground unpolished rice in 100 cc. H_2O and filter; to 25 cc of filtrate add 10 cc. of neutral 0.05% H_2O_2 , let stand 1 hr. at 25°, add 50 cc. H_2SO_4 (concn. not given) and titrate the excess H_2O_2 with 0.1 N $KMnO_4$. Application of the method showed that (1) different qualities of rice vary considerably; (2) the activity of a given quality of rice is approx. the same for samples for neighboring localities, but differs when they come from distant localities; (3) rice from cooler climates is generally more active; (4) with different samples of the same quality and from the same locality, the activity decreases with the time elapsed since harvesting; (5) there is no relation between these phenomena and the sp. gravity of the rice; (6) decrease in activity is retarded when the rice is stored in a dry place; (7) polished rice is less active than unpolished rice. **Biological value of the chief vegetable Japanese foods.** KAICH FURUMI.—The biol. value of the proteins of a few Japanese foods was found to be as follows: polished rice 81.68, semi-polished rice 93.25, unpolished rice 66.08, barley 66.21, sweet potatoes 81.41, koryo 41.08, millet 56.86. **Vitamin contents of Japanese foodstuffs.** SHIMODA, FUJIMAKI AND SARETASHI SAIKI.—*Summer oranges* contain vitamin A. *Canned plums* contain no vitamin B but an appreciable amt. of vitamin C. *Lard*, as marketed, contains very little vitamin A, and even in the porportion of 15% cannot complete a ration otherwise deficient in vitamin A. *Radish juice* has an even higher vitamin C content than orange or lemon juice. *Alc. ext. of *Tapes Philippinarum** (a fresh-water shell) is deficient in vitamin B. *Radish leaves* have a high vitamin A content. The highest vitamin C content of radishes is to be found in the peelings. When radishes are kept in "nukamiso" (paste made from rice polishings) the vitamin C content decreases considerably, and when they are kept in salt it almost completely disappears. The decrease in vitamin C content in *fermented rice* is due to a difference in osmotic pressure, the vitamin disappearing through osmosis and the destructive action of certain org. acids. *Cucumber and egg-plant* preserved in "nukamiso" contain a small amt. of vitamin C, while *cabbage* similarly kept contains only traces of vitamin C. *Buckwheat flour* has a high vitamin B content, but no vitamin A. *Oysters* have a high vitamin A content. The vitamin B content of *red kidney beans* is comparable to that of buckwheat flour; *Japanese eels* (*Eutosphernis japonicus*) has a very high vitamin A content, 0.1 g. added to the ration of young rats being sufficient to ensure normal growth. **Effect of some foodstuffs on growth.** KWAKAMI, UCHIDA AND NAKAMURA.—Curves are given showing the rates of growth of mice fed on animal protein (*dried fish* and "*katsuobushi*") and on vegetable protein (*kidney bean meal*), carbohydrates being supplied in the form of ground rice and vitamins in cabbage, the protein, fat and carbohydrate contents of the diets being 18.4, 4.0 and 75, resp. The animal proteins caused much more rapid growth than the vegetable proteins, and dried fish was superior to "*katsuobushi*," probably owing to the presence of non-protein substances in the former. **Avitaminosis A in guinea pigs.** ANON.—On 2 different occasions avitaminosis A was produced exptly. on lots of 15 guinea pigs in about 2–3 weeks. **Deficiency of vitamin A in unpolished rice.** FUJIMAKI AND SHIMODA.—Expts. (on rats and on pigeons) which have not yet been concluded clearly indicated that unpolished rice can produce the symptoms of avitaminosis A. **Excretion of vitamin B in urine.** SUGIMOTO.—The urine of normal healthy men contains a substance which, like vitamin B, is capable of stimulating the growth of yeast; but the presence of vitamin B in urine is doubtful. **Properties of vitamin D.** SAIKI AND FUJIMAKI.—Vitamin D is not destroyed by heating 1.5 hrs. at 100° or at 115°, is hardly affected in 1.5 hrs. at 130°, slightly destroyed in 1.5 hrs. at 140–5°, about 40–50% destroyed in 45 min. at 150–5° and almost completely destroyed in 1.5 hrs. at 165–70°. It is not destroyed in 1 hr. at temps. down to –60°. It is largely destroyed by heating 1 hr. at 100° in 0.1

N acid or alkali. The proteins of buckwheat flour. M. HARA.—Analysis of the N compds. *via* Van Slyke gave: amino N 0.0525 (8.19% of the total N), humine 0.0487 (7.60), cystine 0.0117 (1.82), arginine 0.1527 (23.82), histidine 0.0158 (2.43), lysine 0.0204 (3.19), monoamino N 0.2599 (40.53), non-amino N 0.0874 (13.63), total N 0.6590 g. H₂O-sol. protein N was 0.80, N sol. in 10% NaCl 1.25, N sol. in 0.20% alkali 0.55%, N sol. in 70% alc. none. The 10% NaCl and 0.20% alkali exts. were colloidal, owing to the presence of mucin. **The protein content of Italian millet.** KONDO.—The compn. was found to be: H₂O 13.57, crude protein 11.12, albuminoids 10.36, crude fat 5.32, N-free ext. 63.68, crude fiber 1.71, ash 0.87%. Total N in 15 g. of millet was 0.2567, sol. in H₂O 0.0561 (21.85% of total N), sol. in 10% NaCl 0.0644 (25.48), sol. in NaOH 0.0774 (30.15), sol. in alc. 0.1443 g. (56.21). Analysis of the protein of polished Italian millet *via* Van Slyke gave: total N 0.6009 g. in 30 g., humine 0.0155 (2.54% of total N), amide 0.0734 (12.03), arginine 0.0592 (9.71), cystine 0.0135 (2.21), histidine 0.0720 (11.81), lysine 0.0369 (6.05), monoamino N 0.3015 (49.43), non-amino N 0.0290 (4.76). **Effects of alkaloids on animals fed on diets deficient in vitamins.** SANETOSHI SAIKI.—Rats fed on a diet deficient in vitamin A can stand higher doses of *strychnine* than those fed on a normal diet. Rats fed on a diet deficient in vitamin B can stand higher doses of *strychnine* than those fed on a normal diet, but not as high as those fed on a diet deficient in vitamin A. Guinea pigs fed on a diet deficient in vitamin A cannot stand higher doses of *strychnine* than those fed on a normal diet. **Comparative nutritive value of the different proteins of Japanese foodstuffs.** OMETARO SUZUKI, YOSHIKOTO MATSUYAMA AND NEKETARO HASHIMOTO.—The nutritive value of *fish proteins* is as high as that of casein, horse meat or beef, and is apparently related to their amino-acid content and particularly to the lysine content. Dried fish, even after prolonged storage, has the same nutritive value as fresh fish as far as the proteins are concerned. The nutritive value of 10% *rice proteins* in the diet is approx. equal (or slightly inferior) to that of 7% fish proteins. When 2% brewers' yeast is added to the diet, 8.5% of rice protein are required for normal growth; while with 2% fish or horse proteins 6.5% rice proteins are sufficient. Addn. of small proportions of milk, meat, egg or fish proteins gives better growth than addn. of larger proportions of rice proteins. The min. proportion of meat, milk or fish proteins required by adult rats is 5–6%, and of rice proteins 7%. Normal growth of rats cannot be obtained when wheat is the sole source of proteins. Sufficient growth can be obtained with 6% wheat proteins and 2% meat proteins, and better growth when approx. 33% of the total protein consists of egg or milk albumin, a diet contg. 10% of the mixed proteins giving much better results than one contg. 15% of wheat proteins alone. Growth is not satisfactory when *Kaoliang* (*Andropogon sorghum*) is the only source of proteins, because of their very low arginine, histidine, lysine and cystine contents. The nutritive value of these proteins is intermediate between those of rice and wheat. Growth was normal with diets contg. 10 and 8%, resp., of *oat proteins*, but was very slow with only 5%. The nutritive value of oats is approx. equal to that of barley; it contains sufficient vitamin B, but is low in Ca, and better results are obtained on adding a little of the latter. Rats fed on rations contg. 10% of *rye proteins* seldom reached a wt. of 200 g. and most of them died in 4–5 months; with 8% a few reached 200 g., but most of the animals died; the results with 5% rye proteins were about the same as with oats and barley, but the death rate was higher. These results may be due to deficiency of Ca or of H₂O-sol. vitamins. Normal growth was obtained with a ration contg. 14% of *pea proteins*, provided sufficient vitamins A and B are supplied; and it can be obtained with smaller proportions of proteins. From the results of their expts. S., M. and H. tried to find a relationship between the nutritive value of the various proteins and their amino-acid contents: the problem apparently cannot be satisfactorily solved at the present time because it is extremely difficult to det. all the amino acids quant. The nutritive value seems more closely related to the lysine content than to the total diamino acid content; but many other amino acids (cystine, proline, etc.) are generally essential, and many recently discovered amino acids certainly are factors in nutrition. **Relation between the salt content of a diet and its deficiency in vitamin A.** FUCHI-NAKAMURA.—Three groups of young white rats were fed on a diet deficient in vitamin A and contg., resp., 0.5, 2 and 5% of mixts. of salts. The results showed that there is an optimum in the salt content of the ration to prolong the life of rats fed on a diet deficient in vitamin A. **Study of foodstuffs used in times of famine: amaryllis.** NARRITA.—Plants harvested in May, dried in the shade and ground to a flour had the following compn.: H₂O 80.53, crude proteins 1.19, crude fat 0.23, crude fiber 0.72, carbohydrates (as glucose) 17.32, ash 0.01%. It contained 0.05% "*sekisamine*" (C₂₄H₄₄N₂O₄), m. 200°, and 0.13% "*lycorine*" (C₂₇H₃₄N₂O₂), m. 248°, difficultly sol.

in Et_2O and EtOH , causing nausea (cf. Kondo and Tomimura, *C. A.* 21, 3622). **Storing of foodstuffs: drying of sea foods.** HARA AND KONO.—A preliminary comparison of the effects of sun-drying and vacuum drying of fish showed that: (1) dehydration is more complete in vacuum drying, resulting in a flatter and more transparent product and more tender flesh; (2) chem. changes in the compn. of the proteins are unimportant in vacuum drying, provided the temp. is not too high; (3) vacuum drying gives preserved fish in a state closer to fresh fish, from both the chem. and physio-chem. standpoints, than any other process; (4) the time required for drying depends on the size and shape of the fish, but is approx. twice as long for sun drying as for vacuum drying.

A. PAPINEAU-COUTURE

The availability of the calcium in calcium lactate in the human. F. W. HEYL AND M. C. HART. *J. Am. Pharm. Assoc.* 17, 225-32(1928).—A short review of previous work is given. For these expts. 5 men lived for 15 days on a fairly uniform diet. During a fore-period of 5 days, the basal diet, adequate in respect to protein and energy requirements, supplied about 0.2 g. Ca per day and established a strictly negative balance. During the following 10 days, in each of 2 series of expts. there was superimposed upon this acidotic diet (1) milk, (2) Ca lactate in soln. The balance for Ca, Mg and P were detd. in 5-day periods, but all calcs. on maintenance requirements are based on the entire 10-day period. Ca and P were detd. in food, urine and feces. When Ca lactate is superimposed for 10 days upon an acidotic Ca-deficient but vitamin-contg. diet, a quantity amounting to approx. 9.5 g. is required to establish Ca equil. This represents 2.5 or more times as much as is necessary to establish Ca-equil. with milk. The urinary Ca excretion was markedly increased, about 10% of the Ca increment taking this route of excretion. The same tendency is noted in using milk. The urinary P excretion was decreased and P retention secured by the ingestion of Ca lactate. In this diet the original Ca: P ratio was 2:9, and the favorable influence upon P metabolism may be due to the establishment of a more favorable balance of 14:9. However, in the milk expts., a ratio of 5:9 yielded a more decided P retention; concerning the effect of Ca lactate upon Mg metabolism, slightly increased losses were noted in 3 of the 5 subjects.

The effect of artificial hyperthermia on the lipid content of horse blood. HUGO THEARELL. *Acta Med. Skand.* 68, 248-52(1928).—A horse was kept in a warm, dry chamber, and its body temp. rose from 38.1° to 40.7° after 22 hrs. Three blood samples were obtained during the expt. (the first sample being the control). The dry residues of these samples were: 20.34, 20.30 and 21.77%, resp. The blood mixed with dry Na_2SO_4 set to a dry mass which was finely powdered and subjected to successive extrn. with ether, ether-alc. mixt. (2 parts ether + 5 parts 96% alc.) and finally abs. alc. Only in the case of cholesterol was there a definite rise of about 11% in the last blood sample.

S. MORGULIS

Biochemical changes in the organism during fatigue. I. Experiments on hammer-smiths and on students. JULIE HEFTER AND RAHEL JUDELOWITSCH. *Biochem. Z.* 193, 62-9(1928).—During very exhausting phys. work there develops a lasting condition of acidosis, depending upon an increased concn. of H_3PO_4 and acetone bodies in the blood. The lactic acid which during work accumulates in the blood disappears very quickly, but the acidotic condition persists even over a night's rest, and the rest period must be considerably prolonged to avoid the accumulative effect from one day to the next. In students after prolonged and intense mental activity there is evidence of acidosis (lowered alkali reserve) but the normal condition is reestablished after a night's rest, while the blood lactic acid content remains within normal limits during the mental exertion.

S. MORGULIS

Methylglyoxal as an intermediate cleavage product in the glycolysis of blood. H. K. BARRENSCHEEN. *Biochem. Z.* 193, 105-8(1928).—Methylglyoxal has been definitely demonstrated by means of forming a compd. with semicarbazide as an intermediate product in blood glycolysis. S. MORGULIS

Is there a proportionality between muscle exertion and the lactic acid, phosphate and sugar content of the blood? N. P. RIABOURSCHINSKY. *Biochem. Z.* 193, 161-75 (1928).—Increased muscle work calls forth an increased passage of lactic acid from the muscles into the blood. The lactic acid during the period immediately following work or during the rest is not uniformly distributed. After static work the lactic acid of the blood increases in the arm exercised due largely to stasis and poor oxygenation; the lactic acid in the unused arm remains unchanged which indicates a rapid disappearance of the acid in the circulation. Immediately after the work there is a slight rise in blood P which is not proportional to the amt. of work. During the resting period the P falls below the initial level, the more so the harder was the work. The changes in blood sugar are slight and not significant. S. MORGULIS

Insulin and fat metabolism. J. HEPNER AND O. WAGNER. *Biochem. Z.* 193, 187-91(1928); cf. *C. A.* 22, 818.—The autolyzing liver of starved rabbits treated with large doses of insulin shows unmistakable evidence of fat synthesis, which is exactly opposite to that observed in pancreatectomized animals. The authors conclude that insulin really contains 2 hormones, concerned with carbohydrate and fat metabolism, resp. Pancreas dialyzate given by mouth has no effect on hyperglucemia but does cause lipodiarresis; furthermore, small insulin doses produce an accumulation of glycogen and a loss of fat in the liver while massive doses have the reverse effect and these facts indicate that the 2 components of insulin are antagonists. S. MORGULIS

The digestion of crude fiber by chickens and the significance in this respect of the appendix. T. RADEFF. *Biochem. Z.* 193, 192-6(1928).—Chickens cannot digest crude fiber from dry barley, but the crude fiber of wheat is 5% digested, that of oats 7% and of dry corn 17%. This digestion takes place practically entirely in the appendix. S. MORGULIS

Studies on the respiration of the frog heart. I. Oxygen consumption of the surviving frog heart in Ringer, Tyrode and Locke's solution. TATSUJI HIRAOKA. *Biochem. Z.* 193, 197-202(1928).—For details of the results obtained with different salt solns. with or without the addn. of glucose the original must be consulted. S. M.

Studies on the respiration of the frog heart. II. Effect of acid and alkali on the oxygen consumption of the surviving frog heart. W. ARNOLDI AND T. HIRAOKA. *Biochem. Z.* 193, 203-6(1928).—Addn. of 0.5-11 cc. 0.001 N HCl or NaOH to 120 cc. Tyrode soln. with glucose causes a marked diminution in the O_2 -consumption of the spontaneously beating heart. The alkali produces a change manifesting itself as a lasting diastolic state, while the acid produces a lasting systole. S. MORGULIS

Studies on fat metabolism. II. A. LÖW AND R. PFELER. *Biochem. Z.* 193, 276-7(1928); cf. *C. A.* 21, 3665.—Subcutaneous injection of adrenaline causes a rise in the blood cholesterol. III. *Ibid* 277-80.—Adrenaline causes fat mobilization from the periphery to the liver; the glycogen store of the liver is greatly diminished. Occasionally, the glycogen supply of the liver following a single injection is increased even when, as in starvation, the glycogen content is greatly reduced. S. MORGULIS

Metabolism of embryonic tissues in serum. SUSUMU KUMANOMIDO. *Biochem. Z.* 193, 315-21(1928).—The anaerobic glycolysis of embryonic tissue (chick, rat) is greater in Ringer soln. than in serum. S. MORGULIS

Studies on the potassium and calcium content of peripheral nerves. A. SIMON AND AND J. SZELŐCZENY. *Biochem. Z.* 193, 393-9(1928).—The K and Ca content of the rabbit, *N. ischiadicus*, shows great variability. The Ca content of the right and left nerve is fairly const., which is not the case with K. The nerve does not contain a const. indiffusible fraction of Ca and K, and both diffuse from the macerated nerve continuously during 24 hrs. Under the influence of cocaine the Ca content of the nerve changes but without any regularity. More Ca diffuses out in 2 hrs. from a nerve in physiol. soln. contg. cocaine than in one without the cocaine. S. MORGULIS

The calcium content of the heart muscle. R. KAPPELLER AND H. KUTSCHERA-AICHBERGEN. *Biochem. Z.* 193, 400-8(1928).—In 4 beef and human hearts (normal) there has been found the same Ca content, 25-25.7 mg. %. There was no difference between the right and left side of the heart. Normal Ca values were found in a case of chronic sepsis and of aortitis luetica. In a case of left insufficiency of the heart, the left half showed a lowered Ca while on the right side there was a slight compensatory increase. In 2 cases of extreme valve failure the Ca content of both sides of the heart was considerably lowered. The Ca content is independent of the lipid content of the

heart. Part of the Ca is bound to lipoid as it is extd. from the dry powder by anhyd. ether. The Ca of the myocardium in heart insufficiency is lowered, the decrease being frequently most pronounced on the side bearing the greatest fractional load. S. M.

Physiology of plasmalogen. II. Behavior of plasmalogen in the serum of the new born. K. IMHAUSER. *Biochem. Z.* 193, 416-22(1928); cf. *C. A.* 21, 3665.—The serum of new born calves contains only traces of plasmalogen, about $\frac{1}{20}$ that found in the serum of adult animals or of the mother. From the day of birth this increases and reaches the normal level at the age of about 1-2 months. S. MORGULIS

Blood composition and blood coagulation. ALFRED GIGON AND RENÉ BOULENAZ. *Biochem. Z.* 194, 83-90(1928).—Serum from clotted blood contains more C than from defibrinated blood, while the latter contains more plasma than from NaF blood (0.3-1%). The differences in the N values are not parallel to those in the C values. Serum from clotted and defibrinated blood shows consistent differences in compn. The addn. of NaF to blood to a concn. of 10% alters very markedly the compn. of the blood, plasma or serum. Stirring vigorously NaF blood yields a plasma richer in C than blood not so treated. S. MORGULIS

The ammonia content and formation in blood. I. ERIK GOTTLIEB. *Biochem. Z.* 196, 151-62(1928).—The NH_3 N of the arterial and venous blood from fasting dogs is 0.03 mg. per 100 cc. Most of this NH_3 is not preformed, but is being produced from the moment the blood is drawn at a uniformly diminishing rate, depending upon the temp. and partly also the H-ion concn. In strongly alk. media, however, (p_{H} 12) there is a greater NH_3 formation. S. MORGULIS

Ammonia formation in the kidney. II. ERIK GOTTLIEB. *Biochem. Z.* 194, 163-76(1928).—Exptl. results are given which corroborate Nash-Benedict's theory of the formation of NH_3 in the kidneys S. MORGULIS

Synthesis and resorption of cholesterol as manifested in experiments on chicken eggs. H. DAM. *Biochem. Z.* 194, 188-96(1928).—Analyses of total cholesterol in fully developed chick embryos and in freshly laid eggs reveal an increase of about 10%, which, however, is not a large enough difference to exclude the possibility that it is due to variation rather than actual synthesis. Cholesterol compounds, which can be extracted only with ether after heating with acetic acid, could not be demonstrated either in the eggs or in the chick embryos. After a feeding of free cholesterol or of cholesterol palmitate the cholesterol content of the eggs increased 20%. S. MORGULIS

Studies on blood coagulation. XIX. Inhibition of coagulation by Germanin ("Bayer 205"). BERNHARD STUBER AND KONRAD LANG. *Biochem. Z.* 194, 204-12(1928); cf. *C. A.* 22, 1798.—A parallelism is observed between the inhibition of coagulation and the velocity of glycolysis of the blood. Renewal of blood glycolysis through CO_2 -breathing removes the inhibiting effect of Germanin on the clotting and *vice versa*. Under the influence of Germanin there is an alteration in the plasma proteins (shift towards the lyophile side), a diminution of the H-ion concn. and of the Cl of the blood, the latter being due to a migration into the tissues. S. MORGULIS

The ammonia content and formation in muscles and their dependence upon function and state. V. The course of traumatic formation of lactic acid and ammonia and its relation to inhibiting factors. ST. CHRZASZCZEWSKI AND WŁ. MOZOLWSKI. *Biochem. Z.* 194, 233-43(1928).—When a muscle is ground with quartz in H_2O there is a formation within 2 min. of lactic acid which represents a tenfold increase over the original quantity. The course of the lactic acid formation is very similar to that of the NH_3 formation under like conditions. Both are inhibited by a borax soln. of p_{H} 9.3; a 1% NaF soln. completely inhibits the lactic acid formation but only slows up more or less the NH_3 formation. This last fact serves to differentiate the 2 processes between which there is no direct relationship. S. MORGULIS

Regulation of the liver metabolism through the nervous system. I. Preliminary experiments. P. ASTANIN, I. KRIWSKY AND W. RUBEL. *Biochem. Z.* 194, 254-61(1928).—Perfusion of liver with defibrinated blood results always in an increase of the urea concn., this increase being very great though irregular if $(\text{NH}_4)_2\text{CO}_3$ is added. The acid-base equil. is undisturbed, the sugar concn. is raised while the non-protein N is likewise increased. Not the entire amt. of used up NH_3 N appears as urea. When the perfusion is made with Ringer soln. there is no new formation of urea and the sugar concn. falls. II. The effect of the vegetative nervous system on urea and sugar formation in the liver. P. ASTANIN AND W. RUBEL. *Ibid* 262-72.—The liver of fasting dogs is isolated without disturbing its vegetative nervous system. Stimulation of the peripheral end of the vagus caused an increase in the urea formation, while stimulation of the sympathetic had no effect. Stimulation of the sympathetic causes a rise in the

sugar concn. of the perfusion fluid, and stimulation of the vagus generally has the opposite effect. S. M.

Further studies on antitrypsin of normal serum. L. UTKIN-LYUBOVITZOV. *Biochem. Z.* 194, 292-305(1928).—Serum antitrypsin cannot be identified with any of the well-known serum proteins. By adsorption with $\text{Fe}(\text{OH})_3$ and subsequent elution it is possible to prep. solns. with very little N but considerable antitryptic activity. S. MORGULIS

Studies on the normal blood sugar content of the horse and cattle. KARL SCHWARZ. *Biochem. Z.* 194, 328-34(1928).—The av. blood sugar concn. of the healthy horse is 0.093%, the values found in different animals ranging from 0.062 to 0.120%. The frequency distribution of the blood sugar variations is as follows: 0.062-0.082% sugar in 26% of the investigated animals; 0.083-0.102% in 46%; and 0.103-0.120% in 27% of the horses. In cattle the av. blood sugar is 0.082%, with the following frequency distribution of the variations: in 15% the concn of sugar is 0.044-0.075%; in 60%, 0.076-0.110%; and in the remaining 25% of the animals the sugar concn. is 0.110 to 0.177%. No obvious relationship was found between the sugar concn. and the sex of the animal. S. MORGULIS

The production of constant blood sugar values in rabbits. KARL SCHWARZ AND ADALBERT LURETZ. *Biochem. Z.* 194, 335-45(1928).—When rabbits are given food *ad libitum* they show an almost const. blood sugar concn when the sampling is made 5 hrs. after the last feeding. This is achieved either by giving dry or green food, though a change from one to the other kind of food leads to strong variations, and the abs. values are greater when green food is used. The av. sugar concn. on the 2 kinds of food was 0.117-0.130% on dry and 0.098-0.103% on green food. S. MORGULIS

Studies on the normal blood sugar content of chickens. KARL SCHWARZ AND KARL HEINRICH. *Biochem. Z.* 194, 346-50(1924). The av. blood sugar of chickens is 0.253%, with variations from 0.212 to 0.309%. In 18% of the chickens the sugar was 0.212-0.235%; in 65.9%, 0.236-0.275%; and in 15.3%, 0.276-0.309%. S. M.

Studies on the relation between the blood sugar content and the production of milk in cows. KARL SCHWARZ AND EGON MEZLER-ANDELBURG. *Biochem. Z.* 194, 362-75 (1928).—Milching cows even on an abundant diet have a lower blood sugar concn. than non-milching cows. While the latter have on the av. 0.082%, the latter have a lower av. concn. with the following frequency distribution: in 5% of the cows 0.040-0.050%; in 20%, 0.050-0.060%; in 45%, 0.060-0.070%; in 20%, 0.070-0.080%; and in 10% the concn. is above 0.080%. There was, however, no direct relationship between sugar concn. and the quantity of milk produced, except that the blood sugar concn. increased with the prolongation of lactation. Furthermore, no evidence was found for the occurrence of hypoglycemia together with a comatous condition of the cow soon after giving birth and the initiation of secretion of milk. S. MORGULIS

Daily variations in the blood sugar of cattle. ANTON RICHTER. *Biochem. Z.* 194, 376-84(1928).—Under uniform conditions the blood sugar of the milch cow shows practically no variations from day to day. There has been no rise observed in the blood sugar following feeding, because the absorption goes on continuously. In this respect the ruminant differs very sharply from the animals possessing the single stomach. S. MORGULIS

Studies on the influence of certain basic fractions of meat extract on the secretion of the stomach glands. R. KRIMBERG AND S. A. KOMAROV. *Biochem. Z.* 194, 410-21(1928); cf. C. A. 21, 2309.—The carnosine-methylguanidine fraction of meat ext. has a powerful excitatory effect on the secretion of gastric glands. The carnitine fraction is also active but is at least 10-15 times weaker than the previous fraction. Finally, the purine and the "residual" fractions of the meat ext. were practically without effect on the gastric secretion. S. MORGULIS

Influence of mental fatigue on the excretion of organic phosphorus in the urine. L. E. TARANOWITSCH. *Biochem. Z.* 194, 461-5(1928).—No definite relationship was found between the excretion of org. and total P during mental work. S. MORGULIS

The influence of bile acids on carbohydrate metabolism. II. Effect of bile acids on the mutarotation of glucose. TAKUICHI HATAKEYAMA. *J. Biochem. (Japan)* 8, 371-9(1928).—In a neutral as well as alk. medium cholic and desoxycholic acids stimulate the mutarotation of glucose. The stimulating action of cholic acid on the mutarotation of glucose increases up to a certain concn. of the acid. On the contrary, desoxycholic acid stimulates only in a concn. 0.025-0.100% but in concns. 0.2-0.3% it has an inhibiting effect. In general the stimulating action of cholic acid is greater than of desoxycholic acid. III. The condensation of glucose or alanine with bile acids. *Ibid*

381-90.—Both glucose and alanine undergo condensation with cholic and desoxycholic acids but the former reaction is much more dependent upon the alkyl. S. M.

Influence of bile acids on the nuclease action in the intestine and in the liver. TAKEJI OKAMURA. *J. Biochem. (Japan)* **8**, 391-6(1928). S. MORGULIS

Water metabolism under different conditions. D. RANCKEN. *Skand. Arch. Physiol.* **51**, 260-86(1927).—The vol. of the lower limbs, the intake of water and the output of urine were measured under various conditions (light, darkness, humidity, warmth, wind) throughout the day at different seasons. In dry and sunny weather the body loses water until about 2 p. m. but conserves its water content during the second half of the day. This is not observed on dark, rainy days, or when the expts. are carried out in a dark room. S. MORGULIS

The relationship between the formation of bile and glycogen in the liver of the rabbit. ERIK FORSGREN. *Skand. Arch. Physiol.* **53**, 137-51(1928).—By pptg. bile acids and pigments with BaCl_2 and using the usual technic for demonstrating the disposition of glycogen in the liver cells the following results were obtained in regard to the relationship between their formation in rabbits. Under normal conditions there is an antagonism between bile and glycogen formation. In liver cells contg. an abundance of specific bile constituents there is very little glycogen and *vice versa*. All liver cells of a lobule may hold simultaneously either an abundance of bile constituents or of glycogen, but more generally the bile constituents are most abundant in the cells on the periphery and glycogen in the central cells of a lobule. Bile formation usually commences in the periphery while glycogen is first deposited in the center of the lobule, and they persist in these situations the longest. Liver function is periodic, bile formation alternating with glycogen formation. In the morning there is as a rule a max. glycogen deposition and min. bile formation in all cells. During the day the situation is reversed, and at intermediate times every transition between these extremes is found. S. M.

The respiratory quotient during muscle work of short duration. J. LINDHARD. *Skand. Arch. Physiol.* **54**, 79-98(1928); *Kgl. Danske Videnskab. Selskab Biol. Medd.* **6**, No. 7, 27 pp.—The respiratory quotient after a brief muscular exertion rises rapidly and becomes greater than 1.0 during the first 5 min. It then quickly falls and in 15-20 min. returns to the resting value. The expts. do not sustain Hill's hypothesis that muscle work of short duration is done entirely at the expense of carbohydrate. S. M.

The relative activity of the thyroid gland of vertebrate animals. B. M. ZAVADOVSKII AND N. A. NOVIKOVA. *Zhurnal expl. biol. Med.* **8**, 51-8(1928).—The physiol. activity of various thyroids is detd. by implantation into axolotls. From 30 to 50 mg. of thyroid are necessary to produce metamorphosis into *Amblystoma*. Expts. with glands from dogs, cats, rabbits, guinea pigs, pigeons and chickens show that thyroids from various species have practically the same activity. S. MORGULIS

Tissue acidosis in autolysis under physiological conditions. B. M. STARK. *Zhurnal expl. biol. Med.* **8**, 162-70(1928).—Acidosis of autolyzing pieces of liver, kidney and spleen occurs sooner *in vitro* than when these pieces are in the organism. In autotransplantation expts. the acidosis reaches a p_H 6.7-5.5 and lasts 6 hrs.; in heterotransplantations the p_H is 6.7-5.1 and the acidity lasts 12 hrs. S. MORGULIS

Vasodilators. K. G. USHINSKII. *Zhurnal expl. biol. Med.* **8**, 314-7(1928).—Platysmographic and elastometric studies show that baths with H_2S -contg. waters act directly on the peripheral vessels causing dilatation. S. MORGULIS

Effect of splenectomy on the blood sugar. A. M. BLINOV. *Zhurnal expl. biol. Med.* **8**, 467-70(1928).—Splenectomy has no effect on the blood sugar curve either during fasting or during feeding. S. MORGULIS

Alteration of vasomotor properties of blood on changing *in vitro* its reaction. H. S. KOSHTOYANTZ. *Zhurnal expl. biol. Med.* **8**, 471-9(1928).—Weak acids (H_3BO_3 , NaH_2PO_4) or weak bases (NaHCO_3 , Na_2HPO_4) have an opposite effect on the vasomotor action of blood. Added to pure Ringer soln. without the blood these substances have no effect. S. MORGULIS

The relation between hormonal and enzymic phenomena in the mechanism of regulation of the carbohydrate metabolism. V. A. ENGELHARDT AND A. N. PARSHIN. *Zhurnal expl. biol. Med.* **8**, 573-80(1928).—Massive doses of insulin which cause death from hypoglycemia in the exptl. animals are practically without any significant effect on the blood amylase. The av. was a 10% rise in the amylase 20 min. after the insulin injection. S. MORGULIS

Sedimentation reaction of erythrocytes in fatigue. D. E. ROSENBLUM. *Zhurnal expl. biol. Med.* **8**, 69-73(1928).—Following a fatiguing march (covering a distance of 10-20 km. at a rate of 6.6 km. per hr. with a 25 kg. load) the rate of sedimentation of

the blood cells diminishes, this being more pronounced the less accustomed the subject is to the exertion.

S. MORGULIS

The dynamics of phosphoric acid and glycolysis in blood. V. A. ENGELHARDT AND A. E. BRAUNSTEIN. *Zhurnal expl. biol. Med.* 9, 162-77(1928).—The change in inorg. P is smaller the more intense the process of glycolysis in the blood. The factors which promote the splitting off of inorg. P inhibit glycolysis in about the same degree. In a system where there is no glycolysis taking place there is no acceleration of the P formation while on inducing glycolysis (addn. of glucose) results at once in a smaller change in inorg. P contour. The inhibition, however, is not a direct effect of glycolysis inasmuch as it was observed also in systems incapable of glycolysis (serum + boiled ext. of red cells; red cells + NaF, or in acidified blood). Conclusion: Two independent processes go on during glycolysis: "hydrolysis" of P from some org. combination and "esterification" of P in conjunction with glycolysis. The fact that in glycolysis there is usually no change in the P content is due to a fine balancing of the 2 opposed reactions. As promotes greatly the splitting of the phosphate esters, and hence under its influence glycolysis is accompanied by a large formation of inorg. P. S. MORGULIS

Changes of double refraction in different rigors of the muscles. HANS STUBBEI, AND TZE-YEH LIANG. *Chinese J. Physiol.* 2, 139-50(1928). (In German.)—A change occurs in the double refraction value of striated muscle fiber in different kinds of rigor in the isotonic and isometric preps. with the compensation measured according to Snéarmont. It appears that the decrease of double refraction is not conditioned by a disorientation of micellae or by a change in the distance of a single micella from its neighbor. The most probable cause of the decrease is either a diminution of the anisotropy of the micellae, or a change in the difference of the refractive indices of the micellae and imbibing liquid; which of these causes was not detd.

G—PATHOLOGY

H. GIDEON WELLS

The reaction of animals with pancreatic diabetes to various forms of carbohydrates. I. Glycogen. W. S. ILJIN. *Z. ges. expl. Med.* 52, 24-32(1926).—When glycogen is injected into pancreatectomized cats, the glycogen is excreted as glucose in the urine. Conclusion: Glycogen is a storage stage of carbohydrate metabolism and insulin is not necessary for its conversion into glucose. F. L. DUNN

The role of the reticulo-endothelial system in streptococcus infections. I. The reaction of the reticulo-endothelial system in the mouse to streptococcus infections. N. LOUROS AND H. S. SCHEVER. *Z. ges. expl. Med.* 52, 291-306(1926).—Histological studies were made following the injection of 18 strains of streptococci into 69 white mice. In general L. and S. conclude that the changes observed were not specific but a pathol. acceleration of normal processes in the reticulo-endothelial system. Bibliography. II. Trypan blue, iron blockade and the function of the reticulo-endothelial system. *Ibid* 307-20.—Both trypan blue and iron did not act on the reticulo-endothelial system by producing a blockade but rather by a chemico-toxic action. The protective action of the reticulo-endothelial system does not parallel the blockade, nor the storage of substances in the reticulo-endothelial system. Bibliography. VI. Therapeutic studies with metals and metallic salts. *Ibid* 57, 221-33(1927).—Mn chloride in 1:1000 to 1:15,000 diln. of a 0.01 M soln. will protect 40% of mice injected with a lethal dose of streptococci. CdCl₂ prolonged life over the controls. VII. Studies with buffer solutions. N. LOUROS AND A. SCHMECHEL. *Ibid* 440-9.—Using Sorenson buffers made isotonic L. and S. show that both acid and alk. buffers had a protective action on white mice injected with streptococci. The maximal protective actions were obtained at pH of 4.5 and 8.3. Life was prolonged and histological studies of the reticulo-endothelial system showed increased protection. Bibliography. F. L. DUNN

The vegetative nervous system and immunity. I. The effect of pilocarpine on immune body production. A. BELAK, F. SAGHY AND L. CSERESZNYES. *Z. ges. expl. Med.* 52, 559-67(1926).—Agglutination tests in rabbits following the injection of killed paratyphoid B bacilli show that pilocarpine increases the titer over controls receiving water and controls receiving atropine. II. The effect of calcium salts on the formation of agglutinins. A. BELAK AND L. CSERESZNYES. *Ibid* 567-71.—Ca solns. show an increased formation of agglutinins over controls in rabbits. III. The irritation theory of immune body formation. *Ibid* 572-8.—If the rabbit ear is amputated and the wound cauterized within 10 min. after the injection, the agglutinin titer following atropine does not rise above that observed for the control, while following pilocarpine the titer increases 2-3 times above the controls. B. and C. suggest that immune body

production requires only a momentary contact between the antigen and the nervous system. F. L. DUNN

Acid and alkali in diabetes. GEZA HETENYI. *Z. ges. expil. Med.* **57**, 409-32 (1927).—A group of diabetics was placed on fixed diets and after a control period, 20-30 g. NaHCO_3 daily was given, and followed with 300 cc. 0.1 N HCl daily. Alkali lowered the blood sugar, NH_3 excretion and ketosis, while acid produced increases over the normal. In rabbits with insulin the injection of NaHCO_3 brought on hypoglycemic convulsions quicker than when insulin was given alone. Conclusion: Alkali favors the action of insulin. F. L. DUNN

Amino acid secretion in liver disease compared with cholesterol and lactic acid. ERNST DERRA. *Z. ges. expil. Med.* **57**, 567-72 (1927).—Urinary excretion of amino acids in normal men did not go above 18 mg. %, or 200 mg. in 24 hrs. There is an increase in fever and the results are variable in liver disease. The highest values were obtained in acute yellow atrophy, severe cirrhosis and cholangitis. Conclusion: The amino acid excretion is not a good index of liver damage. Bibliography. F. L. D.

Physicochemical studies of the serum in scarlet fever. HENDRE TUDOS AND ALFRED EBEL. *Z. ges. expil. Med.* **57**, 709-14 (1927).—The cond. and chloride content of the serum in scarlet fever are somewhat reduced over the normal values. Except for nephritis the complications have little added effect. F. L. DUNN

Alimentary hypoglycemia as a functional test of the Islands of Langerhans. F. DEPISCH AND R. HASENÖHRL. *Z. ges. expil. Med.* **58**, 81-109 (1927).—The blood-sugar curves following the ingestion of 75-100 g. glucose in a 10% soln. were studied. In normals following the hyperglycemia there is a fall in blood sugar to 8-21 mg. % below the normal fasting level. With repeated large amts. of glucose the alimentary hypoglycemia is increased. The hypoglycemia was greater than normal in hypertension, convalescent patients, renal glucosuria, obesity and following starvation, and less in Basedow's disease and diabetes. Bibliography. F. L. DUNN

Experimental studies on insulin resistance in diabetes mellitus. F. DEPISCH AND R. HASENÖHRL. *Z. ges. expil. Med.* **58**, 110-6 (1927).—The serum from a case of diabetes with a paranephritic abscess had an insulin-inhibiting action on rabbits. This effect was not changed by the action of carbolic acid and was only slightly affected by heat up to 80° for 2 hrs. Serum from cases with diabetes but without sepsis did not show this effect, and cases with sepsis but without diabetes did not show it. F. L. D.

Anaphylaxis studies in man and animals. VII. The potassium and calcium content of the blood and tissues of dogs and rabbits and its changes during sensitization and anaphylaxis. A. SCINITTENHELM, W. ERIHARDT AND K. WARNAT. *Z. ges. expil. Med.* **58**, 662-82 (1928).—Values are given for the K and Ca content of various parts of the blood stream, liver, lung, spleen and intestine in normals animals and at the height of anaphylaxis. Following antigen injections the K and Ca contents of the blood rise, the ratio of K:Ca remaining fairly const. In acute anaphylactic shock the K content rises in all vessels studied for serum but not whole blood. F. L. DUNN

Functional tests of the liver and reticulo-endothelial system by the use of dyes; the clinical value of the tetrachlorophenolphthalein test. F. SCHELLONG AND B. EISLER. *Z. ges. expil. Med.* **58**, 738-56 (1928).—Studies of dye disappearance is normal animals, animals with india-ink blockade and with splenectomy showed that the reticulo-endothelial system plays an important part in the rate of disappearance of the dye. The tetrachlorophenolphthalein test does not test liver cells entirely. Clinical data corroborate this view. F. L. DUNN

Blood as a physicochemical system. VII. The composition and respiratory exchanges of human blood during recovery from pernicious anemia. D. B. DILL, A. V. BOCK, C. v. CAULAERT, A. FÖLLING, L. M. HURKTHAL AND L. J. HENDERSON. *Mass. General Hospital. J. Biol. Chem.* **78**, 191-214 (1928); cf. *C. A.* **22**, 113.—A study was made of the physicochem. changes occurring in the respiratory and circulatory mechanisms of a man during recovery from pernicious anemia under liver ext. therapy. The data are collected in the form of a *nomogram*. ARTHUR GROLLMAN

Influence of normal and cancerous blood-serum on pancreatic lipase action and the effect of ionic and colloidal lead. R. F. CORRAN AND W. C. M. LEWIS. *Biochem. J.* **22**, 451-63 (1928).—Cancer serum has a reduced augmentative effect on lipase as compared with normal serum; this confirms the results of Shaw-Mackenzie (*C. A.* **9**, 2769). Lead, both in the ionic and colloidal forms, increases the hypolytic augmentation of both normal and cancerous sera. BENJAMIN HARROW

Renal function test with sodium thiosulfate and sodium iodide. An experimental comparison with the phenolsulfonephthalein test. ADOLF BOLLIGER. *Arch. Internal Med.* **41**, 642-54 (1928).—Ten cc. of a soln. contg. 1 g NaI, 1 g. $\text{Na}_2\text{S}_2\text{O}_3$ and 6 mg. phenol-

sulfonephthalein was injected into normal, pregnant and nephritic dogs and dogs with extrarenal lesions and the urine examd. 2 hrs. later. The NaI test is of little value. The $\text{Na}_2\text{S}_2\text{O}_3$ test is a sp. quant. test for exptl. renal insufficiency even a little more accurate and sensitive for slight renal lesions than the phenolsulfonephthalein test. The $\text{Na}_2\text{S}_2\text{O}_3$ excretion is reduced in pregnancy.

MARY JACOBSEN

Experimental obstructive jaundice. III. Modification of the parathyroid tetany mechanism in jaundice. W. C. BUCHBINDER and RUTH KERN. *Arch. Internal Med.* 41, 754-63(1928); cf. C. A. 22, 1188.—Jaundice, especially one of longer standing, markedly reduces or entirely prevents tetany in parathyroidectomized puppies and adult dogs. The blood Ca falls in puppies much more than in adult dogs, and may reach the tetany level without there being any tetany. Acute jaundice increases the susceptibility to severe and terminal tetany. Tetany may be relieved by 2 cc. whole bile. The blood Ca level is not raised by either CaCl_2 or Collip's hormone. Conclusion: The threshold of nervous excitability is raised in obstructive jaundice in harmony with the fact that bile is a depressant of the central nervous system. M. J.

The origin of cancer. W. CASPARI. *Arch. klin. Chir.* 146, 711-36(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 45.—Review.

MARY JACOBSEN

Anaphylaxis from a biological point of view. GUIDO SERENI. *Biol. Reviews* 3, 93-122(1928).—Critical review, with 170 references. Anaphylaxis and immunity are both allergic phenomena. Their differentiation is artificial and purely teleological. The criteria of anaphylaxis are: an exciting substance, a period of incubation and response to the same substance. The shock is incidental. The presence of antibodies in the circulation is not essential; they may be fixed in organs. For the same reason the failure to produce anaphylaxis in certain organisms with our present technic is not sufficient evidence against the universality of anaphylaxis.

MARY JACOBSEN

Effect of organic antimony compounds on serum in infantile leishmaniasis. STANISLAO FABRIS. *Pediatria Rivista* 36, 5-14(1928).—In 25 cases of infantile leishmaniasis the serum gave a ppt. or, more frequently a turbid contact ring with Heyden's preps. no. 482 (antimonylstibetyl), 292 (stibacetine) and particularly with 1 and 0.5% 417 (stibosan). Most of the inactivated sera behaved in the same manner. The reaction was negative with normal sera and in a no. of various diseases among others splenic anemia.

MARY JACOBSEN

The potassium and calcium content and the potassium : calcium ratio in the serum of infants. VITTORE ZAMORANI. *Pediatria Rivista* 36, 57-71(1928).—The mean values obtained from the serum of 10 normal children were: K 24.34 mg./100 cc., Ca 10.41 mg./100 cc., K:Ca 1.91. In acute bronchopneumonia, typhoid and smallpox, Ca and K vary, while K:Ca remains const. The latter is lowered in spastic and convulsive (non-tetanoid) conditions and increased in tracheo-bronchial adenopathy. The increase is considerable in rickets and asthma, because of the lowered Ca and higher K, in tetany because of the fall of Ca. In these diseases the physiol. equil. between serum and tissue cells is upset, the latter not being able to retain and fix Ca and K in physiol. proportions.

MARY JACOBSEN

The enzyme test in the study of the condition of certain organs in infantile malaria. ANTONIO SIRCA. *Pediatria Rivista* 36, 135-42(1928).—Sivori and Rébaud's enzyme reaction decreased in intensity in the order: spleen, pancreas, liver. Except for a few cases with severe blood picture the adrenals gave an inconst. and insignificant reaction. The test was negative for kidney, thymus and thyroid. The serious damage to the pancreas in malaria has not been pointed out before.

MARY JACOBSEN

Effect of skin vascularization on the Pirquet test. GIUSEPPE CIMMINO. *Pediatria Rivista* 36, 196-205(1928).—Pirquet's reaction is intensified by vasoconstriction or passive hyperemia of the skin and attenuated by vasodilatation or active hyperemia. The reaction depends chiefly on the sp. or unsp. reaction of the skin and to a small extent on sp. circulating substances. Vasoconstriction possibly extends the contact of the circulating antibodies with the antigens fixed in the skin.

MARY JACOBSEN

The blood cholesterol of children in smallpox. GIULIO POI. *Pediatria Rivista* 36, 355-61(1928).—The blood cholesterol was lowered in smallpox and rose to its normal value or even above it during the convalescence.

MARY JACOBSEN

The physiopathological significance of cholesterol. RAFFAELE MENASI. *Rass. clin. terap. sci. affini* 26, 87-98(1927); cf. *Pensiero med.* 15, 30(1926).—Review. M. J.

Effect of mechanical injury on desiccated chicken sarcoma. WARO NAKAHARA. *Inst. Infectious Diseases. Japan Med. World* 8, 51-8(1928).—Active tissue of a Rous sarcoma No. 1 was desiccated and ground by hand in a mortar for 1.5 to 2 hrs. with care not to produce an undue amt. of heat by unnecessary friction. Pulverized material was injected into the breast muscle of the left side of normal chickens, while non-pulver-

ized material was injected into the right side of the same bird. After 3 weeks, pulverized material dried for 5 to 7 days did not produce tumors while non-pulverized material did. Tissue dried for 3 days only, produced palpable nodules following the injection of pulverized material but tumors were produced following the injection of non-pulverized material. The conclusion reads "it seems clear from the above described expts. that the sarcoma transmitting 'agent' is in all probability a formed body and microscopical findings suggest that the formed body in question may be the sarcoma cell itself. If the 'agent' were a chem. substance, its function could hardly be expected to be seriously damaged by so gross a treatment as grinding in a mortar."

N. KOPELOFF

Chemical and biological studies on primrose idiosyncrasy. BR. BLOCH AND P. KARRER. *Vierteljahrsschr. naturforsch. Ges. Zürich* **72**, Beibl., No. 13, 1-26(1927).—A substance primin, having the following properties was isolated from the Et_2O ext. of primrose: yellow cryst. substance, m. $62-63^\circ$, insol. in H_2O , sol. in Et_2O , CHCl_3 and EtOH , slightly sol. in cold petr. ether, sol. in hot H_2O . The analyses and mol. wt. indicate that primin has the formula $\text{C}_{14}\text{H}_{14}\text{O}_3$ or $\text{C}_{14}\text{H}_{12}\text{O}_3$. An O is present apparently as OH or possibly as lactone. Primin is unsatd., decolorizes KMnO_4 and reduces AgNO_3 . Biol. tests show that primin gives the typical dermatitis produced by primrose.

H. R. KRAVBILL

The existence and the chemical nature of hemolytic properties of antigens used for the Wassermann reaction. F. OKOLOV. *Biochem. Z.* **192**, 324-36(1928); *Zhurnal expl. Biol. Med.* **8**, 17-31.—Cooling as a means of removing the hemolytic properties of antigen is an indirect way of bringing about good results through limiting the necessary quantity of ext. The hemolytic property of liver antigen is about twice as great as that of heart antigen exposed to low temps. The hemolytic action of antigen from human liver or heart is due principally to fatty acids or their salts, which are more effective in this respect than lecithin or Na glycocholate.

S. MORGULIS

Chemico-immunological studies on globin and globin derivatives. F. OTTENSOOSER AND E. STRAUSS. *Biochem. Z.* **193**, 426-63(1928).—From the weakly antigenic hemoglobin a strongly antigenic globin can be prepd. under proper conditions. This is an atypical behavior for a basic protein. Nitroglobin and aminoglobins which are sol. in the body fluids and are either weakly basic or not at all basic, act as strong typical antigens. Specific globin pptn. takes place best in antigen solns. at pH 8.1-8.3. Attempts to prep. concd. globin solns. for anaphylaxis expts. were unsuccessful. The species specificity of the antiglobin sera in pptn. of globins is very marked; also the complement formation betrays a species differentiation. Globin possesses the characteristic specificity as hemoglobin.

S. MORGULIS

Preparation of diphtheria anatoxin by means of acetaldehyde. V. M. KULIKOV AND A. KOMPANEJZ. *Zhurnal expl. Biol. Med.* **8**, 79-83(1928).— AcH is more suitable than CH_3O in the prepn. of anatoxin as it can easily be removed by shaking or warming. AcH detoxicates the toxin quickly and with certainty. The anatoxin is antigenic, and this property can be increased by proper exptl. conditions (temp., concn., etc.).

S. MORGULIS

Paraffin as antigen. Z. V. YERMOLYEVA. *Zhurnal expl. Biol. Med.* **8**, 188-90(1928).—Injection of aqueous suspensions of paraffin causes the serum to acquire the specific property to produce pptn. and complement formation with these suspensions.

S. MORGULIS

The individual properties of alexin. II. Role of the individual alexin in the Wassermann reaction. V. FRIEZE AND L. SILBER. *Zhurnal expl. Biol. Med.* **8**, 318-21(1928).—The hemolytic and the adsorption capacity of the alexin are differentiated. These are mutually independent characteristics, the hemolytic titer having no effect on the adsorption capacity. With alexins of the same hemolytic dose sera with a partial pos. Wassermann (+, ++, +++) yielded different results from complete hemolysis to complete inhibition of hemolysis. Strongly pos. sera gave uniform results with all alexins but with neg. sera gave occasionally pos. results with some alexin. It is maintained that for the proper standardization of the Wassermann reaction alexin of standard adsorption capacity must be prepd.

S. MORGULIS

Studies on experimental shock with especial reference to its treatment. MAURICE I. SMITH. *J. Pharmacol.* **32**, 465-508(1928).—Evidence against the traumatic-toxemia hypothesis in shock was furnished by expts. in which direct transfusion of blood from the leg of a dog with leg tissues crushed, to another dog failed to produce shock symptoms in the recipient. Injection of blood from the crushed limb of an animal into the same animal failed to produce shock. Pituitary ext. given during the primary fall in blood pressure observed in histamine shock generally caused recovery, whereas if given

during the secondary stage the ext. was of little or no value. In cases of shock produced by manipulation of the intestines, supplemented by hemorrhage, injections of the following were of no permanent value: normal saline, normal saline and pituitary, 0.5 M glucose, gum saline, gum saline and pituitary, ephedrine, glycogen in normal saline.

C. RIEGEL

Quantitative variations of the blood iron content during asphyxia. LÉON BINET AND PAUL FLEURY. *Compt. rend. soc. biol.* 98, 825-6(1928).—Increases in the Fe content of 23 and 51% were noted in 2 chloralosed dogs which were subjected to 4-min. periods of asphyxia by closing the wind-pipe. In 2 splenectomized dogs asphyxia caused but little change in the Fe content of the blood. Contraction of the spleen forces an increased no. of erythrocytes into the circulation with a consequent rise in the Fe content.

L. W. RIGGS

Metabolism of carbohydrates in epileptics. C. J. MUNCH-PETERSEN. *Compt. rend. soc. biol.* 98, 891-3(1928); cf. Lennox, *C. A.* 22, 111.—A report is given of the sugar metabolism in 12 epileptics in connection with the administration of sugar and adrenaline.

L. W. RIGGS

Action of certain yeasts and more particularly alcoholic fermentation on toxins. ALEXANDRE COMIS. *Compt. rend. soc. biol.* 98, 1091-3(1928).—Toxins of dysentery, ricin, diphtheria and paratyphus B were fermented generally with the yeast *S. ellipsoidens* and inoculated in rabbits. In all cases the toxicity of the toxin was diminished while its antigenic power was preserved and the immunizing action was reinforced.

L. W. RIGGS

Variations in the blood density in the course of asphyxia. Study of the density of the blood from the splenic vein. LÉON BINET AND L. PERLÈS. *Compt. rend. soc. biol.* 98, 1096-7(1928).—Acute asphyxia increased the density of the blood from an av. of 1.0558 to 1.0621 in 6 cases. The density returns to normal in 15 to 45 min. after normal respiration is established. This change in density is not observed in splenectomized dogs. During asphyxia the blood of the splenic vein in 6 dogs had an av. density of 1.0977 as compared with 1.0531 in the arterial blood of the same dogs.

L. W. RIGGS

Accumulation of sulfur in the skin after extirpation of the suprarenals. M. LOEPER, J. DECOURT AND A. LESURE. *Compt. rend. soc. biol.* 98, 1098-9(1928); cf. *C. A.* 21, 2311, 3948.—In 3 dogs deprived of suprarenals the S in the skin increased from 23 to 30% in 8 days following the operation. This fact is of interest in connection with the accumulation of melanin, a highly sulfurized compd., in Addison disease.

L. W. RIGGS

Modifications of cholesterolemia in oxaleemics. G. LAROCHE AND A. GRIGAUT. *Compt. rend. soc. biol.* 98, 1104-5(1928).—In 7 cases of gout there was a hyperoxalemia ranging from 0.059 to 0.078 (normal 0.04), and the cholesterolemia ranged between 2.08 and 3.05, but the variations were not parallel to those of the oxalemia. L. W. R.

Passage of bismuth and of arsenic across the vasculo-meningic barrier in man under the influence of an aseptic meningitis. S. MUTERMILCH AND (MLLE) E. SALAMON. *Compt. rend. soc. biol.* 98, 1113-5(1928); cf. *C. A.* 21, 2332.—The intrarachnoid injection of sterile farina emulsion in general paralytics causes an aseptic meningitis. Under this condition intravenously injected As or Bi medicaments may penetrate the cerebrospinal fluid.

L. W. RIGGS

Diastatic treatment of experimental cobraic in venomation. C. PICADO. *Compt. rend. soc. biol.* 98, 1130-1(1928).—Injection of cobra venom in the rabbit was followed after 5 min. by several injections around the site of the venom injection, of a mixt. of eosin and trypsin and also an intravenous injection of sparteine sulfate. The animals survived without local or general reactions.

L. W. RIGGS

Effect of castration on the basal and summit energy metabolism. X. CHAHOVITCH AND (MLLE) M. VICHNITCH. *Compt. rend. soc. biol.* 98, 1153-5(1928).—Expts. with rats proved that castration caused a lowering of the basal metabolism which began in some of the animals in 18 days after castration. There was also a diminution in the summit metabolism which was pronounced several months after castration.

L. W. RIGGS

Diuretic power of serum of patients with diabetes insipidus. MARCEL LABBÉ AND P. L. VIOLLE. *Compt. rend. soc. biol.* 98, 1290-3(1928).—In tests with rabbits the injection of the serum of patients with diabetes insipidus caused no greater polyuria than did the injections of normal serum.

L. W. RIGGS

Endemic goiter and public health. O. P. KIMBALL. *Am. J. Pub. Health* 18, 587-601(1928).—Endemic-goiter caused by deficiency of iodine in the modern, highly refined, table salt is prevented by the use of iodized salt contg. 1 pt. KI per 5,000 NaCl;

or by taking one iodostarin tablet (10 mg. I) per week. Too much iodine may be harmful. C. M. SALLS

Mineral metabolism in celiac disease. S. V. TELFER. *Glasgow Med. J.* **38**, 306-13 (1928).—The results of a metabolic study of fat and mineral utilization are recorded. On a diet of fresh milk the retention of the bone-forming elements is much reduced and fat utilization is defective. The retention of MgO is not appreciably lessened. The retention of Fe_2O_3 is neg. The mode of excretion differs widely from that in normal subjects. The output of fecal solids is excessively great, and is associated with an undue loss of mineral matter and fatty derivs. from the intestine. The percentage of fatty derivs. in the solids is double the normal while the percentages of total mineral matter and of the individual mineral constituents are below the av. The CaO is excreted as an insol. soap and constitutes a large part of the solids. The urinary excretion of CaO, MgO and P_2O_5 is low. The mode of excretion indicates the existence of a grossly defective absorption of both mineral elements and fats. M. H. SOULE

Surface tension of serum of the sensitized guinea pig. I. Surface tension changes incident to the process of sensitization. SUSAN G. RAMSDILL. *J. Exptl. Med.* **47**, 987-91 (1928).—The change in surface tension behavior in the serum of sensitized guinea pigs is, as du Noiry has concluded for immunized rabbit serum, not referable to an antibody content, since the capacity for transfer of sensitization remains in the serum indefinitely, while the increased time-drop phenomenon is a transitory manifestation. That this phenomenon cannot be invoked by a new antigen capable of calling out its sp. antibody would seem to indicate that this expense is due to some basic stable alteration of a tissue active in the general process of sensitization. That this alteration is not called out by such a simple toxic injury as a $\text{UO}_2(\text{NO}_3)_2$ nephritis is contributory evidence that the primary toxicity of the horse serum is not the sp. factor involved.

II. Surface tension changes in the blood in anaphylactic shock. *Ibid.* 993-8.—The primary change in surface tension of serum incident to anaphylactic shock is probably due to a lowering of the surface tension of the serum by the addn of the antigen serum. But this may be followed by a further decrease or by an increase depending on the intensity and duration of certain secondary tissue changes. C. J. WEST

H—PHARMACOLOGY

A. N. RICHARDS

The influence of some gases and drugs upon the tonus and peristalsis of the isolated intestines. TSUNEYA NISHIKAWA. *Jikei-Kwai Med. Col., Tokyo Sei-i-Kuon Med. J.* **47**, No. 1, 3-4 (1928).— O_2 increases the duration of peristalsis in isolated rabbit intestines suspended in Tyrode's soln. while the effect of N is not so marked. The bubbling of H_2 through the soln. has an unfavorable effect, and CO_2 is more harmful. Under the influence of O_2 morphine or atropine in 1:10000 soln. accelerates both the tonicity and peristalsis while in stronger soln. (1:5000) they increase the tonicity and weaken the peristalsis. The action of morphine with CO_2 on the intestines is the same as that with O_2 while atropine causes in both dilns. with this gas a lowered tonicity and peristalsis. With N, morphine has no effect in the smaller dose but in the higher concn. weakens the peristalsis but does not change the tonicity. Atropine behaves the same on the intestine with N as with O_2 . With no gases morphine accelerates the natural peristalsis and tonicity, the more pronounced effect being noted with the greater concn. of the drug. Atropine on the other hand causes a marked decrease in peristalsis and tonicity, a greater effect being noted with the stronger soln. H. J. DEUEL, JR.

Blood calcium studies. IX. The influence of insulin on the blood calcium. E. KULIN. *Z. ges. exptl. Med.* **52**, 260-1 (1926).—The blood Ca was detd before insulin injection in 8 diabetics, and again 4-5 hours afterwards. A drop of 0.5 to 3.5 mg. per 100 cc. was observed. F. L. DUNN

The mechanism of alimentary hyperglucemia. I. The influence of the vegetative nervous system upon alimentary hyperglucemia. W. GRUNKE. *Z. ges. exptl. Med.* **52**, 488-98 (1926).—Blood-sugar curves were detd. following the ingestion of glucose with and without the previous administration of ergotamine. Ergotamine markedly reduces the blood-sugar elevation. Fluoroscopic studies showed that ergotamine did not disturb the function of the stomach and G. suggests that the vegetative nervous system is an important factor in alimentary hyperglucemia. F. L. DUNN

Electrolytes and vagus irritability. F. BRICKER and A. TSCHARNY. *Z. ges. exptl. Med.* **52**, 550-8 (1926).—An excess of Ca ion in the blood of rabbits increases the effect of pilocarpine on the blood pressure; and also increases the irritability of the peripheral end of the vagus nerve. K ion does not have this effect. F. L. DUNN

The action of potassium and calcium on urinary acidity. ISTVÁN HETENYI AND J. HOLLO. *Z. ges. expth. Med.* 52, 595-602(1928).—The titratable acidity and the pH of the urine were followed for 4 hrs. following the injection of solns. contg. K and Ca into patients with various diseases. Both salts were diuretic. Ca shifted the urinary reaction to the acid side and K to the alk. Controls using NaCl did not show this effect.

F. L. DUNN

The effect of oxidation inhibitors upon glucolysis in the blood of birds. A. BORNSTEIN AND O. ASCHER. *Z. ges. expth. Med.* 52, 607-14(1928).—Goose blood kept at 37° does not show any glycolysis in 2-3 hrs. normally. It is not observed then unless the O in the blood has been consumed, or unless the blood has been satd. with CO₂, or unless such poisons as cyanide, quinine or arsenious acid have been added. This is in confirmation of the Meyerhof theory of glucolysis.

F. L. DUNN

Studies on diiodotyrosine and thyroid gland preparations with a discussion of the gas metabolism method of Knipping. FR. HOFFMAN. *Z. ges. expth. Med.* 57, 68-76 (1927).—No changes were observed in basal rate, pulse or temp. in normal men following the injection of 3,5-diiodo-L-tyrosine in doses up to 4.2 g. and in 1 case with daily doses of 4 cc. of a 15% soln. It was not found possible to increase the basal rate more than 50% above normal no matter how large the dosage of thyroid gland prepn. was.

F. L. DUNN

The distribution of gold in the healthy and tuberculous organism following the injection of sanocrysin. SHUSAKU KUROSA. *Z. ges. expth. Med.* 57, 77-110(1927).—Histochem. studies in white mice and guinea pigs following the injection of sanocrysin showed an increased deposit in the diseased organs in tuberculous animals, but not in the diseased part. Bibliography.

F. L. DUNN

Studies with secretin. I. The blood-sugar lowering action of secretin in animals. LADISLAUS TAKÁCS. *Z. ges. expth. Med.* 57, 527-31(1927).—A substance can be extd. from the small intestine mucosa which reduces the blood sugar 50-60% in rabbits and dogs. II. **The blood-sugar lowering action of secretin in healthy and diabetic individuals.** *Ibid.* 532-6.—Similar results were obtained, the lowering amounting to 55% in some instances. Hypoglycemic symptoms appeared and the ext. was effective when given by mouth or rectally. T. suggests that this may have a bearing on the etiology of diabetes.

F. L. DUNN

Studies on chologogs. I. The action of sodium dehydrocholate (decholin) in man. STEPHAN RUSZNYAK. *Z. ges. expth. Med.* 57, 536-53(1927).—With a duodenal tube no therapeutic effect was observed in 19 cases when 2 g. of decholin was injected intravenously. Bibliography.

F. L. DUNN

The action of colloidal sulfur upon the respiratory exchange. G. PENNETTI. *Z. ges. expth. Med.* 57, 584-94(1927).—Colloidal S in subcutaneous doses of 30-40 mg. per kg. in deeply urethanized rabbits had no noteworthy effect on the respiratory exchange, but did lower the blood sugar 15-20%. Doses of 100 mg. per kg. body weight resulted in lowering of the respiratory quotient and a hyperglucemia, due to a S poisoning.

F. L. DUNN

Studies on the excretion of unoxidized substances in the urine. The action of adrenaline, insulin and phlorhizin on the C:N ratio and on the oxygen deficit in the urine. HANS E. BUTTNER. *Z. ges. expth. Med.* 57, 721-39(1927).—The amt. of O required in the complete combustion of urine is the O deficit. Following doses of adrenaline 0.5 mg. per kg. the O deficit increases for about 8 hrs. to double the normal, sinking to below the normal during the following 16 hrs., making the total amt. the same as in the normals for the 24-hr. period. The increased O deficit did not seem to be due to carbohydrate or org. acids. A definite change in the O deficit was not shown following the injection of insulin, 2 units per kg., into rabbits. Phlorhizin in rats increased the O deficit 150%.

F. L. DUNN

The dependence of the action of insulin on the female sex glands. E. VOGT. Univ. Tübingen Hospital. *Deut. med. Wochschr.* 54, 701-2(1928).

A. G.

The therapeutic use of phosphorus. G. ZACHARIAE. *Deut. med. Wochschr.* 54, 920(1928).—A discussion of the therapeutic use of *tonophosphan*, a com. prepn. contg. P.

ARTHUR GROLLMAN

Poisoning by somnifen. E. LICHTENSTEIN. *Deut. med. Wochschr.* 54, 921(1928).—Report of a case.

ARTHUR GROLLMAN

Morphine poisoning in a seven-week old infant. J. FLEISCHER. *Deut. med. Wochschr.* 54, 921(1928).—Report of a case.

ARTHUR GROLLMAN

Action of benzene upon simple secondary anemias in rabbits and upon normal rabbits. THOMAS HODGE MCGAVACK. Univ. Calif. *J. Am. Inst. Homeopathy* 21, 461-76(1928).—Subcutaneous administration of C₆H₆ in daily doses ranging from 0.004

to 0.1 cc. had no influence on the recovery of 10 rabbits from simple secondary anemia due to hemorrhage. The smallest dose of C_6H_6 which produced a definite physiol. action in normal rabbits was 0.1 cc. given subcutaneously for 20 to 25 consecutive days. In 20 rabbits suffering from chronic C_6H_6 poisoning, the bone marrow was stimulated with the production of immature types of cells, and either destruction of granulocytes or failure to produce them in any but the smallest quantity (2 to 4%); the red cells were reduced slightly in no.; and the megakaryocytes increased greatly in activity. The more primitive forms of cells entered the circulation, and were frequently caught in the lungs as a result of their size; thereby a tendency existed to obstruct the smaller arterioles and capillaries and produce minute necrotic areas. The spleen was rarely affected. When 4 rabbits were given a dose of 0.75 cc. per kg. of body wt. subcutaneously daily for 6 or 7 days, the thrombocyte count in the circulating blood showed an initial increase, followed, in turn, by a primary fall, a secondary rise, and a secondary fall; complete recovery to normal was attained on the 17th to 20th day of the expt. When this dose was doubled, and given to 2 rabbits until death occurred, their bone marrow and lungs showed the same changes as recorded above in chronic poisoning. Acute poisoning with recovery followed intraperitoneal injection of a single dose (1.5 cc.); among the symptoms were subnormal temp., increased respiration and pulse rate, paralysis of the adductor muscles, decreased control of the neck muscles, spasmodic twitchings of the facial and trunk muscles and rigidity of the spinal muscles; lapse of consciousness did not occur; the leucocyte count was markedly lowered; the erythrocyte and the thrombocyte counts were but little changed. Conclusion: C_6H_6 exerts its action upon the marrow of the long bones; small doses (0.1 cc. daily) over a sufficiently long period of time produce the same effects as larger doses for shorter periods; the action is essentially leucotoxic, and chiefly affects the granulocytes, mononuclear types and megakaryocytes, but not the erythrocytes. In acute poisoning, the bone marrow activity is first depressed, then increased; in chronic poisoning, the reverse occurs. The total amt. of C_6H_6 required to produce death is no greater in chronic than in acute poisoning.

JOSEPH S. HEPBURN

The effect of drugs on cardiac output. VI. The effect of ephedrine on the minute cardiac output of normal dogs. CHARLES P. WILSON, COBB PILCHER AND T. R. HARRISON. *Arch. Internal Med.* 41, 622-32(1928).—"Ephedrine increases the minute cardiac output, and the results of its use in shock indicate it is of value as a cardiac stimulant."

Copper in medicine and industrial pathology. II. Pathology of copper workers. 1. Workers with pure copper. 2. Workers engaged in the manufacture of copper salts and compounds and those coming into contact with them. 3. Workers engaged in the manufacture of copper alloys. VINCENZO MAZZI. *Rass. clin. terap. sci. affini* 27, 49-76; 119-61(1928). Cf. *C. A.* 22, 1804.

M. J.

The physiological action of anions. N. ONODERA. Kyushiu Imperial Univ. *Jap. Med. World* 8, 58-60(1928).—As a result of expts. on men and dogs it is concluded that "the sulfuric acid on coming into contact with the mucous membrane of the stomach forms a substance resembling peristaltic hormone and makes the mech. component of digestion, while the HCl and pepsin make the chem. components. Salt of cholic acids protect the intestinal wall, completing the absorbing function; phosphate of soda acting on the duodenal wall manifests its action by stimulating the internal secretion of the pancreas."

N. KOPELOFF

Physicochemical modifications in the blood following chloroform narcosis. G. MONTENARTINI. *Boll. soc. ital. biol. sper.* 3, 140-1(1928).—Dogs were anesthetized with 20 g. chloroform. The index of refraction of the blood increased. In man, the protein equil. was disturbed, tending towards an increase in globulins. A hypocholsterinemia was observed in dogs.

PETER MASUCCI

A comparative study of the convulsant action of the acid and neutral salts of acid fuchsin. J. E. THOMAS. St. Louis Univ. *J. Pharmacol.* 33, 1-19(1928).—Frogs were bled by excision of the ventricle, and solns. of fuchsin injected into the aorta. Acid solns. of fuchsin caused convulsions in less time, and more consistently than alk. solns. of fuchsin. In frog perfusion expts. when the concn. of acid fuchsin in the Ringer soln. was greater than that of alk. fuchsin convulsions occurred sooner than when the greater part of the fuchsin was present as the alk. form. The convulsant action of alk. solns. of fuchsin in perfused frogs was greater if the soln. was used immediately after the addition of alkali rather than later, after decolorization had occurred. C. R.

A comparison of the actions of cocaine and adrenaline upon excised smooth muscles

of different species. C. H. THIENES. Univ. of Oregon. *J. Pharmacol.* 33, 21-41 (1928).—Cocaine was added to a bath of Tyrode, Locke or Ringer soln., in which was suspended a strip of smooth muscle. With stomach muscle of the rabbit, guinea pig, rat and cat, there was increased tonus with cocaine. With strips of small intestine or colon from the rabbit, cat, dog, guinea pig, either an increase or decrease in tone was produced. Strips of the fundus of the urinary bladder usually showed increased tonus after the addition of cocaine. Low concns. of cocaine (1:50,000 to 1:25,000) caused increased tonus of uterine strips, while with high concns. (1:10,000 to 1:5000) there was either an augmentation or a depression of activity. Adrenaline in the majority of cases gave results opposite to those produced by cocaine. C. RIEGEL

Studies on hypnotics of the barbituric acid series. NATHAN B. EDDY. Cornell Univ. *J. Pharmacol.* 33, 43-68(1928).—Given orally to cats, the fatal doses of the drugs studied were found to be: barbital (diethylbarbituric acid) 280 mg.; amytal (isoamylethylbarbituric acid) 100 mg.; ipral (Ca ethylisopropylbarbiturate) 140 mg.; neonal (butylethylbarbituric acid) 84 mg.; phanodorn (cyclohexenylethylbarbituric acid) 120 mg. per kg. Thirty cats were divided into 6 groups of 5 each, and members of each group administered a certain percentage of the fatal dose of each drug. Effects on the following were observed: posture, hypnotic effect, heart rate, respiratory rate, analgesia, rectal temp., size of pupils, reaction of pupil to light, conjunctival reflex, correction of abnormal position, running, righting reflex, knee jerk, tone of hind limbs, general condition. Phanodorn was the most depressant and hypnotic, produced only a moderate depression of the respiration and was least likely to cause muscular rigidity and trembling. Amytal was very similar but had a greater effect on respiration. Ipral was the least desirable because it was the least depressant, and complete recovery was delayed more than with the others. To produce a stupor amounting to anesthesia a dose of at least 50% of the fatal dose had to be given. There were no consistent effects with any of the drugs on heart rate or size of pupil. C. RIEGEL

Pharmacological action and chemical characteristics of products produced from Witte's peptone by electrolysis. FRANK P. UNDERHILL and ERWIN G. GROSS. Yale Univ. *J. Pharmacol.* 33, 69-80(1928).—A soln. of Witte's peptone was electrolyzed. The soln. obtained from the anode chamber was acid to litmus. The material obtained on evapn. gave a bright red color with HNO_3 . It had a low ash content, was low in tryptophan and compared to Witte's peptone was low in basic N, especially arginine and lysine. The soln. obtained from the cathode chamber was alk. to litmus. The material obtained on evapn. had a high ash content, and a tryptophan content higher than that of the anode material but lower than Witte's peptone. The basic N was high, particularly arginine and histidine. The soln. from the center chamber was neutral to litmus. Both the sol. and insol. portions showed reactions similar to the original Witte's peptone. C. RIEGEL

The pharmacology of cardiazole. W. J. R. CAMP. Univ. of Illinois. *J. Pharmacol.* 33, 81-92(1928).—In the frog, ablation of the cerebrum and optic lobes did not affect the convulsions produced by cardiazole (given either subcutaneously or intravenously), but removal of the medulla prevented convulsions. In the rat and rabbit, removal of the cerebrum affected the convulsions of the entire body except the head. Cardiazole injected into the 4th ventricle after respiration had stopped stimulated respiration. Salivary secretion was increased after cardiazole. The action was inhibited by deep ether anesthesia, and ineffective after section of the 7th cranial nerve. The latter indicates central action of the drug. In a rabbit with the cervical sympathetic chain cut on one side, administration of cardiazole had no effect on the eye on the operated side, but caused dilation of the pupil and exophthalmos on the normal side. This also indicates central action. Kidney vol. was increased after cardiazole. The urinary bladder was markedly contracted. Both these effects were inhibited by deep ether anesthesia, or, in the case of the kidney, by section of the splanchnic nerve, and in the case of the bladder, by section of the dorsal cord. C. RIEGEL

The influence of atropine and adrenaline on the reaction of the perfused frog heart to acetylcholine. O. W. BARLOW. Western Reserve Univ. *J. Pharmacol.* 33, 93-113(1928).—Perfusion of a soln. of acetylcholine into a frog heart caused a depression of the amplitude and rate of the heart beat, the effect increasing with increase in concn. of the drug. Increasing the perfusion pressure increased the depressive action on the amplitude but had little or no effect on the rate. Acetylcholine lowered the threshold of stimulation of the vagus. The depressant effects of acetylcholine in concns. up to 1 in 10^6 were completely removed by the presence of one part of atropine to 10 of acetylcholine. If the concn. of acetylcholine was increased up to 1 in 10^4 or 10^5 the depression is merely delayed by atropine, and with stronger concns. of acetylcholine atropine has

little or no effect. Administration of acetylcholine in concns. of 1 in 10^4 to 1 in 10^3 to a heart being perfused with atropine causes acceleration. This is attributed to a stimulation of the sympathetic receptive mechanism. The stimulating effect is obscured in a normal heart by parasympathetic stimulation and becomes apparent only after the parasympathetic effect has been prevented by atropine. With concns. of acetylcholine 1 in 10^2 there is a depressant action on the heart muscle. Adrenaline in dilns. greater than 1 in 10^6 after acetylcholine had no effect or an action antagonistic to the depressant action of acetylcholine. Concns. of adrenaline greater than 1 in 10^6 had an additional depressant action. C. RIEGEL

Chemical constitution and pharmacological properties of the derivatives of methylimidazole. J. V. SUPNIEWSKI. *Compt. rend. soc. biol.* **98**, 1229-30(1928).—Imidazole, 4-methylimidazolyl alc. or 4-imidazolyl aldehyde administered to the cat produces an increase in the blood pressure by vaso-constriction. They also cause a contraction of the isolated uterus of the guinea pig. Intravenous injection of 0.03 g. per kg. of 4-methylimidazole in the cat causes a diminution in the blood pressure by vasodilatation of the intestinal and renal regions. This compd. increases the frequency and amplitude of the respiration. The actions of 4-methyl-5-methylimidazolyl alc., 4-chloromethylimidazole, 4-aminomethylimidazole, 2-thio-4-methylimidazole, 4-diethylaminomethylimidazole and 4-piperidylmethylimidazole are described. In general each of these substances affects the blood pressure and the respiration. L. W. RIGGS

Insulin and the external secretion of the pancreas. JEAN LABARRE AND PIERRE DESTREÉ. *Compt. rend. soc. biol.* **98**, 1237-9(1928).—The injection of insulin causes a diminution in the output of pancreatic juice, especially marked at the moment of the greatest lowering of the glucemia. The lipolytic, tryptic and amylolytic powers are diminished at the same time. L. W. RIGGS

Stimulating action of intravenous injections of dextrose on the external secretion of the pancreas. JEAN LABARRE AND PIERRE DESTREÉ. *Compt. rend. soc. biol.* **98**, 1240-2(1928).—The cross circulation method of Heymans and Heymans for perfusing the brain being used it is found that injection of hypertonic glucose soln. causes an increase in the pancreatic secretion and in the digestive powers of the secretion by action on the nerve centers (vagus). The effect does not occur from similar injections of hypertonic NaCl. L. W. RIGGS

Influence of beryllium on the irritability of the frog heart. W. DULIÈRE AND L. DEBORGGRAEF. *Compt. rend. biol. soc.* **98**, 1255-6(1928); cf. *C. A.* **22**, 1627, 2212, 2623.—The substitution of $\frac{2}{3}$ of the Ca in the perfusing liquid by Be is perfect, but the substitution of $\frac{1}{4}$ of the Ca by Be is impossible. A critical zone exists as in the substitution of Ca by Mg. Be may replace K to a slight extent. L. W. RIGGS

Influence of subcutaneous injections of oxygen on the saturation of arterial blood. P. SPEHL AND A. LEMORT. *Compt. rend. soc. biol.* **98**, 1262-3(1928).—The subcutaneous injection of 500 to 1500 cc. of O had no influence on the O satn. of arterial blood in patients with pulmonary emphysema. L. W. RIGGS

Mobilization by ephedrine of the formed elements of the blood in reserve in the spleen. LÉON BINET, A. ARNAUDET, (MLLE.) B. FOURNIER AND M. KAPLAN. *Compt. rend. soc. biol.* **98**, 1282-4(1928).—Expts. with dogs showed that the splenic contraction caused by ephedrine results in the passage into the circulation of the formed elements which are held in reserve in the spleen. L. W. RIGGS

Action of adrenaline by instillation into the conjunctival sac on the physico-chemical properties of the aqueous humor. MAURICE VINCENT. *Compt. rend. soc. biol.* **98**, 1284-6(1928).—The instillation of adrenaline into the conjunctival sac causes an increase in the p_H of the aqueous humor and a diminution in its total CO_2 content. L. W. RIGGS

Effect on intra-ocular pressure of intravenous injections of hypertonic salt solution. ROBERT K. LAMBERT AND SAMUEL SILBERT. *J. Am. Med. Assoc.* **90**, 1435-6(1928).—An av. drop of 40% occurred in the intra-ocular pressure in 25 patients with normal pressure, following the intravenous injection of 300 cc. of 5% NaCl soln. and a proportionate drop of 21% followed the injection of 150 cc. of the same soln. L. W. R.

Fate of alcohol in the human body. W. LAUFFBERGER. *Wochschr. Bruu.* **45**, 88-9(1928).—Alc. cannot be stored for long in the body and hence is either oxidized to CO_2 and water or excreted unchanged. It is probable that the amount excreted increases with habitual indulgence in alc. A. SCHULTZ

The influence of gas adsorption on the gas effect during its pharmacological action on the extirpated frog heart. I. NARANOSUKE KŌDA. *Acta Schol. Med. Univ. Imp. Kioto* **10**, 137-54(1928).—The contractions of an isolated frog heart were recorded; then the effect of a gas soln. was studied and following this, the effect of adsorbing

the gases by certain added adsorbents. The gases used were CO_2 , CO , coal gas, NO , N_2O , H_2S , SO_2 , C_2H_4 , C_2H_2 , MeCl , Cl_2 , H_2 , O_2 and tobacco smoke; they were applied dissolved in Ringer soln. Blood charcoal, bolus alba, infusorial earth, starch powder, pancreatin and mastic emulsoid were used as adsorbents. With exception of O_2 , all gases showed an inhibitory action on the heart contraction, and every adsorbent able to adsorb the gas employed accelerated recovery. Charcoal and bolus were the best adsorbents. Each adsorbent has its own order of affinities for the different gases. Inorg. gases seem to be more readily adsorbed than org. gases. Two exceptions from the rule that the amt. of gas adsorbed is increased with the b. p. of the resp. gas adsorbed were found: MeCl is weakly adsorbed despite high b. p. and NO strongly adsorbed in spite of low b. p. **II. Experiments with various charcoals.** *Ibid* 155-64.—Blood charcoal, wood charcoal, carbonin (a prepn. of wood charcoal) and straw charcoal were tested regarding their affinity towards gases acting on the extirpated frog heart. The same method as above was used, the recovery of the amplitude and the rate of the heart beat being the indicator for the intensity of the reacting power. Blood charcoal was the most effective material, while carbonin and wood charcoal came next. **III. Experiments at high and low temperatures.** *Ibid* 165-73.—The pharmacol. action of C_2H_2 , CO_2 and H_2S , on the heart contractions and their adsorption by blood charcoal or bolus alba were investigated under the influence of high and low temp. The temps. chosen ranged between 37° and 45° or 0° and 9° . The method used was the same as described in the above. K. found the pharmacol. effect of the gases greater at extreme than at moderate temps.; at extremely high or low temp., the recovery was weaker than at moderate temp. No recovery occurred over 48° or under 1° . The recovery through adsorption was better at low than at high temp. The order of the recovering action of charcoal or bolus for each gas was the same at high and low temps. as at moderate temps.

G. SCHWOCH

Action of veratrine on striped muscle. A. QUERIDO. Univ. Amsterdam. *Arch. n  rland. physiol.* 12, 28-153(1927).—A few workers have supposed that the drug acts on the motor nerve; the majority, however, believe that it poisons the muscle by altering its metabolism, by forming a toxin in it, by removing a normal inhibitor of contraction or by affecting the red fibers rather than the white or the sarcoplasm rather than the fibrillae. Q. working with frogs and rats shows that the threshold of veratrinized rat's muscle is less than normal; minimal stimuli produce simply a prolonged contraction without the initial quick phase; with increasing strengths of stimulation, the areas of the curves increase by steps; the muscle therefore still obeys the "all or none" law. The latent period is shortened but the refractory period prolonged to a duration equal to several times that of the contraction; the subnormal contraction of the relative refractory period is similar to that produced by subnormal excitations. The form of the elec. response depends on the sensitivity of the string galvanometer; a large no. of oscillations were found of frequency 80 to 120 per second, diminishing in amplitude but increasing in frequency towards the end. Silhouette records of a small part of the muscle show oscillations at 50 per second in irregular groups lasting 0.4 second. Degenerated muscles (section of motor nerve) do not give a veratrine contraction, but section of the sympathetic does not prevent its appearance. Veratrine has no definite effect on the smooth muscle of the nictitating membrane, but acts on the frog's heart as on skeletal muscle, the effect being demonstrated by mech. stimulation of a heart stopped by vagal stimulation. The muscle can be poisoned by applying veratrine to the nerve, alive or dead; indirect excitation will only produce a veratrine contraction if the nerve is uninjured; the drug prevents the action of the vagus on the heart, but not its effect on respiration. After curare and veratrine, direct stimulation produces the usual veratrine curve; indirect stimulation produces only a prolonged contraction without the preliminary twitch. The intensity and course of the poisoning are influenced by the concn. of the veratrine, but the amt. absorbed by the muscle in a given time depends on the total quantity supplied, and not on its concn.; in 1 hr. an isolated muscle of *R. esculenta* requires 5×10^{-9} to 25×10^{-9} g. to poison it. The action of the drug increases to a max. when it is present in low concn.; above this concn., after the max. effect is attained, its influence diminishes and the muscle dies. Conclusion: A veratrine contraction is due to the asynchronous rhythmical contraction of groups of the muscle fibrillae, and the drug acts directly upon the muscle, which it can reach by way of the nerve. A very complete bibliography is given.

M. H. SOUT  

Active principles of the posterior lobe of the pituitary gland. I. Demonstration of two active principles. II. The separation of the two principles and their concentration in the form of potent solid preparations. OLIVER KAMM, T. B. ALDRICH, I. W. GROTE, L. W. ROWE AND E. P. BUGGER. *J. Am. Chem. Soc.* 50, 573-601(1928).—

The oxytocic and pressor principles of the posterior lobe have been sepd. and obtained as stable, H₂O-sol. powders; the Me₂CO-desiccated gland material is extd. with 0.25% AcOH, the ext. concd. at a low temp., the proteins and the active principles are pptd. with (NH₄)₂SO₄ and the principles extd. from the ppt. with glacial AcOH, followed by fractionation with various org. solvents (Me₂CO, Et₂O and light petroleum) and subsequent purification. No decompn. occurs during the process and the combined components show activities identical with those of the original ext. The prepn. of the pressor principle (for which the term β -hypophamine is suggested) is 80 times as potent and the oxytocic (α -hypophamine) more than 150 times as potent as the International Standard Powdered Pituitary. The principles have not been obtained cryst., but both are basic. Expts. on rabbits seem to indicate that the diuretic-antidiuretic action of the posterior lobe of the pituitary is due to the pressor principle. The development of a tolerance to the pressor principle by a rapid succession of intravenous injections of relatively large amts. is identical with that obtained with impure pituitary exts. but no depressor action is observed with the pure prepn. The 2 principles are being manufactured for exptl. clinical use under the trade names *oxylocin* and *vasopressin* and a preliminary discussion of the therapeutic indications is presented.

Relation between the reducing power of sea water and the distribution of sea-shore organisms. F. FISCHER. *Compt. rend.* **185**, 1525-7 (1927).—Dissolved reducing substances in sea water favor the distribution of *Sabella pavonia*, Sav., and *Nassa reticulata*, L.

B. C. A.

The muscle protein. V. The nutritive value of the muscle protein. (2). The amount of lysine in the muscle protein and its effect on the growth of young rats. HIDE-SABURO SEKINE. *J. Imp. Fish. Inst.* **22**, 42-3 (1926); (In Japanese; English résumé, p. 20); *Biol. Abstracts* **1**, 260.—Two muscle proteins, from the fish *Oncorhynchus masou* and the mollusk *Meretrix meretrix* (without an adductor muscle), were used. The growth-promoting value and the lysine content of the fish-muscle protein are, resp., 69-74% and 69% of that of the mollusk protein. Conclusion. The lysine content of muscle protein is directly related to the growth of young animals whereas the other amino acids, such as tryptophan and histidine, are practically not related to this function, because the amts. of the latter are present in sufficient quantities in the muscle proteins or are substituted by others (histidine, arginine).

H. G.

The influence of altered hydrogen-ion concentration on *Stentor*, *Diaptomus* and *Daphnia*. K. MÜNSTER STROM. *Nyt. Mag. Naturvidenskub.* **64**, 109-15 (1926); *Biol. Abstracts* **1**, 853.—An attempt to study the effect of changes in p_H alone, independently of changes in concn. of other ions. For this, Sorensen's phosphate mixts. are unsuitable because of the toxic effect of K ions—more marked in *Diaptomus gracilis* and *Daphnia pulex* than in *Stentor*. S. uses very dil. mixts. of phosphates, but does not indicate how the final p_H is estd. *Stentor* is only slightly influenced by changes of p_H from 6.5 to 8.0. *Daphnia* thrives in slightly alk. medium (p_H 7.9), while *Diaptomus* prefers a slightly acid reaction.

H. G.

The adaptation of protozoa to poisons. O. HARNISCH. *Zool. Anzeiger Supplementband 2* (Verhandl. Deutsch. Zool. Ges. E. V. 1926) 99-108 (1926); *Biol. Abstracts* **1**, 636.—*Colpidium campylum* was grown in 1% dextrose soln., p_H 6.4-6.6, with *Barterium coli*. Quinine-HCl was added in increasing amts., beginning with 1:5000. Usually 1:2000 was the max. tolerated by *Colpidium* not previously adapted. Adapted by living in increasing concns., it tolerated 1:300. Reported destruction of quinine by *Paramecium* could not be verified. *P. caudatum*, grown with *Bact. proteus* for a week in lettuce water contg. sublethal concns. of arsenious acid, later lived in 2 or 3 times these concns. The toxic dose varies with environment and with the reaction of the medium.

H. G.

Effect of chloropicrin on silk worm pupae. ARNALDO PIUTTI. *Rend. accad. sci. (Napoli)* **33**, 106-11 (1927).—Killing the pupae by 1 hrs.' exposure to 0.01 g. chloropicrin per l. instead of by heat represents a saving in time and equipment and eliminates the risk of heat injury to the cocoon. The cocoon unwinds as easily as a normal cocoon. The crude thread has the same color, translucency and strength. The yield in degummed thread is 9.8% higher than by the old process. A sixfold thread winds up very well at 108 bobbin revolutions per min. The pupae are dark brown and have

a characteristic disagreeable odor. They should preferably be used for the manuf. of fatty oils instead of for fertilizer. The poisoned pupae yield on extrn. 1.5–2% more oil, which seps. *stearic acid* on standing. The latter is perhaps split off by the sudden poisoning.

MARY JACOBSEN

The respiratory proteins of the blood. III. The acid-combining capacity and the dibasic amino acid content of the hemocyanin of *Limulus polyphemus*. ALFRED C. REDFIELD AND ELEANOR D. MASON. Harvard Med. School. *J. Biol. Chem.* **77**, 451–7 (1928); cf. *C. A.* **22**, 979.—The hemocyanin of *Limulus polyphemus* binds about 160×10^{-5} mols. of acid per g. and reacts with acid as though it were a univalent base with an apparent dissoen. const. of 3.3. The max. acid-binding power agrees closely with that calcd. from the dibasic amino acids of this protein. On the basis of the presence of 2 atoms of Cu in the hemocyanin mol. the probable no. of basic amino acids in the mol. has been calcd. to be as follows: arginine 36, histidine 40, lysine 38, total 114; total acid-combining capacity 117 (dett. experimentally).

A. P. LOTHROP

Reducing substances in the blood of the dogfish, *Squalus sucklii*, and certain other fishes. F. D. WHITE. Univ. Manitoba Med. School. *J. Biol. Chem.* **77**, 655–69 (1928).—“Blood samples taken from the dogfish, *Squalus sucklii*, shortly after capture show a low sugar content but if the fish is kept for a period of not less than 4 days, even under fasting conditions the sugar content rises to an approx. const. level of 55 to 60 mg. per 100 cc. of blood. Blood filtrates subjected to fermentation according to the procedure of Folin and Svedberg demonstrate that in dogfish blood the sugar is almost completely fermentable, while in the blood of 3 species of teleosts there appear to be normally present non-fermentable reducing substances to the extent of about 10 to 12 mg. per 100 cc., as detd. by the revised Folin procedure. Dogfish subjected to conditions of gradually increasing asphyxylation have shown no evidence of hyperglucemia under the exptl. conditions employed.” The revised Folin method (*C. A.* **20**, 2340) when very rigidly carried out gives results which more closely approx. the true glucose content of blood than do the Folin-Wu or Benedict procedures.

A. P. LOTHROP

The changes in the plasmic-nuclear ratio in immature eggs of sea urchins under the influence of differences in the osmotic pressure of the medium. S. SKOWRON AND (MME.) H. SKOWRON. Zoological Sta., Naples. *Bull. intern. acad. Polonaise* **1926B**, 859–79.—The authors measured the vols. of the nucleus and protoplasm of immature eggs of *Sphaerechinus granularis* when placed in glucose solns. of varying osmotic concns. At a concn. corresponding to that of sea water ($\Delta 2.28^\circ$) the plasmic-nuclear ratio was 6.6:1. The ratios 5.4:1, 5.0:1, 5.6:1, 5.4:1 and 6.2:1 were found for the concns. corresponding to $\Delta 1.73^\circ$, $\Delta 1.70^\circ$, $\Delta 1.26^\circ$, $\Delta 1.08^\circ$ and $\Delta 2.57^\circ$. The eggs of *S.* have a membrane between the nucleus and the cytoplasm in addn. to the membrane segg. the cell from the surrounding medium. The differences in plasmic-nuclear ratio are probably due to the existence of different osmotic pressures in these 2 parts of the cell.

LAWRENCE P. MILLER

The proteolytic enzymes of serum. IX. The difference in behavior of sera at definite stages of anuran metamorphosis. M. v. FALKENHAUSEN, H. J. FUCHS AND M. SCHUBERT. *Biochem. Z.* **193**, 269–75 (1928).—The sera of cold-blooded animals in different stages of metamorphosis act upon fibrin from older stages by causing it to become hydrolyzed, whereas upon fibrin from younger stages it acts like an immune serum causing the disappearances of the non-protein N. Serum of the fully developed frogs does not display immunological reactions with the fibrins of the different developmental stages.

S. MORGULIS

Studies on fish bile. II. Bile from *Tetrodon porphyreus* Sieb. (Fugu fish.) NORITARO TERAOKA. *J. Biochem. (Japan)* **8**, 341–50 (1928).—Cholic acid and taurine were isolated and identified from the bile of the Fugu fish. The taurocholic acid is the chief component of this bile (about 9%).

S. MORGULIS

The relative thyroid gland activity in axolotl and *Amblystoma*. T. ROLITCH. *Zhur-nal ekspl. biol. Med.* **8**, 60–71 (1928).—By the method of implantation it is shown that the axolotl thyroid gland is not very active. Transplanting 36 axolotl glands subcutaneously into one axolotl induced metamorphosis in 5 months; in another instance metamorphosis was induced in 11 months following the implantation of 78 glands. On the contrary, the subcutaneous implantation of 38 *Amblystoma* glands into axolotls produced metamorphosis in 37–39 days. Smaller quantities of thyroid gland (axolotl or *Amblystoma*) produce; only after 10–11 months, weak symptoms of metamorphosis (exophthalmus).

S. MORGULIS

12—FOODS

F. C. BLANCK AND H. A. LEPPEL

Recent investigations in food chemistry. R. STROHECKER. *Arch. Pharm.* **266**, 329-46(1928).—A review. W. O. F.

A new material for food storage. W. E. WARNER. *Food Manuf.* **3**, 376(1928).—The advantages of Celotex for the construction of cold-storage space are detailed.

J. A. KENNEDY

Coloring matters in food. F. W. ANDREWS. *Food Manuf.* **2**, 257-8, 283-4, 371-2 (1928).—The general rules and finer points to be observed by the user in applying colors to foods are given and the pitfalls and dangers to be avoided are pointed out. The application to the various confectionery and meat products is dealt with in detail. There is also discussed the question of purity in relation to food colors. J. A. K.

Bacteria and the canning industry. R. F. HUNWICKE. *Food Manuf.* **1**, 19-20, 2, 179-80, 184(1928).—Microorganisms which are assocd. with the spoilage of canned meats and fish are discussed. Bacteria are more implicated than yeasts. Spoilage of the 2 kinds of *condensed milks* is due to a variety of causes; the bacteriol. problems encountered differ very much from those assocd. with other classes of canned foods.

J. A. KENNEDY

The salmon canning industry. ERNEST D. CLARK. *Food Manuf.* **3**, 345-50, 363-7(1928), cf. *C. A.* **22**, 828.—C. gives an account of the life history of the salmon and a picture of the plant and processes used at the Western Canneries. J. A. K.

The successful cider mill of today. II. HOWARD F. MACMILLAN. *Fruit Products J. and Am. Vinegar Ind.* **7**, No. 10, 13-15, 17(1928); cf. *C. A.* **22**, 2626.—Several plans by which cider may be successfully handled and marketed are considered. Among these are the principles of filtration, filtering medium, filtering outfits, bottling equipment and the possibilities of a maturing period for apple cider which is said to be distinctly beneficial.

J. A. KENNEDY

A new procedure for the determination of caffeine in tea. W. A. UGLOW AND A. M. SCHAPIRO. Leningrad Med. Inst. *Z. Untersuch. Lebensm.* **55**, 149-55(1928).—An accurate, simple, rapid method for detn. of caffeine in tea is as follows: 10 g. of the powd. sample is boiled 30 min. in 400 cc. of 4% Na_2CO_3 soln., the mixt. cooled to 60-70° and the tannins and albuminous material are pptd. by satd. CuSO_4 soln., gradually added until the reaction is slightly acid. The mixt. is diluted to 500 cc., shaken for 30 min., allowed to stand 20 min., 300 cc. of clear liquid pipetted out and extd. 4 times with 80-cc. portions of CHCl_3 . The CHCl_3 is evapd. from the combined exts. at a temp. not exceeding 60°, the residue (caffeine) dried at 80-90° and weighed. The caffeine obtained by this method being taken as 100%, the amt. by the method of Leindrich and Nottbohm (*C. A.* **3**, 1429-30) is 88% and by the method of the Russian military Pharm. (1913) is 80%. The method may be applied to *coffee*, provided fat is removed by extn. with petroleum ether.

WILLIAM J. HUSA

The composition and food value of margarine. J. S. ABBOTT. *Bull. Inst. Margarine Manufrs.* No. 10, 23 pp.(1927).—A popular account of the prepn., food value and uses of margarine.

W. C. EBAUGH

The effect of acidity on the softening of dill pickles. B. E. LESLEY AND W. V. CRUESS. *Fruit Products J. and Am. Vinegar Ind.* **7**, No. 10, 12(1928).—The authors' expts. lead them to believe that the softening of dill pickles is due to acidity.

J. A. KENNEDY

Concentrated milk. I. KRENN. *Wiener med. Wochschr.* **78**, 397(1928).—Analysis of samples of natural and condensed milk are given.

ARTHUR GROLLMAN

Elimination of iodine in milk. W. RASCHE. *Z. Kinderheilk.* **42**, 124-32(1926).—After ingestion by cows and goats of KI (0.5-1 g. 3-4 times at 48-hr. intervals), 11% of the I was recovered from the milk, irrespective of its vol. or fat content. B. C. A.

The action of the halides on milk and on the milk constituents. A. J. J. VANDEVELDE. Univ. Ghent, Belgium. *Natuurwetenschap. Tijdschr.* **10**, 66-72(1928).—Small quantities of Cl, Br or I do not sterilize milk. Larger quantities cause the pptn. of the casein. Analyses are given of the ppt. and of the serum in each case. The lactose content diminishes slightly with Cl and Br; the rotation due to lactose disappears or may even change its sign; an acid, $\text{C}_6\text{H}_{10}\text{O}_8$, m. 210° is obtained; I seems to have no effect.

A. L. HENNE

The determination of moisture in dry skim milk by the Bidwell-Sterling toluene distillation method. P. A. WRIGHT. *J. Dairy Sci.* **11**, 240-2(1928).—Detns. of moisture in dry skim milk by a vacuum oven showed slightly lower results than from the

Bidwell-Sterling toluene-distn. method (cf. *C. A.* 19, 620). As prolonged heating shows progressive decompn. of the lactose hydrate, the use of the toluene-distn. method, with a 2-hr. distn. time, is recommended. W. C. EBAUGH

The cooling and freezing of milk. HENRI CORBLIN. *Bull. soc. encour. ind. nat.* 1928, 232-42.—Chem. analyses of milk, frozen by standing for 48 hrs. at -10° , showed that the upper layer contains most of the fat, while the center and lower layer were rich in lactose and casein. When melted, the milk was changed in flavor and the cream floated in globules on the surface. This is a serious problem in transportation of milk for long distance. If thin layers of the fresh milk are cooled to -15° , with const. stirring, it can be frozen in about 8 min. This frozen milk is homogeneous, and when melted is similar to fresh milk. The milk may be transported in solid form, by freezing it between 2 cylindrical vessels 1 cm. apart in a brine. A more practicable application is to freeze the outside layer of milk in ordinary milk cans by cooling 15 min. in brine. In melting this does not affect the quality of the milk, and keeps the temp. of the inner liquid at 0° . AMY LEVESCONTE

Estimation of the milk constituents of caramels. WILHELM HARTMANN. *Pharm. Zentralh.* 69, 337-9(1928).—A discussion of the author's experience in examg. numerous samples and controls, the estn. of the fatty content being effected substantially *via* Ritthausen, in that a 20% aq. soln. of the caramel (100 + 400) was freed from nuts by sedimentation and filtration through cotton or mull, then after pptn. with 25 cc. of Fehling soln. and addn. of 25 cc. of 0.25 *N* caustic alkali the mixt. was treated with a suspension of filter paper (prepd. from 100 sq. cm. cut, fat-free filter paper shaken with H_2O) and later freed therefrom by decantation). This filter mass, washed and dried, was then exhausted of its fat by extn. with Et_2O for 6 hrs. Volatile fatty acids were thereupon detd. in not less than 1-g. samples of the recovered fat after hydrolysis with 4 g. of 5% glycerolic KOH soln., distn. being carried out in a Polenske app. in the presence of dil. H_2SO_4 until the distillate amounts to 110° . The values (R.-M. nos., etc.) obtained on some 16 samples involving butter, coconut, beef and pork fat, and mixts. thereof, have been tabulated and graphed. W. O. E.

Determination of corn-cockle in flour by hemolysis. F. S. OKOLOV. Research Inst. for Sanitation and Hygiene, Moscow. *Z. Untersuch. Lebensm.* 55, 155-62(1928).—The hemolytic action of the saponin in corn-cockle is the basis of a method for the detn. of corn-cockle in flour in amts. ranging from 0.05 to 6%. Flour is macerated with 1% NaCl soln. Part of the liquid is filtered off and tested for hemolytic action, a 1 to 18 suspension of washed erythrocytes from rabbit's blood being used. W. J. H.

Factors of flour quality. The colloid particle. C. O. SWANSON. Kans. State Agr. Coll. *Miller's Rev.* 92, No. 5, 27-9(1928).—A clear explanation of the term colloid, with especial reference to its application to flour dough. L. H. BAILEY

Flour specifications. G. L. ALEXANDER. Commercial Milling Co., Detroit. *Miller's Rev.* 92, No. 5, 21-3(1928).—Flour specifications began with the use of simple "hand tests" for color, odor, fineness of granulation, water absorption and doughing properties. In the hands of a trained operator such tests gave good comparative results, but there is not way to reduce these measurements to figures, and differences arise in the results of different operators working with the same flour. Gluten washing is another test that has been largely used. Chemical analyses are more reliable than the so-called "hand tests" when made by competent analysts. Moisture, ash and total protein have largely replaced these other tests. Of late years physical and physical-chemical methods have been applied but have not quite justified the claims of their originators. The baking test is also used extensively in judging flours. Flours differ greatly in characteristics or qualities, but no flour is a poor flour because it will not make the best bread. It may make excellent pastry, or *vice versa*. The safest way to sell flour or any other material is on sample. It is more important that a flour should be suitable for the purpose for which it is to be used than that it should meet rigidly some arbitrary specifications as, for instance, ash content. Specifications for yeast breads have been pretty well worked out. Work is being done on specifications for flours for other purposes. Pastry flours may be classified as those most suitable for (1) pies; (2) sponge or angel-food cakes; (3) pound cakes or layers and (4) cookies and fried cakes. For pies, soft wheat patents or sometimes clears, contg. 6-7% protein, are most desirable. For the sponge type of cakes a short patent from one of the stronger varieties of soft wheat is most effective. Pound cakes, chocolate layers and other cakes with a fairly heavy tendency can be made from long patent soft flours. For cookies and doughnuts, clear flours can be used to the best advantage. L. H. B.

The strength of flour. D. W. KENT-JONES. *Food Manuf.* 1, 101-2(1927).—The strength of flour may be regarded as the factor which will normally produce large, well-

piled loaves, provided that the gas production is sufficient; in practice this can often best be judged from the behavior and the properties of the fermented dough. Another useful viewpoint is the power of a flour to carry a known weak flour and still produce a good loaf. Such a method will clearly show when a flour is so strong that it becomes over strong. In such cases the over-strong flour will not make a good loaf when baked alone, but will do so when carrying a very large proportion of the weak flour. J. A. K.

The effect on their bread-making properties of extracting flours with ether. ARNOLD H. JOHNSON. Minn. Agr. Expt. Sta. *Cereal Chemistry* 5, 169-80(1928).—Bread of better color, texture and vol. was produced from ether-extd. flour than from natural flour. Low-grade flours were improved more in vol. of bread baked from them than were patent flours. Extn. of flours with ether did not affect the absorption, the wet or dry gluten or the viscosity of the water-extd. acidulated suspension. The extensibility of ether-extd. flours was slightly lower than that of the corresponding natural flours. Diastatic activity and reducing sugar content were higher in ether-extd. flours than in the corresponding natural flours. Treatment of the flours used in making this study with 70% alc. or with 96% alc. markedly lowered its quality for bread making. Such other properties as viscosity and extensibility were also reduced. Treatment with 70% alc. was the more injurious. Treatment of the flour with water did not notably affect its properties for bread making, but its extensibility and viscosity were reduced.

L. H. BAILEY

A study of "rope" in bread. E. A. FISHER AND P. HATTON. Research Assoc. of British Flour Millers, St. Albans, Eng. *Cereal Chemistry* 5, 192-208(1928).—"Rope" in bread is a disease due to the activities of various forms of *B. mesentericus*. It is similar in some of its effects to the disease of the same name observed in wine, beer and wort. Much of the earlier work on this disease is reviewed and it is shown that moisture, warmth and a low degree of acidity are necessary for its development. Many of the methods suggested for controlling "rope" depend on the addition of acids or acid substances to the dough, whereby the H-ion concn. is raised sufficiently to inhibit rope development. In this connection a study has been made of acetic acid, lactic acid, tartaric acid, acid potassium phosphate and acid calcium phosphate. Of these substances, acid calcium phosphate is the most effective as a preventive of rope and is least open to objection. The changes in pH and buffer value of bread consequent on rope development have been detd., and these changes show that slight stickiness and faint smell in bread do not mark the beginning of ropiness (as was formerly thought), but are characteristic of a late and acute stage of the disease.

L. H. BAILEY

The action of phosphatides in bread dough. E. B. WORKING. Kansas State Agr. College. *Cereal Chemistry* 5, 223-34(1928).—At least two distinct changes are brought about in dough during development by fermentation. Both of these are required to produce the proper balance between tenacity and ductility necessary for the production of the best bread. One of the changes is the reduction of the tensile strength of the gluten strands caused by acid through its effect of swelling the strands by increasing their absorption of water. The other change is the increase in ductility of the dough caused by substances such as phosphatides through a lubricating effect on the gluten strands allowing them to slip more readily upon each other. By adding acid and also egg yolk or an oxidizing agent that will cause the liberation of phosphatides, thus artificially bringing about these two changes, finished bread and buns of the best quality can be produced, two hrs. after the mixing is started. This sharp differentiation of two factors in dough development should make possible more intelligent testing of flour for quality and fermentation tolerance, and a more intelligent study of the problem of flour maturing and bleaching.

L. H. BAILEY

Some factors influencing the absorption in experimental baking. JAN MICKA AND ELIZABETH CHILD. Trent Inst. of Baking Technology, Ontario, Can. *Cereal Chemistry* 5, 208-14(1928).—The quantity of flour used in a dough does not appreciably alter its absorption. There is a difference of approx. 3% between the absorption of a dough consisting of flour and water alone and that of a dough contg. salt, sugar, lard and yeast. It is much more difficult to det. the end point of absorption in a dough of only flour and water. The absorption is increased with the use of salt in a dough because any slackness directly after mixing is more than offset by the stiffening of the dough during fermentation, salt having a toughening effect on the gluten. Sugar is largely responsible for the decreased percentage absorption of a dough contg. salt, sugar, lard and yeast as compared with a dough made of flour and water alone. Lard is to a small extent responsible for reducing the percentage absorption of a dough contg. salt, sugar, lard and yeast as compared with a dough made of flour and water. The absorption of a flour is slightly increased by yeast. High absorption is more detri-

mental to the quality of bread than low absorption. Information would be more reliable if percentage absorption were reported in figures which were practical in making bread, taking into consideration the retention power during fermentation and all other factors which influence absorption. Absorption should not be computed to a 13.5% or a 15% moisture basis.

L. H. BAILEY

Effects of heating immature wheat. C. O. SWANSON. Kans. State Agr. Coll. *Miller's Rev.* 92, No. 5, 47-52(1928).—Carefully controlled use of heat on fully matured, but new wheat will bring about an improvement in baking qualities. However, if the degree of temp. is too high or if the period of heating is too long, marked damage may result. When heating takes place under uncontrolled conditions, such as happen when wheat is cut immature, and stacked with too much moisture or when cut with the combine when not sufficiently matured, serious damage results. There is no damage in combine wheat if cut when fully mature and when it is not wetted by rain. Controlled heating will improve immature wheat when the degree of temp. is not too high nor the period of heating too long. The main purpose of this expt. was to find the limits of time and temp. at which wheat could be safely heated. The expts. will be repeated in order to det. more accurately the practical applications. This procedure will be used to det. the safe limits of heat in tempering wheat.

L. H. BAILEY

Lipoid phosphorus of wheat and its distribution. BETTY SULLIVAN AND CLEO NEAR. Russell Milling Co., Minneapolis, Minn. *Cereal Chemistry* 5, 163-8(1928).—In an analysis of the lipoids extd. from various parts of the wheat kernel, it has been found that the highest percentage of P is present in the lipid from the highest grade of flour (the patent) which contains the least total P. The phosphorus percentage of the lipoids decreases with decreasing refinement and increasing total phosphorus of the products from which they are extd. The N content of the lipid extd. from the patent was higher than that extd. from the germ. Anhydrous ether exts. a smaller quantity of the total lipoids in the sepsis. from the endosperm than from the embryo and pericarp of the grain.

L. H. BAILEY

Yeast fermentation in flour-water suspensions. T. R. JAMES AND L. X. HUBER. Sperry Flour Co., Spokane, Wash. *Cereal Chemistry* 5, 181-91(1928).—A method has been developed for the convenient measurement of rate of fermentation. The rate of fermentation is greater for clear flours than for patents. Oxidizing agents were found to be of no value to fermentation. NH_4Cl greatly stimulated the growth of yeast toward the end of the fermentation period. Alky. decreased yeast growth and added acidity increased fermentation. The effect of acidity varied greatly with the type of flour.

L. H. BAILEY

Tallowiness or rancidity in grain products. M. S. FINE AND A. G. OLSEN. *Ind. Eng. Chem.* 20, 652-4(1928).—Tallowy odors in patent flour developed most quickly in samples contg. 2.0% moisture and at temps. above 20° . A moisture content of 5% was protective, and samples contg. 10-12% moisture have shown no tallowy odor after 3 years. Suitable hydration of a dry baked product which had developed a tallowy odor exerted a curative effect. Addn. of 0.25 to 0.5% glycerol also exerted a protective action.

AMY LEVESCONTE

Fiber content and viscosity of potato flour. W. EKHARD. *Z. Spiritusint.* 50, 322-3(1927).—Addns. of 0.5, 1, 2, 3 and 5% of fiber to pastes with H_2O content approx. alike, 17.61 to 17.81%, gave no marked changes in viscosity measured according to the method of Saare. The gel properties reside in the esterified amylopectin, but the amylose ester may also form gels. It is impossible at present to explain the properties necessary for high viscosity. Nor can the change in viscosity of flours, due possibly to seasonal variation, be accounted for.

C. N. FREY

The digestibility of potatoes as influenced by methods of preparation. BESSIE BOGGESS AND A. C. IVY. Univ. Chicago. *J. Home Econ.* 19, 496-503(1927).—The starch of potatoes fried in cold fat is more easily digested than that of boiled potatoes and of those fried in hot fat. Fats in the amts. used facilitated the digestion of starch by the pancreatic juice. In dogs boiled potatoes were emptied from the stomach at a faster rate than fried. No appreciable difference was noted in the rates of emptying between pan fried (12.5% fat) and French fried (7.1% fat). In four of five human subjects potatoes boiled or fried were emptied at the same rate while with the fifth boiled potatoes were emptied faster. Excess fat (37.5%) with boiled potatoes caused a marked delay in emptying. In the av. normal individual fried potatoes, unless steeped in fat, are no more likely to cause digestive disturbances than boiled potatoes.

L. D. ELLIOTT

The application of luminescence phenomena in the study of apple preserves. F. M. LITTSCHIED. *Z. Untersuch. Lebensm.* 55, 175-8(1928).—Data are given on

the luminescence phenomena in ultra-violet light of apple preserves, showing the influence of impurities and adulterants.

WILLIAM J. HUSA

The microscopic structure of some tropical fruits and their detection in marmalade-like preparations such as "Lukutate-Mark." C. GRIEBEL. *Z. Untersuch. Lebensm.* **55**, 89-111(1928).—A description is given of the microscopic structure of the fruits of *Diospyros lotus*, *Achras sapota*, *Mangifera indica*, *Carica papaya*, of the seed coat of *Durio zibethinus* and of a bulb known as "Nillu," with emphasis on the characteristics of value for the detection of these plant parts in preps. The marmalade-like prep. known as "Lukutate-Mark" has a variable compn.

WILLIAM J. HUSA

Pectin. W. PEYER AND H. IMHOFF. *Apoth. Ztg.* **43**, 613 4(1928).—The nature of pectin is discussed in connection with methods of prep. from apple and orange peel, notably also from the sugar beet, after its freedom from sucrose. Some new uses for pectin are suggested.

W. O. E.

Acidity of juices of fruits and preserves. C. F. MUTTELET. *Compt. rend.* **186**, 1299-1301(1928).—In the detn. of acidity of fruit juices pectin must be removed. In place of the costly pptn. by concd. alc., it is proposed to hydrolyze the pectin to pectic acid, ppt. the latter with $\text{Ba}(\text{AcO})_2$ and det. the citric and malic acids in the filtrate by the usual methods.

L. W. RIGGS

Starch sugar and marmalade manufacture. W. EKHARD. *Z. Spiritusind.* **51**, 82(1928).—The addn. of glucose to marmalade has been criticized because it neither gives the desired sweetness, as some state, nor is crystn. prevented by its use. No harmful physiologic action of starch sugar was observed in the fermentable and unfermentable portion. Some investigators found glucose equal to cane sugar from a nutritional standpoint. Colloids found in glucose protect the organism against the osmotic action of sugars. Cane sugar has a strong osmotic action and its assimilation is thereby hindered. Glucose is considered a good sugar for marmalades.

C. N. FREY

Honey diastase. J. FIEBE AND W. KORDATZKI. Hygienic Inst., Landsberg. *Z. Untersuch. Lebensm.* **55**, 162 9(1928).—By the method of Koch the diastatic action of honey is detd. under the conditions of acidity and salt content existing in the honey. The method of Gothe depends on the detn. of the activity of diastase under optimum conditions and thus gives a measure of the actual diastase content. Gothe's method is as follows: Ten g. of honey is dissolved in H_2O , neutralized to litmus with 0.05 N Na_2CO_3 soln. and dild. to 100 cc. A series of tests is run with various proportions of honey soln. and starch soln., the total vol. of 16 cc. contg. 0.5 cc. of 0.02 N HAc and 0.5 cc. of 0.1 N NaCl. The tests are run for 1 hr. at 45-50° and cooled in ice water. The test which gives a purple color on addn. of 1 drop of 0.1 N I soln. is noted. A good honey requires less than 2.8 cc. of honey soln. to digest 5 cc. of 1% starch soln. under the above conditions. F. and K. have modified Gothe's method by using 0.05 N NaOH and phenolphthalein for the neutralization.

WILLIAM J. HUSA

The composition and valuation of the honey of bees fed on sugar. J. FIEBE. Hygienic Inst., Landsberg. *Z. Untersuch. Lebensm.* **55**, 169-73(1928). The honey of bees fed on sugar has the following properties. It remains fluid even on long keeping, with only a slight tendency toward crystn. It is light yellow in color, deficient in aroma and lacks flavor. A 10% soln. of the honey turns the plane of polarized light slightly to the right or slightly to the left. The sucrose content is increased, but is variable, being dependent on the amt. of sugar fed, season of feeding, etc. The sucrose is gradually inverted. The honey is low in mineral matter and in diastase. Such honey is sometimes considered to be an adulterated product.

WILLIAM J. HUSA

Jam manufacture. HERBERT MANSFIELD. *Food. Manus.* **1**, 12-4, 89 92(1927).—The factors to be taken into consideration in deciding between the direct process of converting the fruit directly into jam and the indirect process of preserving the fruit for jam-making at a subsequent date are discussed. Particulars are given for preserving fruit by chemicals, pulping by heat, parboiling and refrigeration.

J. A. KENNEDY

Maple sap and its improvement. EDWARD HART. *Ind. Eng. Chem.* **20**, 581(1928).—A comm. has been formed of the Faculty of Lafayette College to carry forward a plan wherein by careful selection of seed, it is hoped that the yield of sugar can be materially increased. This comm. consisting of 3 members, together with their successors, is pledged to carry this work to completion.

J. A. KENNEDY

The detection and identification of poison mushrooms by experimental and biological methods. Rehabilitation of allegedly poisonous and suspected mushrooms. GIOVANNI FERRI. *Boll. chim. farm.* **67**, 97-105(1928).—A tabulated classification of poison mushrooms, chem. and biol. methods and symptoms of poisoning. Mushrooms contg. hemolysins which are destroyed by cooking or digestive juices are not only harmless, but mostly edible. *Boletus luridus*, *Amanita spissa* and *A. ompha* are edible. A.

mappia, *A. citrina*, *Volvaria gloiocephala*, *V. speciosa* and *A. panternia* although harmless are not edible because of disagreeable taste or odor. *Chilocybe candicans*, allegedly harmless, contains 3-4 times as much *muscarin* as *A. muscaria*. The biol. method of detection is simpler and more rapid than the chem. Pellegrini-Gillot's method is often misleading: (1) because the guinea pig is immune to the poison of *Boletus satanus* and *Gyromitra esculenta* and highly resistant to *A. muscaria*, while it succumbs to the injection of the harmless meadow mushroom; (2) because the sporophore ext. used in this method is apparently often toxic by the subcutaneous, even if harmless by the oral, route. F. uses for the test minute doses of an ext. of the flesh portion. Besides guinea pigs, rabbits, rats, pigeons and sparrows are suitable for the expts. The sparrow is particularly useful for forensic tests, where often only traces of the poison are available. For the detection of *A. phalloides* the very rapid and sp. hemolytic test may be used.

MARY JACOBSEN

The organic acids of tomatoes. ARTHUR BORNTAEGER. *Z. Unters. Lebensm.* 55, 112-43(1928); cf. *C. A.* 20, 952.—B. has never found oxalic acid in mature tomatoes, although very unripe tomatoes may contain traces. Canned tomatoes when spoiled may contain oxalic acid formed through the action of bacteria or molds. The filtered expressed juice of mature green tomatoes contained no pectin, traces being found in the juice of ripe, but not over-ripe, tomatoes. Aq. exts. prepd. on the boiling water bath contained much pectin in the entirely unripe up to the somewhat softened tomatoes; as the softening proceeded further the amt. diminished. During softening of the ripe fruit, citric and malic acids disappeared. Over-ripe fruit contained succinic acid and sometimes arabic acid.

WILLIAM J. HUSA

By-products of the pineapple canning industry. V. R. GREENSTREET AND GUNN L. TEIK. *Malayan Agr. J.* 16, 8-13(1928).—Expts. indicate methods for more efficient disposal of pineapple waste in Malaya. The expressed juice, subjected to yeast fermentation and distn., gives a *potable alc. liquor*. The residue may be made into a nutritious *cattle food* or allowed to decomp. on the land as a *fertilizer*. N. M. N.

Chemical composition of turnips and turnip leaves. STAN. REYNAERT. Univ. Louvain, Belgium. *Natuurwetensch. Tijdschr.* 10, No. 3, 92-7(1928).—Ordinary analysis of several varieties of turnips, with a comparison between the leaves and the bulbs.

A. L. HENNE

The asparagus industry in California (JONES, ROBBINS) 11D. Report on (the determination of) total chlorine in plants (TILDEN) 11D. Preservation of orange juice with Na benzoate (ÁLVAREZ) 28. Apparatus for sterilizing or pasteurizing milk (U. S. pat. 1,673,215) 1. Apparatus for dehydrating milk (U. S. pat. 1,673,066) 1. Food products from oleaginous seeds (Brit. pat. 279,122) 27.

BRÉTIGNIÈRE, L., AND GODFERNAUX, J.: *L'ensilage des fourrages verts. Méthodes anciennes. Procédés nouveaux*. Paris: Libr. agricole de la Maison rustique. 256 pp. F. 14.

Foods (vegetable extracts with phosphates) treated with ultra-violet rays. J. PERINO. *Brit.* 279,487, Oct. 22, 1926. Nutritive exts. are obtained from vegetables by treatment with salts such as alkali phosphates and NaCl and with ultra-violet rays in the substantial absence of O. Various details are given and among the materials which may be treated are: peas meal, cabbage, spinach, green kale, lettuce and carrots. An aq. paste of Ca, Mg and Fe hydrates may be used in prepg. the ext. from peas meal and it may be mixed with exts. of the other vegetable materials.

Edible protein products from blood. F. C. ARWOOD (to American Protein Corporation). U. S. 1,673,964, June 19. All of the red corpuscular matter is sepd. from blood and the resulting soln. is subjected to heat (suitably at a temp. of about 37°) completely to ferment the blood sugar present. Yeast may be added.

Apparatus for drying alimentary pastes. G. GARBUIO. U. S. 1,674,326, June 19. Apparatus for concentrating fruit juices by freezing. W. A. HEYMAN. *Brit.* 278,799, July 13, 1926.

Preserving citrus fruit juices. W. H. BRADLEY. U. S. 1,673,493, June 12. The extd. juice is refrigerated and allowed to stand for sepn. of assoc. pulp, the clarified juice is drawn off and mixed with sugar, again allowed to stand until the sugar is absorbed by the juice and the juice is then sterilized and bottled.

Preserving egg contents. A. K. EFRSIN. *Brit.* 279,159, July 19, 1926. A treatment especially applicable to egg yolk to be frozen without impairing its emulsi-

ing properties comprises the addn. to the material of a water-sol. org. OH compd. such as glycerol, EtOH, ethylene glycol, sucrose, lactose or dextrose capable of preventing denaturing of egg protein during freezing, and an edible acid capable of increasing the water-imbibing capacity of the protein, e. g., acetic, tartaric, citric, lactic, malic or succinic acids or H_3PO_4 . A condimental essential oil may also be added if the product is subsequently to be used for making salad dressing or the like in which the oil would be a suitable ingredient.

Preserving meat or other foods by refrigeration and treatment with a "fog" of salt solution. A. R. McLEOD (to Food Chillers, Ltd.). U. S. 1,673,694, June 12. An app. is described.

Treating tea. H. NAGASAKI. U. S. 1,673,264, June 12. Tea is dehydrated by heating to a low temp. under reduced pressure, then pulverized and sprayed with an edible dehydrated oil such as olive oil or peanut oil from which all free fatty acid has been removed, so as to impregnate the tea with the oil. This treatment serves to preserve the flavor of the tea.

Food for animals. U. S. FARM FEED CORPORATION. Brit. 278,818, July 20, 1926. Hay, straw, clover, corn stalks or other farm "roughage" is subjected to an accelerated fermentation in the presence of moisture to increase the palatability and digestibility. The fermentation may be induced by ferments naturally present or yeast or malt may be added. MgO , lime, S , $NaCl$ and phosphates may be added, and BzH may be used as a flavoring and antiseptic agent.

13 —GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Chemical engineering at Iowa State. S. D. KIRKPATRICK. *Chem. Met. Eng.* 35, 338-41(1928) E. H.

Editorial impressions of economic and technical progress in German chemical industry. H. C. PARMELEE. *Chem. Met. Eng.* 35, 334-7(1928) E. H.

Industrial thallium poisoning. TELEKY. *Wiener med. Wochschr.* 78, 506-8 (1928).—The literature of Tl poisoning is reviewed with 27 references. Clinical findings in the cases of workers in factories manufg. Tl who suffered from Tl poisoning are also reported. ARTHUR GROLLMAN

Sulfur dioxide. CHARLES W. JOHNSTON. *Refrigerating Eng.* 15, 61-71(1928). Complete description of a manufg. plant. The methods of analysis, purification, effect on the human body and special properties are discussed. H. F. ZOLLER

Steam storage. A. J. T. TAYLOR. *Fuel in Science and Practice* 7, 206-26(1928).—The general principle of steam storage is discussed and the Ruths steam accumulator and its principal parts are described in detail. The Ruths accumulator is based on the old principle of storing the heat energy of steam in a large quantity of H_2O under pressure and at saturation temp. It differs from other accumulators in its large storage capacity capable of accommodating wide variations in steam consumption over periods of several hours. Installations of Ruths accumulators in (1) textile mill, (2) sugar refinery, (3) iron and steel works, (4) pulp and paper mill, (5) colliery, are described. D. A. REYNOLDS

Conditions governing the extraction of a solution by an immiscible solvent. E. I. SMITH. *J. Soc. Chem. Ind.* 47, 159-60T(1928).—It is mathematically proved that for a given vol. of extg. solvent and a given no. of extns., the max. extn. is obtained when the solvent is divided into equal portions. T. S. CARSWELL

Behavior of lead in the animal organism. I. ROBERT A. KEHOE AND FREDERICK THAMANN. *Am. J. Pub. Health* 18, 555-64(1928).—Expts. on the elimination of Pb from the animal organism indicate that a significant portion of the Pb in the body exists in the form of compds. with org. constituents of the tissues, the quantities in equil. with inorg. phosphates being constantly changed by reason of the conversion of the org. compds. into the forms in which the Pb is excreted. Since the av. daily excretion of Pb depends upon the quantity of Pb stored in the body it should be possible to make a careful study of Pb excretion over a sufficient period of time to det. the adequacy of all the preventive measures that are used to control an industrial lead hazard. C. M. SALLS

Educational and research activity in refrigeration. E. F. BURTON. *Refrigerating Eng.* 15, 93-112(1928).—A comprehensive discussion of the place of refrigeration in university and trade school curriculae, the type of research carried on in each school

and the necessity of lab. instructions. Several research projects are proposed.

H. F. ZOLLER

Dry ice in modern refrigeration. J. W. MARTIN, JR. *Refrigerating Eng.* 15, 33-5 (1928).—Solid CO_2 exposed to its own gas at atm. pressure maintains a temp. of -109.3°F . It will absorb approx. twice as much heat as will the melting of H_2O ice. Its heat of fusion is 81.54 B. t. u.; heat of vaporization 158.6 B. t. u.; heat of sublimation 246.4 B. t. u. The total heat-absorptive power at 32° in raising the temp. from -109° to $+32^\circ \text{F}$. is about 285 B. t. u. CO_2 is mainly produced from burning coke. H. F. Z.

Armored containers for storing and shipping compressed gases. F. RIEDER. *Z. kompr. fluss. Gase* 27, 6-7 (1928).—Compressed gas containers of thin corrugated metal encased in heavy wire screen armor are described. These containers will withstand the pressures used in the ordinary heavy-walled steel cylinders, and are considerably lighter in weight. The construction is protected by Swiss Patent No. 123,156.

R. L. DODGE

Gas defense conference in Brussels. RUDOLF HANSLIAN. *Z. ges. Schiess-Sprengstoffw.* 23, 140-5, 172-6 (1928).—The report of an international conference called by the Red Cross on gas defense for civilian populations in future wars. A comprehensive plan is presented for individual and group protection.

J. S. REICHERT

The tear gases. I. V. VOLJANSKI. *Arhiv. hem. farm.* 2, 14-24 (1928).—A short review.

JAROSLAV KUČERA

Filters for gas masks. ENGELHARD. *Z. ges. Schiess-Sprengstoffw.* 22, 330-3 (1927); 23, 27-9, 103-4, 176 7 (1928); cf. *C. A.* 22, 649.—E. describes the design of a tightly fitting facepiece, anti-dimming eyepieces, chemical container, chemical fillings, life of the canister against various gases, methods of testing, toxic smoke filters and the gas mask carrier.

J. S. REICHERT

Cu in medicine and industrial pathology (MAZZI) 11H.

BOLL, MARCEL, AND BAUD, PAUL: **Memento du chimiste. Tome II. Partie industrielle.** Paris: Dunod. 686 pp. Paper, F. 95; bound, F. 103.

Refrigerating apparatus of the absorption type. SIGURD M. BACKSTRÖM (to Electrolux Servel Corporation). U. S. 1,673,931, June 19.

Continuous-cycle absorption refrigerating apparatus. PLATEN-MUNTERS REFRIGERATING SYSTEM AKTIEBOLAG (to Electrolux Ltd.). Brit. 279,132, Sept. 15, 1925.

Electric refrigerating apparatus adapted to operate with ethyl chloride. H. R. VAN DEVENTER. Brit. 279,088, Oct. 12, 1926.

Coating or impregnating process. A. BIDDLE. Can. 279,849, May 1, 1928. Porous and cellular bodies and fibrous materials are impregnated with a water-resisting substance by forcing, under fluid pressure, an aq. dispersion of a colloid against the surface and into the pores, cells and interstices of such bodies and materials, the bodies so coated then being subjected to an insolubilizing agent to convert the coating into a water-resisting material.

Generating mixtures of steam and combustion products under pressure. R. TAIT and D. M. TAIT. Brit. 279,197, Aug. 18, 1926. Liquid gaseous or powd. fuel is supplied to a mixing chamber to which primary air (which may be mixed with steam) is supplied at a pressure of about 800 lbs. per sq. in. and the mixt. thus formed is admitted to an elongated combustion chamber supplied with secondary air at a pressure of about 500 lbs. per sq. in. and at a temp. of about 540° ; the mixt. is spontaneously ignited by compression ignition. Details of the app. are described.

Purifying gases. H. J. KRASE, H. C. HETTERINGTON and A. T. LARSON (to Arthur B. Lamb, Trustee). U. S. 1,673,877, June 19. CO_2 is removed from H-N mixts. or other gases by bringing the gas mixt. into contact with an aq. ammoniacal soln. of an NH_4 salt other than the carbonate, e. g., NH_4NO_3 .

Purification of gases. G. PISTOR and E. BROSBACH. Can. 279,987, May 8, 1928. Dust is sepd. from the raw gases escaping from a P furnace by passing such gases through a filter chamber filled with constituents of the charge of the furnace and kept at a temp. above the dewpoint of P.

Sterilizing water or other liquids by contact with bodies coated with metals such as copper and silver. G. A. KRAUSE. Brit. 279,085, Oct. 14, 1926.

Evaporating solvent from solution of polymerized styrene or other solutions. W. S. JOHNSTON and A. W. KEEN (to Naugatuck Chemical Co.). U. S. 1,673,685,

June 12. Steam or other gaseous drying agent under pressure is intimately mixed with the soln. and the pressure is suddenly released from the mixt. An app. is described.

Rectifying system for fractional distillation of petroleum oils or other liquid mixtures. J. P. FISHER (to Heat Treating Co.). U. S. 1,672,978, June 12. An app. is described.

Insulated electric wires and cables. H. B. BURLEY (to Boston Insulated Wire & Cable Co.). U. S. 1,674,156, June 19. A conductor is coated with a layer of rubber compn. and a layer of fibrous material, the layer is semivulcanized, a second layer of rubber compn. is applied and further vulcanization is effected under pressure between heated plates.

Heat-insulating composition. W. K. NELSON. Can. 280,010, May 8, 1928. A heat-insulating material of a cellular texture comprises the set product of a mixt. contg. H_2O , calcined gypsum as the major ingredient, an acid-reacting salt, a carbonate compd., a gas-adsorbing or emulsifying substance and a bubble-strengthening substance of colloidal particles, the last-named substance being used in such quantities as to have little retarding effect on the hydration and setting of the gypsum. Cf. C. A. 21, 3404.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Water purification. ALEXANDER HOUSTON. *Chemistry & Industry* 47, 522-5 (1928).—There are included 5 photomicrographs of microorganisms found in plankton; a sketch map of the New Walton Works and photographs of the primary and secondary filters, interior of the primary filters and the chlorinating plant at Walton. J. A. K.

Water softening with barium salts. C. J. RODMAN. *Chem. Met. Eng.* 35, 221-3 (1928).—The description of softening by means of Ba salts is given in some detail.

The pollution of tidal and non-tidal waters. J. H. COSTE. *J. Soc. Chem. Ind.* 47, 133-9T (1928).—This is a review with reference to conditions as they exist in England.

J. A. KENNEDY

The new water works for Bilston. R. C. S. WALTERS. *Water Water Eng.* 30, 101-5, 153-8 (1928).—A complete and detailed description is given of this new plant.

J. A. KENNEDY

The chemistry of mineral water. J. KNETT. *Oesterr. Chem. Ztg.* 31, 77-9 (1928).—Mineral water is discussed from the standpoint of compn. and methods of reporting analyses.

RUSSELL C. FRB

Study of physical and chemical conditions in San Francisco Bay especially in relation to the tides. ROBERT C. MILLER, WILLIAM D. RAMAGE AND EDGAR L. LAZIER. *Univ. California Pub. Zool.* 31, 201-67 (1928).—A study was made of the salinity, temp., turbidity, dissolved O_2 , dissolved H_2S and H-ion concn. of the water at 5 selected localities in San Francisco Bay in relation to tidal changes, meteorological conditions and sewage contamination. In the presence of strong tidal currents, the ebb and flow of the tide influenced the results. Max. salinity, lowest temp. and lowest H_2S usually occurred near the end of flood. No regular tidal relationship was found for dissolved O_2 , pH and turbidity. However, the pH varied directly with the dissolved O_2 ; and the dissolved H_2S bore an inverse relation to these 2 factors. Surface water had a lower av. salinity, higher temp., greater concn. of dissolved O_2 and higher pH than did bottom water even at depths of only a few ft. The av. dissolved H_2S content was not influenced by the depth. The % of satn. with dissolved O_2 increased with the temp. and the number of hrs. of sunshine. The water was usually 80% or more satd. with O_2 ; at times rapid photosynthesis gave rise to satn. or supersatn. The pH values were rather high and varied within narrow limits: 7.50 to 8.16. The max. value for H_2S was 0.42 cc. per l., the av. value 0.13 cc. "So far as our investigations show, the chem. effect of the sewage at present discharged into San Francisco Bay is inconsiderable and is quickly dissipated by tides and currents. The most objectionable feature, biologically, of sewage contamination in the bay appears to be the accumulation of sludge on the bottom near the sewer outlets." A 4-page bibliography is given. J. S. H.

New cooling apparatus cracks off scale. ANON. *Oil & Gas J.* 26, No. 51, 76 (1928).—A cooler or condenser developed by the Griscom-Russell Co. consists of a series of Admiralty metal tubes set with an initial curvature into cast iron headers. Scale formed on the tubes by the evapn. of the cooling water is automatically cracked off if the flow of hot liquid through the tubes is interrupted, causing them to return to their

initial curvature. The same principle is applied to evaporators for distg. pure boiler feed water from hard, dirty or salt water. M. B. HART

Improved method for phenol determinations (BAYLIS) 7. Sterilizing water (Brit. pat. 279,085) 13. Base-exchanging substances (Brit. pat. 279,466) 18.

Portable water filter. T. C. HOLZ and E. L. PEGG. U. S. 1,674,203, June 19.

Apparatus for aerating water. C. DEROSI. Brit. 279,281, Jan. 7, 1927.

Valve to control flow of water through water-softening apparatus. J. N. D. HEENAN. Brit. 279,330, April 22, 1927.

Base-exchanging substances. A. ROSENHEIM. Brit. 279,028, Oct. 16, 1926. Natural minerals or rocks of suitable character or artificial substances such as glass are rendered base-exchanging or their capacity in this respect is increased by treatment under pressure with acid, neutral or alk. reagents or successively with reagents of different character. Pressures up to 10–15 atm. and temps. up to 170–200° may be employed. Examples are given of: treatment of trachytic tuffs, palagonite tuffs, phonolite tuffs, or glasses rich in alkali, with H_2SO_4 or a bisulfate soln.; treatment of baked or unbaked kaolin with an alkali or alk. earth hydroxide; treatment of glauconite with a soln. of NaCl, KCl, KNO_3 , $NaNO_3$, Na phosphate or NH_4Cl ; treatment of shale with a waterglass soln.; treatment of baked bricks, clinkers, baked clay or minerals such as feldspar, leucite, phonolite, basalts, slags, lava, unbaked clay, field soil or their mixts. with HCl followed by alkali silicate, or NaOH, or by alkali carbonate, phosphate or aluminate; treatment of granite with HCl and then with water-glass soln. When alk. earth compds. are used it is preferable to replace them with alkali. Oxides such as those of Fe, Al, Si, Zr or Ti may be pptd. in or on the substances. Coke may be impregnated with Al sulfate and then treated with alkali silicate and afterward, if desired, with NaCl. Pumice may be successively treated with an acid and with alkali silicate. Cf. C. A. 22, 2424.

Boiler compound. NAKASABURO KUBO. Jap. 69,069, Aug. 7, 1926. A mixt. of powdered graphite, tannin, sugar cane and $NaHCO_3$ or alkali carbonate is specified.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Fertilizing of heavy soils rich in potash. DIENST. *Ernährung der Pflanze* 1927, No. 6.—Two stiff clay soils, shown by the Neubauer method to contain ample available potash, nevertheless proved very responsive to potash fertilizers when cropped with roots and potatoes. B. C. A.

Increasing iodine content by iodine addition. K. SCHARER AND A. STROBEL. *Angew. Bot.* 9, 187–99(1927); *Biol. Abstracts* 1, 1022.—When KI was added to soil in which sugar beets, peas, oats, alfalfa, pasture grasses, etc., were growing, in all cases the I content of the crop was increased. The increase is outside the limits of analytical error. H. G.

The effect of colloidal silica on the efficiency of phosphates. SHINPEI SEKI. *Bul. Sci. Fakultato Terkultura, Kjusu Imp. Univ.* 2, 253–61(1928).—In the experimentation with rice plants by the method of sand culture, the addn. of colloidal SiO_2 increases the efficiency of $Ca_3(PO_4)_2$ markedly, and that of acid phosphate slightly. The increase of the phosphoric acid content in the plants depends on the quantity of colloidal SiO_2 supplied. The contents of crude ash and SiO_2 in the straws and in the mixts. of husks and chaff increase with the colloidal SiO_2 supply. In the unhulled rice, the H_3PO_4 content and its % of the total H_3PO_4 in the plant increase with the supply of colloidal SiO_2 ; it seems that SiO_2 facilitates the transportation of H_3PO_4 in the plant body. The SiO_2 content of the plant depends on the SiO_2 supply. No difference exists between colloidal SiO_2 and so-called pptd. SiO_2 , with respect to their beneficial action upon the efficiency of phosphates. The effect of colloidal SiO_2 on the decomn. of $Ca_3(PO_4)_2$ with or without nutrient salts is negative, at least in lab. expts. A. L. H.

Superphosphate as stimulant of [plant] growth. L. ZALESKI. *Mem. Inst. Nat. Pol. Econ. rurale Pulawy* 7, 1–27(1926).—A study of the effect of the introduction of small quantities of superphosphate immediately under the seeds. B. C. A.

Solubility of phosphates in citric acid. Z. SZWARCJA. *Przemysl Chem.* 12, 137–41(1928).—The final equil. of $Ca_3(PO_4)_2$ in citric acid according to $3Ca_3(PO_4)_2 + 4C_6H_8O_7 \rightleftharpoons 3Ca(H_2PO_4)_2 + 2Ca_3(C_4H_4O_7)_2$ depends on fineness, temp., time of action and

quantity of water, the stoichiometric ratio being 930.81 parts of $\text{Ca}_3(\text{PO}_4)_2$ to 768 parts $\text{C}_6\text{H}_5\text{O}_7$. On these considerations the soly. of Constantine and Rochow phosphates is compared. Contrary to earlier findings, it is found to be greater for the former, in which the phosphate content is much greater. In their present forms both the conventional and the Robertson methods for measuring the soly. in citric acid of H_2PO_4 in phosphates are irrational. The judgment of the suitability of such phosphates does not depend on purely chem. considerations. A. C. ZACHLIN

By-products of the pineapple canning industry [as a fertilizer] (GREENSTREET, TEIK) 12. The cell stimulation problem as applied to medicine and agriculture (POPOFF) 11A. Cellulose [for use in fertilizer making] (U. S. pat. 1,672,895) 23.

Fertilizer. N. CARO and A. R. FRANK. Brit. 279,421, Oct. 23, 1926. A fertilizer of alk. reaction is made by passing NH_3 over CaCO_3 or mixed carbonates such as dolomite heated to 500–900° under either ordinary or higher pressure.

Fertilizer. SELBI SOC D'EXPLOITATION DE LICENCES DE BREVETS INDUSTRIELS Brit. 279,022, Oct. 16, 1926. A non-hygroscopic fertilizer is obtained by mixing vinasses from distilleries and sugar factories (preheated and preferably mixed with peat or sawdust or the like) with a equal wt. of superphosphate (preferably also previously heated) and heating the mixt. sufficiently to effect drying, e. g., at a temp. of 125–30°.

Superphosphates. A. GAILLARD. Brit. 279,380, Oct. 25, 1926. Superphosphate is dried at a low temp., removed to a "silo" or the like where part of the acquired heat is retained, subjected to a second drying operation and these operations are repeated until the product attains a desired degree of moisture content (suitably 3–4%). An app. is described. Cf. C. A. 22, 1429.

Insect powder. A. IMAZU. Brit. 278,816, July 20, 1926. Pyrethrum powder is mixed with C_{10}H_8 and camphor. MgCO_3 , ultramarine and camphor oil also may be used in similar mixts.

Fungicidal preparation. K. MARX and H. WESCHER. Can. 280,362, May 22, 1928. A fungicidal prepn. contains an alkali-sol. complex org. Hg compd. and an alkali-sol. Cu compd.

Fungicide for seeds. K. MARX and H. WESCHER. Can. 280,363, May 22, 1928. A fungicide for seeds contains $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, $\text{KNaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$, NaOH and NaCl .

16—THE FERMENTATION INDUSTRIES

C. N. FREY

New aims of fermentation technology. F. HAYDUCK. *Z. Spiritusind.* 50, 297 (1927).—The industries involved and their research problems are discussed. C. N. F.

Alcohol fermentation. XIV. The nature of zymín fermentation. S. KOSTYCHEV AND V. FAERMANN. *Z. physiol. Chem.* 176, 46–54 (1928); cf. C. A. 21, 3206.—Zymín, the "Acetondauerhefe" prepd. by dehydration of yeast with MeAc and Et_2O , differs from Lebedev's dried yeast or "Trockenhefe" in that no induction period precedes the fermentation, and the power of stimulating living yeast cells is absent. This lack of stimulative power is not due to removal of active substances by the solvents employed but rather to the failure of these substances to diffuse out of the plasmolyzed cells, since the stimulative action on living cells may be restored by boiling the zymín. The usual tests, such as inoculation on beer wort gelatin, show no evidence of the presence of living cells, and the fermentation brought about by zymín has always been considered a cell-free fermentation. It is now shown that the zymín cells are not actually dead, but can be resuscitated by proper treatment. If the zymín is placed in 10% sucrose at 0° for 8 hrs. and the temp. raised to 30° for 16 hrs., yeast colonies may be obtained by inoculation on the gelatin plates. This treatment deplasmolyzes the cells and re-

stores their power of proliferation. Zymin preps. consist of yeast cells which are moribund but still living and capable of fermenting sugar. Buchner and his collaborators committed a serious oversight in examg. their preps. culturally before and not after the fermentation. The conversion of sugar into EtOH and CO_2 by zymin is not a cell-free fermentation. XV. The fermentation of yeast maceration juice. S. KOSTYCHEV AND A. CHROMITSCH. *Ibid* 55-73.—The filtrate obtained by passing yeast maceration juice through a Chamberland filter may or may not have the power of fermenting sugar. If the pores of the filter are relatively large and the filtration takes place rapidly, an active filtrate is obtained. Fermentation by such filtrates has been regarded by other investigators as evidence in support of the zymase theory. However, the first portion of a filtrate may be active and a later portion, after the pores have become clogged and the filtration less rapid, may be inert. This cannot be due to a removal of the supposed zymase by ultrafiltration, since a large amt. of protein and invertase passes through. For the same reason the induction period of active filtrates cannot be attributed to removal of hexosephosphoric acid, as claimed by Kluyver and Struyk (*C. A.* 22, 245). Inactive filtrates undergo fermentation when inoculated with minimal quantities of the unfiltered maceration, showing that secondary factors such as cozymase and hexosephosphoric acid are still present in abundance. Inoculation of inactive with active filtrates also gives rise to fermentation. Finally, as will be reported in a later paper, the living organisms have been isolated from filtered maceration juice. Fermentation by maceration juice is therefore a biological process and furnishes no grounds for the assumption of a cell-free fermentation. A. W. DOX

Isolation of methylglyoxal in alcoholic fermentation. W. WINDISCH *Wochschr. Brau.* 45, 80-1(1928).—The isolation of the disemicarbazone of methylglyoxal from the products of alc. fermentation by Kostychev and Soldatenkov was unsuccessfully attempted by Neuberg and Kobel. The latter claim that the Russian scientists had isolated hydrazodicarbamide, a decompn. product of semicarbazide. Both compounds have the same m. p. and soly in water but differ in their ultimate compns. A. S.

Production of glycerol by fermentation. V. Effects of sulfites on yeast cell and fermentation. Y. TOMODA. *J. Soc. Chem. Ind. (Japan)* 31, 9-20; *Suppl. binding* 5-6B (1928). (In English); cf. *C. A.* 22, 1822.—The effects of sulfites on yeast cell and fermentation have been studied by means of staining the cell with methylene blue and detg. the decrease of sugar in the fermenting medium. NaHSO_3 is very injurious to the yeast cell and fermentation. Even a soln. of 0.5% has a marked injurious effect. The inhibiting action of NaHSO_3 is reversible to some extent. The activity of the yeast cell, which has been injured by NaHSO_3 , can be regenerated by adding Na_2CO_3 or NaHCO_3 within 20 hrs after the addition of NaHSO_3 . The injurious effect of NaHSO_3 is due to the action of HCO_3 ion. The presence of Na_2SO_3 or of SO_3 ion nearly arrested the propagation of yeast; and the fermentive activity is greatly diminished, being dependent upon the free zymase, which is not in the combined state with the protoplasm of the yeast cell. In a synthetic medium, which contains Na_2SO_3 , the velocity const. of the fermentation is a linear function of the number of yeast cells in unit vol. But in a natural medium, such as molasses soln., the velocity const. becomes a linear function of the log of the number of yeast cells. $\text{CH}_3\text{CHO} \cdot \text{NaHSO}_3$ complex has no injurious effect upon yeast cell and fermentation, but in alk. medium the complex is slightly dissoed into its components, which produce an injurious effect. The inhibiting action of NaHSO_3 can be eliminated by adding AcH, but not by adding cozymase. Y. NAGAI

Comparing the values of raw fusel oil by various methods. B. LAMPE. *Z. Spiritusind.* 51, 30(1928).—The detn. of fusel oil and its water and amyl alc. content was attempted by various methods. Tables are given. C. N. FREY

The influence of various factors on the production of fusel oil during fermentation of molasses. SVETOZAR JANKOVIC. *Z. Spiritusind.* 51, 105-6(1928).—A molasses contg. 52.4% sugar and 1.7% N was fermented under various concns. and temps. The largest quantity of fusel oil, 1.45%, was obtained at 15 balling, at a temp. of 27° , acidity of 0.5° and with double percent of stock. The smallest quantity, 0.22%, was obtained at 25 balling, 27° , acidity 1.5° and double the amt. of stock. The greatest quantity of fusel oil was formed under those conditions most favorable to yeast activity. No nutriment except that in the molasses was added. The protein of the yeast was 31.31% in the 15 balling and 36.81 in the 25 balling. The proteins of the yeast furnish the material from which fusel oil is created. Higher yeast addn. and low concn. of molasses favor degradation of yeast amino acids. C. N. FREY

The determination of small quantities of fusel oil. E. GLIMM, H. SCHRÖDER AND F. STENTZEL. *Tech. Hochschule Danzig. Z. Untersuch. Lebensm.* 55, 173-5(1928).—

The R6se "shaking buret," using 100 cc. of liquid, has been employed in smaller sizes, using 10 cc. and 20 cc. of liquid, without sacrifice in accuracy. WILLIAM J. HUSA

Statistics of analytical results for brewing materials. F. KUTTER. *Wochschr. Brau.* 45, 24-6(1928).—A method is described of calcg. a weighted av. from a number of analytical results. A. SCHULTZ

Extension of malt analysis by a test of flavor. H. KROPPF. *Wochschr. Brau.* 45, 87-8(1928).—Differences in the quality of malts not detectable by chem. means can be found by testing the flavor of their worts. Slow germination at relatively low temps. and rapid kilning are advocated for the production of a good malt. A. SCHULTZ

Linear or logarithmic methods of calculating color values in malt analysis. F. KUTTER. *Wochschr. Brau.* 45, 238-9(1928).—Linear color calcns. of worts agree better with facts than the logarithmic. A. SCHULTZ

Linear or logarithmic methods of calculating color values in malt analysis. H. K. SCHINDLER. *Wochschr. Brau.* 45, 15-6(1928).—In calcg. the color of worts from a certain concn. to that of the standard, e. g., 10% it is usually assumed that the color is proportional to the concn. This linear method has been criticized and a logarithmic one was suggested. S shows that the latter method gives absurd results and maintains that the linear method is justified on scientific grounds. A. SCHULTZ

Barleys of the 1927 crop and their malting. C. SCHWARZE. *Wochschr. Brau.* 45, 7-9(1928).—A table shows the compn. of barleys from Saxony and Schleswig for the years 1911 to date. The present crop is inferior because of a deficiency of sunlight. The moisture content of this years' barley is 16.35% as compared with 12.96 to 17.00% for the preceding years. Protein on the dry basis averages 11.93 as compared with 9.63 to 12.73. Longer steeping is required for this barley. A. SCHULTZ

The chemical composition of barley and malt and their worts and beers of 1925. W. WINDISCH, P. KOLBACH AND W. BANHOLZER. *Wochschr. Brau.* 45, 197-201, 209-13, 219-24(1928).—Analytical data are given for a number of barleys, malts, worts, and beers. A. SCHULTZ

Oxalic acid and its adsorption compound in beer. C. GEYS. *Wochschr. Brau.* 45, 1-7(1928).—The oxalic acid in beer is derived mainly from the malt. The soly. of CaC_2O_4 is 20 mg. per l. of mature beer and thus sepn. of crystals often occurs. Conditions favorable for the coagulation of colloids also favor oxalate crystn. and so the adsorption compd. develops into a CaC_2O_4 crystal surrounded by coagulated colloid. A. SCHULTZ

Application of the copper method to the determination of sugars and dextrin in beer in three operations. MARIO TAVEIRA. *Bol. assoc. Brasil. farm.* 8, 10 4(1927).—(1) The reducing sugars are detd. with Fehling's soln. and calcd. as maltose. (2) Dextrose is pptd. with 70% alc., the filtrate inverted with HCl and titrated. (3) The total carbohydrates are inverted and titrated. MARY JACOBSEN

Filters and chips. B. SIMON. *Wochschr. Brau.* 45, 163-4(1928).—The so-called Simon chips is a better device for the maturation of beers than Hallermann's aluminum plates because of a better circulation of the beer. These chips are adapted for any tank or vat of any size. A. SCHULTZ

Filters and chips. A. HALLERMANN. *Wochschr. Brau.* 45, 107-10, 224-9(1928).—Extra settling surfaces consisting of Al plates 2×0.25 meters were provided in large tanks to hasten clarification and maturing of beers. A. SCHULTZ

Studies on sarcina. K. SILBERNAGEL. *Wochschr. Brau.* 45, 143-8, 155-60(1928).—About 20 organisms of the sarcina type were isolated mostly from beers. They were divided into a group showing vigorous growth on agar and producing yellow colonies within 10 days while the second group gave white colonies and grew much slower. Food requirements of these organisms are given. A. SCHULTZ

Characterization of coal-tar dyes added to wines. R. A. VALENTINI. *Boll. chim. farm.* 66, 161-4(1927).—Basic dyes: add pure $\text{Ba}(\text{OH})_2$, NaOH or KOH to 100 cc. wine to a slightly alk. reaction and shake cautiously with 20 cc. AmOH. A violet color indicates orsellin, pink Biebrich scarlet or roccelin, green aminoazobenzene. If the AmOH remains colorless acidulate with HCl: pink indicates fuchsin, or safranine, yellow aminoazobenzene, chrysoidine or chrysaniline, violet methylviolet or mauveine. Evap. the AmOH soln. in the presence of wool or silk fibers, and pour a few drops HCl on the fiber. The characteristic colors appear. Acid dyes: The wool dyed by the above procedure is boiled with a few cc. of very dild. NH_4 . The pink soln. is evapd. and gives with concd. H_2SO_4 the following colors: safranine green, dild. blue-violet-pink, bordeaux blue, dild. sherry red, Biebrich violet streaked green and blue, dild. ponceau red, roccelin violet, dild. red, purpurine maroon dild. red ppt., erythrosine brownish yellow, evolves I vapors on heating. Coal-tar dyes may be distinguished from the

natural wine colors by Rota's SnCl_2 reduction: Add to the aq. dye soln. a few drops concd. HCl , then 10 cc. 10% SnCl_2 and heat to the b. p. Azo dyes are completely, NO_2 derivs. partly, decolorized; auramines, aurines and alizarin are not changed. Certain dyes disappear from the wine on standing. Fuchsin is pptd. by the tannins, while azo dyes are destroyed by microorganisms in diseased wines. M. J.

Identification of "black yeast." G. K. BOVGWITZ. *Wochschr. Brau.* 45, 213 (1928).—The cultural properties of the black yeast, *Nadsoniella nigra*, are described.

A. SCHULTZ

Observations regarding the flocculation point of brewers yeast. RICHARD KOCH. *Wochschr. Brau.* 45, 187-92, 201-6(1928).—The flocculation point is a characteristic of the yeast culture and independent of the compn. of the wort.

A. SCHULTZ

Relations between time and temperature of storage of beer yeast and their joint influence on fermentation, reproduction and acid formation. F. STOCKHAUSEN AND F. WINDISCH. *Wochschr. Brau.* 45, 31-7, 49-57(1928); cf. C. A. 22, 2026.—The fermentative and reproductive powers of two bottom fermentation yeasts, U and 1103, were increased by storage under water at 32°F. and diminished by storage under water at 68°F.

A. SCHULTZ

The nutrition of yeast with organic nitrogen-containing substances and ammonium salts in the aeration process. A. WOHL. *Chem.-Ztg.* 52, 202-3(1928).—A reply and criticism on an article by Claassen (C. A. 22, 1209).

J. C. JURRJEWS

Electrocolorimeter (STOCKHAUSEN, WINDISCH) 1. Buffer action as a biological principle (BERMANN) 11A. By-products of the pineapple canning industry [as a potable alcoholic liquor] (GREENSTREET, TEIK) 12. The successful cider mill of today (MAC-MILLAN) 12.

Beverage extracts. I. WALLERSTEIN (to Wallerste'n Co.). U. S. 1,673,273, June 12. A mash is formed of materials including malt and is allowed to stand at a suitable temp. and for a time sufficient to effect conversion of the starches present into a high percentage of dextrins and a low percentage of fermentable sugars; a proteolytic enzyme is then added to increase the quantity of water-sol. protein in the mash or wort, and the mash is maintained at a proteolyzing temp. U. S. 1,673,274 specifies a similar process in which the proteolyzed wort is boiled with hops after filtration. U. S. 1,673,275 specifies adding to the mash material during the process a material such as proteolyzed proteins of soy beans, which is rich in non-coagulable proteins.

Dihydroxyacetone. W. LENZ. *Can.* 278,945, Mar. 27, 1928. Glycerol is converted into dihydroxyacetone by means of bacteria obtained from hay or similar vegetable materials which have undergone fermentation, and cultivated on such nutrient media as contain extractive substances from vegetable materials such as straw, wood, hay, bran, rice-bran, waste products left in making malt or the like, to which is added the glycerol to be converted.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Esters of lemon and orange oils. R. H. JENSEN. *Perfumery Essential Oil Record* 18, 510(1927).—The ratio of aldehydes to esters (expressed as linalyl acetate) should be about 2.5 when the latter are detd. by sapon. with 0.5 N alc. KOH, and boiling for 15 min. only. Higher ratios indicate adulteration with citral. B. C. A.

A method of preparation of a liver extract powder for the treatment of pernicious anemia. J. B. COLLIP. *Can. Med. Assoc. J.* 18, 392-3(1928).—Allow frozen liver to soften and mince finely while still semi-frozen. Drop into boiling water (approx. 4 vols.) and agitate violently, keeping the temp. below 80°. Within a few min. rapidly transfer to a large canvas bag and express juice. Transfer this to a large no. of meat trays and place them in a wind tunnel. If there is any delay at this stage add a phenol preservative or acidify adequately to prevent bacterial decompn. By means of a hot-air blast through the tunnel reduce the juice to sirupy consistency. Transfer to a large enamel container and add 2 vols. $(\text{CH}_3)_2\text{CO}$. Collect the ppt. on large filters and allow to drain. Air-dry at a temp. not exceeding 60°. Powder. The prepn. is simple and not costly, and is effective in the treatment of pernicious anemia. A. T. CAMERON

The preparation of peptone for therapeutic purposes. J. TEMMINCK GROLL. *Pharm. Weekblad* 65, 465-74(1928).—Directions are given for the prepn. of peptone

for alimentary purposes by successive digestion of casein, beefsteak or fibrin with pepsin and pancreatin. Such preps. are free from the bitter taste of Witte peptone in which the digestion is made with acid. They show a higher amino N content (formol titration) and also higher ash (NaCl) than com. Witte peptone, Nutrose and Somatose.

A. W. DOX

Microchemical reactions for hyoscyamine. M. WAGENAAR. *Pharm. Weekblad* **65**, 549-51(1928).—A discussion of various reactions of hyoscyamine, including sublimation, pptn. of the free base and the cryst. ppts. obtained with AuCl_3 , picric acid, $\text{KI} + \text{I}$ and $\text{KBr} + \text{Br}$.

A. W. DOX

Volatility of nicotine. W. R. HARLAN AND R. M. HIXON. *Ind. Eng. Chem.* **20**, 723-4(1928).—Dry air satd. with nicotine vapor was passed through 2 N H_2SO_4 and the nicotine detd. by pptn. with silicotungstic acid, ignition and weighing (A. O. A. C. method). The following quantities were found per 10 l. of air, viz., 1.8 mg. at 25°, 2.7 mg. at 30°, 4.1 mg. at 35° and 5.9 mg. at 40°. The vapor concn. of nicotine over 2.97% nicotine-hydrated lime dust at 35° varied from 2.97 to 3.42 mg. per 10 l., and that over a 2.94% nicotine-bentonite dust was too small to measure, only slight amts. of nicotine being detected in the vapor phase.

W. C. EBAUGH

Starch solution of the German Pharmacopeia. G. FRERICH. *Apoth. Ztg.* **43**, 599-600(1928).—The difficulties are pointed out in the prepn. of official starch soln. The method specified in D. A.-B. 5 is considered superior to that of the present edition.

W. O. E.

New condensation product of salicylic acid and isovaleric anhydride. JULIUS DALIETOS. *Arch. Pharm.* **266**, 325-8(1928).—A series of expts is described looking to the prepn. of isovalerylsalicylic acid (comparable to acetylsalicylic acid or aspirin). A mixt. of salicylic acid (7 g.), isovaleric anhydride (12 g.) and concd. H_2SO_4 (0.05 g.) was heated 4 hrs. on the sand bath at 150°, the fused mass then treated with CHCl_3 and toluene, alc. NaOH and finally abs. EtOH. The Na salt, $\text{C}_{12}\text{H}_{13}\text{O}_4\text{Na}$, m. 233.6°, had a sweetish taste and characteristic odor. The free acid, $\text{C}_{12}\text{H}_{14}\text{O}_4$, forms white unctuous leaflets of primarily bitter followed by sweetish taste and valerian-like odor. Its therapeutic properties are being investigated.

W. O. E.

Narcotic poisons. FRITZ REDLICH. *Apoth. Ztg.* **43**, 603-5(1928).—A brief historical treatment of poppy culture and opium prepn. as practiced from the earliest times in Egypt and Asia-minor, showing its spread eastward and notably east and south-east through India and China. The difficulties are pointed out in the various national and international attempts to control production and traffic in opium and its products, as also those of the coca leaf.

W. O. E.

Detection of arsenic. G. FRERICH. *Apoth. Ztg.* **43**, 610-3(1928).—A commentary on the official method for detecting As in the various pharmacopeial preps.

W. O. E.

Safran. C. GRIEBEL AND F. WEISS. *Apoth. Ztg.* **43**, 642-4(1928).—A study has been made of the question whether this little used drug in strictly pure condition contains NH_3 in the form of a salt. The answer is affirmative and affects somewhat the pharmacopeial requirement. Several samples of safran were examd. and the results are tabulated.

W. O. E.

Hexamethylenetetramine. L. ROSENTHALER. *Apoth. Ztg.* **43**, 653-4(1928). A morphological study of different com. samples of this drug, with illustrations.

W. O. E.

Liquor hydrogenii peroxidi. PHILIP A. BERRY. *Australasian Assoc. Advancement Sci.* 1928 (preprint), 3-11.—Because of the recognized unsatisfactory nature of the British Pharm. characters and tests for this prepn. a critical study has been made of the methods now in general use (the British gasometric method, the Ger. iodometric process, and the U. S. P. permanganate method) and later other standards, such as the limit of acidity, solid residue, etc., are also dealt with.

W. O. E.

Propagation conditions of the peppermint and its probable parents. W. HIMMELBAUR AND W. HINDES. *Heil- und Gewürz-Pflanzen* **11**, 1-24(1928).—An historical study leading among other results to the conclusion that the parents of the peppermint are found in *Mentha spicata* (varidis) and *M. aquatica*.

W. O. E.

Natural drugs of Soviet Russia. LUDWIG KROEBER. *Heil- und Gewürz-Pflanzen* **11**, 33-6(1928).—A brief report on the production and traffic in crude drugs and tannins.

The apothecary Johann van Beethoven. OTTO ZEKERT. *Pharm. Monatsh.* **9**, 29-35, 62-8, 90-3, 107-10(1928).—An address.

W. O. E.

International organization for the culture and collection of drug plants. W. C. DE GRAAFF. *Pharm. Monatsh.* **9**, 85-7(1928).—An address.

W. O. E.

Simplified adjustment of normal solutions of the German Pharmacopeia. E. RUPP. *Apoth. Ztg.* **43**, 568-9(1928).—Several modifications in the official procedure are suggested and discussed for 0.1 *N* solns. of I, $\text{Na}_2\text{S}_2\text{O}_3$, NaAsO_3 , KBrO_3 , KMnO_4 and AgNO_3 . W. O. E.

Galenical preparations. F. WRATSCHKO. *Pharm. Monatsh.* **9**, 87-90, 103-6 (1928).—An address dealing with the biol. and phys. methods of evaluation. W. O. E.

Cenomasse zyma. H. ESCHENBRENNER. *Pharm. Ztg.* **73**, 701-3(1928).—A further study has been made of the adaptability of this yeast ext. product to the prepn. of pill masses of varying compn., notably those contg. creosote. The results obtained were generally favorable. W. O. E.

Adulterated anise powder. D. AYE. *Apoth. Ztg.* **43**, 675-6(1928).—A case is cited in which a sample of powdered anise was found to be adulterated with poison hemlock, the alkaloid of which is coniine. W. O. E.

Nicotine in tobacco. A. HEIDUSCHKA AND F. MUTH. *Pharm. Zentralhalle* **69**, 305-7(1928); cf. *C. A.* **21**, 3103.—A study has been made of some 10 different brands of cigarettes (full strength tobacco) and 6 different brands of cigarettes (more or less de-nicotinized), the nicotine content of the resp. tobaccos and of the smoke therefrom detd. and the results tabulated. Of the "regular" cigarettes the nicotine content ranged from 1.11 to 1.31%, while that of the so-called de-nicotinized product ranged from 0.64 to 1.22%. W. O. E.

Preparation of monobromocamphor. F. CHEMNITIUS. *Pharm. Zentralhalle* **69**, 307-9(1928).—A detailed description is given for the prepn. of this drug. W. O. E.

Chemistry of the essential oil from angelica seed. ELEMÉR KOPP. *Pharm. Zentralhalle* **69**, 353-5(1928).—From a study of several freshly distd. samples it is concluded that the limits of consts. of this oil should be modified to read: d_{40} 0.851 to 0.900; $[\alpha]_D^{15}$ 11° to 13.5° (or -1.4° to -6.2°), n_{20} 1.4846 to 1.4890; acid no. 1.7 to 6.7; ester no. 13 to 62.2, acetyl no. 46.3 to 140.2; soly. in 90% alc. not always clear; however the freshly distd. oil yields a clear soln. in 96% alc., while an old product is insol. even in 15 parts of 96% alc. W. O. E.

New reaction of lichenin. A. v. LINGELSHEIM. *Pharm. Zentralhalle* **69**, 355-7 (1928).—Lichenin yields in aq. soln. a ppt. with tannin, thus explaining the behavior of *Cetraria* decoction on the addn. of tannin (pptn.). W. O. E.

Grahe's reaction of the cinchona barks. A. v. LINGELSHEIM. *Pharm. Zentralhalle* **69**, 321-5(1928).—This test, involving dry distn. of the bark in a test tube and deposition of the evolved vapors on the cooler portions of the glass as a "reddish tar," has now been applied to a large no. of bark varieties, with the result that certain samples yield a reddish brown deposit, others no reddish drops at all, the distn. product being brownish yellow. Some 170 samples were examd., both true and false barks, and the results recorded and discussed. W. O. E.

Traffic in drugs during the year 1927. J. HERZOG. *Apoth. Ztg.* **43**, 628-9(1928).—An address dealing with the exploitation of certain specialties, as besco tablets, glukhorment, lukutate, adsorgan, synthalin, salvamin, sympathol, thyroxine and others. W. O. E.

Sensitiveness of sodium hypophosphite solution toward selenium. G. BÜMMING AND K. FERREIN. *Pharm. Ztg.* **73**, 656-7(1928).—The sensitiveness of the official soln. of Na hypophosphite (Thieles reagent) toward Se ($1/100$ mg.) under the conditions of the Ger. Pharm. has been studied and found to be greater than toward As ($1/50$ mg.). W. O. E.

Odor tests. A. ROSENTHAL. *Seifensieder-Ztg.* **55**; *Parfumer* **2**, 33-4(1928).—To test essential oils and exts. for odor R. recommends diln. with alc. or spreading 0.5-0.10 cc. upon strong filter paper. P. ESCHER

The butyrates and isobutyrate in perfumery. A. MÜLLER. *Seifensieder-Ztg.* **55**; *Parfumer* **2**, 43-4(1928).—A table of 23 butyrates and isobutyrate, giving their name, odor and specific use in perfume. P. ESCHER

The ouabain content of *Acokanthera schimperi* of Erythrea. S. BERLINGOZZI AND D. MIGLIACCI. *Boll. chim. farm.* **67**, 33-5(1928).—The ouabain content as detd. by the frog heart and dog method (no chem. sepn. of the glucosides was made) is 0.3% in the wood and 0.1% in the leaves. MARY JACOBSEN

Determination of morphine in opium. V. MACRI. *Boll. chim. farm.* **67**, 129-31 (1928); cf. Eder and Märki, *C. A.* **22**, 1652.—According to E. and M. the morphine is extd. with water, liberated with 2 *N* BaHCO_3 or NH_3 , pptd. with benzene, dissolved in 0.1 *N* HCl and the excess of the latter titrated with methyl red. M. prefers extn. with a satd. morphine soln. contg. the necessary amt. of Ca(OH)_2 , especially when the

opium has an alk. reaction. Org. solvents have the disadvantage of dissolving other alkaloids. Ether as a precipitant is preferable to benzene because of its soly. in water. Benzene does not permit the detection of a certain possible adulterant, the nature of which is being investigated. Weighing the dried extd. opium residue is preferable to detg. the wt. of the evapn. residue of the ext. MARY JACOBSEN

Fluidextract of chelidonia. ADOLFO ALBANESE AND ANTONIO PEDRONI. *Boll. chim. farm.* 67, 194-200(1927); cf. C. A. 15, 1902-3—Chelidonia exts. are mentioned in several pharmacopias but no tests are given. The fluidext. supplied by an Italian manufacturer was a brown, bitter, fairly thick liquid, leaving a brown residue when dissolved in hot or cold water or alc. It is insol. in other org. solvents, sol. in concd. acids with a reddish maroon color. It reduces Fehling's soln. The reactions of the ext. (directly and after purification with Pb acetate) with HCl and H₂SO₄ and alkaloidal reagents are given in detail. For the identification of the active constituents the ext. is preferably shaken out with CHCl₃ and the latter evapd. on a porcelain plate, leaving a residue with a pink center (I) and a yellow border (II) which gives the following color reactions: concd. H₂SO₄ I violet blue, II coffee brown, concd. HNO₃ orange-yellow; Fröhde's reagent I brownish green, gradually streaked blue, II violet, turning green. The I reactions are characteristic for β - and γ -homochelidonine and sanguinarine the II and HNO₃ reactions for chelidonine and homochelidonine. The ext. contains: 0.18% alkaloids (Schmidt's method) 28% of which are β - and γ -homochelidonine; 3.24% ash, 42% of which is K₂CO₃; water-insol. portion 11.11%; free acids = 0.410 g. NaOH per 100 g. Dextrin was absent; traces of Cu were found. MARY JACOBSEN

Synthetic musks. L. GIVAUDAN. *Aromatics* 9, 25, 46(1928)—Descriptive

WILHELM SIEGERBLOM

Natural source of citronellol. EUGENE CHIARABOT. *Aromatics* 9, No. 1, 28(1928).—See C. A. 22, 139.

Pharmacy in Canada and the United States. HERBERT SKINNER. *Chemist and Druggist* 108, 215-23(1928)—Descriptive account of a visit, with photographs, including those of Canadian and U. S. Colleges of Pharmacy. S. WALDBOTT

The estimation of liquor bismuthi et ammonii citratis. ANON. *Pharm. J.* 120, 270(1928).—The Brit. Pharm. method (evap. 10 cc. to dryness and ignite, yield not less than 0.5 g. Bi₂O₃) entails loss through spurring and partial reduction to Bi. The following reduction method with CH₂O in alk. soln. is more rapid and gives more uniform results. Heat in a beaker on a water bath for 30 min. a mixt. of 10 cc. of the liquor with 20 cc. CH₂O soln. (Brit. Pharm.), 5 cc. of 20% NaOH and 20 cc. H₂O, transfer the ppt. formed to a previously ignited and tared Gooch crucible, wash out the alkali, then dry and det. the wt. of Bi₂O₃ after ignition in a Davies' furnace. S. W.

Volumetric estimation of liquor strychninae hydrochloridi. J. RAE. *Pharm. J.* 120, 270(1928).—The method is based on the quant. pptn. of strychnine from slightly acid solns by K₂Cr₂O₇. Evap. 10 cc. of the liquor in a beaker on a water bath to 5 cc. to expel all the EtOH, add 5 cc. H₂O, 25 cc. of 0.1 N K₂Cr₂O₇ and 2 cc. of dil. H₂SO₄ (Brit. Pharm.) set aside for 30 min. Transfer the contents of the beaker to a 100-cc. flask, make up to vol. with H₂O, shake and filter off 50 cc. To the filtrate add 1 g. KI, 3 cc. HCl and titrate with 0.1 N Na₂S₂O₃. Multiply the no. of cc. used by 2, subtract from 25 and multiply the result by 0.1356 to obtain the % of strychnine-HCl in the soln. examd. S. WALDBOTT

The volatile oil of hypericum perforatum. E. R. MILLER. *J. Am. Pharm. Assocn.* 16, 824-8(1927).—Seven specimens of plant collected in the autumn of 1915 were distd. at that time. Yields 0.106-0.125%; d₁₅ 0.8065-0.8180; n_D 1.4555-1.4612; α_D 12.4-15.9°, constituents α -pinene, (probably) an aliphatic hydrocarbon and one or more sesquiterpenes. L. E. WARREN

Studies in drug analysis. IX. Estimation of acetylsalicylic acid (aspirin), phenylcinchoninic acid (cinchophen) and caffeine in admixture. W. O. EMERY. *J. Am. Pharm. Assocn.* 17, 18-22(1928).—Warren's method (C. A. 21, 801) gave results 1-4% too high with corresponding low values for aspirin. Tablet material was exhausted by treatment with dil. Na₂CO₃ and filtering on a suction plate. Caffeine.—For each 0.3 g. aspirin add 1 g. of dry Na₂CO₃ and 10 cc. of H₂O and stir occasionally for 30 min. Filter by suction and wash the container and filter with water. Transfer the soln. to a separator and ext. the caffeine with CHCl₃. Wash the solvent, evap. it and dry the residue and weigh as caffeine. Aspirin.—Add the washings to the alk. soln. and heat to dryness. Dissolve the residue in 25 cc. of H₂O, add 1.5 g. of dry Na₂CO₃ and dil. with H₂O to 200 cc. Heat on the steam bath and add 10 cc. portions of 0.2 N I until

an excess of I is apparent after protracted heating. Add 0.5 g. of Na_2CO_3 and heat for 1 hr. Filter through a weighed Gooch crucible and wash with 200 cc. of hot H_2O . Dry the residue at 100° . The ppt. multiplied by 0.5238 = aspirin. *Cinchophen*.—Evap. the filtrate to 10 cc., transfer to a separator and acidify with 10% H_2SO_4 . Ext. with 4–50 cc. portions of $\text{CHCl}_3\text{-Et}_2\text{O}$ (40–10). Wash the solvent with a soln. of SO_2 and then with H_2O . Continue the extn. and washing until the cinchophen residue has been removed. Evap. the solvent and weigh as cinchophen. In a second method where caffeine is absent the cinchophen or mixt. of cinchophen with aspirin is dissolved in glacial acetic acid, the soln. heated and a measured excess of 0.1 *N* I added. The soln. is made to vol. and the uncombined I detd. in an aliquot portion with 0.1 *N* $\text{Na}_2\text{S}_2\text{O}_3$. The results by both methods are good.

L. E. WARREN

The standardization and stabilization of nux vomica, gelsemium and veratrum and the hydrogen-ion concentration factor. IV. E. E. SWANSON AND C. C. HARGREAVES. *J. Am. Pharm. Assocn.* 17, 23–7 (1928).—The preps. studied were (A) fluidexts. of nux vomica U. S. P. IX, (B) gelsemium U. S. P. IX and (C) veratrum U. S. P. IX. The chem. assay method and the bio-assay method give correlative results. A is stable and requires no H-ion concn. factor. B requires no definite H-ion concn. to stabilize its alkaloids. The chem. method of assay is not reliable; consequently a bio-assay is desirable. C appears to require some definite H-ion concn. to control its deterioration and stabilization. The chem. method of assay is unreliable. The drug should be assayed by biological means.

L. E. WARREN

Causes of deterioration of strophanthus seed during storage. ELIZABETH PICKERING. *J. Am. Pharm. Assocn.* 17, 121–3 (1928).—A specimen of seed of *Strophanthus Kombé* assayed 120–33% U. S. P. After grinding and storage for 1 yr. it assayed but 37.5–48.5%. The literature indicates that exposure to light, heat, moisture and mold spores tends to cause deterioration in the drug.

L. E. WARREN

p_{H} Determinations in alcoholic solutions. RALPH B. SMITH. *J. Am. Pharm. Assocn.* 17, 241–3 (1928).—Nineteen pairs of buffer solns. were made up, one in each pair contg. H_2O as solvent and the other 50% EtOH. The voltage of each was detd. at 25° against a standard calomel half-cell. EtOH buffer solns. gave stable readings. The e. m. fs. of the EtOH solns. were higher in every case than those of the H_2O solns. It is not possible to calc. the p_{H} from the results obtained because the constant of the H electrode in EtOH is not known. However comparative values were obtained by using the constants for H_2O . By this procedure the variations of the two members of the pairs are from 0.16 to 1.88 p_{H} units. The method was extended to tinctures. It is important to use a freshly plated electrode which has been presatd. with H immediately before use. The voltage will usually become stable in 5–15 min. and remain so for 15–20 min. or even longer. Poisoning then sets in and the voltage drops off. The following values were found: tinct. digitalis U. S. P. 5.12–5.77; tinct. aconite U. S. P. 5.20–5.51; tinct. of strophanthus U. S. P. 5.43, tinct. of aconite made with acid menstrua gave values between 2.32 and 4.53.

L. E. WARREN

The boycott of Spanish ergot. H. H. RUSBY. *J. Am. Pharm. Assocn.* 17, 249–52 (1928).—R. claims that there is a movement to boycott Spanish ergot in favor of Russian or other kinds. He examd. very large quantities of Spanish ergot during the past 25 years. He never saw a specimen which would not comply with the requirements of the present Pharm. He never saw a specimen of Russian ergot which was really good.

L. E. WARREN

Gelatin in medicine. GEORGE D. BEAL AND ANDREW NEFF. *J. Am. Pharm. Assocn.* 19, 261–5 (1928).—An assay in which the gelatin amino acids, gelatin as a pure protein, its use in infant feeding, hemostatic action, therapeutic uses, as a basis for capsules and suppositories and its use in adult dietaries are discussed. Recently 9 adults subsisted for 1 month on plain or gelatinated milks. With the exception of a small amt. of fruit, no other food was taken. In spite of this strenuous diet, these men all continued their work as usual, and all remained in perfect health throughout the test.

L. E. WARREN

Viburnum cassinoides, a recent substitute for *viburnum prunifolium*. HEBER W. YOUNGKEN. *J. Am. Pharm. Assocn.* 17, 330–5 (1928).—A bark labeled “black haw” was found to be *Viburnum cassinoides* L.

L. E. WARREN

Cascara. T. J. STARKER. *J. Am. Pharm. Assocn.* 17, 335–9 (1928).—Historical essay.

Chinese botanical sources of ephedrine and pseudoephedrine. B. F. READ AND J. C. LIKE. Peking Med. Coll. *J. Am. Pharm. Assocn.* 17, 339–44 (1928).—The botanical sources of the drug Mahuang have been traced to *Ephedra equisetina* Bunge and *E. sinica* Stapf. Both plants yield ephedrine and pseudoephedrine and both

show great seasonal variation in the alkaloidal content. Autumn is the best time for collecting.

The occurrence and alkaloidal content of various *Ephedra* species. II. C. NEILSON and H. McCausland. Abbott Labs. *J. Am. Pharm. Assocn.* 17, 427-30(1928).—Continuation of (C. A. 21, 4024). *Ephedra trifurca* Torr. was collected in Arizona and was analyzed for alkaloids by standard methods but none was found. *Ephedra vulgaris* was grown in Illinois from seeds imported from Switzerland. The first year plants (without the roots) contain no alkaloids.

Ephedrine assays by titration. H. O. MORAW. Lab. Swann Myers. *J. Am. Pharm. Assocn.* 17, 431-5(1928).—In the gravimetric method at least 12 hrs. are required to dry the alkaloid over H_2SO_4 before weighing. The residue continues to lose wt. after that; a white sublimate collects on the sides of the desiccator. Heat cannot be used without losses. Assays of known alkaloid were conducted by shaking with NH_4OH , Et_2O , evapg. most of the solvent, adding a measured excess of standard acid, evapg. the remaining excess of solvent and titrating the excess acid with bromothymol blue as indicator. NH_4OH does not interfere if the vol. of Et_2O be reduced to about 10 cc. by evapn. Tablets and sirups contg. ephedrine may be assayed readily. Solns. of ephedrine in oil may be titrated directly by adding an excess of petr. benzine, a nearly equal vol. of H_2O and a measured excess of acid. The mixt. is shaken thoroughly and the excess acid titrated in the usual way.

Preliminary report on the examination of *Viburnum cassinoides*. FLORIN J. AMRIEIN. *J. Am. Pharm. Assocn.* 17, 556(1928).—The specimen was a commercial root bark labeled shonny haw. It was identified by Youngken as *Viburnum cassinoides* L. $EtOH$ reducing sugars, valeric acid and a "resinous glucoside" were found.

The behavior of the cyanogenetic glucosides of cherry laurel during starvation (GODWIN, BISHOP) 11D.

This journal will replace the *Year Book of Pharmacy*. Vol. I, No. 1, contains 162 pp. 10s.

Synthetic drugs (santalol derivatives). VEREIN FÜR CHEMISCHE INDUSTRIE AKT.-GES. Brit 278,982, July 14, 1926. Double compds. of santalol esters with $(CH_2)_6N_4$ are prepd. by reaction of the components, preferably in a solvent such as $CHCl_3$, CCl_4 or C_6H_6 , with or without heating; e. g., santalol may be treated with bromoacetyl-bromide and the resulting bromoacetic acid santalyl ester allowed to stand in $CHCl_3$ soln. with $(CH_2)_6N_4$ when a cryst. powder seps. Other santalyl esters referred to are the halides, nitrate, sulfate, thiocyanate, alkyl- or aryl-sulfonates such as the benzene sulfonate, esters of halogen-fatty acids and aryl-sulfo-fatty acids. Santalyl nitrate is made by treating santalol with HNO_3 and H_2SO_4 ; santalyl sulfate is made by treating santalol with H_2SO_4 ; santalyl thiocyanate is formed when mixed solns. of santalyl chloride and $NaCNS$ in dry acetone are allowed to stand, the $NaCl$ being filtered off and the acetone distd.; santalyl benzenesulfonate is made by cooling mixed solns. of santalol, benzene sulfochloride and pyridine in ether, shaking the resulting soln. with water, drying and distg. the ether.

Complex antimony compound. H. HAHN (to Winthrop Chemical Co.). U. S. 1,674,362, June 19. A complex Sb compd. is derived from thioglycollic acid and antimonyl pyrocatechol, which probably has the formula (as a Na salt): $C_6H_4O_2-Sb-SCH_2-COONa$. It crystallizes from water as a white compd. sol. with a practically neu-

tral reaction, and may be used as a *therapeutic agent* in trypanosome infections. Cf. C. A. 21, 2170.

Thiocarbazides of the naphthalene series. G. M. DYSON, F. A. MASON and A. RENSHAW (to British Dyestuffs Corporation, Ltd.). U. S. 1,673,498, June 12. By the action of aromatic carboxylic or sulfonic halides which contain in the aromatic nucleus a nitro group, upon sulfonated amines or aminophenols of the naphthalene or acenaphthene series, or upon their derivs., which contain an —NH— group in the α -position, *N*-acidyl-substituted compds. are obtained which, after reduction of the NO_2 group and diazotization of the NH_2 group formed and reduction of the diazo compd. thus obtained, yield hydrazines which may be converted by CSCl_2 into the corresponding thiocarbazides. The latter may be used as *therapeutic agents* for destroying blood parasites or as *intermediates for making dyes*. U. S. 1,673,599 describes the similar manuf. of *carbazines* (instead of thiocarbazines) by using phosgene (instead of thiophosgene) in the process. The carbazines also may be used as *therapeutic agents* or as *dye intermediates*. Numerous starting materials are listed as suitable for use in making the thiocarbazines and carbazines and a specific detailed example is given in each patent.

2,3-Dihydro-2-keto-1-methyl-5-benzimidazolearsonic acid. W. KOLLE, K. STREITWOLF and A. FEHRLE (to I. G. Farbenind. A.-G.). U. S. 1,674,368, June 19. This compd. is formed by reaction of phosgene on $\text{C}_6\text{H}_5\text{As}(\text{OH})_2\text{O}(1).\text{NHCH}_3(4).\text{NH}_2(3)$. It is a *therapeutic agent*. The corresponding 1-propyl deriv., the 1-allyl deriv., 1-benzyl- and 3-methyl- deriv. all m. 280° .

Organic arsenic compounds and dyes. I. G. FARBENIND. A.-G. Brit. 278,789, July 7, 1926. 4-Hydroxy-3-acetamido-aryl-1-arsonic acids are prepd. by reducing an aryl-1-nitro-3-acetamido-4-hydroxy compd. and then replacing the amino group with the arsonic acid group by Bart's method as described in Brit 568 of 1911 (C. A. 6, 1819). Examples are given of the production of 4-hydroxy-3-acetamidophenyl-1-arsonic acid, 5-chloro-4-hydroxy-3-acetamidobenzene-1-arsonic acid and 5-methyl-4-hydroxy-3-acetamidobenzene-1-arsonic acid. These compds. may be used for *therapeutic purposes*. 1-Amino-3-acetamido-4-phenol may be diazotized and combined with resorcinol to a bluish red and with R-salt to a dull violet *dye*. 5-Chloro-1-amino-3-acetamido-4-phenol, diazotized and combined with resorcinol yields a reddish dye.

Pile remedy. W. F. BROCKETT. U. S. 1,674,353, June 19. Volcanic ash contg. a large proportion of SiO_2 , Al_2O_3 and Na_2O is formed into a salve by admixt. with petroleum jelly contg. PhOH 2% and KMnO_4 1%.

Surgical plaster. D. SARASON. Brit. 279,030, Oct. 16, 1926. Unvulcanized rubber contg. little or no resin is applied to fabric and the exposed surface is treated with talc to render it non-adhesive when not in use. Before use it is coated with rubber soln.

Hormones. I. G. FARBENIND. A.-G. Brit. 279,123, Oct. 15, 1926. Solns. of the active principle of the ovary are purified by use of water-sol. N-free ethers or esters of a polyhydric alc. such as diethylin, diacetin or 1, 3-glycerin-dimethyl ether. Water is added to ppt. cholesterol.

Hormones. I. G. FARBENIND. A.-G. Brit. 279,445, Oct. 20, 1926. Hormones affecting the action of the heart and which are sol in water but not sol. in strong alc. are obtained from the hearts of warm-blooded animals by extn. with water or with org. solvents such as acetone or ether, preferably under neutral or slightly alk. conditions; "balast substances" such as albumins and lipoids are removed from the exts. by known methods. Several examples are given.

Treating cigaret tobacco with menthol dissolved in oil of eucalyptus. A. VUCCINO. U. S. 1,673,216, June 12.

Hair-waving composition. L. ONGRASSIA. Can. 278,476, Mar. 13, 1928. A compn. for use in hairdressing comprises 80 parts borax, 1 part mineral oil and 4 parts $\text{Na}_2\text{S}_2\text{O}_4$.

Bactericidal and therapeutic agent. R. W. FRENCH and W. C. HOLMES. Can. 278,331, Mar. 6, 1928. A reactive form of a basic dye is made to react with a cyclic compd. contg. phenolic groups.

Fumigant. H. W. HOUGHTON. Can. 280,056, May 8, 1928. A fumigant is produced by generating CNCl and HCl by liberating nascent Cl_2 in an aq. soln. of a cyanide acidified with HCl by the addn. of a chlorate compd. protectively coated with a silicate compd.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

The fusion of carbon and the preparation of diamonds. I. PLOTNIKOV. *Arkh. hem. farm.* 1, 199–206 (1927).—Articles by Rishkevich (*C. A.* 15, 1432; 16, 368, 1523, 2444, 2804); Lummer (*C. A.* 9, 143, 2351); and others are criticized as a result of tests made in Moscow in 1916 (*C. A.* 12, 248). Other media more suitable than Fe will be tried under high temp. and pressure.

JAROSLAV KUČERA

Active charcoal. Amorphous nature, temperature stability, dependence of adsorptive power on the physical and chemical properties of the charcoal and the adsorbed molecule. OTTO RUFF AND PAUL MAUTNER. *Kolloid chem. Beihefte* 26, 312–56 (1928). Expts. on the relationship between granule size and adsorptive power of various charcoals led to the conclusion that the minimal adsorptive power is not a function of surface area but of the no. of "corner" atoms of unsatd. character in the surface. The no. of such atoms is greater in amorphous and less in graphitic charcoals. Colloidal materials are adsorbed by a charcoal in greater amts. than molecularly dispersed solutes. By means of x-ray studies the decrease in adsorptive power of charcoals caused by heating was connected with the increase in graphite space lattice of the charcoal. The continued graphitization of charcoals at 1000° caused a marked decrease in adsorptive power. X-ray data on "Supranorit" are reported. Commercial charcoals were examined and their adsorptive capacity and intensity ratings listed. Current methods of rating com. charcoals are discussed. It is not yet possible to rate a charcoal for all purposes by any single standard test. An extensive bibliography is included.

R. L. DODGE

Utilization of brass scrap in the manufacture of copper sulfate. A. V. VINOGRADOV AND V. I. VINOGRADOVA. *J. Chem. Ind. (Moscow)* 3, 1229–30 (1926).—To utilize the scrap brass accumulated in a Russian factory, the brass was oxidized by calcination in a furnace, then dissolved in HCl and the Cu and Zn were sepd. by pptg. the former as Cu_2Cl_2 either by the action of H_2 under pressure, or by addition of Zn or of brass. On strongly agitating and heating this Cu_2Cl_2 , suspended in a small amt. of H_2O , with a 10% soln. of BaCl_2 , the latter in some excess, a black ppt. of easily filterable Cu_2S was obtained, while BaS , BaCl_2 and $\text{Ba}(\text{OH})_2$ remained in soln. and were ultimately recovered in the form of BaCl_2 by acidifying with HCl. The reaction: $\text{Cu}_2\text{Cl}_2 + \text{BaS} = \text{Cu}_2\text{S} + \text{BaCl}_2$ is almost quant. Cu_2S was filtered, dried at 80–90° and ignited slightly at 200–300°. Analyses of the ignited substance have shown that it consists practically of $\text{CuSO}_4 \cdot 3\text{H}_2\text{O}$, CuO 44, BaSO_4 11 to 12, H_2O 5 to 5.5%. It is transformed into CuSO_4 by dissolving in dil. H_2SO_4 , leaving a small residue of BaSO_4 .

BERNARD NELSON

Cement [from phosphorus furnace] (Can. pat. 277,732) 20.

Recovery of nitric acid from waste nitrating acid. H. N. LENTZ. Can. 277,995, Feb. 21, 1928. A current of waste acid, free from aromatic compds. and having more HNO_3 than nitrosulfuric acid, is subjected to a current of steam at a rate of flow sufficient completely to denitrate the waste acid. The HNO_3 portion of the vapors arising from the waste acid is condensed and N_2O_4 is sepd. from the resulting condensate. The N_2O_4 is converted into dil. HNO_3 , the latter being returned to the current of waste acid.

Apparatus for ammonia synthesis. I. W. CEDERBERG (to Patents Exploitation Co. "Alpina" Ltd.). U. S. 1,673,966, June 19. The reaction chamber has permeable walls throughout its entire length and its temp. may be controlled by an elec. heater.

Oxidation of ammonia. F. G. LILJENROTH. Can. 278,867, Mar. 27, 1928. A non-explosive gas mixt. composed of NH_3 , O_2 and nitric oxide is subjected to a catalytic combustion. The resulting gas mixt. is supplied to a condensation system, wherein a part of the condensable products is condensed, the remainder being used in forming the gas mixt. to undergo combustion in continuously performing the operation.

Salts from natural brines. C. E. DOLBEAR. U. S. 1,673,969, June 19. In order to recover a K salt, borax and Na_2CO_3 from mixts. contg. also NaCl and Na_2SO_4 in the solid state, the mixed salts are leached in the presence of CaO with a hot soln. contg. K, a Na borate, NaCl and Na_2SO_4 . The resulting soln. is cooled to crystallize the K salt.

Purification of salts. A. VOHL and W. WACHTENDORF. Can. 277,919, Feb. 21, 1928. Solns. of metal salts contg. org. impurities are purified by treatment with oxi-

dizing and basic agents. Those metallic agents and reaction products thereof which are different from the bulk of the metal ions originally present in the soln. are removed and the deposits formed are sepd.

Anhydrous chlorides. M. JÄGER, W. MOSCHEL and R. SUCHY. Can. 277,353, Jan. 24, 1928. Metal chlorides which are decompd. when heated alone can be produced free from H_2O and oxides by melting with the addn. of reactive C, and running the melt downward in a heated irrigation tower counter-current to a gaseous chlorinating agent.

Alkali metal nitrates. W. WILD and C. BECK (to I. G. Farbenind. A.-G.). U. S. 1,674,077, June 19. In producing nitrate from a chloride such as KCl which is contaminated with sol. sulfates, the material is treated in aq. soln. with HNO_3 and then treated with a Ca compd. or other suitable oxides, carbonate or nitrate which will form a difficultly sol. sulfate which is removed.

Alumina. H. SPECKETER and K. ROSENBERGER. Can. 279,990, May 8, 1928. Aluminous material is dissolved in H_2SO_4 and the soln. sepd. from the residue. An alkali metal chloride is added to the soln. in a quantity equiv. to the sulfate present and the soln. is then evapd. to dryness. The product is heated to about 700° to expel the HCl, the sintered product mixed with coal, and the mixt. reduced to about 1000° to form aluminate, sulfide and alkali metal carbonate. The melt is dissolved, and CO_2 is introduced until Al_2O_3 begins to sep. The Al_2O_3 is pptd. by stirring.

Purifying alumina. B. T. HORSFIELD. Can. 277,526, Jan. 31, 1928. Fused Al_2O_3 is treated with a carbonaceous reducing agent in excess of the amt. needed for reduction of oxides of Fe, Si and Ti, whereby the alumina is left with a relatively high content of free C. A gas is injected into a stream of the molten alumina at a velocity sufficient to cause the formation of hollow globules and simultaneous oxidation of the free C and volatilization of Fe_2O_3 . Cf. C. A. 21, 3717.

Anhydrous aluminum chloride. N. C. CHRISTENSEN. U. S. 1,673,495, June 12. Al is heated in the presence of $PbCl_2$ or other suitable chloride of a metal having less affinity for Cl than Al at high temps. and the $AlCl_3$ is sepd. from the residue by volatilization and condensation.

Ammonium salt. H. BAIER. Can. 278,027, February 21, 1928. Gas mixts. contg. H_2S , NH_3 and available O_2 are maintained at a suitable elevated temp. in contact with a catalyzer comprising a metallic component for binding S and a metallic component for transferring O_2 . A metal sulfide is thus produced, the S being oxidized and the NH_3 reacting with the oxide of S to produce an NH_4 salt.

Purifying barium carbonate. J. E. MARWEDEL and J. LOOSER (to Rhenania-Kunze in Verein Chemischer Fabriken A.-G.). U. S. 1,673,985, June 19. Impure $BaCO_3$ contg. small quantities of insol. S compds. is mixed with an alkali metal hydroxide and heated to about 120° to solubilize the S compds.

Purifying bauxite. T. R. HAGLUND (to International Patent Corporation). U. S. reissue 17,001, June 19. See original pat. 1,569,483 (C. A. 20, 804).

Calcium arsenite. J. ALTWEGG and A. M. DUTEL. Can. 277,392, Jan. 24, 1928. Pulverulent $CaHASO_3$ is manufd. by forming a mixt. of CaO and H_3AsO_3 in the mol. proportions of 3 to 1, and subjecting the mixt. to the action of a current of steam.

Calcium cyanamide. G. E. COX (to American Cyanamid Co.). U. S. 1,674,466, June 19. Ground CaC_2 is placed in a container and covered with a layer of comminuted insulating material such as kieselguhr and reaction is then effected between the carbide and N. An app. is described.

Calcium nitrate. APPAREILS ET EVAPORATEURS KESTNER. Brit. 279,037, Oct. 16, 1926. HNO_3 is used to react with $CaCO_3$ and the CO_2 evolved is led by pressure or suction in the same direction as the HNO_3 . A reaction tower and assoc. app. are described.

Carbon disulfide. E. LEGELER (to I. G. Farbenind. A.-G.). U. S. 1,672,948, June 12. Raw CS_2 to be purified in liquid form is passed countercurrent to vapors of CS_2 generated in the heating chamber of a rectifying column to remove H_2S and the partially refined CS_2 contg. S and S compds. is passed into the heating chamber of a distg. column in which a soln. of S in CS_2 is kept boiling; escaping vapors of CS_2 are condensed and collected and the excess of S soln. is withdrawn from the chamber. Cf. C. A. 21, 3538.

Carbon disulfide. P. SIEDLER. Can. 277,731, Feb. 7, 1928. A column of carbonaceous material is heated by passing an elec. current longitudinally through it, and S is introduced adjacent to one end of the column, so that the vapors produced are passed longitudinally through the column and withdrawn at a point adjacent to the other end of the column. Cf. C. A. 21, 804.

Cobalt carbonyl. C. MÜLLER and E. KEUNECKE. Can. 278,950, Mar. 27, 1928.

Co carbonyl is produced by acting on metallic Co with CO under a pressure of at least 5 atms., and cooling the reaction gases prior to the release of pressure to a temp. sufficient to sep. most of the carbonyl.

Copper arsenate. J. ALTWEGG and A. M. DUTEL. Can. 279,168, Apr. 3, 1928. Copper arsenate is prepd. by heating CuHASO_3 and passing through it a heated current of a gaseous mixt. contg. O_2 .

Cyanamide. H. C. HETHERINGTON and L. A. PINCK (to Arthur Bamb. L, trustee). U. S. 1,673,820, June 19. In producing a soln. of cyanamide practically free from dicyanodiamide, a slurry is formed from crude Ca cyanamide and water, filtered and the filter-cake while still on the filter is treated with water at over 30° , the filtrate is cooled to about 20° , substantially all the Ca is pptd. out of the cooled filtrate, *e. g.*, by CO_2 under pressure and the ppt. is removed.

Cyanamides. N. CARO and A. R. FRANK. Brit. 279,419, Oct. 23, 1926. Cyanamides are prepd. by reacting on carbonates of Ca, Mg, Zn, etc., with NH_3 under pressures of 3-10 atm. and at temps. near the temps. of disson. of the carbonates under ordinary pressure. Inert gases or H may be mixed with the NH_3 and the water formed in the reaction may be removed by a condenser connected with the reaction vessel. Brit. 279,420 specifies producing cyanamides of bivalent metals such as Ca, Ba, Mg or Zn by treating dolomite or other carbonates with dry NH_3 and CO under ordinary or higher pressure at temps. near the temp. of disson. of the carbonates. Fluxes such as alkali carbonates, CaF_2 or CaO may be added. The reaction may be carried out in ceramic or quartz vessels and the presence of Fe, Ni or other metals which cause decomn. of NH_3 or formation of carbonyl compds. should be avoided.

Cyanogen chloride. J. P. SCHMITTNAGEL. Can. 277,566, Jan. 31, 1928. NaCN is treated with Cl_2 in the presence of an inert solvent, b. $60-100^\circ$, and of a small amt of an org. catalyst.

Manufacture of galena for radio use. SHIMADA SADA0. Jap. 69,092, Aug. 11, 1926. Oxide of Pb, S, AgNO_3 , ZnO, Si and B are melted in a crucible at $1120-1250^\circ$, a small amt. of Ag_2S , ZnS and trace of Si are contained in the product.

Iron oxide. J. LAUX. Can. 278,167, February 28, 1928. Aromatic nitro compds. are reduced to amines with the production of an Fe oxide which is suitable for use as a pigment, the reduction being carried out by means of Fe and an amt. of HCl insufficient for dissolving the resulting amine and Fe in the presence of a concd. soln. of a metal chloride which is not reduced by Fe.

Iron oxide. J. LAUX. Can. 278,168, Feb. 28, 1928. Aromatic nitro compds. are reduced to amines with the production of an Fe oxide which is suitable for use as a pigment. The reduction is carried out by means of Fe and a concd. aq. soln. of the HCl salt of the aromatic amine corresponding to the nitro compd.

Iron oxide. J. LAUX. Can. 278,169, February 28, 1928. Fe oxide pigments are produced as by-products in the reduction of aromatic nitro compds. to the corresponding amines, the reduction being carried out by means of Fe, Al metal and a dil. acid insufficient to dissolve the Fe.

Anhydrous magnesium chloride. W. R. COLLINGS and P. COTTRINGER. Can. 277,344, Jan. 24, 1928. Partially dehydrated MgCl_2 is intermixed with the normal hydrated salt, both in solid form, and the mixt. is directly heated through a gradually increasing temp. range of $115-350^\circ$.

Purifying phosphatides. H. BOLLMANN (to Mary F. Foster, trustee). U. S. 1,673,615, June 12. An emulsion comprising lecithin, phosphatides insol. in alc., oil, bitter substances and other impurities is dild. with a mixt. of C_6H_6 and a much larger quantity of alc., the soln. and undissolved material are heated to the b. p., boiled for some time and the soln. is removed from the "settled smear" contg. insol. phosphatides and is slowly cooled to about 20° , the residue consisting of phosphatides insol. in alc. and free from bitter substances and neutral oil is removed, the remaining soln. is evapd. *in vacuo* and the lecithin thus obtained is further purified by washing it with acetone.

Phosphorus sulfide. YOSHITARO NAKANO. Jap. 69,074, Aug. 11, 1926. Phosphate, or a substance contg. this, is mixed with carbonaceous matter and S or sulfide or sulfate, and then heated.

Phospho-tungsto-molybdenum compound. P. RAHE, B. WENK and E. HARTMANN. Can. 279,822, May 1, 1928. A new phospho-tungsto-molybdenum compd. consists of reduced $24(\text{WO}_3 + \text{MO}_3) \cdot \text{P}_2\text{O}_5 \cdot 3\text{H}_2\text{O}$.

Sodium bicarbonate from brines. W. A. KUHNERT. U. S. 1,674,474, June 19. Complex brines contg. Na_2CO_3 are treated with CO_2 while keeping the temp. below 45° and coarsely cryst. sesquicarbonate is thus pptd. until the concn. of Na_2CO_3 in the brine is materially reduced. The brine, still mixed with the ppt. thus formed, is then further

carbonated to ppt. NaHCO_3 and convert at least part of the ppt. previously formed into NaHCO_3 and the NaHCO_3 is sepd. Cf. C. A. 21, 1168.

Sodium chromate. H. SPECKETER and G. HENSCHEL. Can. 277,733, Feb. 7, 1928. A mixt. of chrome ore and bauxite with an amt. of soda ash required for forming chromates, aluminates and ferrates is exposed in an oxidizing atm. to a temp. of 900–1000°. The mass is extd. with water and alumina, Na_2CO_3 and chromates are sepd. therefrom.

Sodium sulfate. M. A. PURDY (one-half to Pacific Distributing Corporation). U. S. 1,673,471, June 12. Purification is effected by wet crushing the anhyd. sulfate in contact with a substantially satd. soln. of Na_2SO_4 , maintaining a flow of the sulfate soln. gradually decreasing in strength and advancing the material from the crusher through the soln. to a point of discharge where the soln. will have the least strength.

Sodium sulfide. A. SCHAFER. Can. 279,988, May 8, 1928. Na_2S is produced by heating an intimate mixt. of Na_2SO_4 and coal in a plate furnace. The mass is agitated by suitable mechanical means and access of air to the mixt. is prevented.

Zinc oxide. H. REINHARD. Can. 279,299, Apr. 10, 1928. ZnO is manufd. by volatilizing crude Zn or Zn-contg. mixts. in a closed chamber provided with an outlet for fumes and feeding to the outlet a gas which retards or prevents oxidation and condensation, so that formation of metallic or oxidic accretions is prevented.

Beryllium. H. FISCHER (to Siemens & Halske A.-G.). U. S. 1,673,043, June 12. Impure metallic Be is purified by introducing it into a molten mixt. formed from CaCl_2 , CaF_2 and NaCl or other suitable alk. earth and alkali metal halides.

Active carbon. J. VAN LOON. Can. 278,517, Mar. 13, 1928. Active C is manufd. by grinding C in the presence of liquid at elevated temp.

Activated carbon. NAAMLOOZE VENNOOTSCHAP ALGEMEENE NORIT MAATSCHAPPIJ. Brit. 279,104, Oct. 16, 1926. C is activated or regenerated or improved by treatment with various reagents and then heating and subjecting to further treatment. Among the reagents which may be used are: Na and K hydroxides and carbonates, lime and other alk. earth compds., H_2SO_4 , H_3PO_4 , HNO_3 , chlorides of Zn, Mg, Ca or other chlorides, compds. evolving Cl, sulfates, bisulfates, sulfides, peroxides, perchlorates and other persalts and oxidizing agents. The activity of C may also be increased by the direct action of an elec. current so that the C is heated to 600–1000° by serving as a resistance. An app. is described and numerous details and modifications of procedure are given.

Adsorbent carbon. A. B. RAY. Can. 278,932, Mar. 27, 1928. A non-coking coal admixed with ZnCl_2 is calcined at a high temp.

Carbon black from mixtures of acetylene and other hydrocarbons. L. R. CHURCHILL (to Goodyear Tire & Rubber Co.). U. S. 1,673,496, June 12. A mixt. of air and hydrocarbon gas is introduced into an expansion chamber, a large vol. of C_2H_2 is forced into the chamber, detonation is effected before diffusion of the C_2H_2 with the other hydrocarbon material (which may be gasoline or CH_4) has occurred and the chamber is cooled; this cycle is repeated. An app. is described.

Hydrogen. BERGWERKSVERBAND ZUR VERWERTUNG VON SCHUTZRECHTEN DER KOHLENTCHNIK GES. Brit. 279,128, Oct. 16, 1926. MgO is used as a catalyst in producing H by reaction of CO with steam. An app. is described.

Hydrogen. FRANS G. LILJENROTH and MARKUS LARSSON (to Phosphorus-Hydrogen Co.). U. S. 1,673,691, June 12. Reaction is effected between PH_3 and steam in the presence of a catalyst such as Pd-asbestos at an elevated temp. (suitably about 500–600°) at which the P of the PH_3 is oxidized by the O of the H_2O and the H of both the PH_3 and H_2O is liberated.

Hydrogen. R. WILLIAMS (to Lazote, Inc.). U. S. 1,673,032, June 12. In producing H by the catalytic reaction of steam and a gaseous mixt. contg. unsatd. hydrocarbons, the unsatd. hydrocarbons are eliminated by passing the mixt. contg. them together with H over a heated hydrogenation catalyst such as reduced Ni.

Hydrogen production and destructive hydrogenations. I. G. FARBENIND. A.-G. Brit. 279,072, Oct. 14, 1926. H for use in destructive hydrogenations is made by decomp. gases contg. hydrocarbons (such as gases obtained in the destructive hydrogenation of coal or the like) with CO_2 with or without steam or other gases not rich in O. Catalysts as described in Brit. 254,713 (C. A. 21, 2793) or other catalysts may be used. Numerous details of procedure are given.

Phosphorus. H. LANG. Can. 280,361, May 22, 1928. Gases contg. P are cooled below the dew-point of the latter and rapidly moving drops of a liquid are caused to strike upon the resulting P fogs.

Sulfur. A. E. SMAILL. Can. 280,493, May 29, 1928. S is recovered from gases

by segregating the SO_2 content, followed by a decomp. reaction with carbonaceous material and sulfide.

Mining sulfur by underground fusion. W. T. LUNDY and H. S. BURNS (to Freeport Sulfur Co.). U. S. 1,673,879, June 19. Fusion is effected by injecting into the S-bearing formation a heated fluid carrying lumps of earthy materials in suspension, e. g., hot water carrying clay, gumbo, sand, gravel, etc. Cf. C. A. 21, 630.

Sulfur recovery from iron sulfides. R. F. BACON. U. S. 1,672,924, June 12. Substances such as monosulfide of Fe are treated with SO_2 to form S and Fe oxide.

Precipitation of tin. H. HARRIS. Can. 279,739, May 1, 1928. Sn is pptd. from a soln. contg. Na oxysalts of Sn and As in soln. by adding calcareous matter as the pptg. agent for the Sn to such a soln. already contg. CO_2 or a carbonate to prevent the simultaneous pptn. of As.

Titanium compound. P. FARUP. Can. 280,396, May 22, 1928. Ti compds. are produced by adding a soln. contg. Ti to another soln. contg. Ti and an acid and under partial decompn., the resultant soln. being heated to pptn. of Ti compds. in the same.

Titanium compound. W. B. LLEWELLYN and S. F. W. CRUNDALL. Can. 280,393, May 22, 1928. Hydrated basic titanic phosphate is prepd. by mixing gradually under agitation H_3PO_4 or a phosphate with a soln. of a titanic salt of a concn. of between 2.5 and 10% of TiO_2 by vol., and at a temp. of not less than 50° .

Purifying zinc solutions. R. H. STEVENS, G. C. NORRIS and W. N. WATSON (RHODESIA BROKEN HILL DEVELOPMENT Co., LTD.). Brit. 278,851, Sept. 1, 1926. Preliminary to electrolysis, Zn solns. are freed from impurities such as Cu, Cd, Co, Ni, Hg, Sb and As by pptn. with alkali xanthates, Zn xanthates or similar compds.

Alcohol composition. R. A. WEINSTEIN. Can. 280,501, May 29, 1928. A jelly-like compn. consists of a minor portion of agar-agar and a major portion of dil. alc.

Drying hydrogels. E. B. MILLER (to Silica Gel Corporation). U. S. 1,674,558, June 19. A hydrogel such as silica gel or metal oxide gel is heated at a relatively low temp. while stationary until the water content is sufficiently reduced that the hydrogel will withstand being tumbled about, and is then heated at a higher temp. while agitated.

Base-exchanging substances. A. O. JAEGER (to Selden Co.). Brit. 279,466, Oct. 19, 1926. Base-exchanging substances which may be used for water purification, as adsorbents for gases, as pigments, insecticides, seed disinfectants or cements are prepd. by reaction of at least one sol. silicate (or alk. salts of the acids of B, P, S, N, Sn, Ti, W, Cr, Cb, Ta, U, As, Sb or Mn) and a metal salt and a metallate so as to obtain a product which is alk. to litmus. Salts which may be used include those of Cu, Ag, Au, Bi, Be, Zn, Cd, Al, the rare earths, Ti, Zr, Sn, Pb, Th, Cr, U, V, Mn, Fe, Ni and Co; and by "metallates" are included any alkali compd. of a "metal acid" which can form a base-exchanging compd. with a sol. silicate either with or without changing its valency during the reaction. An extremely large number of details and illustrative examples of different reacting substances are given.

Catalyst. R. G. FRANKLIN. Can. 280,008, May 8, 1928. A catalyst for the production of oxygenated org. compds. from CO and H_2 is prepd. by causing a sol. Cr compd. to react with ZnCO_3 .

Catalysts for synthesis of ammonia. G. F. UHDE. Can. 279,790, May 1, 1928. The catalysts are complex compds. of Fe cyanide insol. in H_2O and the extra-radical Fe is substituted by another metal, such as Al.

Regeneration of catalysts. A. O. JAEGER. Can. 280,580, May 29, 1928. Contact masses, which have become deteriorated by use in the catalytic oxidation of org. compds., are regenerated by treating them with an "acid radical substance" or inorg. peroxide which is volatile below red heat and which does not leave a residue non-volatile upon treatment with O_2 -contg. gases at elevated temps.

Chemical composition. J. F. KING. Can. 277,908, Feb. 14, 1928. A compn. of matter consists of 300 lbs. NaBO_3 , 50 lbs. cornstarch, 30 lbs. Na_2PO_4 , 25 lbs. sulfate alumina powder, 75 lbs. tipsom salts and 20 lbs. denatured alcohol.

Agglomerating cork. ARMSTRONG CORK CO. Brit. 279,190, Aug. 6, 1926. After particles of cork are pressed into blocks, sheets or other form, hot gases are passed through the material to set up an oxidizing exothermic reaction. Air, steam or furnace gases may be used and the temp. may be 220 – 350° .

Condensation product of urea with formaldehyde. A. GAMS and G. WIDMER (to Soc. anon pour l'ind. chim. à Bâle). U. S. 1,674,199, June 19. Condensation is effected under superatm. pressure (suitably a pressure of about 2–3 atm.) which serves to accelerate the reaction.

Phenolic condensation product. O. A. CHERRY and F. KURATH. Can. 280,359, May 22, 1928. A phenolic condensation product is prepd. by condensing a combination

of a phenol and a methylene-contg. substance in the presence of furfuramide, while maintaining an excess of phenol over that necessary for complete combination with the methylene-contg. substance.

Phenolic condensation product. O. A. CHERRY and F. KURATH. Can. 280,543, May 29, 1928. A potentially reactive phenolic condensation product is prepd. by heating a mixt. of a phenol, a methylene-contg. substance, furfural and NH_3 .

Casein product. A. POULBOR. Can. 279,665, Apr. 24, 1928. In the production of plastic masses or elements consisting of hardened casein, the required quantity of CH_3O is mixed and pressed in the cold with casein in the presence of EtOH , being subsequently heated for the purpose specified.

Molded articles comprising pitch or other similar organic binders. F. KURATH and L. T. RICHARDSON (to Cutler-Hammer Mfg. Co.). U. S. 1,674,287, June 19, 1928. Articles of high impact resistance are formed by cold molding sep. composite particles of a mixt. comprising an org. binder such as a mixt. formed from stearin pitch, coal-tar pitch, gilsonite and fish oil or castor oil and asbestos or other fibrous material. The particles are so arranged as to insure a ragged or uneven break when the molded article is broken. Cf. C. A. 22, 2644.

Material for preparing metals for painting. J. H. GRAVELL. Can. 280,098, May 15, 1928. A material for prep. metals for painting consists of an admixt. of H_3PO_4 , alc., gelatin, NaCNS and As_2O_3 .

Finish remover. J. G. DAVIDSON. Can. 280,536, May 29, 1928. A finish remover contains a finish solvent having the type formula: $\text{HOC}_n\text{H}_{2n}\text{O}-\text{C}_x\text{H}_{2x}\text{OR}$, where R is an alkyl or aryl group, and n and x equal 2 or 3. The dash stands for either a single bond or a bivalent radical.

Finish remover. J. G. DAVIDSON. Can. 280,537, May 29, 1928. A finish remover contains a finish solvent having the type formula: $\text{ROC}_2\text{H}_4\text{O}-\text{C}_2\text{H}_4\text{OR}_1$, where R is an acyl group, R_1 is an alkyl or aryl group, and the dash is a simple bond or $\text{C}_2\text{H}_4\text{O}$.

Stencil sheets. S. HORII. Brit. 278,956, March 18, 1927. Sheets such as Yoshino paper are coated with a compn. contg. a soln. of an ester of polysaccharides such as mannan acetate, cellulose acetate or cellulose nitrate and the fatty acid of tsbaki oil. The fatty acids of sasanqua oil and other ingredients such as EtOAc , AmOAc , AmOH and gasoline may be used in the compn.

Stencil sheet. H. L. SHALLCROSS (to Shallcross Co.). U. S. 1,674,611, June 19, 1928. A suitable paper of porous open texture is coated with an alc. soln. of lac admixed with dissolved nitrocellulose, camphor and oils.

"Anti-slipping" composition. J. TALBOT. Brit. 278,785, July 6, 1926. A compn. for use on mats, rugs or other articles to prevent them from slipping on polished surfaces comprises water, a size such as glue, gluten or gelatin, a hygroscopic compd. such as glycerol or KCl , latex and CH_2O .

Laminated material for gears, clutch facings, etc. F. GROFF (to Bakelite Corporation). U. S. 1,673,239, June 12, 1928. A fibrous base such as paper, cloth or asbestos is impregnated with a resin of the glycerol-phthalic anhydride type, the material is dried to expel solvent and set the resin, a plurality of sheets are superposed with intervening reactive phenolic resin, and the sheets are united by heat and pressure.

Impregnating woven fabrics for brake bands, etc. W. OTTMANN. Brit. 279,496, Oct. 21, 1926. Fabrics such as bands of asbestos fabric with a cotton weft may be treated with waterglass, dried and then subjected to the action of HCl , H_2SO_4 or $(\text{NH}_4)_2\text{SO}_4$ to form a ppt. in the fabric; part of the waterglass may be left undecompd. to render the fabric more adhesive if desired, or the fabric may be further treated with waterglass after the decompn. SiCl_4 or SiF_4 also may be used for the impregnation and then decompd. by water, alkali or waterglass soln.

Steel driving belts. R. J. REANEV. Brit. 279,288, Jan. 24, 1927. The core of a driving belt is formed of a strip of metal such as Swedish steel treated with weak HCl or H_2SO_4 or similar solvent and then washed with alkali or treated with a grease solvent or buffed to render it suitable to receive a thin layer of liquid rubber which is burnt by a blow torch "to sweat it into the surface of the metal." A further coating of rubber also may be applied and a layer of fabric is then subjected to friction on both sides and subjected to further treatments which may include the application of a shellac coating.

Waterproof plastic. W. A. COLLINGS. Can. 280,263, May 22, 1928. Calcareous plastics are waterproofed by incorporating dry bentonite into the same.

Pencil "leads" formed of an alloy of zinc and bismuth. E. ROSENBAUM and J. W. GUNDLICH (to Guroschreibstift Ges.). Brit. 279,090, Oct. 12, 1926.

Ink ribbons, carbon paper and like articles. R. JARMAI and E. LORAND. Brit. 279,403, Oct. 19, 1926. Ultramarine is added to various mixts. contg. other coloring

substances and which may also contain waxy or oleaginous vehicles, to lessen the liability of the compn. to smearing. Formulas are given.

Metal-cleaning preparation. J. D. KLINGER and C. L. BOYLE. Can. 279,500, Apr. 24, 1928. A prepn. for cleaning metal for painting consists of an admixt. of H_3PO_4 , a sol Cr compd., and ethyl methyl ketone. Cf. C. A. 22, 1833.

Anti-freeze composition. J. G. COLLINS. Can. 279,520, Apr. 24, 1928. An anti-freeze compn. consists of 1 gal. H_2O , 2 lbs. NaCl (97% test), and glucose (43% gravity) mixed with the soln. of NaCl in the proportions of 1 qt. of glucose to $1\frac{1}{2}$ gals. of the soln. Glycerol may also be added to the soln. to lower its freezing point.

Non-oxidizing jelutong product. M. L. HAMLIN (to Beech-Nut Packing Co.). U. S. 1,674,435, June 19. A product suitable for use in making chewing gum is prep'd by coagulating the latex of *Dyera costulata* or similar trees, removing the coagulated product and treating it while heated with an anti-oxidizing compd. such as a phosphate to distribute the compd. throughout the mass and protect it from oxidation by the air.

Protecting material from moths. W. LOMMEL, H. MUNZEL, H. STÖTTER and B. WENK. Can. 280,549, May 29, 1928. Material is protected from moths by treating it with an *o*-hydroxy-3-carboxylic acid or deriv. of the same, in which the *p*-position to the hydroxyl group is occupied by halogen or S.

Gluing wood with starch. J. FLASCHNER. Brit. 279,087, Oct. 14, 1926. Starch or starch-contg. material is applied to the surfaces to be glued and the starch is then converted *in situ* into an efficient glue by the action of heat and pressure. Substances such as polymerized CH_2O and $MgCl_2$ may be added.

Sealing composition. F. A. ADAMSKI. Can. 279,433, Apr. 17, 1928. A sealing compn. comprises a mixt. of a fibrous material and S, the S being in considerable excess of the fibrous material.

Stereotype. E. S. HOLE. Can. 279,238, April 10, 1928. In making printing surfaces, matrices, etc., a mixt. of an aldehyde, a coal tar intermediate and an alk. condensing agent is boiled, and a salt of Cr and NH_4OH are added, while the mixt. is in its H_2O -sol. state. A fibrous base is then impregnated with the mixt., and the impregnated base is dried and molded under heat and pressure.

Artificial lithographic stone. SATARO FURUYA. Jap. 69,052, Aug. 7, 1926. Powdered whetstone and clay are mixed with fused S, kneaded, pressed into a mold and cooled.

19- GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

A new method of determination of boric acid in glass. A. A. MACHIGIN AND T. F. KORZUKHINA. *J. Russ. Phys.-Chem. Soc.* 59, 573-8(1927).—A sample of glass (2.5 g.) is fused with 15 g. Na_2CO_3 and dissolved in H_2O . The soln. is transferred to a 500-cc. volumetric flask provided with a reflux condenser. HCl is added until decompn. is complete, then solns. of 65 g. $BaCl_2$ and 19 g. cryst. Na_2CO_3 in H_2O . The mixt. is boiled for 0.5 hrs. and on cooling made up to 500 cc. The $BaCO_3$ which is formed ppts. Si and Al salts while $Ba(BO_2)_2$ dissolves in the excess of $BaCl_2$. Measured portions of the filtrate are made acid to Me orange; CO_2 is boiled off and the soln. rendered alk. with $Ba(OH)_2$ before titration in the presence of mannitol and phenolphthalein. The av. error is slightly over 0.1%.

BASIL C. SOYENKOFF

Relationship between chemical composition and the resistance of glasses to the action of chemical reagents. II. Glasses containing iron oxides. VIOLET DIMBLEBY AND W. F. S. TURNER. *J. Soc. Glass Tech.* 12, 52-7(1928); cf. C. A. 21, 2364.—Glasses contg. 1-3 mols. Fe_2O_3 per 100 mols. SiO_2 show greatly increased resistance to corrosion by H_2O , HCl and Na_2CO_3 . At higher Fe_2O_3 contents the resistance increases very slowly. NaOH solns. attack glass more readily with higher Fe_2O_3 content. Tabulated below are the results of the resistance tests of Fe_2O_3 -bearing glasses compared with glasses of other metallic oxides, either through the whole series or up to the mol. content shown where equal resistances are developed to the boiling reagents:

	CaO	BaO	PbO	MgO	ZnO	Al_2O_3	ZrO_2	TiO_2
H_2O	>	>	>	>12	>10	>8	>4	>8
HCl	>6	>8	>8	>6	>6	>4	>4	>4
Na_2CO_3	>	>	>	>	>4	>4	>	<
NaOH	>4	>6	>8	>4	>6	>4	>12	<

Thus for example iron-contg. glasses are superior to CaO glasses throughout the series in resisting H_2O and Na_2CO_3 but only up to 6 mol. CaO glass in HCl soln. and 4 mol. CaO glass in NaOH soln. H. F. K.

Influence of iron oxide on the properties of glass. S. ENGLISH, H. W. HOWES, W. E. S. TURNER AND FRANCIS WINKS. *J. Soc. Glass Tech.* 12, 31–44(1928).—In the 10-member series of the general mol. formula $6SiO_2(2-x)Na_2O.Fe_2O_3$, the amts. of Fe_2O_3 varied from 44.4 lb. to 444 lb. per 1000 lb sand. Melting was carried out at 1400° in a sillimanite pot which became corroded but slightly. Up to 222 lb. Fe_2O_3 per 1000 lb. sand the melting of the batches occurred readily; above this Fe_2O_3 content the time of melting increased. Analysis of the glasses showed a conversion to FeO of about 15%. Since the color of glass is affected by the FeO/ Fe_2O_3 ratio, temp., time, atm. condition, compn. of glass and its viscosity are detg. factors. With increasing Fe_2O_3 content the glasses increased in hardness, annealing temps. and quite regularly in density but decreased in thermal expansion. H. F. K.

The estimation of ferrous oxide in heat-protective glasses. H. HEINRICHS. *Glastech. Ber.* 5, 154(1927); *J. Soc. Glass Tech.* 11, 373–4A.—A special interest attached to the estn. of the FeO content of glasses for heat-protective purposes, in which Fe oxide was intentionally added, and melting was carried out under reducing conditions. For a series of glasses of this type the FeO was detd. by dissolving the glass in HF and H_2SO_4 in an atm. of CO_2 and titrating the residue with 0.001 N $KMnO_4$. Decompn. was performed in a Pt dish placed in a specially designed Pb container, heated by an a r-bath. Results are summarized as follows:

Glass No.	Total iron as FeO %	Content of FeO in glass %	Color of glass
1	1.0	0.234	Green
2a	1.0	0.637	Intense bluish green
2b	1.0	0.675	Intense bluish green
2c	1.0	0.665	Intense bluish green
2d	1.0	0.651	Intense bluish green
3	1.12	0.388	Green with blue tinge

The ratio %FeO: % Fe_2O_3 was 0.3 for the green glass and 2.0 for the blue glasses, and in no case was complete reduction of the Fe secured. Although the blue tint increased with increasing FeO content, the results did not warrant a conclusion as to the color of a glass contg. all the Fe in the ferrous condition. The possibility that such a glass would be colorless, in conformity with the statement by G. R. McCarthy that $FeSiO_3$ in the Fe minerals possessed no color, still existed. A qual. test for FeO in glass was due to von Chugaev and Orelkin (*C. A.* 9, 1442). 0.3–0.5 g. of powd. glass in a reagent glass tube with 10 cc. of dil. HCl was heated in a beaker of boiling water and filtered. The cold filtrate was treated with 2–3 drops of a satd. alc. soln. of dimethylglyoxime and rendered ammoniacal. By this test traces of FeO were detected in perfectly colorless glasses. The red color obtained could easily be distinguished from that given by Ni when present in the glass as coloring agent or decolorizer, since the ferrous compd. was decompd. by heating while the Ni compd. when in larger amt. coagulated. H. G.

Study of the casing of colorless by cobalt blue glass. I. The thermal expansions. W. E. S. TURNER AND FRANCIS WINKS. *J. Soc. Glass Tech.* 12, 57–75(1928).—The glasses used were (a) fairly soft glass of the formula $6SiO_2.0.7CaO.1.3Na_2O$, (b) a standard crystal tableware batch consisting of sand 1000 parts, red lead 660, K_2O 330 and KNO_3 53, and some commercial colored glasses. Cobalt oxide was added in small amts. up to 0.5% in glass "a" and to 0.9% in glass "b." The thermal expansion was detd. on rods 10 cm. \times 0.5 mm. in a special furnace fully described. With soda-lime glass the thermal expansion increases with temp. even below the lower annealing temp., but is no greater than 3% for the 0.49% CoO glass except during the annealing range. With the K_2O -lead oxide glass the effect of 0.9% CoO addn. is again not over 3%. This is not enough to prevent successful welding of the members of each series. Additions of CoO displaced both the upper and lower annealing temps. as much as 25° for the 0.9% CoO addn. to the K_2O glass. II. The question of setting rate. S. ENGLISH AND W. E. S. TURNER. *Ibid* 75–82.—A soda-lime-silica glass and one of potash-lead oxide-silica showed increasingly greater setting rates with increased CoO content, although the viscosities between 1400° and 700° grew less. Colored glasses showed greater difference between inner and outer layers due to greater radiating power. H. F. KRIEGER

Ultra-violet light transmission of some colorless bottle glasses. DAVID STARKIE AND W. E. S. TURNER. *J. Soc. Glass Tech.* 12, 27–9(1928).—Glass sections were

taken from 8 varieties of food containers. These were ground to 2 mm. thickness, polished and their absorption spectra detd. by the aid of a Hilger quartz spectrograph. Results indicate a rather definite increase in absorption with rise of Fe_2O_3 content in glasses. TiO_2 also absorbs violet light though the amount present in most commercial glasses is below 0.02% and hence too small to function greatly. H. F. KRIEGE

The temperature-time curve of visible devitrification in plate glass. E. ZSCHIMMER AND A. DIETZEL. *Sprechtsaal* 60, 110, 129, 145, 165, 186, 204 (1927); *J. Soc. Glass Tech.* 11, 142A. The method and results were described previously. The glass tested had the compn SiO_2 70.15, Al_2O_3 1.09, Fe_2O_3 0.21, CaO 15.62, Na_2O 11.79, K_2O 0.16, As_2O_5 0.14, SO_3 0.84% and the danger zone lay between 950° and 1050° . At the point of max. crystn., 1005° , crystals grew to a length of 10μ in half a min., to 50μ in $2\frac{1}{2}$ min. and 100μ in 5 min. H. G.

Valency of arsenic and antimony in glass. H. HEINRICH and F. SALAQUARDA. *Glastech. Ber.* 4, 130-7 (1926).—The amt. of As_2O_5 and Sb_2O_5 is detd. by heating the powd glass with KI and HCl and detg. the excess of I. The total As and Sb, including trivalent As, is also detd. From 75 to 80% of the As is present as As_2O_5 , but only 0-6% of the Sb as Sb_2O_5 . The detn. is facilitated by the addn. of a large excess of salt-peter. B. C. A.

The influence of moisture in the manufacture of glass. W. E. S. TURNER. *Glastech. Ber.* 5, 57 (1927); *J. Soc. Glass Tech.* 11, 325A.—Large quantities of moisture in the glass batch resulted in an appreciable lowering of temp. when the batch was introduced into the furnace, and a batch contg. crystal soda and having a total moisture content of 28% reduced the temp. of the pot from 1400° to 500° . Small quantities of moisture distinctly affected the time required for melting. A soda ash-limestone-sand batch melted most rapidly when contg. 1% of water, while the optimum condition for melting a soda-lime batch contg. an appreciable proportion of saltcake, or a potash-lead oxide-sand batch, was that in which 4% moisture was present. Working properties of the glass were affected by the moisture present in the batch, and a soda-lime-silica glass became increasingly viscous as the moisture in the batch increased beyond 5%, batches with 10 to 15% of water giving highly viscous, lumpy glasses. Similar differences were found with glasses made from batches contg. sand, feldspar, limestone, magnesia, potash and soda. Again, soda-alumina-silica glasses with 4-5% of Al_2O_3 set more rapidly when hydrated Al_2O_3 was used than when calcined Al_2O_3 was employed. Borosilicate glasses of the lamp glass type, on the other hand, were const. in property whether crystal or calcined borax was used. The variations in property were strongly marked even where analysis indicated almost identical chem. compn. Little of the batch moisture apparently remained in the glass, for a soda-lime glass from a batch contg. 10% of water lost only 0.02% more in wt. when heated to 920° than one made from a batch contg. only 1% of moisture. H. G.

What is lead crystal? I. SPRINGER. *Sprechtsaal* 60, 481 (1927); *J. Soc. Glass Tech.* 11, 232A.—The older conception of a "flint" glass was that of one contg. at least 30, generally 33, and rarely more than 38% of Pb oxide, although for optical purposes as much as 80% were used. Improvements in firing enabled light flints contg. up to $22\frac{1}{2}\%$ of Pb oxide to be made in open pots. More recently still a cheaper demicrystal with less than 10% of Pb oxide, with CaO or BaO , or both, has appeared on the market. The following limitation of terms was suggested: heavy lead crystal, Pb oxide above 30%, light crystal, from 17 to 23%, and demicrystal from 7 to 13%. The question of differentiation arose for those not expert, and in this connection color and luster were perhaps the best guides, together with d., and the fact that the cutting and polishing were not so good in the lighter wares. H. G.

The color method in ceramic and mineral research. R. RIEKE AND O. WIESE. *Ber. deut. keram. Ges.* 9, 109-55 (1928).—Methods of examn. of minerals and ceramic mixts. microscopically with the aid of dyes are described. These may be examd. after firing to different temps. The results of such examn. of the following minerals and mixts. are described: $\text{Al}(\text{OH})_3$, H_2SiO_3 , CaCO_3 , CaF_2 , MgCO_3 , MgSiO_3 , dolomite, feldspar, muscovite, kaolinite and ceramic mixts. A bibliography on the examn. of clays and minerals is included. H. G. SCHURECHT

The formation of crystals in ceramic bodies and glazes. R. RIEKE. *Ber. deut. keram. Ges.* 9, 156-68 (1928).—The formation of crystals in ceramic bodies may be good or bad, depending upon the use of the material and upon the nature of the crystals. For elec. porcelain the formation of mullite is desirable because it increases the strength and resistance to sudden temp. changes, but for translucent porcelain it is undesirable since it reduces the translucency. Amorphous mullite forms at temps. as low as 1000° but does not become cryst. until fired to higher temps. Fluxes which lower the viscosity

of the molten part of the body, as CaO , MgO or ZnO , facilitate the formation of crystals in bodies. Likewise glazes with a low viscosity may develop crystals, whereas viscous glazes may hinder their growth. Many opacifiers produce opacity in the glazes through crystn. of certain ingredients during cooling. S gases in the kiln may combine with the glaze and form cryst. alk. earth silicate patches on the glaze, some of which are soluble.

H. G. SCHURECHT

The salt glaze examined in thin section. W. FISCHER. *Keram. Rundschau* 36, 165-7 (1928).—A microscopic study of thin sections cut normal to the glaze-body contact shows (1) the more densely burned the body, the sharper the boundary between glaze and body; (2) the thickness of a normal salt glaze is 0.01 to 0.05 mm.; (3) the longer the period of salting the greater the thickness of the glaze, although the increase in glaze thickness is greatest in the early periods; (4) the salt glaze is heterogeneous and tends to crystallize; (5) the thicker the glaze the greater the crystn. tendency. Imperfect (foamy or silvery) salt glazes are characterized by great glaze thickness and by octahedral crystals arranged in bands or cords and often as skeleton forms which are probably composed of Fe_2O_3 with dissolved FeO and of ilmenite. H. INSLEY

The testing and behavior of refractory material under stress at high temperatures. A. J. DALE. *Trans. Ceram. Soc. (Eng.)* 26, 138(1926-7); *J. Soc. Glass Tech.* 11, 363A(1927).—Silica bricks contg. unconverted quartz were liable to disruption under heavy load at temps. above 1250-1300° unless an especially elastic matrix was present. A silica brick contg. a large % cristobalite under a load of 4 lbs. per sq. in. withstood the highest temp. attainable in the load-test furnace without abnormal expansion at high temp. Under a load of 50 lbs. per sq. in. the brick failed at 1700-1730° but with no deformation until 1700°. Rapid expansion was developed between 200° and 350°, due to the α - β -cristobalite inversion. With a silica brick having good tridymite development the subsidence range under a load of 4 lbs. per sq. in. was 150-180°, whereas with many silica products this seldom exceeded 50-80°. This extended range suggested failure due to a viscous flow of the matrix. The temp. of ultimate collapse was above 1675° even under a stress of 75 lb. per sq. in. There was no rapid expansion at high temps., which makes the brick especially suited to high-temp. arch work, etc. Rapid expansion at low temps. (100-300°) was not particularly marked. Bricks of high tridymite content might fail under high loadings below 1600°, but if a matrix of moderate viscosity were present a distribution of internal stress was possible. A fireclay brick with high Fe_2O_3 content is not necessarily inferior as regards refractoriness at moderate temps. A brick with 3.71% Fe_2O_3 stood up to a temp. of 1400° before rapid subsidence developed. Much depends on whether the Fe content is homogeneously or heterogeneously distributed. A brick of low refractoriness may prove satisfactory at a temp. below 1250°, but the margin of safety would be small. High Al_2O_3 content and moderate porosity favor refractoriness at temps. up to and around 1400°. The temp. of complete squatting of a brick under load is not a safe guide to the behavior of the material at a lower temp. as a brick might be subsiding over a temp. interval of 150-200°.

D. E. SHARP

Comparative evaluation of the quality of enameled ware of Russian and non-Russian origin. I. I. SILVESTROVICH AND P. N. GRIGORIEV. *Keram. Rundschau* 36, 187-9(1928).—Comparative tests were made on Russian and non-Russian cast iron and sheet-metal enameled ware. Tests included detn. of color, resistance to soln. in boiling H_2O , AcOH and Na_2CO_3 , resistance to mech. shock and resistance to quenching after heating to 200°. Non-Russian enameled ware tested was of Polish, Czechoslovakian and German origin. General results of tests were: (1) Russian ware was slightly darker in color than non-Russian; (2) no other marked differences in appearance were noted; (3) Russian ware showed far greater resistance to soln. and failure in 1% AcOH ; (4) non-Russian ware showed somewhat greater resistance to quenching after heating; and (5) Russian ware was somewhat superior to non-Russian in resistance to mech. shock.

H. INSLEY

Alloy for sealing hard glass (Can. pat. 279,434) 9.

KONINGH, H. DE: **The Preparation of Precious and Other Metal Work for Enameling.** London: C. Lockwood. 88 pp. 4s. 6d., net.

Glass. W. C. TAYLOR. Can. 280,176, May 15, 1928. A colored heat-resisting glass of low coeff. of expansion has a high SiO_2 content and contains K_2CO_3 , lithia, boric oxide, Al_2O_3 and a usual coloring oxide.

Glass. W. C. TAYLOR. Can. 280,177, May 15, 1928. A heat-resisting green glass which shows high transmission of green light and generally good absorption of the other parts of the spectrum contains boric oxide, lithia, CuO and Co_2O_3 .

Plate glass manufacture. M. BICHEROUX (to Maatschappij tot Beheer en Exploitatie van Oetrooten). U. S. 1,637,098, June 12. Mech. features

Apparatus for making plate glass. M. BICHEROUX (to Maatschappij tot Beheer en Exploitatie van Oetrooten). U. S. 1,673,138, June 12

Apparatus for plate glass manufacture. M. BICHEROUX (to Maatschappij tot Beheer en Exploitatie van Oetrooten). U. S. 1,673,347, June 12.

Apparatus for making sheet glass. L. D. SOUTHER (to Libbey-Owens Sheet Glass Co.). U. S. 1,673,892, June 19.

Apparatus for producing sheet glass. E. T. FERNGREN (to Libbey-Owens Sheet Glass Co.). U. S. 1,673,907, June 19.

Apparatus for producing sheet glass. N. MAMBOURG (to Libbey-Owens Sheet Glass Co.). U. S. 1,673,916, June 19.

Apparatus for drawing glass. A. E. SPINASSE. U. S. 1,674,529 30, June 19.

Apparatus for pressing glass. R. L. ELLERY. U. S. 1,673,108, June 12.

"Unbreakable glass." F. THIEL, A. VACHA and F. J. GOLDSCHMIDT. Brit. 279,031, Oct. 12, 1926. Sheets for making lamp shades or other articles are formed of celluloid or similar material coated with transparent or translucent varnish and with small particles of glass uniformly distributed.

Blowing glassware. G. E. HOWARD (to Hartford-Empire Co.). U. S. 1,673,747, June 12. After the glass has been expanded to fill a mold, air is simultaneously passed into and out of the expanded glass, to hasten its cooling. An app. is described.

Flue and draft system for brick and pottery kilns. J. N. SILVA. U. S. 1,673,597, June 12.

Ceramic body. F. H. RIDDLE. Can. 277,673, Feb. 7, 1928. A raw batch for ceramic bodies contains a mineral of the sillimanite group and other aluminous material. Cf. C. A. 21, 3439.

Ceramic materials. F. H. RIDDLE. Can. 277,672, Feb. 7, 1928. The raw batch of a ceramic material consists of cryst. Al silicate, a synthetic flux contg. an alk. earth metal oxide, raw clay and an alk. earth metal flux.

Abrasive composition. A. BIDDLE. Can. 279,851, May 1, 1928. An abrasive compn. consists of 50 parts by wt. rubber latex, 10 parts casein, 3 parts of a casein solvent, 25 parts H_2O , and 80 parts sand.

Refractory compositions. SOUTH METROPOLITAN GAS CO. and R. H. B. LAMPREY. Brit. 278,821, July 23, 1926. A compn. suitable for making gas retorts and the like comprises tridymite and quartzitic silica and fireclay which has been purified by elutriation and treatment with acid. The proportions are such as to produce a desirable reduction of the shrinkage of the clay during drying and burning and to counteract after-shrinkage during use; a suitable mixt. is clay 40-45, calcined flint (No. 4 No. 8 mesh) 20-25, calcined flint (No. 8 No. 12 mesh) 20-15 and sand 20-15%. Alumina or SiC may replace the sand.

Refractory material. J. G. DONALDSON and H. L. COLES (to Guardian Metals Co.). U. S. 1,673,106, June 12. Walls of safes or vaults or other refractory articles are formed of over 70% Zr oxide and less than 30% Zr silicate and C-dissolved in the silicate. U. S. 1,673,107 specifies a material formed by heating together ZrO_2 over 85, SiO_2 less than 15 and C less than 10 parts, to fuse together the oxides and dissolve the C in the product.

Vitreous enamel. H. V. HUBER and T. M. FELTON (to Vitro Mfg. Co.). U. S. 1,673,679, June 12. A vitrifiable compn. suitable for use on earthenware or other material comprises a coloring sulfide such as CdS , a compd. of Pb such as Pb_2O_3 and another compd. such as CdO which has the same base as the sulfide and prevents formation of a discolored compd. H_3BO_3 and other compds. may be used.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Cement in 1926. P. W. BAGLEY. Bur. Mines, *Mineral Resources of U. S. 1926*, Part II, 303-34 (preprint No. 27, published April 4, 1928). I. C.

Hair felt [for roofing] (U. S. pat. 1,673,967) 25.

ECKEL, E. C.: **Cements, Limes and Plasters.** 3rd ed., revised. New York John Wiley & Sons. \$7. Reviewed in *Eng. Mining J.* 125, 953 (1928).

WECKE, FRIEDRICH: **Handbuch der Zementliteratur.** CHARLOTTENBURG: Zementverlag. 1447 pp. Cloth bound, M. 44.

Cement. G. PISTOR and R. SUCHV. Can. 277,732, Feb. 7, 1928. Hydraulic cement is produced by withdrawing the molten slag from a P furnace and introducing aluminous additions into the slag.

Coating with cement. L. G. COPEMAN. Can. 278,359, Mar. 6, 1928. The surface of the material to be coated is treated with a soln. of $MgCl_2$ and then a coating of oxy-chloride cement is applied.

Cement mortars and concrete, etc. C. PICKSTONE. Brit. 279,355, June 16, 1927. Fine slate flour is substituted for 5–15% of the usual aggregate and 0.25–0.50% of Na silicate of 50–55° Bé. is added to the gaging water.

Bituminous concrete. L. S. VAN WESTRUM. Can. 279,417, Apr. 17, 1928. Bituminous concrete is manufd. by mixing a mineral aggregate with true cement or a cementitious powder consisting of a true cement and stone or slag flour, with oxide of iron, and further mixing the mixt. with a bituminous soap.

Aggregates for use with concrete. J. R. GARROW. Brit. 278,788, July 7, 1926. Org. material such as wood, sawdust, shavings, coir, sizal or paper pulp, for use with cement or concrete, is expanded by the action of heat and moisture and then treated with substances which will fill the pores and maintain them in expanded condition, e. g., 2 solns. may be employed which will react to form an insol. compd. in the pores such as $PbSO_4$, Pb chromate, $BaSO_4$ or $Zn(OH)_2$. Numerous other examples also are given. A salt of high osmotic pressure such as $CaCl_2$ may be added to the soln. used for expanding the pores.

Road-making material. S. S. SADTLER (to Am'esite Asphalt Co. of America). U. S. 1,674,523, June 19. A soap contg. unneutralized acid is dissolved in a bitumen liquefier such as kerosene, stone is treated with the compn. thus formed and the material is afterward incorporated with a bitumen.

"Artificial marble." H. L. BATES. Brit. 278,983, May 13, 1927. See U. S. 1,629,854 (C. A. 21, 2369).

Felt for tread surfaces or sound-insulation in building construction. F. CARL and C. RIEDEL. Brit. 279,093, Oct. 15, 1926. Sheets or slabs of felted animal fiber are impregnated with bitumen or tar which may be used with solvents such as C_4H_{10} or a petroleum oil.

Cement waterproofing material. MITSUBISHI GOSHI Co. Jap. 69,075, Aug. 11, 1926. To a mixt. of a glyceride of a fatty acid with resin and alk. earth oxide is added silica gel. This compn. is used as waterproofing material.

Waterproofing and fireproofing timber. F. S. VIVAS. Can. 279,153, Apr. 3, 1928. Timber is immersed in a hot aq. soln. of borax and $CaCl_2$, and subsequently in an aq. soln. of iron sulfate.

Drying and seasoning wood. L. BACHRICH. Brit. 279,453, Oct. 20, 1926. Wood is first treated with air at a temp. of 40–60° in 2 stages at the end of each of which the satd. air is allowed to escape through a valve in the top of the treating chamber, and is then treated with air at 70–75°. With wood about 4–5 cm. thick, the stages may require 4–5 and 7–8 hrs., resp., and a period of "rest" may intervene between the stages. The treatment may be repeated with wood of large dimensions.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Notes on recent developments in fuel technology. R. WIGGINTON. *Fuel in Science and Practice* 7, 193–4, 241–4 (1928); cf. C. A. 22, 2254.—Brief reviews of the following subjects: carbonization at power stations, benzene (crude motor spirit), oil from coal, removal of O from feed water, water softening with Ba salts, producer gas vehicles.

D. A. REYNOLDS

Observations on the determination of the elementary oxidizable carbon in fossil solid fuels. I. BLUM. Inst. Ind. Chem., Bucarest. *Bul. chim. soc. română științe* 30, 43–9 (1928).—In the detn. of the oxidizable elementary C, one should subtract from the total CO_2 a quantity equiv. to the CO_2 absorbed in the coal, to the CO_2 evolved by the mineral matter, and to the CO_2 obtained from org. constituents. The CO_2 to be

subtracted is detd. in a single assay, when 1 g. of coal is distd. in the combustion tube in a N atm, or when a sample is distd. from the Fischer-Schrader Al retort. This correction is to be used when the calorific power is calcd. A. L. HENN:

Sardinian fuels, with special attention to fuels of the Perdasdefogu basin (Ogliastrea). II. R. BINAGHI AND A. BRUNDO. Univ. Cagliari. *Ann. chim. applicata* 18, 122-34(1928) — Earlier studies on lignites (cf. B and Romoli-Venturi, *C. A.* 20, 652) being extended, the Ogliastrea anthracites were examd., their chief interest being their potential value for use in blast furnaces utilizing limonite ore occurring nearby. Analyses of representative anthracite show the following % compn.: moisture 1.66-1.75, ash 8.51-26.14, C 49.79-73.53, H 2.39-3.95, O 12.59-19.82, N 0.58-0.76, S 0.84-1.10, with calorific power of 4430-5675. A comparison of the character of this anthracite with similar anthracites which have been used successfully in metallurgy shows that the Ogliastrea anthracite may be used in connection with the blast-furnace reduction of the local limonite ores. A review of earlier publications on the fuel resources of Sardinia is included, with numerous rare references. C. C. DAVIS

Combustible liquids from coal, a lecture delivered at the college of France. R. CHAUX. *Bull. soc. chim.* 43, 385-411(1928) — A review is given of the production of combustible liquids from coal by hydrogenation and by the utilization of the hydrocarbon constituents of coke-oven gas for the production of alcs. and use of coal tars for producing C_6H_6 , its homologs and other aromatic compds. The syntheses of MeOH, Synthol and liquid hydrocarbons from CO produced by the gasification of coal are discussed. A bibliography of 160 references is given. RAYMOND E. SCHAAD

Motor spirit, its use in internal-combustion engines. H. Y. V. JACKSON. *J. Inst. Petroleum Tech.* 13, 855-74(1927) — A general survey of the requirements for a good fuel. BRIAN MEAD

Detection and determination of benzine, benzene, alcohol, ether and tetralin in motor fuels. I. FORMÁNEK (*Chem.-Ztg.* 52, 325-6(1928)) — The dyes algol red BTK, algol red 2G, and lake red Ciba B dissolve in C_6H_6 , its homologs, and in tetralin; the first 2 produce a red color; the latter gives a rose-red with orange yellow fluorescence. These dyes are practically insol. in benzine, petroleum and gas oil, and entirely insol. in alc. and in Et_2O . Benzene in com. benzine and C_6H_6 adds to turpentine oil may be detd. colorimetrically by agitating 20 cc. of the liquid with 0.01 to 0.02 g. of any of these dyes, and comparing the tint of the fuel layer with those of a color scale prepd. from a series of synthetic fuel mixts. contg. known amts. of C_6H_6 . By means of these dyes 5% of C_6H_6 is detectable in a mixt. of C_6H_6 or other aromatic hydrocarbon with benzine, spirits, Et_2O , or with other fuels. Spirits-sol. aniline blue 2B colors alcs., aldehydes and ketones deep blue. It is insol. in H_2O , benzine, petroleum, C_6H_6 , PhMe, $C_6H_4Me_2$, higher homologs of C_6H_6 , tetralin, cyclohexane, Et_2O , CS_2 and turpentine oil. With this dye 2.5% of alc. can be detected in a benzine-spirits mixt., less than 2% in a C_6H_6 -benzine-, or benzine- C_6H_6 -spirits mixt., or even 1% in Et_2O , natural benzines can be distinguished also from such artificial fuels as Synthol, Synthin, Ketol, etc., which consist of alcs. and aldehydes. *Ibid.* 346-8. — Perchromic acid soln. (aq. $K_2Cr_2O_7$ soln. acidified with H_2SO_4 and treated with H_2O_2) gives a blue color to Et_2O , but not to benzine, petroleum, gas oil, C_6H_6 , EtOH or tetralin. The blue color which it gives to alcs., aldehydes and ketones changes after some time through bright green to yellowish green, and to brown with AmOH and BuOH while they are oxidized to aldehydes. Addns. of PhNH₂ dissolved in a fuel during heating sep. on cooling if it contains benzine only or not more than approx. 20% of C_6H_6 , tetralin, Et_2O , 99% EtOH or 35% of 96% EtOH. The original fuel is fractionated to detect Et_2O , C_6H_6 , benzine and tetralin. The distillate collected below 40° is tested for Et_2O by perchromic acid, that from 40° to 120° for C_6H_6 and benzine, and the residue boiling above 200° is tested for tetralin by algol red, lake red Ciba B or chem. means. Benzine or C_6H_6 in mixts. of benzine or C_6H_6 with EtOH is detd. volumetrically by dissolving the EtOH from 100 cc. of the mixt. by 150 cc. of H_2O colored with fuchsin. By adding 50 cc. of benzine followed by 100 cc. of colored H_2O to 100 cc. of an Et_2O -EtOH mixt., shaking and allowing to settle, the Et_2O dissolves in the benzine layer and is measured volumetrically. Thus the known Et_2O content of a synthetic mixt. is obtained within approx. 1% when the correction is applied for the soly. of Et_2O in H_2O . R. E. S.

Fusion of coal, coke and motor fuel by sodium peroxide. G. E. MABEE. *Ind. Eng. Chem.* 20, 644-5(1928). — Complete combustion of coal or coke can be obtained when fusing with Na_2O_2 , without the use of $KClO_3$ or $PhCO_2H$, if 0.5 g. substance is mixed with 15 g. Na_2O_2 and ignited by placing in a muffle furnace at 800°. When highly volatile mixts. are to be fused, the charge consisting of 1 cc. of substance and 15 g. Na_2O_2 is ignited by the addn. of 0.5 cc. MeOH. T. S. CARSWELL

The gas industry in Jugoslavia. M. HORVATÍĆ. *Archiv. hem. farm.* 1, 67-72 (1927).—A review of the present state of the gas industry in Jugoslavia. J. K.

Modern gas supply. FRANZ BÖSSNER. *Oesterr. Chem.-Ztg.* 31, 82-4(1928).—A comparative review of modern gas technic. A. S. CARTER

More common commercial gas fuels. L. H. DALMAN. *Oil & Gas J.* 26, No. 51, 116, 119, 220, 222, 224-7(1928).—The combustion theory of illumination and the chem. principles involved in prepg. illuminating gas are discussed. The manuf. of coal gas, chem. theories of carbonization, manuf. of carbureted water gas and acetylene and gas fuels are included in the discussion. M. B. HART

Climate fixes type liquid-gas fuel. W. T. ZIEGENHAIN. *Oil & Gas J.* 27, No. 1, 168-9(1928).—Compressed C_2H_6 , C_4H_{10} and iso- C_4H_{10} , alone, or in mixts., may be used as a domestic fuel. The heating values of these gases are very high, 2522 B. t. u. per cu. ft. for C_2H_6 , 3275 for iso- C_4H_{10} and 3275 for C_4H_{10} , as compared with 1000 for natural gas. A mixt. of iso- C_4H_{10} and C_2H_6 is preferable for all-season use to a mixt. of C_4H_{10} and C_2H_6 because the former mixt. has less spread between vapor-compn. and b. p. curves. In a mixt. contg. all three a max. vol. of iso- C_4H_{10} tends to give a mixt. showing a minimum change in compn. through the boiling range. Burner design for such fuel, and mixts. should be standardized. M. B. HART

Examination of products of combustion from typical gas appliances. II. Gas fires. ARTHUR SMITHELLS, et al. *Inst. Gas Eng. 17th Rept. of the Gas Investigation Comm.* 1927, 85-154; cf. *C. A.* 21, 3730.—A modern 9-radiant gas heater was installed in a room 16'3" × 13'11" × 11'11" high and tested for carbon monoxide production. With a heater adjustment consisting of an air-gas ratio of 1.5 and a 5" flame from each burner the normal gas rate was 38.3 cu. ft. per hour. The CO production (caled. to parts of CO per 10,000 parts of gas consumed) was 15 parts at 0.5 normal gas rate, 30 parts at the normal gas rate, 150 parts at 15% overload on the gas rate, and 200 parts at a 30% overload. On increasing the air-gas ratio on the same heater to 1.9 the CO production was 13 parts at 0.75 normal gas rate, 16 parts at the normal rate, 50 parts at 25% overload. A popular 10-radiant heater manufd. in 1911 was tested in the same manner, the normal gas rate being 42.6 cu. ft. per hour. With an air-gas ratio of 1.4 the CO production was 16 parts at 0.5 normal gas rate, 33 parts at 0.7 rate, 200 at 0.9 rate and 235 parts at a normal gas rate. On increasing the air-gas ratio to 1.9 the CO production decreased to 7 parts at 0.5 gas rate, 80 parts at the normal rate and 100 parts at 20% overload of the gas rate. Interchanging the radiants in the two heaters indicated that the 1911 type showed a lower CO production. The differences in design are discussed from the standpoint of this information. With the radiants removed completely, the open burners produced about 12.4 parts of CO per 10,000 of gas consumed at a 0.8 normal gas consumption rate. Additional notes on the iodine pentoxide method for CO and discussion of the report by members of the society are appended. A. S. CARTER

The so-called "odorizing" of illuminating gas. JOSEF DOLLINGER. *Oesterr. Chem.-Ztg.* 31, 87-8(1928).—D. discusses the use of highly odorous agents (e. g., mercaptans, sulfides, carbilamines, etc.) to produce a gas of violent odor and thus decrease the chance of poisoning. A. S. CARTER

Oxygen determination in illuminating gas. VIKTOR FUNK. *Gas u. Wasserfach* 71, 443-4(1928).—The usual methods for detg. O_2 in illuminating gas may be in error 0.2% or more. A convenient form of gas buret and special precautions are given which insure much greater accuracy. The pyrogallol and chromous acetate (gas volumetric) methods are described in detail. In the former method the difference between the known percentage of O_2 and that found by analysis averaged about 0.02% and in the latter method somewhat less. All solns. are satd. with gas before use and temp. is controlled within 0.1° during a detn. R. W. RYAN

Flow of gas through small orifices. E. L. RAWLINS. *Oil & Gas J.* 26, No. 51, 111-2, 125-6, 129(1928).—A study carried out at the Bureau of Mines of the flow of gas through small orifices has shown that all problems can be reduced to two formulas, one applicable when the flow is critical (ratio of downstream pressure to upstream pressure less than 0.55 to 0.62), and the other when it is non-critical (ratio of downstream to upstream pressure greater than 0.55-0.62). M. B. HART

Causes of illuminating gas accidents and precautions for their prevention. HANS GUNTNER. *Oesterr. Chem.-Ztg.* 31, 84-7(1928).—A general survey of the various types of gas accidents from the standpoint of prevention. Six types of safety devices are reviewed: (1) app. automatically acting when in an atm. of unburned gas through the change in temp. of Pt or the rate of diffusion of the gas; (2) app. to shut off gas supply if the flame is extinguished; (3) a device to prevent accidental opening of valves;

(4) a device which is put in action by tubing slipping off or preventing such slipping; (5) app. turning off wall-valves or indicating by light or sound when the valves are not closed; (6) automatic lighters to ignite escaping gas. A. S. CARTER

Carbonization. II. ARTHUR SMITHELLS, *et al.* *Inst. Gas Eng. 18th Rept. of the Gas Investigation Comm.* 1927, 207-70; cf. *C. A.* 21, 4047.—By the same app., coal and method of the previous report, carbonization measurements were made with a retort temp. of 915° instead of 980°. In the early stages of carbonization the rate of gas evolution decreased with a decrease in size of coal particle, and from mixts. of sizes the rates were less than when the constituent sizes were worked sep. In the later stages the rate of gas evolution was greater with the smaller sizes; hence in the end the vol. of gas produced is about the same in all cases. The 60° temp. decrease between this and the previous tests caused a decrease in gas vol. of 750 cu. ft. per ton of coal and a 30% increase in the yield of tar. The thermal value was decreased by 4 therms. Mixing coke with the coal gave an increased gas evolution and NH₃ yield and increased thermal value with decrease in amt of tar when calcd. to the coal content, but the disadvantages outweighed the advantages in the case of this particular, not highly caking, coal. The addn. of 2 parts CaCO₃, Fe₂O₃ or Na₂CO₃ to 98 parts of coal caused an increase in the gas evolution, but the gas was of lower calorific value. With CaCO₃ the gas increase was 11%; with Fe₂O₃, 6% and with Na₂CO₃, 24%. Thermal values increased with CaCO₃, 5%, with Fe₂O₃, 2% and with Na₂CO₃, 12%. CaO and Fe₂O₃ lowered the ignition temp. of the coke and Na₂CO₃ increased it, though the latter coke was the most active toward steam. The discussion of the report by the society is included. A. S. CARTER

Low-temperature carbonization of lignites and sub-bituminous coals. J. I. DAVIS AND A. E. GALLOWAY. *Ind. Eng. Chem.* 20, 612-7(1928). Comparative low-temp. lab.-scale carbonization tests were made on 24 sub-bituminous coals and lignites by 3 different methods: the oil-shale method of the Bureau of Mines; the Gray and King method developed in England and the Franz Fischer method as used in Germany. The latter method gave the most concordant results. T. S. CARSWELL

Removal of sulfur from commercial benzene. HUGO KIEMSTEDT. *Brennstoff-Chemie* 8, 326-7(1927).—The S in benzene is formed mainly from H₂S reaching the crude product from the gas. It is, therefore, desirable to remove the H₂S as early as possible in the process, or before it has been oxidized or has reacted with the liquids. The H₂S may be removed by washing the freshly condensed distillate with NaOH. E. G. MEYER

Chemical study of low-temperature tar. G. T. MORGAN. *J. Soc. Chem. Ind.* 47, 131-3T(1928).—An attempt to sep. low-temp. tar into its constituents by fractional distn. resulted in losses by decompn. Sepn. by low-boiling solvents resulted in the identification of the following substances: (1) *neutral oils*, valuable as fuels with anti-knock properties; (2) *waxes*, melting from 61-2° down to 10°, and contg. 3 hydrocarbons with C contents corresponding to C₂₆, C₂₇ and C₂₉; (3) *aromatic hydrocarbons*, among which are *anthracene*, *dimethylnaphthalene*, and probably *β-methylanthalene*; (4) *volatile bases*, among which are *PhNH₂*, *α-picoline*, *2,4-lutidine*, *s-collidine*, *quinoline* and *quinaldine*; (5) *amorphous bases*, called *resinamines*, with the properties of resins; (6) *acidic substances*, mainly *phenols*, among which are *PhOH*, *cresol* and *s-xyleneol*. *Bacterial study of the phenols* showed max. germicidal activity of the fraction b₁ 140-70°. T. S. CARSWELL

Effect of physical characteristics of coke on reactivity. J. D. DAVIS AND D. A. REYNOLDS. *Ind. Eng. Chem.* 20, 617-21(1928).—Results of reactivity tests of low- and high-temp. cokes in air, steam and CO₂ over temp. ranges from 800° to 1100° are given. The effects on reactivity of bulk density, volatile matter, adsorptive power, size of test particles, and varying reactivity of particles of the same sample have been detd., and the app. with which the detns. were made is described. T. S. CARSWELL

Coke tumbler tests. A. R. POWELL AND D. W. GOULD. *Ind. Eng. Chem.* 20, 725-8(1928).—A new tumbler machine is described. Comparative results are given for different cokes as to shatter test, tumbler test and plant yields. The tumbler test does not imitate closely the type of handling coke received in the plant but does indicate the ability of sized coke to withstand handling between the point of production and the point of use. DAVID GORDON

STACH, ERICH: **Kohlenpetrographisches Praktikum**. Berlin: Verlagsbuchhandlung Gebrüder Borntraeger. 196 pp. \$2.80. Reviewed in *Mining Met.* 9, 292 (1928).

Fuel for burning in pulverized form. L. B. GREEN (to Borden Co.). U. S. 1,673,114, June 12. Solid fuel such as coal is initially pulverized and then compressed into briquets; pulverized fuel is subsequently removed from the surfaces of the briquets and immediately delivered to a burner.

Fuel briquets. L. RUDEMAN. U. S. 1,674,179, June 19. Peat, bagasse or other aq material contg. fibrous vegetable matter and contg. not more than 65% of water is treated with waste sulfite lye and carbolineum or other suitable phenolic compn. and briquets are formed from the mixt. by preliminary pressure at about 100° and then subjected to a sustained final pressure (suitably 100–400 atm.). Pitch or other binders also may be used.

Fuel briquets. A. M. HART. Brit. 279,140, April 22, 1926. Vegetable material such as grasses, weeds, bracken, straw or leaves is mixed with Na or K silicate, briquetted and dried. The vegetable material may be preliminarily carbonized if desired and carbonized mineral matter such as coal refuse or lignite also may be added. The process of carbonizing described in Brit. 188,807 (*C. A.* 17, 1709) may be used. Cf. *C. A.* 22, 2259.

Fuel composition. H. S. REID. Can. 280,524, May 29, 1928. A fuel compn. contains 98–80 parts liquid hydrocarbon oil, 2–20 parts paraldehyde and up to 12 vols. of C_2H_2 per vol. of paraldehyde.

Composition for kindling fuels. F. J. DIEDERICH. U. S. 1,674,163, June 19. Comminted wood is mixed with a difficultly ignitable mineral oil and with $KClO_4$, BaO_2 or other suitable non-explosive compd. capable of generating O when heated.

Liquid fuel. J. LEFRANC. Can. 277,394, Jan. 24, 1928. A liquid fuel for internal-combustion engines is composed of a soln. of C_2H_2 in a mixt. of the complex ketones obtained from the dry distn. of aliphatic salts of Ca with another combustible liquid having insufficient carbureting and calorific properties.

Washing coal, separating ore constituents, etc., by upward currents of water. L. HOVOIS. Brit. 279,447, Oct. 19, 1926. An app. is described.

Apparatus for "amalgamating" and distilling coal, etc. W. B. RULON. U. S. 1,674,129, June 19.

Low-temperature carbonization of coal, lignite, etc. SOC. DE RECHERCHES ET DE PERFECTIONNEMENTS INDUSTRIELS. Brit. 279,130, Oct. 15, 1926. Coal, lignite or similar material is heated with a gas such as superheated steam by direct contact in an app. which is described and in which the material is periodically moved from one to the next of a plurality of treatment chambers.

Destructive hydrogenation. A. L. H. SPILKER, C. ZERBE and GES. FÜR TEERVERWERTUNG. Brit. 279,410, Oct. 20, 1926. The destructive hydrogenation of hydrocarbons, coals and coal products is effected by the catalytic action of halogens or halogen compds. (other than I and its compds.) in mixt. with each other or with I or I compds. Crude natural mixts. or mother liquors from the potash industry may be used. $C_{10}H_8$ may be treated with H at 470° under 100 atm. pressure in the presence of NH_4Cl to obtain 70% of liquid products. Coal-tar pitch similarly treated in the presence of KBr and Fe alum yields about 70% of liquid products mainly b. 200–360°. Coal from seams of recent formation may be hydrogenated in the presence of KI, KBr and KCl or NH_4Cl ; and products of the benzene type are obtained by hydrogenating brown-coal tar or low-temp. coal-tar in the presence of KI, NH_4Cl and $FeCl_3$ at temps. of 200–500°.

Hydrogenation of carbonaceous materials. M. PIER, K. WINKLER and K. WISELL. Can. 278,742, Mar. 20, 1928. In the destructive hydrogenation of carbonaceous materials, the gases freed from the liquid reaction products are scrubbed with a benzine-like product of the destructive hydrogenation.

Hydrocarbons. C. KRAUCH and M. MÜLLER-CUNRADI. Can. 278,741, Mar. 20, 1928. Hydrocarbons of high mol. wt. are produced by converting products of the

destructive hydrogenation of carbonaceous materials into unsatd. hydrocarbons by dehydrogenation and polymerizing the latter.

Absorption of ammonia and hydrogen sulfide. C. HANSEN. Can. 278,558, March 13, 1928. A process for the simultaneous absorption of NH_3 and H_2S from industrial gases consists in absorbing such gases in an aq. soln. of NH_4 sulfite-bisulfite.

Gas from coal. M. W. TRAVERS and F. W. CLARK (to Travers and Clark, Ltd.). U. S. 1,674,000, June 19. In the manuf. of gas which is carbureted only by the products of carbonization of the coal, air is blown during the blow period through hot coke in a chamber into which coal is fed at the top, and the blow gases thus produced are passed through a regenerator without passing through the coal; during the run steam is blown through the coke and water gas thus produced is passed through the coal and a sufficient quantity of the gas to effect complete carbonization of the coal is forced back through the regenerator and directly through the coal without passing through the main gasification zone. An app. is described.

Gas manufacture. C. S. CHRISMAN (to Humphreys & Glasgow, Ltd.) Brit 279,059, Oct. 13, 1926. A mixt. of distn gas and carbureted water gas is obtained by blasting the lower portion of a fuel bed, making an up-run through the fuel bed, carbureting and fixing other gas by heat stored during the blasting and passing the carburetted gas and water gas from the up-run through the upper part of the fuel bed to generate coal gas which is mixed with the other combustible gases. An app. is described. Brit 279,060 specifies the production of a mixt. of distn. gas and water gas from fuels contg volatile substances by the use of 2 gas producers, the lower part of each of which is blasted with air; the heat of the blast gases is stored in stoves and one producer is subjected to up-streaming to liberate coal gas and the other to down-streaming through its lower portion to produce water gas and the latter is heated and passed through the upper part of the up-streamed producer and the mixed gases are led off from the latter. Other details of operation and construction are also described.

Gas producer. I. G. FARBENIND. A.-G. Brit. 279,316, March 22, 1927. In a gas-making process as described in Brit 214,544 (C. A. 18, 2802) in which air or both air and steam are blown through powd fuel on a grate so as to agitate the material, the gasifying agent is blown from above onto the fuel bed, and may also be blown from below. Fuel dust carried away in the gas is gasified by the admission of a limited supply of air or O and fresh fuel may be supplied to the charge from below the normal fuel surface during the "run" for water gas. Liquid fuel, tar or molten asphalt may be added to increase the calorific value of the gas. An app. is described.

Gas producer for use on motor vehicles. G. IMBERT. Brit 279,475, Oct. 25, 1926. A producer is described in which wood, peat and other vegetable fuel may be used.

Heat-exchange apparatus adapted for heating air with flue gases. T. W. MUNFORD (to Mantle Engineering Co.) U. S. 1,673,418, June 12.

Apparatus for using waste heat from gas-making apparatus for heating a boiler, etc. P. PLANTINGA. U. S. 1,673,589, June 12.

Testing flue gases by comparative resistance measurements of electrically heated wires. SIEMENS & HALSKE A.-G. Brit 279,478, Oct. 25, 1926.

Safety device for preventing escape of gas on stoppage of the gas-propelling supply fan. O. GALAUP. U. S. 1,673,976, June 19.

Extracting phenols and other compounds from tarry liquors. A. WEINDEL (to P. Franke). Brit. 279,465, Oct. 21, 1926. Tarry liquors from coking and gas works are treated with a tar oil fraction, b. 230-350°, to ext. tarry matter, phenols and pyridine bases. The tar oil may be prepd. for use by treating with soda to remove any phenol and then with dil. acid to remove pyridine bases, and any C_{10}H_8 present may be removed by crystn. An app. is described in which the treatment may be carried out counter-currentwise and the oil may be repeatedly used after removal of the phenol and pyridine bases which are extd.

Semi-coke briquets. KOKS- UND HALBKOKS-BRIKETTIERUNGS-GES. Brit. 279,020, Oct. 14, 1926. Finely divided bituminous coal is briquetted with water-sol. or inorg binders such, e. g., as sulfite waste liquor and clay, and the briquets are subjected to a roasting and then to a distn. at a temp. of 350-650° (depending on the kind of coal used).

Petroleum in 1926. G. R. HOPKINS AND A. B. COONS. *Bur. Mines, Mineral Resources of U. S., 1926, Part II*, 335-417 (preprint No. 28, published April 26, 1928); cf. *C. A.* 22, 1032. L. C.

Treating California straight-run gasoline. E. N. KLEMGARD. *Refiner Natural Gasoline Mfr.* 7, No. 4, 80-1, 84 (1928).—A review of treating processes. M. B. H.

Good products at any cost from any crude available. P. TRUESDELL. *Natl. Petroleum News* 20, No. 17, 85-8 (1928).—The equipment and methods used by the Marland Refining Co. in combining Dubbs, Fleming and Cross cracking plants are described. M. B. HART

Simplified calculations in design of natural gasoline absorbers. W. K. LEWIS. *Chem. Met. Eng.* 35, 93-5 (1928).—Previously developed principles are extended. BRIAN MEAD

Vapor pressure of gasoline. G. G. OBERFELL, R. C. ALDEN AND H. HEPP. *Natl. Petroleum News* 20, No. 20, 57-9, 61, 63-4 (1928).—A comparison of procedure and errors involved in 7 proposed methods for the detn. of the vapor pressure of gasoline has shown that the Beistle-Prather method, in which pressure readings at const temp. are taken for 200 and 400 cc. air vol. and the true vapor pressure of the gasoline calcd. therefrom, is simple, easy to manipulate and requires only a short time. It should be possible to establish shipping limits for this method, making it possible to use it commercially. M. B. HART

Method of fractionation natural gasoline. D. B. KEYES. *Chem. Met. Eng.* 35, 92 (1928); cf. *C. A.* 21, 1701.—A simple scheme for rectification of natural gasoline is outlined. BRIAN MEAD

Theory and practice of fractionation in natural gasoline plants. L. S. GREGORY. *Natl. Petroleum News* 20, No. 21, 102-6 (1928).—Natural gasoline may be fractionated alone, or mixed with gas or mineral seal oil or both. These methods may be compared by calcg the operating conditions necessary to produce grade-A gasoline having 35% C_4H_{10} , 36.7% C_5H_{12} and 28.3% heavier. In general, fractionation of the gasoline alone is most successful on a very lean or very rich gas when a wide range of products is desired. For a narrow range of products with a rich gas, fractionation of the gasoline with gas or mineral seal oil or both gives better results. High-pressure fractionation permits of ease in controlling reflux temp. and prevents column freezing. Aviation gasoline and a volatile liquid suitable for gaseous fuel may be made directly from natural gasoline by fractionation. M. B. HART

Tube-still distillation. C. H. S. EDMONDS. *Oil Eng. Tech.* 9, 121-7 (1928).—For topping or stripping crude oil, a single flash distn. system is preferred but in cutting deeply into the crude oil for lubricating stocks the step-up or series system is better, as it lends itself to vacuum operation. Single flash, however, yields a much greater percentage of distillate than the step-up system at the same temp., and the total heat input is less. The use of heat exchangers and building the still so that the max. use of radiant heat is attained make it possible to obtain very high efficiency of operation. Tables show how the nature of products from Midcontinent crude oil can be varied by regulation of the temp. and rate of heating. M. B. HART

Double stabilizing column installed at Roxana plant in Logan county. J. C. CHATFIELD. *Natl. Petroleum News* 20, No. 16, 54, 57 (1928).—It is asserted that the use of a double stabilizer results in complete sepn. of C_3H_8 and C_4H_{10} , and gives 97% recovery of gasoline having the following boiling range: I.B.P. 68° F.; 10% over at 82° F.; 20% at 92°; 30% at 102°; 40% at 112°; 50% at 126°; 60% at 138°; 70% at 168°; 80% at 180°; 90% at 212°; E. P. 282° F. The gasoline exerts a vapor pressure of only 7.5 lbs. at 100° F. M. B. HART

Designing equipment for chemical treatment of oil distillates. J. C. MORRELL AND D. J. BERGMAN. *Chem. Met. Eng.* 35, 291-5 (1928); cf. *C. A.* 22, 2262.—Calcs. are given to aid the designing of blow-case orifices for handling both 66° Bé. H_2SO_4 and 30° Bé. NaOH soln. Reagent and recirculating pumps with capacities of 10 and 20 bbls. per hr., resp., are recommended. The sludge and the reagent remaining unused after treating are allowed to settle out from the oil in settling tanks in which water-washes may be made also. For removing small quantities of H_2S from cracked distillates a water spray is used in the settling tank. For larger amts. of H_2S the orifice column and baffled coil may be used followed by a NaOH wash together with recircula-

tion of the NaOH and oil through the orifice column to remove the last trace of H_2S . A Pb-lined 1000-bbl. cylindrical batch agitator with a recirculating pump having a capacity of at least 1000 gallons/min. is discussed and illustrated in detail. Flow diagrams are given for arranging and assembling the finished treating plant.

RAYMOND E. SCHAAD

Cracking process actually used in Mexico for the treatment of heavy oils. RAMON CEBALLOS. *Bol. petroleo* **24**, 407-10(1927).—The feature of this cracking process is the obtaining of a residue of low viscosity which can be utilized in making fuel oils. Its characteristics are as follows: The crude petroleum is not subjected to a preliminary distn. before cracking, for removing the lighter constituents, and there is no withdrawal of the lighter fractions, except of water vapor and gases, until the cracking is completed and the cracked oil is in the still. The temp. of the crude oil is raised by steps by passing it through 2 heat interchangers at 115° and 315° , after which it enters a heater where it is cracked at about 430° . The hot, cracked oil serves to heat the 315° heat interchanger and is thereby cooled to 315° , after which it is distributed to the stills where it arrives at a temp. of about 200° . The paper is illustrated by a flow sheet of the process; by drawings of the heaters for cracking and of the tubular heat interchangers, and by photographs, at the Port of Tampico, of plants of the Huasteca Petroleum Co., and of the Transcontinental Petroleum Co. of S. A., both of which use this process

R. H. LOMBARD

Composition of cracked distillates. J. S. S. BRAMB AND T. G. HUNTER. *J. Inst. Petroleum Tech.* **13**, 794-816; Discussion 816-24.—**Part I. Separation of the component classes of hydrocarbons.**—The use of selective solvents was investigated: MeOH, satd. soln. of SO_2 in Me_2CO , $C_6H_5NO_2$, $C_6H_5NMe_2$, $C_6H_5NH_2$. No satisfactory sepn. occurred. Aniline points were used largely as a measure of fractionation. The following results give aniline points of a few pure hydrocarbons: pentane, 70.0° ; hexane, 70.0° ; heptane, 70.0° ; octane, 70.5° ; isopentane, 77.0° ; isodecane (diisomyl), 78.0° ; benzene, -20.0° ; xylene, -20.0° ; cumene, below -15.0° ; amylene, 0.7° ; β -isomylene (trimethylethylene) 11.0° ; *l*-limonene below -15.0° ; hexylene, 16.4° . Sepn. by mercuric acetate also proved unsatisfactory. The final method adopted was bromination followed by reduction with Zn-Cu couple in neutral alc. For the sepn. of paraffins and naphthenes a third liquid was added. This could be aniline, MeOH or Am. alc. **Part II. Composition of cracked spirit.**—Raw material was cracked spirit obtained by cracking Russian kerosene in a Cross unit. By use of the methods described in part I, with modifications, the following compn. data were obtained. Both normal and iso-paraffins were present. Naphthenes occurred in as great proportion as the paraffins. Olefins predominate in the lower-boiling fractions. Di-olefins were definitely in the first cuts. Cyclic olefins predominate among the unsatd. compds. in higher-boiling naphthas. Small quantities of aromatics were present, benzene and toluene.

BRIAN MEAD

The how and why of gasoline performance. J. BENNETT HILL. *Proc. Am. Soc. for Testing Materials* (preprint), **86**, 11 pp.(1928); cf. Davin, C. A. **22**, 2261.—The volatility as indicated by the A. S. T. M. distn. curve and detonation tests made in an engine under carefully controlled conditions cover suitably the required properties of a motor fuel which are primarily ease of starting in a cold engine, normal functioning without choke, uniform feed from the carburetor, and combustion under high cylinder pressures with min. detonation. Lab. tests now used to det. gasoline quality cover the other characteristics such as: odor, corrosive qualities of the fuel or of the exhaust gases, crank case dila., deposition of solid C, evapn. loss during handling, transportation and storage, chem. or phys. changes on long standing and harmful physiol. effects from contact with the gasoline. Also in *Oil and Gas J.* **27**, No. 8, 116, 119, 120(1928).

RAYMOND E. SCHAAD

Effect of antiknock compounds in the vapor phase. M. AUBERT, DUMANOIS AND A. PIGNOT. *Compt. rend* **186**, 1298-9(1928); cf. C. A. **22**, 863.—Photographically recorded time-pressure curves were obtained for the adiabatic ignition of hexane-air mixts. with a 1.1752 by wt fuel-air ratio. The addn. to the hexane-air mixts. of 5% of different antiknock compds in the vapor phase increases the duration of the combustion period, as measured by the duration of rise of pressure, from 0.004 sec. for the hexane-air mixt. alone to the values with the dopes of: $PbEt_4$ 0.011, toluidine 0.01, MeOH 0.006 and Et_2S 0.005 sec.

RAYMOND E. SCHAAD

Composition of petroleum and its products. G. A. BURRELL. *Ind. Eng. Chem.* **20**, 602-8(1928).—Chem. research accomplished and remaining to be done is discussed with respect to the compn. of straight-run gasoline, kerosene and natural gas; olefins, naphthenes, acetylene, aromatics; etc.; in petroleum; color in petroleum; gums; cracked

products; coke formation; oxidized products; petroleum acids; N compds.; O and S in petroleum; the sweetening reaction; the action of H_2SO_4 ; identification of hydrocarbon groups; detn. of unsatd. compds.; by-products from petroleum such as alc., glycol and amyl acetate.

D. F. BROWN

Solid-solution formation in mixtures of paraffin waxes. L. D. MYERS AND G. STEGEMAN. *Ind. Eng. Chem.* 20, 638-41 (1928).—Paraffin wax was fractionated by distn. under an abs. pressure of 0.1 mm. and at a rate of 12 drops of distillate per min. Extn. of the purified wax indicates that waxes from diff. sources have very similar compns. and that differences in m. ps. of com. paraffin waxes are due to differences in their oil content. Investigation of the wax mixt. shows that paraffin waxes form solid solns., the m. ps. of which lie between the m. ps. of the components and the existence of these solid solns. accounts for the absence of a sharp m. p. for paraffin wax. Investigation of the oil-wax mixt. shows that the soly. of paraffin wax in oil increases markedly at about 10° below the m. p. of the wax; low-melting waxes are more sol. in oil than high-melting waxes; mixts. of low-melting and high-melting waxes have intermediate solubilities; increase of soly. of mixts. in oil at about 10° below the m. p. is as marked as in pure waxes; this increase in soly. explains the loss of wax in the later stages of sweating; the wax appears to retain oil as a solid soln. of oil in wax (about 2% at room temp.). The amt. of oil retained in the last stages of sweating is too small to be detected but appears to explain some of the difficulties encountered in the sepn. of oil from wax.

D. F. BROWN

Treatment of Baku lubricating oil distillates by German plants. K. KOSTRIN. *Azerbajdzh. Neft. Khoz.* 1928, No. 5, 55-7.—Agitators used for oil treatment with acid and caustic are similar to those used in Baku. Each unit has a filter press. Solar oil of d. 0.890 is used. Transformer and white oils are manufd. For transformer oils the solar oil is treated hot with two 3% portions of 98% H_2SO_4 and the sludge is discharged after each treatment. Neutralization is carried out with a 15° Bé. soln. of NaOH with the addn. of 2% of a 30% alc. NaOH soln., the alc. being later recovered by distn. During the neutralization the temp. is kept at $75-80^\circ$. The oil is tested with phenolphthalein. The oil is washed with H_2O 6-7 times and dried with air at 90° , 1.5% of fuller's earth is added and the oil is filtered through a filter press. After addition of another 1.5% of fuller's earth the oil is filtered again and is then ready for use as transformer oil. The total loss through treatment amounts to 11-12%. To obtain medicinal white oil 45-50% of H_2SO_4 is used and the neutralization carried out with a 25° Bé. soln. of NaOH. Following are the losses at treatments with various proportions of H_2SO_4 : 10% acid, loss 15%; 20%, loss 24%; 30%, loss 30%; 40%, loss 35%. Sometimes the oils are treated with aniline dyes to destroy the fluorescence. Oils of American origin have a higher loss when treated. For turbine oils a distillate is used of viscosity $E = 4$ or 6. For heavy transformer (turbine ?) oils 6% of 98% acid is used, for light transformer (turbine ?) oils 4.5% only. Neutralization is carried out the same way as for transformer oils; also the fuller's earth and filtration process. Ordinary machine oil of E_{40} 6.5-7.0 viscosity is treated in the same way. The losses are: acid about 2.7%, caustic (solid) 0.4%, alc. 1.0%, fuller's earth 1.5%. Cylinder and spindle oils are treated the same way. For cylinder oils the filter press must be heated and losses in filtration amount to 2.0-2.5% each time. Turbine oil treated without the addn. of alc. gave a product which did not stand the emulsification test, and showed a loss of 7-8% as compared with the loss of 6.5% when alc. was used. Instead of fuller's earth the following acid-treated clays were used: Terrana and Frankonit. The NaOH sludge is used for prepg. emulsion cutting oils. The use of clay is important, as more stable oils are obtained and traces of sulfonic acids removed.

A. A. BOERTLINGK

The determination of acid and saponification numbers of insulating and steam-turbine oils. BAADER. Goldenberg-Werk, Knapsack b. Köln. *Erdöl u. Teer* 4, 234-5, 252-3 (1928).—For com. analysis, the sample (5-8 g.) is weighed and dissolved in 75 cc. of a so-called "blue soln." (1.2 g. alkali blue 6B to 1000 cc. pure benzene and 1500 cc. 96% alc.) in a 250-cc. Erlenmeyer flask with a side tube, for observing the color through a thin layer of liquid, and titrated quickly with 0.1 N alc. KOH, from a 25-cc. buret, to obtain the acid no. For the sapon. no., the remainder of the 25 cc. of KOH is run in and boiled $\frac{1}{2}$ hr. under a reflux and titrated back with 0.1 N HCl. In each case the titration of a blank detn. is subtracted and the difference $\times 5.6/\text{sample}$ = the desired value. For more accurate work, the acid no. is detd. on a sep. sample in a 100-cc. flask with 40 cc. of blue soln. Because of the small relative magnitude of the values in question, especial exactitude is required in the volumetric measurements and regulation of conditions. A uniform titration temp., which should not exceed 20° .

is important. Because of the sensitiveness of the blue soln. to CO_2 and other air contamination, titrations should be carried out as quickly and with as little shaking as possible; any change after the first end-point is ignored. The reflux condenser used is of the so-called mushroom type, which sits in the neck of the flask without a cork. Cork introduces appreciable errors. With proper precautions the results are highly reproducible. From examn. of numerous specimens, the sapon. no. is regarded as a criterion of refining in new oils, in which it should not exceed 0.15, and of deterioration in used oils, which are no longer serviceable if it exceeds 4, for insulating oils, or 6 for steam-turbine oils. The acid no. is superfluous if the sapon. no. is less than 1.0

F. S. GRANGER

The significance of various tests applied to motor oils. ROBERT E. WILSON AND D. P. BARNARD, 4TH. *Proc. Am. Soc. for Testing Materials* (preprint), **87**, 1200(1928).—The relatively large no. of methods which have been developed for or sometimes used for testing motor oils are evaluated in the light of all available information in terms of the bearing which the results of the tests have upon the performance of the oil in service. The tests for properties important in service are: viscosity including temp. coeff. of viscosity, pour test and C residue. Tests having little relation to performance but which may indicate contamination or inadequate refining include color, H_2O and sediment, neutralization no. and corrosion test. Gravity, flash and fire tests have little or no bearing on performance but may indicate the probable source of the oil. Tests designed for other products but sometimes rashly applied to motor oils include those for S content, unsatn., emulsification, pptn., evapn. and analytical data. Satisfactory tests are not available for 2 other properties of possible importance, oiliness and resistance to oxidation

RAYMOND E. SCHAAD

The viscosity-gravity constant of petroleum lubricating oils. J. B. HILL AND H. B. COATS. *Ind. Eng. Chem.* **20**, 641-4(1928).—A math. relation between viscosity and sp. gr. is derived from published data on the physical properties of petroleum fractions. This relation is expressed by the formula $G = a + [(1.0752 - a)/10] \log(V - 38)$, where G = sp. gr. at 60°F . (15.6°C .), a = a const. which is different for each crude and is characteristic of it, V = the Saybolt viscosity at 100°F . (37.8°C .). The const. a is low for the paraffinic crudes and high for the naphthenic crudes and its value for any oil is a direct index of the degree of the paraffinic or naphthenic character of the oil.

D. F. BROWN

Solubility of lubricating oil in liquid carbon dioxide. ELTON L. QUINN. *Ind. Eng. Chem.* **20**, 735-7(1928).—When CO_2 is used in the refrigeration industry any oil carried to the expansion coils will solidify and prevent efficient heat transfer. Q. detd. soly. and d. of lubricating oil in liquid CO_2 at various temps. Max soly., 0.9% by wt. of oil, occurred at 10° . The oil did not appreciably change the d. of liquid CO_2 at ordinary room temp. The soly. of glycerol in liquid CO_2 was less than 0.005%. D. G.

Corrosion by oil. HORACE J. YOUNG. *J. Inst. Petroleum Tech* **13**, 760-72 (1927); discussion 772-92. See *C. A.* **22**, 602.

BRIAN MEAD

Liquefaction of naphtha asphalt by the Bergius method. K. SMOLENSKI AND W. BADZYNSKI. *Przemysl Chem.* **12**, 117-36(1928). Asphaltic still residues from Polish paraffin oils are susceptible to treatment by the Bergius process. The total yield of liquid fuel runs about 60% of asphalt used, in which figure are included 20% benzine, and about 20% naphtha. The properties of these are related to those of light Polish crude oils. Of the remainder 25-30% is in the form of coke, from which further hydrogenation does not yield further quantities of liquid products. This coke contains about 87% C and 4% H and has a heat value of about 8000 cal. It can be briquetted for use as fuel. On liquefaction by means of H a gas contg. CH_4 and H_2 is produced to the extent of about 15% by wt. of asphalt. A series of products is obtained from asphalt, the value of which exceeds that of the original material. The cost of producing H_2 is the controlling factor. In addn. to the known technical methods of producing H_2 which are used for NH_3 synthesis there is the possibility of using CO or water gas with steam. The use of natural gas should also be considered.

Fractionation and decomposition of petroleum during capillary migration (Cook) **8**. Mud volcanoes of the Baku region (STAHL) **8**. Petroleum deposits in Altmark (SCHROEDER) **8**. The geologic relationship of the occurrence of oil in the Emba-Ural region to that in the Caucasus (STAHL) **8**. Apparatus for distilling hydrocarbons (Brit. pat. 278,768) **1**. Rectifying system for fractional distillation of petroleum oils (U. S. pat. 1,672,978) **13**. Unsaturated hydrocarbons (Can. pat. 270-622) **10**.

Cracking crude petroleum oils. H. BLUMENBERG, JR. (to A. M. Buley). U. S. 1,673,491, June 12. Al chlorosulfate is used to assist cracking.

Cracking hydrocarbon oils. L. DE FLOREZ (to Texas Co.). U. S. 1,674,390, June 19. Oil is continuously heated in a vaporizing zone and the vapors produced are heated under pressure in a cracking zone to a cracking temp. The velocity of flow of the material is progressively increased as it passes through the vaporizing and cracking zones; vapors are discharged from the cracking zone and expanded so as progressively to decrease their velocity and are condensed after expansion. An app. is described.

Destructive hydrogenation of hydrocarbons, coal, etc. A. L. H. SPILKER, C. ZERBE and GES. FÜR TEERVERWERTUNG. Brit. 279,055, Oct. 18, 1926. In processes such as described in Brit. 277,974 (C. A. 22, 2655) in which I or an I compd. is used, the I compds. employed are such as are decompd., but slightly or not at all at the reaction temp. (such as alkali or alk. earth iodides) and these are used together with a substance which will cause dissocn. of the I compds., such as Fe alum, FeCl₃ and CuSO₄. Tetrahydronaphthalene and benzene hydrocarbons may be produced from C₁₀H₈ and NH₃ and liquid hydrocarbons may be produced from coal-tar pitch.

Treating residue from petroleum cracking, etc. C. B. WATSON (to Pure Oil Co.). U. S. 1,673,854, June 19. Residue from cracking or distn. is circulated through a conduit to a sepg. receptacle and an inert gas such as steam is forced under pressure into the conduit to force the residue in atomized form into the receptacle; heated inert gas is supplied to maintain the material in the receptacle in a turbulent and heated condition, lighter fractions are withdrawn from the upper part of the receptacle and passed to condensing and collecting app. and a portion of the residual oil is fed to burners and the rest is removed from the system. An app. is described.

Decolorizing and purifying petroleum hydrocarbons. A. OBERLE (one-half to Thomas E. Scofield). U. S. 1,674,020, June 19. Oil such as gasoline obtained by cracking is treated with a soln. contg. KI, and filtered after permitting sepn. from the treating soln.

Treating petroleum hydrocarbons containing sulfur. H. G. M. FISCHER and W. J. ADDEMS. Can. 278,206, Feb. 28, 1928. Petroleum hydrocarbons contg. sour S compds. of the type of mercaptans are mixed with S in the presence of PbS and an alkali, the total amt. of lead in the mixt. being insufficient directly to convert more than a small proportion of the mercaptans into Pb mercaptides.

Desulfurizing liquid hydrocarbons. H. H. WILSON. Can. 278,381, Mar. 6, 1928. Low-boiling petroleum oils contg. S are brought into intimate contact with anhydrous KOH in finely divided condition.

Producing hydrocarbons by hydrogenation of phenols. D FLORENTIN, A. KLING and C. MATIGNON. Brit. 279,488, Oct. 23, 1926. The process described in Brit. 276,007 (C. A. 22, 2479) is applied to phenolic oils and tars such as low-temp. carbonization tars; PhOH is converted into C₆H₆ and cresols are converted into toluene by the action of a dehydrating catalyst and H under pressure. With complex material such as low-temp. tars, a second catalyst may be employed such as a halide of Mg, Zn, Fe, Cr or Al and the hydrogenation effected in 2 stages at different temps. Examples are given.

Refining hydrocarbons. R. K. STRATFORD. Can. 278,179, Feb. 28, 1928. The S content of hydrocarbon materials is reduced by treating the materials with freshly pptd. PbS.

Treatment of hydrocarbon oils. J G. DETWILER. Can. 280,586, May 29, 1928. Hydrocarbon oil is treated with a reagent with the resultant formation of sludge, after which the oil is treated with CH₂O to effect coagulation and sepn. of the sludge from the oil, the remaining oil being treated with NH₃.

Apparatus for distilling petroleum oils. H. M. GODSEY. U. S. 1,673,238, June 12. A plant is described in which furnace gases are introduced directly into oil in a still.

Device for removing deposits of coke or the like from "soaking drums" of petroleum-cracking apparatus, or for breaking out filter beds and tank residues, etc. BEACON OIL CO., B. P. CRITTENDEN, A. C. KILLINGER and H. L. BOLTON. Brit. 278,944, Feb. 28, 1927.

Demulsifying agents for refining petroleum oils. E. D. GRAY (to Standard Oil Co. of Calif.). U. S. 1,673,045, June 12. A petroleum sulfonate sludge contg. some free H₂SO₄ is treated with a lubricating oil stock, the treated oil is sepd. from the sludge, partially neutralized with alkali such as NaOH, freed from sediment and is then further neutralized and washed to obtain a demulsifying agent.

Apparatus for dehydrating petroleum emulsions or similar emulsions by electric

treatment. W. O. EDDY (to Petroleum Rectifying Co. of Calif.). U. S. 1,674,242 June 19.

Distilling oil shale or other solid carbonaceous material. M. J. TRUMBLE. U. S. 1,674,420, June 19. Steam is passed through the material to preheat it and effect distn. The residue is treated with superheated steam under pressure at a temp. which will effect destructive distn. and satd. steam is then passed through the residue to raise the temp. of the steam which is then used for the first step of the process. An app. is described. Cf. C. A. 22, 1672.

Processing shale. W. H. HAMPTON. Can. 280,272, May 22, 1928. An intimate mixt. of solid bitumeniferous matter and a base with an oil is digested at temps. within the approx. range of from 600° to 700° F. to liberate NH_3 and volatilize certain valuable hydrocarbon oil fractions.

Processing shale. W. H. HAMPTON. Can. 280,617, May 29, 1928. Bituminiferous solid material, such as shale, etc., is digested in comminuted condition with a suitable digestion liquid, such as an oil, the products vaporized in the digestion being recovered and the residual solid matter sepd. from the digestion liquid by centrifuging.

Gasoline recovery. T. DOBRESCU. Can. 280,614, May 29, 1928. Gasoline is extd. from petroleum gases by adsorptive agents such as activated C, at high temp., the rate of flow of the gases and the temp. being controlled in such a manner that the adsorption of other gases is avoided as much as possible and the adsorption agent is charged substantially only with the gasoline.

Lead tetraethyl. H. W. DOUDT. Brit. 279,106, Oct. 15, 1926. Mg Et_2 chloride is caused to react upon Pb salts, e. g., Et_4PbCl may be added to Mg turnings in the presence of ether contg. a small proportion of MeI and I , and the resulting soln. then treated with a suspension of PbCl_2 in ether for several hrs., the product poured into water, the ether distd. and the Et_4Pb recovered by steam distn.

Lubricant. H. DIMMIG. Can. 280,036, May 8, 1928. An oil compn. comprises a soln. of hydrocarbon oil and lead oleate.

Lubricant. M. C. VAN GUNDY and H. DIMMIG. Can. 280,037, May 8, 1928. A mixt. of oleic acid and lead oxide is heated to approx. 520–525° F., thereby forming normal lead oleate, which is then mixed with lubricating oil.

Use of lubricants. G. WISNER. U. S. 1,672,922, June 12. A "neutralizing substance" such as stearic acid is used for coating surfaces outside of and around clock bearings or like surfaces to be lubricated, and the surface to be lubricated is then treated with mineral oil or other lubricant of small cohesive properties, the creeping of which is prevented.

Filter for lubricating oil, etc. R. P. F. LIDDELL (to Union Tru t Co. of N. Y.). U. S. 1,673,572, June 12.

Apparatus for separating gas, oil and water by gravity. V. CHANCELLOR and S. L. CALVERT. U. S. 1,673,663, June 12.

Extraction of tar sand. C. KNIGHT. Can. 278,861, March 27, 1928. The crude petroleum and asphaltum content in bituminous or tar sands is liquefied by treating such sands while heated to a proper temp. with H_2O to which has been added sufficient distillate and a proper percentage of NaCl .

Extraction of tar sand. C. KNIGHT. Can. 278,862, Mar. 27, 1928. The crude petroleum and asphaltum content of bituminous or tar sands is liquefied by using superheated air with either hot or cold distillate along with a proper percentage of NaCl or Na_2CO_3 delivered under pressure through a pipe or air line passing through the overburden into the sands.

Bituminous composition. L. KIRSHBRAUM. Can. 279,241, Apr. 10, 1928. An emulsion comprises bitumen forming the internal phase and H_2O and bentonite forming the external phase.

Bituminous emulsions. SOC ANON LA TRINIDAD. Brit. 279,026, Oct. 15, 1926. Asphalt or other bituminous material contg. pulverulent or colloidal mineral matter is mixed with an anhyd. emulsifying agent such as a Na or K soap contg. 1–8% of added com. olein. The mixt. may be converted into an emulsion by stirring it with cold water. Tar, schist oil or residual oil of petroleum may be mixed with the bituminous material used. Cf. C. A. 22, 316.

Cellular bituminous material. J. H. YOUNG (to H. H. Robertson Co.). Brit. 279,360, Nov. 8, 1926. See U. S. 1,630,103 (C. A. 21, 2383).

Asphaltic material. W. C. WEST. Can. 279,421, Apr. 17, 1928. An asphaltic compn. includes a mineral aggregate, a semi-liquid asphalt or asphaltic flux and a hard asphalt remaining unblended while cold but adapted to blend with the asphalt or asphaltic flux upon the application of heat.

Petroleum asphalt. E. A. RUDIGIER (to Standard Oil Development Co.). U. S. 1,673,533, June 12. Petroleum still residuum at a temp. of about 215° is transferred from reducing stills to a heat-insulated container and blown with air, without applying external heat. An app. is described.

Acetic acid. W. ZEISS. Can. 278,933, March 27, 1928. AcOH is produced by acting with H₂SO₄ on Ca pyrolignite dissolved in a mixt. of CaSO₄ and AcOH.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Problems in cellulose chemistry. K. HESS. Kaiser-Wilhelm-Inst., Berlin. Z. *Furben-Ind.* 20, 57-60, 135 5(1928); cf. C. A. 18, 1384; 20, 664, 2410, 2663; 21, 173.—A review.

FREDERICK C. HAHN

Cellulose resources. III. Cost of field crops for cellulose. GEORGE M. ROMMEL. *Ind. Eng. Chem.* 20, 716 9(1928).—Approx. costs per ton are given for cellulose field crops as follows: corn stalks, \$8 00; straw, \$7.50-\$14.00. Corn stalks contain 40% "extractable" cellulose. Pulp from corn stalks averages 95.6% α -cellulose. The economic effect of diverting such field crops to the manuf. of cellulose is problematical since there is no satisfactory information on their food value and on their fertility value.

J. S. REICHERT

Influence of the preliminary alkaline treatment in the preparation of cellulose with chlorine gas. FRANCESCO GIORDANI. Reale Scuola di Ingegneria Napoli. *Ann. chim. applicata* 18, 87-90(1928).—Expts. carried out over a long period by G. and his collaborators (cf. Bakunin, *Giorn. chim. ind. applicata* 3, 517(1921); G., *Boll. soc. naturalisti Napoli* [2], 38, 260(1924); G. and Cittadini, C. A. 21, 2984; *Atti ist. inc. Napoli* [6], 80, 3(1928)) are at variance with the results recently published by Mutti and Venturi (C. A. 22, 316). According to G., the yield of cellulose from esparto increases to a max. at 3% NaOH and then decreases with further increase in the concn. of alkali. Furthermore at 3% concn. of NaOH, the consumption of NaOH increases notably and becomes greater than that of Cl, so that the general economy of the process, which is based on the utilization of excess Cl, is destroyed. The % α -cellulose varies irregularly so that no conclusions can be drawn. The α -cellulose and Cu no. show that the Cl gas method of treatment is not so inefficient as often considered. The consumption of NaOH and therefore the efficacy of the preliminary alk. treatment depends upon the ratio between the wt. of fiber and vol. of NaOH soln., which in industrial practice is approx. 1 kg. per 5 l. Data show that the relative consumption of NaOH and of Cl varies greatly with the ratio of wt. of fiber to vol. of alk. soln., the quantity of NaOH relative to Cl consumed decreasing with decrease in the vol. of soln. of a given concn. Thus with 2% NaOH, the following results were obtained with ratios of 1/10 and 1/7.5: NaOH consumed 43.5, 24.0; Cl consumed 57.0, 54.0; yield of cellulose 50.0, 55.6; % α -cellulose 78.7, 71.8; Cu no. 1.9, 1.8. This is a typical case showing that with diminution in the quantity of NaOH and of Cl consumed the yield and quality of the product improve.

C. C. DAVIS

Mercerization of sulfite cellulose. V. I. SHARKOV. *J. Chem. Ind. (Moscow)* 3, 1148-9(1926).—In the manuf. of viscose the first stage consists in mercerizing sulfite cellulose by NaOH. An investigation of this operation by D'Ans and A. Jäger (C. A. 20, 819) has shown that the max. of swelling of sulfite cellulose is with 11-13% NaOH solns. and that NaCl, Na₂CO₃, or sugar, alc., tannin and other substances decrease the swelling of cellulose during mercerization. S. undertook to study this phenomenon in greater detail, using sulfite cellulose cardboard, and came to the same general conclusions as D'Ans and Jäger. He gives 4 diagrams and 2 tables. The max. of swelling is with approx. 14% NaOH solns. or 17% KOH solns. In absorption of alkalis by cellulose the equil. of the system is reached after 30 sec. provided the soln. has a free access to each sep. fiber. Alc. or glycerol added to the NaOH soln. lowers the extent of swelling more than any other substances.

BERNARD NELSON

State of aggregation of cellulose acetate. H. PRINGSHEIM, W. KUSENACK AND K. WEINREB. *Papier-Fabr.* 25, 785-9(1927).—The viscosities in cuprammonium soln. of a sample of cellulose, of the same material after heating to 125°, after treating 4 hrs. with 50% NaOH, and after treating for 3 days with thrice its wt. of 16% NaOH were, resp., 5.41, 3.49, 2.58 and 1.62. The viscosities of the acetates prepd. from these samples (in tetrachloroethane) were, resp., 2.13, no change, 1.64 and 1.53. The viscosity of the cellulose regenerated from the acetates ran parallel with that of the

acetates. By heating the acetate of the alkali-treated cellulose to 250–5° in naphthalene, its viscosity was further reduced; cellulose obtained by hydrolysis of this acetate had a viscosity of 1.24. The lowest viscosity obtained by heat-treatment of the acetate was 1.19, but even this acetate was insol. in MeOH, and therefore the cellulose from which it was derived still possessed a higher state of aggregation than glucose anhydride.

R. H. DOUGHTY

The chemistry of wood. I. Analysis of wood rays in hardwoods. WM. M. HARLOW AND LOUIS E. WISE. *Ind. Eng. Chem.* 20, 720–2(1928).—Wood rays were isolated by mech. means from white oak and flame she-oak and subjected to chem. study. Ash, hot water-sol., alc.-benzene ext., lignin, cellulose and pentosans were detd. in the total wood and in the wood rays. The wood rays are higher in lignin and lower in cellulose than the total wood in both species. With flame she-oak the sum of the alc.-benzene sol., lignin, pentosans and pentosan-free cellulose accounts for approx. 95% of the sample, both for the wood rays and for the total wood. With white oak the sum of the water-sol., lignin, pentosans and pentosan-free cellulose accounts for approx. 97% of the dry sample, both for the wood rays and for the total wood.

J. S. REICHERT

[Caustic] soda recovery plant [for use with waste liquors from esparto grass digestion]. J. HOLMES. *Proc. Tech. Sect. Papermakers' Assoc.* 7, 27–45(1926).—The low heat efficiency of soda recovery units of the usual design is discussed, and a description is given of the Holmes closed system of recovery in which a considerable economy of heat is realized by blowing the digester charge into a closed pressure tank, which also receives the relief steam from the digester during the cook. Feed liquor to the evaporator is withdrawn from the bottom of this tank, and the steam available from the pressure reduction is used to heat the first effect of the evaporator. Heat exchangers are placed in the vapor pipes of the evaporator to effect the transfer of heat to the wash liquor and to fresh caustic liquor. The operation of the vacuum evaporator is dealt with in detail, and emphasis is laid on the reduction of efficiency caused by air leaks, gases dissolved in the liquor and scale. The prospect of utilizing the heat, which under the present system is dissipated in the roaster, is also discussed, and it is suggested that, given reasonably efficient plant, the total heat recovered should supply not only the soda recovery plant, but also the digesters.

B. C. A.

Preparation of bleaching liquors from liquid chlorine. H. WREDE. *Papier-Fabr.* 25, 817–24(1927).—Methods and app. used in American paper mills are described and discussed.

R. H. DOUGHTY

Caroá fiber as a paper-making material. M. B. SHAW AND G. W. BICKING. U. S. Bur. Standards, *Tech. Paper* No. 340, 21, 323–46(1927).—Exptl., followed by semi-com., cooks indicate that caroá fiber could be satisfactorily used for paper-making. The yield, soda consumption and the character of the pulp depend to some extent on the preliminary treatment of the raw material. Retting appears to give the most favorable results, a 55.3% yield of pulp (dry pulp on dry material after cutting and dusting) being obtained by digestion with 25% of caustic soda for 4 hrs. at 172°. When bleached with 10% of bleaching powder the product compares favorably with rag pulp and is capable of furnishing paper of high strength. The semi-com. trials were made on unretted fiber that had been beaten dry, and gave lower yields of bleaching pulp, e. g., 49.5–51.5%. Caroá fiber has a fiber length of 2.25–5.75 mm. (av. 4 mm.) and a thickness of 0.0046–0.0154 mm. (av. 0.01 mm.), and should therefore have good felting properties. When less soda is used pulps are obtained which, though technically unbleachable, provide excellent wrapping papers equal in strength to those made from kraft pulp. There is no organized caroá industry at present, but the economic availability of the fiber for paper-making appears promising. The paper-making equipment and the technic employed in paper-making research are described in detail.

B. C. A.

Gelatin. J. S. ALLAN. *Proc. Tech. Sect. Papermakers' Assoc.* 7, 69–87(1926).—The properties of gelatin, more especially in relationship to the sizing and coating of paper, are reviewed.

B. C. A.

Tanning materials from cellulose (ESOURROU) 27. Genuine lignin. I. Acetylation of pine wood (FUCHS) 10.

Cellulose. A. CLASSEN. *Brit.* 279,147, June 7, 1926. Finely divided cellulose is obtained from wood meal, paper refuse or like material by dissolving in strong HCl with or without another strong acid such as H₂SO₄ or H₃PO₄ at a temp. of about 0° or lower (preferably with introduction of gaseous HCl), sepp. any undissolved material,

and adding a pptg. agent such as an alkali salt, *e. g.*, an alkali metal chloride or Na or NH_4 sulfate. Straw is also mentioned as a raw material.

Cellulose. P. J. A. MAIGNEN. U. S. 1,672,895, June 12. Raw plant material such as straw, grasses, wood or pine needles is subjected to the progressive action of a soln. of NaOH generated in the cooker used from Na_2CO_3 and $\text{Ca}(\text{OH})_2$ in water, at atm. pressure; the cellulose produced may be used for making paper, and the soln. of non-cellulosic substances may be used as a fertilizer.

Cellulose rich in α -cellulose. BROWN CO. Brit. 278,767, April 13, 1926. Bisulfite pulp is treated with NaOH or other alkali to effect purification without mercerization and obtain a product suitable for making cellulose esters or ethers or for making high-grade paper. An app. is described.

Cellulose from wood. I. G. FARHENIND. A.-G. Brit. 279,036, Oct. 13, 1926. Material such as moist fir wood is treated (in a modification of the process described in Brit. 274,892 (C. A. 22, 2273) first with air contg. oxides of N so that HNO_3 is formed in the material and then, for several hrs., with air alone. A temp. of 40–50° is suitable.

α -Cellulose fiber. G. A. RICHTER and M. O. SCHUR. Can. 278,538, Mar. 13, 1928. An alk. digesting liquor is mixed with an aq. suspension of chem. wood pulp of a predetd. consistency, and such mixt. is thickened to a predetd. consistency, the pulp then being digested in the alk. liquor

α -Cellulose fiber. G. A. RICHTER. Can. 278,540, Mar. 13, 1928. Predigested pulp is digested in an alk. liquor contg. Na compds. recovered from the spent liquor resulting from the digestion of raw cellulosic material in the production of pulp together with the spent liquor resulting from the digestion of predigested pulp with alk. liquor.

α -Cellulose fiber. G. A. RICHTER. Can. 278,541, Mar. 13, 1928. Predigested pulp is digested in an alk. liquor, the spent liquor is mixed with waste liquor from the kraft process and Na is recovered from the mixed spent liquors.

α -Cellulose fiber. G. A. RICHTER. Can. 278,543, Mar. 13, 1928. Raw pulp is digested at a relatively low temp. in a liquor contg. an alkali and an oxidizing agent, and the pulp is then digested in an alk. liquor at elevated temp.

α -Cellulose fiber. G. A. RICHTER. Can. 278,544, Mar. 13, 1928. Pulp is treated with a NaOH soln. at a temp. considerably below 212° F., the NaOH being present in an amt. sufficient to render sol. a substantial proportion of the less resistant celluloses, ligneous and other coloring substances, but insufficient to cause a mercerization of the α -cellulose content.

Treatment of cellulose fiber. G. A. RICHTER. Can. 279,811, May 1, 1928. Cellulose fiber is treated with a NaOH soln. of mercerizing strength, the treated fiber is aged to effect a depolymerization of the same, and the fiber is then washed and digested in an alk. soln.

Process and apparatus for treating fiber. G. A. RICHTER. Can. 278,542, March 13, 1928.

Cellulose film fabric. H. DREYFUS. Can. 279,892, May 8, 1928. Artificial filaments or threads are made from cellulose esters of viscosities exceeding about 50 by spinning solns. of such cellulose esters, the solns. comprising a small proportion of a high-boiling liquid.

Digesting cellulose. R. PICTET and F. THARALDSEN. Can. 279,430, Apr. 17, 1928. Cellulose pulp is produced by treating wood, etc., under pressures above 8 atms. and under heat not exceeding 110°, with highly concd. aq. solns. of H_2SO_4 contg. more than 100 g. of SO_2 per l.

Coloring cellulose esters and ethers. M. J. THEUMANN. Can. 278,978, Mar. 27, 1928. An inorg. coloring matter is produced by chem. reaction, in a soln. of the cellulose deriv. to be colored. The colored cellulose deriv. is subsequently pptd. from the soln. by a liquid which dissolves the solvent of the ester or ether, and in which both the ester or ether and the produced coloring matter are insol.

Cellulose compounds. L. LILIENFELD. U. S. 1,674,401, June 19. Cellulose thiourethans and their substitution derivs. are formed by treating viscose or the like with monochloroacetic acid or other suitable monohalogen deriv. of a fatty acid and then treating the resulting reaction product with aniline or similar aromatic amine. The products are suitable for making films, threads, plates, etc., and are insol. or but slightly sol. in water but are sol. in alkalies and may be pptd. by neutralizing the alkali. They are also sol. in aq. pyridine and various other org. solvents. Numerous details and examples are given. U. S. 1,674,402 relates to the production of Et or other alkyl esters of cellulose thiourethans. The products dissolve in C_6H_6 -alc. mixt., MeOH-MeOAc mixt. and alc.-acetone mixt. and may be used in coating compns., as substitutes for celluloid, artificial silk, for elec. insulation, coating fabric for artificial leather for binding books or for similar purposes. Numerous details and examples are given.

U. S. 1,674,403 specifies artificial products such as may be formed with a cellulose aryl-thiourethan and a plasticizing agent.

Cellulose derivatives. I. LILIENTHAL. U. S. 1,674,404, June 19. Films, threads or other products are formed by bringing an aq. alk. soln. of a cellulose phenylthiourethan into the desired form and treating it with H_2SO_4 of 50-78% strength or other suitable acid bath which may also contain various admixts. U. S. 1,674,405 specifies treating viscose with monochloroacetic acid or similar monohalogen fatty acid and then treating the product with NH_3 to obtain compds. having properties similar to those of U. S. 1,674,401. Cf. C. A. 21, 822.

Films of cellulose derivatives. I. G. FARBER. A.-G. Brit. 279,047, Oct. 16, 1926. In app. for making films, the surface of the support consisting of a cellulose deriv. such as nitrocellulose is subjected to sapon., denitration or like treatment, *e. g.*, by use of a soln. of Na hydrosulfide or NH_4 sulfide, so that the support will not swell nor dissolve in the solvent used for making the film-dope.

Solutions and products from cellulose esters and ethers. H. J. HANDS and S. ICERS, LTD. Brit. 279,139, April 21, 1926. Chloropropanes contg. at least 4 Cl atoms are used (suitably with various other solvents, plasticizing agents and the like) with cellulose acetate or other esters or ethers of cellulose or other carbohydrates in forming coating compus., artificial threads, films, molded articles, etc.

Applying cellulose esters and ethers. G. SCHNEIDER. Can. 277,599, Jan. 31, 1928. Metallic effects obtained by rubbing crystals of metallic salts on polished surfaces of cellulose derivs. are preserved by coating the surfaces so treated with a soln. of a cellulose deriv. in a solvent which does not dissolve the cellulose deriv. forming the base. Cf. C. A. 22, 2273.

Composition of sulfur and cellulose. M. DARRIN. Can. 277,710, Feb. 7, 1928. A compn. of matter comprises approx. 20-35% cellulose and the remainder chiefly S.

Ligninsulfonic acid. J. BADDILEY and A. J. HAILWOOD. Can. 280,152, May 15, 1928. New, technically valuable, products are manufd. by the moderated oxidation of sulfite cellulose pitch with HNO_3 .

New derivatives of ligninsulfonic acid. H. ADAMS and A. SHEPHERDSON. Can. 279,809, May 1, 1928. New derivs. of ligninsulfonic acid (sulfite cellulose pitch) are manufd. by treating the acid at an elevated temp. with NaOH followed by an acidifying treatment.

Apparatus for dry-spinning of cellulose acetate filaments, etc. COURTAULDS, LTD. AND F. D. LEWIS. Brit. 278,814, July 19, 1926. Threads of the highest luster and free from glitter are obtained by employing a temp., at and near the nozzle, approaching the highest temp. compatible with continuous spinning; lowering the temp. decreases the luster and later leads to production of threads showing the effect of glitter. The max. temp. used depends on various other factors of the process.

Apparatus for dry-spinning artificial silk filaments. COURTAULDS, LTD. AND C. F. TOPHAM. Brit. 278,881, Oct. 11, 1926.

Filaments of artificial silk or other materials. J. G. JACKSON. U. S. 1,672,943, June 12. Filaments as they are extruded into a coagulating bath are subjected to a vibratory wave effect which may be induced by injecting a fluid through a nozzle adjacent the spinning nozzle. The filament formed thus assumes a permanently waved effect and its flexibility and elasticity are improved. An app. is described.

Artificial silk. H. SCHMIDT and E. HUBERT. Can. 279,296, April 10, 1928. In the manuf. of artificial silk from a cuprammonium cellulose soln., the spinning is effected in a pptg. bath contg. free CO_2 or a bicarbonate.

Rayon threads, films, etc. W. H. BRADSHAW. Can. 279,630, Apr. 24, 1928. Threads, films, sheets, etc., are prepd. from cellulosic materials by treating a prepd. cellulose contg. 98-100% α -cellulose with a cuprammonium soln. and mechanically working the mass in a closed mixer contg. a relatively small amt. of air.

Rayon. G. A. RICHTER. Can. 279,610, Apr. 24, 1928. Viscose rayon is manufd. by rapidly heating an aq. soln. of cellulose xanthate immediately prior to spinning it, spinning such soln. while so heated into filaments, and delivering the filaments into a setting bath.

Artificial textiles. T. KOCH. Can. 280,291, May 22, 1928. Artificial textile products are prepd. from viscose, substances being added to the viscose which are emulsifiable with the same but which during the subsequent process do not yield gas but evap. on drying the thread after fixation.

Artificial textiles. T. KOCH. Can. 280,292, May 22, 1928. In the prepn. of artificial textile products with reduced luster, substances are added to the spinning

soln. which are emulsifiable with the same and which practically do not evolve gas during the subsequent spinning process.

Pulping wood. F. G. RAWLING. U. S. 1,673,089, June 12. See Can. 271,900 (C. A. 21, 3743).

Wood pulp. L. BRADLEY and E. P. MCKEEFE. Can. 279,696, Apr. 24, 1928. Wood is cooked in a liquor comprising substantial amts. of NaOH, Na₂S and Na₂SO₃. Cf. C. A. 22, 868.

Wood pulp. L. BRADLEY and E. P. MCKEEFE. Can. 279,697, Apr. 24, 1928. Wood chips are digested with a cooking liquor which contains Na₂S and Na₂SO₃. The residual liquor thus produced is concd., the org. compds. are decomposed and a product is formed which contains Na₂CO₃. A soln. of the soda compds. is prep'd., and the soln. treated with a sulfite, whereby Na₂CO₃ is converted into Na₂SO₃. The liquor thus produced is employed in the cooking step.

Sulfate pulp. G. A. RICHTER. Can. 279,810, May 1, 1928. Raw cellulosic material is cooked in an alk. soln. of NaOH and Na₂S and the Na compds. of the waste cooking alk. liquor are melted in an oxidizing atm., the resulting Na compds. being recovered in soln. Such soln. is acidified with SO₂ and cellulosic material is cooked in such acid soln., the Na compds. of the waste acid cooking liquor being smelted and the resulting Na compds. being recovered in an alk. soln. Any Na₂CO₃ in such soln. is causticized with lime and the insol. carbonate removed. Raw cellulosic material may then be cooked in the resulting soln., a cyclic operation thus being completed.

Molding receptacles of waterproofed wood pulp with an exterior layer of absorbent pulp (for cooling by evaporation, etc.). J. J. H. STURMEY. Brit. 279,210, Sept. 4, 1926. Mech. features.

Apparatus and method of forming receptacles from fibrous pulp by felting and pressure. J. B. HAWLEY (to Arvey Mfg. Co.). U. S. 1,673,047, June 12.

Paper-making apparatus. W. H. MILLSPAUGH. Brit. 278,817, July 20, 1926

Suction box for paper-making or similar apparatus. G. PEEBLES (to Selbec, Inc.). Brit. 279,048, Oct. 12, 1926.

Apparatus for refining paper pulp. L. A. THOMAS. U. S. 1,674,231, June 19.

Insulating paper. R. P. ROSE and H. E. CUDE. Can. 279,628, Apr. 24, 1928. An insulating paper comprises rosin-sized hydrated cotton fiber, rubber and a protective colloid including an acetylated starch and a sol. silicate.

Carbon paper. F. PELTZER & Co. Brit. 279,375, Oct. 23, 1926. Very thin paper is used and a very thin film-like coating is applied so that the product is suitable for attachment to the original and may be used once and discarded because of its cheapness. The viscosity of the usual coating compn. may be modified by the addn. of fatty acids such as stearic acid, carnauba wax, montan wax, neutral fats, hydrocarbons or higher alcs.

Protecting cardboard containers or other articles against moisture. L. RADO and J. MODERN. Brit. 278,775, June 8, 1926. Composite sheets of Al foil and paper are used.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

The influence of different kinds of stemming on the efficiency of explosives. JOS. JØRSTEN. *Z. ges. Schiess-Sprengstoffw.* 22, 346-8(1927).—Five explosives of different types, viz., gelatin dynamite, kieselguhr dynamite (75%), an NH₄NO₃ explosive, a NaClO₄ explosive and a KClO₄ explosive, were tested by the Trauzl Pb block test to det. their efficiency with various kinds of stemming materials. The results with loam were approx. as good as with cement, and better than those with water, sand or rock dust.

C. G. STORM

Flame movement in gaseous explosive mixtures. O. C. DE C. ELLIS. *Fuel in Science and Practice* 7, 195-205(1928); cf. C. A. 21, 1356, 2065.—When an explosive mixt. is ignited at the center of a spherical vessel, the pressure is communicated along a falling gradient, and is accompanied by a surge in the gas. There is a finite period between ignition and the moment at which pressure is increased at any point from the ignition point. The pressure is generated from the expanding layer of gas adjacent to the flame-surface and within it. Pressing outwards, it displaces the flame-surface, increasing the vol. of the flame-gases and compressing the unburned gas surrounding the flame; inwards it compresses the flame gases. The first function decreases as the vol. of the flame grows. When the vol. of the flame is approx. half the vol. of the sphere,

the pressure generated is distributed equally outward and inward. After this critical moment, the second function is increasingly marked as the vol. of the unburned gas decreases. There is, therefore, a gradual arrest of the distension of the flame which reaches a critical point when the vol. of the flame is approx. half that of the explosion-vessel—within a sphere when the diam. of the flame is approx. 0.8 that of the vessel. This arrest would not occur if the gas were not enclosed, because in that case there would be no increase in pressure in the unburned gas, surrounding the flame. Numerous illustrations are included.

D. A. REYNOLDS

Theories of combustion processes. N. SEMENOV. *Z. Physik* **48**, 571-82(1928).—Explosions are shown to be of 2 types: (1) Heat explosions, in which heat is liberated by the reaction at the start faster than it is removed through the walls of the vessel; hence the resulting increase in temp. produces an infinite reaction velocity. (2) Chain reactions in which, according to Arrhenius, the excess energy of an excited mol. is given by collision to a normal mol. of the reacting substance, thus causing it to become excited and finally producing an infinite reaction velocity. Reactions of type (1) have for each temp. a crit. d. below which the explosion will not take place. The equation relating the crit. d. to temp. is derived. Reactions of type (2) have a crit. d. which is independent of the temp. and is very small. If, in type (2), the no. of mols. activated in unit time is very small some time may elapse after the mixing of the reactants before ignition takes place. The ignition may be hastened by increasing the pressure above the crit. pressure. In order to check the reaction, however, the pressure must be lowered below its crit. value. Exptl. evidence supporting these ideas is to be published.

H. F. JOHNSTONE

The denitration of spent acids under reduced pressure. ARNOLD SCHMID. *Z. ges. Schiess-Sprengstoffw.* **22**, 354-8(1927).—In the usual process for denitration of spent acids from the manuf. of *nitroglycerin*, the effect of steam is to convert a large part of the original 12% of HNO_3 to oxides of N, and the recovered HNO_3 is in a much diluted condition. Also the recovered H_2SO_4 is of only about 70% strength. S. describes a new vacuum process of denitration which yields 98-100% HNO_3 practically free from N_2O_5 , and H_2SO_4 of about 83%. About 70% of the HNO_3 is recovered by slow heating up to about 110° at reduced pressure. Further heating up to 150° without diln. removes the remainder of the HNO_3 and completely oxidizes all org. matter to CO_2 and H_2O , leaving the H_2SO_4 free from such impurities. Exptl. work leading to the development of the process is discussed and a plant layout described.

C. G. STORM

Recovery of HNO_3 from waste nitrating acid (Can. pat. 277,995) 18.

25--DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

The relation between the chemical constitution and the color of dyestuffs. S. R. TROTMAN. *Dyer, Calico Printer* **59**, 208-9(1928).—A general theoretical discussion.

RUBY K. WORNER

Studies of dibenzodithiazinequinones, a class of the vat dyestuffs. II. Reaction between nitric acid and dibenzodithiazinequinone. R. SHIBATA. *J. Soc. Chem. Ind. (Japan)* **31**, 73 5, *Suppl. binding* [in English], 23-4B(1928); cf. *C. A.* **22**, 1585.—When dibenzodithiazinequinone was treated with the mixt. of fuming HNO_3 and glacial AcOH in the cold, a powdery substance was obtained. It resembles Orange II in color, is sol. in dil. alkali, and forms cryst. compds. with NaOH , KOH and NH_4OH , which are sol. in H_2O and crystallize out from the soln. on addn. of alc. From the hyposulfite vat contg. NaOH , it gives the same shade on fibers as dibenzodithiazinequinone. By analysis, it has been found that the action of the above mixed acid upon dibenzodithiazinequinone is an oxidation, not a nitration, resulting in the formation of the corresponding disulfoxide.

Y. TOMODA

Testing the permanence of dyes in light. W. KACZKOWSKI. *Przemysl Chem.* **12**, 141-5(1928).—Factors which influence the rate of fading of dyes in light are enumerated. The effect of the fiber is stressed. Sunlight is so varied with location, season and even time of day that it is not suitable for testing. A standardized artificial light source is indispensable for quick comparisons. The quartz lamp is too rich in the ultra-violet spectrum. "Osram" and "Philips" lamps are satisfactory in respect to the character of their light.

A. C. ZACHLIN

Printing of cellulose acetate rayon mixed fabrics. ERICH HEIM. *Z. Farben-Ind.* 20, 65-6(1928).
FREDERICK C. HAHN

The present position of the dyeing of artificial silks. H. H. HODGSON. *Z. Farben-Ind.* 20, 66-8(1928).—A review.
FREDERICK C. HAHN

Unequal dyeing of rayon. H. HOZ. *Z. Farben-Ind.* 20, 68-70(1928).—Uneven dyeings which are often obtained with rayon are due to unevenness of surface and non-uniformity of internal structure of the filament. A number of dyes are mentioned, however, which minimize the effect of the foregoing unevenness.
F. C. H.

Dyeing of straw. ADOLF GEBHARDT. *Z. Farben-Ind.* 20, 71-6(1928).—A general article on the bleaching of straw, and on the dyeing of raw and bleached straw with different types of dyes.
FREDERICK C. HAHN

Uneven dyeing. J. MOFFAT. *Dyer, Calico Printer* 59, 182-3, 206-7(1928).—Among the causes of uneven dyeing are: impurities, especially Fe, in H₂O; alkali used in scouring, alkali migration; selection of dyestuffs; temp. at which addns. are made to the dye bath; machine used in dyeing; uneven temp. in the dyebath; oil used in carding; mixts. of wool. The use of leveling agents is advised in case of trouble.
R. K. W.

Production of bright colors on textile fabrics. XXXIII. RAFFAELE SANSONE. *Am. Dyestuff Rept.* 16, 623-6(1927); cf. *C. A.* 21, 3747.—Bright colors with basic dyes, the oil mordanting process and the construction and operation of the machinery required are the subjects of this paper. XXXIV. *Ibid* 671-2.—The construction and operation of a drying app. are described. XXXV. *Ibid* 17, 355-9(1928).—The equipment and operations of the Al(AcO)₃ processes are described.
L. W. RIGGS

Dyeing union materials consisting of cotton and (viscose) artificial silk. W. ALTERHOFF. *Melliand's Textilber.* 8, 795-6(1927).—In dyeing cotton-viscose silk materials, level shades may be obtained if the gray material be scoured for 1/2 hr. in a boiling bath contg. 1 g. of soda ash and 0.5 g. of Monopole soap per l., and then entered into a boiling liquor contg. 20% of Glauber's salt and 1 g. per l. of a sol. oil (e. g., Monopole Brilliant oil or Aviroil KM), the dye being added after 1/4 hr. and dyeing continued for 3/4-1 hr. at the boil and 1/2 hr. in the cooling dye bath. The dyed material is then washed and scoured in a warm bath containing acetic or formic acid, a small quantity of a suitable oil being added if a soft handle be desired.
B. C. A.

Preliminary treatment and dyeing of acetate silk. NOVOSILK. *Kunstseide* 9, 599-606(1927).—A general article.
FREDERICK C. HAHN

Studies on natural silk. I. Iodine-absorbing power of silk fibroin. T. TAKAHASHI. *J. Soc. Chem. Ind. (Japan)* 31, 152-5; *Suppl. binding* [in English], 42B(1928).—Silk-fibroin, which had been treated with various reagents and regenerated, showed various iodine-absorbing power. This shows that the chem. reactivity of fibroin depends greatly on the fibrous structure.
Y. TOMODA

Silk degumming. V. Influence of fatty acid upon silk degumming. T. TAKAHASHI. *J. Soc. Chem. Ind. (Japan)* 31, 148-51; *Suppl. binding* [in English], 41B(1928); cf. *C. A.* 22, 2468.—Fatty acid prevents the degumming of silk either in acid or in alk. medium, but the effect is not distinct when the acidity of the medium is stronger than the isoelec. point of sericine. The degumming action of soap soln. is due to its alky., by which the sericine becomes solvated; the fatty acid or acid soap liberated as the result of combination of alkali with sericine is adsorbed on the fiber and protects the fiber better from the further action of alkali.
Y. TOMODA

Soaking raw silk for crepe yarns and producing crepe effect in fabric. WARREN P. SEEM. *Textile World* 73, 3701-3(1928).—A discussion of the factors affecting shrinkage of silk fabric and the materials used for soaking raw silk for crepe.
RUBY K. WORTER

Advantages of controlling hydrogen-ion concentration in wet processes of wool manufacturing. CHAS. E. MULLIN. *Textile World* 73, 2623-7, 3094-6(1928).—Possible applications of pH control in the wool industry are discussed.
RUBY K. WORTER

Cockles in woolen goods. TEXTUS. *Textile World* 73, 3579(1928).—A brief discussion of their cause and prevention.
RUBY K. WORTER

Fiber cross-sections. A. HERZOG. *Kunstseide* 9, 558-61(1927); cf. *C. A.* 21, 2563.—A quick method for the prepn. and examn. of fiber cross-sections is described, which depends on cementing a bundle of fibers together with collodium, cutting a cross-section thereof, covering the cross-section with paraffin oil contg. some sol. dye and then examg. microscopically. Methods of illumination and photographing are described.
FREDERICK C. HAHN

Changing and sampling of colors under different conditions of light. G. RUDOLPH. *Kunstseide* 9, 561-5(1927).—A discussion of difficulties in matching colors, and methods of avoiding these difficulties by the use of different sources of light.
F. C. H.

Determination of rayon and silk in woolen goods. P. M. GREMPE. *Kunstseide* 9, 570-1 (1927).—The tests given are based on the fact that wool and silk dissolve in 3% NaOH soln. while the rayon is insol. The treatment of the alk. soln. with Na_2PbO_2 gives a brown to black color with wool, but no color with silk. FREDERICK C. HAHN

Stretching of rayon. W. ALTERHOFF. *Kunstseide* 9, 571-2 (1927).—Some suitable methods of sizing rayon are described, and tests on the sized rayon show improved stretching properties. FREDERICK C. HAHN

The scouring of rayon. FRED. GROVE-PALMER. *Am. Dyestuff Rept.* 17, 342-4 (1928).—Because of the frail quality of rayon fiber, especially when wet, it must be handled with care. Only easily saponifiable oils should be used in lubricating the fiber, and kerosene should be avoided in the degumming process on account of the sticky residue which it leaves. L. W. RIGGS

Testing of wetting-out agents. H. C. ROBERTS. *Am. Dyestuff Rept.* 17, 339-42 (1928).—The methods of Auerbach (cf. *C. A.* 20, 3575), Frieberger, Voltz and Lawrie for wetting-out textiles are compared. From the author's expts. it appears that some factor other than the fat content detcs. the superiority of one wetting-out agent over another. L. W. RIGGS

Increasing the production of cotton padders. REYNOLDS LONGFIELD. *Am. Dyestuff Rept.* 17, 349-55 (1928).—A description is given of the procedure followed in the dye-house of a cotton-finishing plant for increasing production per man-hour and per machine-hour without investment for addnl. equipment. In this instance the av. daily wages per man increased 25%, production per machine 36%. The av. unit labor cost decreased 27.5% and the annual reduction in labor cost per million yards was \$20,000. L. W. RIGGS

Effectiveness of materials used for waterproofing canvas, and their influence on the fabric. T. D. JARRELL AND H. P. HOLMAN. *Textile World* 73, 3103-5 (1928); cf. *C. A.* 21, 3132.—Samples of canvas variously treated and exposed to the weather for 6 months showed the following decreases in strength: untreated, 39%; treated with 85% yellow petrolatum and 15% beeswax, 90%; with raw sienna added to the petrolatum and beeswax treatment, 23%; with burnt umber incorporated, 19%; treated with boiled linseed oil, 65%; with burnt umber added to the linseed oil, 47%; with Al bronzing powder added to linseed oil, 18%; with lampblack added to linseed oil, 13%; and treated with paraffin, 81%. Thus the oily, greasy or waxy waterproofing materials tried, with the exception of some bituminous materials, increased the rate of deterioration in strength. The loss was always much less with pigments than without them. If dark colors and a greasy finish are unobjectionable, bituminous materials are recommended. For light finishes, a mixt. of beeswax with petrolatum or amorphous mineral wax in the ratio of 1 to 4 is satisfactory. Drying oils, such as linseed, may be used for canvas in a fixed position where air permeability is unnecessary. Paraffin is an unsatisfactory waterproofing agent chiefly because of its cryst. structure. Other objections are that it melts in warm weather; it causes rapid loss in strength on exposure to sunlight; and it increases susceptibility to mildew when conditions are favorable. Methods of applying bituminous materials and the best treatment for paulins, light-weight tent fabrics and awning materials are discussed. The water resistance of the fabrics was rated according to the amt. of H_2O passing through a filter composed of the fabric folded with absorbent paper and placed in a glass funnel. R. K. W

Soaps for silk (GROVE-PALMER) 27. Decimal classification of colors (RUTHARDT) 2. Colloidal phenomena in dye solutions (HOLMES) 2. Organic arsenic compounds and dyes (Brit. pat. 278,789) 17. Thiocarbazides and carbazides of the naphthalene series [for use as dye intermediates] (U. S. pats. 1,673,498-9) 17.

KRETSCHMER, KARL. *Die Schlichterei in ihrem ganzen Umfange*. 2nd revised ed. Wittenberg: A. Ziemsen. 272 pp. M. 10; cloth bound, M. 12.

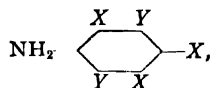

Dyes. BRITISH DYESTUFFS CORPORATION, LTD., A. SHEPHERDSON and S. THORNLEY. Brit. 279,205, Aug. 26, 1926. Benzanthrone and its unsulfonated derivs. (other than dibenzanthrones) such, e. g., as methylbenzanthrone, are condensed with hydroxylamine and the resulting compds. subjected to alkali fusion. The products dye cotton from the vat in gray to black shades. The condensation may be effected in the presence of H_2SO_4 and FeSO_4 .

Dyes. I. G. FARBENIND. A.-G. Brit. 278,771, May 12, 1926. Anthraquinone-carbazoles are made by treating the condensation products from dibromophenan-

threnequinone or other halogenphenanthrenequinones and 1-aminoanthraquinone with AlCl_3 (suitably in pyridine and followed by purification with hypochlorite). The product of the example given dyes cotton reddish brown shades from the vat.

Dyes. I. G. FARBENIND. A.-G. Brit. 279,003, May 12, 1926. Anthraquinone carbazoles are made by treating condensation products from halogenphenanthrenequinones and 1-aminobenzoylaminoanthraquinones with acid condensing agents such as AlCl_3 , chlorosulfonic acid and H_2SO_4 . The products dye cotton from the vat yellow-brown and red-brown shades. Several examples are given.

Dyes. I. G. FARBENIND. A.-G. Brit. 279,146, May 20, 1926. Azo dyes are made in substance, on the fiber or on a substratum, by coupling a 2,3-hydroxynaphthoic arylide with a diazotized amine of the general formula

in which X represents H or a univalent substituent, one Y represents an alkyl, aralkyl or aryl sulfone or ketone group or a sulfonamide or carboxamide, and the other Y represents halogen, alkyl, aryl, oxyaryl, oxyaralkyl, oxyaryl, thioalkyl, or thioaryl. (The use of alkyl-, aryl-, and aralkylamides of alkyloxy-, aralkyloxy-, and aryloxy-*m* aminobenzoic acids and their homologs and substitution products is, however, excluded.) A very large no. of suitable starting materials are listed.

Dyes. I. G. FARBENIND. A.-G. Brit. 279,401, Oct. 21, 1926. Vat dyes are formed by treating with an oxidizing agent and then with a sapon. agent 9,10-diethers of anthrahydroquinones contg. one or more β -amino or β -mono-substituted-amino groups and in which at least one *o*- α -position to an amino group is occupied by H; *e. g.*, 2-aminoanthrahydroquinone-9,10-dimethyl ether may be heated in dil. HCl suspension with FeCl_3 and the product sapond. with concd. H_2SO_4 . The product thus obtained may be purified by vatting and repptn. or by extn. with pyridine; it dyes cotton from the vat fast blue. Alk. hypochlorite may also be used as the oxidizing agent. The 2-aminoanthrahydroquinone-9,10-diethers are made by reducing 2-amino- or 2-acylamino-anthraquinones, alkylating the leuco compds. formed, and with the acylamino compds. splitting off the acyl residue. The reduction may be effected with H under pressure in the presence of Ni in alc. soln.

Dyes. I. G. FARBENIND. A.-G. Brit. 279,429, Oct. 22, 1926. Monoazo dyes are made by coupling diazo compds. of *o*-aminonaphthol or its diazotizable derivs. with 1-naphthol-8-sulfonic acid. They dye wool red shades which change to gray on chroming. Cr compds. of the dyes may be obtained by boiling, or heating to 120° under pressure, with Cr formate soln. 1-Amino-2-naphthol-4-sulfonic acid or a nitrated deriv. may be used as first component.

Dyes. I. G. FARBENIND. A.-G. Brit. 279,489, Oct. 23, 1926. Thioindigoid dyes are made by treating with a ring-closing condensing agent a 3-methylbenzene-1-thioglycolic acid substituted in the 2-position by -CN, -CONH₂, or COOH and either oxidizing the "4-methoxythionaphthene" or condensing it with a diketone or a reactive deriv. 3-Methylbenzene-1-thioglycolic-2-carboxylic acid nitrile (which may be used as a starting material) is made from 1-methyl-2-amino-3-nitrobenzene by substituting the cyano group for the amino group, reducing the NO₂ to NH₂ and exchanging the latter for the thioglycolic acid residue by way of the diazo compd. 3-Methylbenzene-1-thioglycolic acid is made from 1-methyl-2-amino-3-chlorobenzene by replacing the NH₂ group by cyano, sapong. the latter, and exchanging the Cl for the thioglycolic acid residue.

Dyes. SOC. ANON. POUR L'IND. CHIM. À BÂLÉ. Brit. 279,479, Oct. 20, 1926. Violanthrone, isoviolanthrone and their substitution products such as dimethylviolanthrone ("diketopyrene dyes") are treated with sulfonating agents such as H_2SO_4 monohydrate, fuming sulfuric acid, or chlorosulfonic acid, to form sulfonic derivs. which dye cotton from the hyposulfite vat in bluish tints. The sulfonic acids, by alkali fusion, yield other dyes which are probably hydroxy compds. which dye cotton blue to gray not fast to Cl. These hydroxy compds. yield fast dyes by further treatment with etherifying agents such as chlorinated hydrocarbons, acid esters, aldehydes, or acetals, or with halogenating agents, or with both an etherifying and a halogenating agent (which may be used in either succession). Several examples are given.

Dyes. R. F. THOMSON, J. THOMAS and SCOTTISH DYES, LTD. Brit. 278,834, Aug. 4, 1926. The pure form of dibenzanthrone obtained as described in Brit. 251,313 (C. A. 21, 1361) and Brit. 278,112 (C. A. 22, 2668) is halogenated, *e. g.* by treatment

with sulfuryl chloride or Cl in PhNO_2 with or without addn. of I or with Cl in chlorosulfonic acid or with Br in PhNO_2 . Di-, tri, tetra- and a lower chlorinated dibenzanthrone and a dibromodibenzanthrone are produced. The products dye cotton from the vat fast blue

Dyes and intermediates. I. G. FARBENIND. A.-G. Brit. 279,436, Oct. 23, 1926. 3,5-Dichlorotoluene-2-carboxylic acid is made by transforming 3,5-dichloro-2-aminotoluene by Sandmeyer's method into 3,5-dichloro-2-cyanotoluene and saponing. The product can be converted by way of the mercaptocarboxylic acid into 4-methyl- β -chloroxythionaphthene.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 279,134, Oct. 18, 1926. Compds suitable for use as intermediates are obtained by reaction of a secondary aromatic amine with a 1-halogen-2,4- (or 2,6-) dinitro-6- (or 4-) sulfonic or carboxylic halide; or the process may be conducted so that the halide is prepd. "*in situ*" as by condensing 4-chloro-3,5-dinitrobenzoic acid and monomethylaniline by use of PCl_5 . Among the reacting materials which may be used together are: 1-chloro- (or other halogen) 2,6-dinitro-4-sulfonic chloride and methyl- or benzylaniline, 1-halogen-2,6-dinitro-4-carboxylic chloride and methylaniline, or methyl-4-hydroxy-3-carboxyphenylamine, 1-halogen-2,4-dinitro-6-sulfonic chloride and monomethylaniline. The condensation does not require an indifferent solvent but if a solvent is used the reaction may be effected in a ball-mill with an acid-binding substance such as CaCO_3 or NaOAc .

Azo dyes. P. CACCIA. U. S. 1,673,311, June 12. An amino compd. such as 2-amino-8-naphthol-6-sulfonic acid is coupled in the presence of NaCN with diazo derivs. of benzidine, toluidine, or dianisidine or the like to form dyes which can be used for dyeing the cotton and artificial silk in mixed goods without dyeing silk.

Trisazo dyes. HENRY JORDAN (to E. I. du Pont de Nemours & Co.). U. S. 1,674,114, June 19. Trisazo dyes of various grayish blue to gray shades are made by coupling aryl diazo compds such as those from *p*-toluidine or *p*-sulfanilic acid, aniline, xylidine, *o*-toluidine, *o*-anisidine or 1,6-Cleve's acid, as first component, with a 1,6- or 1,7-naphthylaminesulfonic acid, diazotizing and further coupling with a 1,6- or 1,7-naphthylaminesulfonic acid, diazotizing and coupling with a peri-aminonaphtholsulfonic acid. Several examples are given. Cf C. A. 22, 1692.

Dye powders. B. L. WEST (to National Aniline & Chemical Co.). U. S. 1,672,920, June 12. Niagara Blue 2B or other dry dye is triturated with a hydrated salt such as $\text{crystd. Na}_2\text{SO}_4$ until the mixt. becomes substantially homogeneous in color. The mixt. thus formed is suitable for dyeing in uniform shades.

Dye preparations. I. G. FARBENIND. A.-G., K. F. MAENNCHEN and F. HÜMMERICH. Brit. 278,890, Oct. 21, 1926. The alkali-starch prepn. used in making stable preps of vat dyes as described in Brit. 259,999 (C. A. 21, 3468) is replaced by a mixt. of dry caustic alkali and starch.

Solubilizing dyes with guanidine derivatives. R. F. ROSE (to E. I. du Pont de Nemours & Co.). U. S. 1,674,128, June 19. Pontamine yellow CH, eosin or similar dyes contg. a strongly acid group are rendered sol. in ordinary org. solvents by combining dixylylguanidine or other water-sol. disubstituted guanidine salt with a water-sol. salt of the dye such as the Na salt, by double decompn.

Benzanthrone derivative. K. ZAHN and W. ECKERT (to Grasselli Dyestuff Corporation). U. S. 1,674,351, June 19. Benzanthrone-Bz-1-amino-2-sulfonic acid is made by boiling nitrobenzanthrone with NaHSO_4 soln., dilg., acidifying, boiling and salting out. It is a dark red powder sol. in hot water with a red color and in concd. H_2SO_4 with a brownish yellow color showing a weak fluorescence and dyes wool from an acid bath bright red.

Dyeing with aniline black. CALICO PRINTERS' ASSOCIATION, LTD., L. A. LANTZ and R. WATSON. Brit. 279,164, July 20, 1926. After material is impregnated or printed with the usual mixt. of aniline salt, alkali chlorate and alkali ferrocyanide, it is heated to 110–180° in the absence of steam, then heated with steam (either at 100–105° or at higher temps.) and is finally washed in water or a weak alk. soln. Various features of app. are described.

Dyeing cellulose acetate "silk." G. REDDELIEN and GEORG MATZDORF (to Grasselli Dyestuff Corporation). U. S. 1,673,301, June 12. Suspensions are used formed from dyes of the general formula $\text{R-N:N-R'-N-(alkyl-OH)}_2$, in which R and R' represent aromatic radicals of the benzene series, e. g., the dye 4-nitroaniline-azo-dihydroxydiethylaniline.

Dyeing cellulose esters and ethers. E. FISCHER and C. E. MÜLLER (to Grasselli Dyestuff Corp.). U. S. 1,674,168, June 19. Yellow dyeings are produced by 4-

benzene-azo-2',6'-dinitro-4'-sulfodiphenylamine or other monosulfonated arylazodiarylamines contg. at least 1 NO₂ group in the diarylamine complex.

Dyeing cellulose esters and ethers. I. G. FARBENIND. A.-G. Brit. 279,133, Oct. 18, 1926. Water-sol. dinitroarylamino-diarylamines which dye animal fibers yellow to reddish brown and generally yield fast tints on acetylcellulose and other cellulose esters and ethers are made by condensing *p*-aminodiphenylamine or one of its substitution products with an aromatic dinitrohalogen compd. such as 3,5-dinitro-4-chlorobenzoic acid or one of its salts, 2-chloro-3,5-dinitrobenzoic acid or similar compds. The condensation may be effected in water, alc., pyridine or PhNO₂ with or without addition of acid-binding substances such as CaCO₃ or NaOAc. Brit. 279,135 specifies producing brown dyeings upon cellulose esters or ethers with dyes of the type just described free from sulfonic groups and contg. at least 2 nitro groups and one carboxylic group. Several examples are given.

Apparatus for dyeing hanks. W. GERBER. Brit. 279,236, Oct. 8, 1926.

Filter-press for use in dye manufacture, etc. A. M. CAPRA. Brit. 278,940, Feb. 14, 1927.

Preparing cotton fibers for dyeing with direct dyes. P. KARRER (to Chemische Fabrik vorm Sandoz). U. S. 1,673,627, June 12. Cotton fibers after partial esterification with an org. sulfonic group as by treatment with a toluenesulfonic compd. are further treated with a heterocyclic N compd. such as pyridine or quinoline which improves the affinity of the material for acid dyes. Cf. C. A. 22, 690.

Apparatus and method of printing flat and bas-relief ornamentations on textile fabrics. E. CADGÈNE and G. DUPONT. U. S. 1,673,933-4, June 19.

Producing decorative pattern effects on various surfaces with condensation products of urea and formaldehyde. BRITISH READ PRINTERS, LTD., and F. A. H. HEYNERT. Brit. 278,801, July 13, 1926.

Treating threads, yarns and fabrics of cellulosic fibers. R. VAN BUGGENHOUDT and R. HOMÉYER. Brit. 279,137, Oct. 18, 1926. Effects involving swelling and weighting are produced by dipping the material for a few min. in an alk. soln. which may be formed from a mixt. of KOH 85, tannic acid 6.5, HOAc 5, and ether 3.5%, then passing through air, and finally neutralizing and washing.

Apparatus for testing cotton strands, etc. W. A. STRAW (to Western Electric Co.). U. S. 1,672,963, June 12.

Weighting silk. F. ELÖD (to Rudolph Koepp & Co.). U. S. 1,674,356, June 19. Silk fiber is treated with a double salt of alkali metal formate and a Sn salt such as SnCl₄ and the treated material is washed to hydrolyze the Sn salt.

Viscose silk. I. G. FARBENIND. A.-G. Brit. 279,437, Oct. 23, 1926. "Viscose silk" is desulfurized by a soln. of caustic alkali or a soln. contg. an alkali salt which in hot or cold water is hydrolytically dissoed. such as salts of the higher fatty acids and other acids such as sulforicinoic acid, soaps and carbonates. Waste lyes from mercerizing, brought to a content of 1-2% NaOH, may be used. When a soap soln. is employed, the "silk" has a crackling feel.

Artificial silk. YONEKICHI TODA. Jap. 69,042, Aug. 2, 1926. After it leaves the coagulating bath the artificial silk is washed with water and treated with a sol. size in the untwisted condition. After bleaching, the woven fabric has a high luster.

Imitation linen. TSUNEICHI SAWANISHI. Jap. 69,503, Aug. 7, 1926. A union fabric is made from untreated cotton yarn and yarn treated with H₂SO₄. This fabric is treated with concd. H₂SO₄ to give it a crimped effect and the feel of linen.

Artificial wool. H. C. IZIGUX. Can. 277,412, Jan. 24, 1928. A cellulosic artificial textile resembling wool is obtained by immersing the textile to be treated in a bath contg. per l the following: 25-75 g. NaOH, 80-150 g. Na₂S and 120-200 g. Na₂S₂O₃. After immersing for 15 min., the textile is drained and passed through a tepid bath contg. 100-200 g. H₂SO₄.H₂O per l., whereby colloidal S is pptd. into the textile, which is then washed with hot water and centrifugally dried.

Preparation of effect threads. A. RHEINER. Can. 278,731, Mar. 20, 1928. Effect threads are prepd. by acetylation of vegetable fibers with a mixt. of Ac₂O, AcOH and one of the catalyzers which hitherto have been employed for the prepn. of cellulose triacetate, the acetylation being allowed to advance only to the formation of cellulose mono- and diacetate.

Wetting and cleansing textile materials. I. G. FARBENIND. A.-G. Brit. 278,752, May 22, 1925. Wetting and cleansing by aq. liquids is improved by use of sulfonic acids or their salts such as: *N*-diamyl- α -naphthylaminesulfonic acid, isopropylchloro-naphthalenesulfonic acid and isopropyl-naphtholsulfonic acid.

Degumming flax straw. L. N. GILLIS. Brit. 279,302, Feb. 15, 1927. In produc-

ing linen fiber, the straw is crushed and the shives are eliminated as far as possible and the strips are then laid in parallelism and treated for 10-20 min. with a soln. formed of NaOH 1.75 lbs., $K_2Cr_2O_7$ 3.5 oz. and water 12 gals., at boiling temp., washed with warm water and then with neutral soap soln. and then with cold water and with a bath acidulated with H_2SO_4 , and the material is dried and hackled.

Hair felt. A. L. CLAPP (to Beckwith Mfg. Co.). U. S. 1,673,967, June 19. Felt suitable for roofing or other purposes is formed on a paper machine from hair of original length, short hair and cellulosic material such as rag fiber.

Forming felted sheet material with plies of different character. I. J. NOVAK (to Raybestos Co.). U. S. 1,672,988, June 12. Mech. features.

26—PAINTS, VARNISHES AND RESINS

A. II. SABIN

British standard specifications for pigments. C. A. KLEIN. *J. Oil and Color Chem. Assoc.* 10, 355-72(1927).—A general account of the inception of the Brit. Eng. Standards Assoc. Sub-Comm. on paint materials, with special reference to the work of the Pigment Panel. The nature of the specifications evolved for dry pigments and oil-pastes is indicated, the various clauses being briefly discussed. B. C. A.

Accelerated tests for the settling of pigments in paints. SIDNEY WERTHAN and R. H. WIEN. *Ind. Eng. Chem.* 20, 729-32(1928).—An accelerated settling test is described in which the sample is kept at 65-70° for 18 hr., then centrifuged for 20 min. at 1000 r. p. m., returned to the oven for 5 hr., centrifuged again for 20 min. and this cycle repeated for 4 or 5 days, reproducing conditions typical of 2 yrs. normal storage. A special penetrometer for testing the settled pigment is described. H. STOERTZ

Some theories of pigment settling. P. R. CROLL. *Ind. Eng. Chem.* 20, 734-5 (1928).—A discussion of settling with particular reference to the effect of particle size, mech. dispersion, degree of wetting, shape of pigment particle and viscosity. H. S.

Settling of pigments in house paints. H. L. BEAKES. *Ind. Eng. Chem.* 20, 732-4 (1928).—Single pigment paints are made up with ZnO (5% leaded), sulfate white lead, Titanox, Pb_3O_4 (96-97%), asbestine, SiO_2 , barytes and china clay, and 2 double pigment paints (1) 50% Pb and 50% Zn, (2) 60% Pb_3O_4 and 40% asbestine. Settling tests are made in 10 gal. drums, % pigment at various levels being detd. from day to day by drawing samples through 5 openings. ZnO, sulfate white lead and Titanox showed marked settling in 1 month, asbestine in 18 days, SiO_2 in 11 days, Pb_3O_4 in 9 days and barytes in 2 days. The 50-50 Pb-Zn showed marked settling in 6 days, but the 60-40 Pb_3O_4 -asbestine showed practically no settling in 1 month. H. S.

Effect of weathering on the heat-reflecting efficiencies of paints on metal tanks. H. A. NELSON and R. W. JAMIESON. *Ind. Eng. Chem.* 20, 702-5(1928).—Five different paints are tested: (1) 2 coats of a flat paint followed by 2 coats of 100% ZnO oil enamel, (2) 3 coats of a white Zn pigment paint that chalks away on exposure, (3) 3 coats of medium gray industrial metallic Zn pigment, (4) 2 coats of Al paint, (5) 1 coat of a black oil enamel. The loss in efficiency as detd. by heat reflection based on the black surface as a standard is in 11 months exposure to weather for the metallic Zn paint—50%, for the Al paint—50%, for the white enamel—60% and for the white paint—10%. H. STOERTZ

Coal-tar paints as metal preservatives. A. V. SIVOLOBOV and A. I. IUZHILIN. *J. Chem. Ind. (Moscow)* 3, 1308-10(1926).—Coal-tar paints, which usually contain fillers such as portland cement, lime, etc., and a thinner such as kerosene or light fractions of coal-tar distillates, are not harmful to iron and preserve it from rusting as long as the coat of paint remains intact. For painting iron roofs, however, these paints can replace oil paints only on condition of renewing the coat of paint every year, since they are very apt to soften in summertime and weather-off. An account is given of various expts. concerning the speed of drying of these paints and their anti-corrosion effect. BERNARD NELSON

Vanadium compounds as driers. F. HEBLER. *Farben-Ztg.* 32, 2077-8(1927).—Polemical with Swehten (C. A. 21, 1716) and with Rhodes and Chen (C. A. 16, 1325). V driers accelerate the rate of O-absorption of linseed oil films, but retard their actual drying. Boiled oil films contg. 0.1% and 0.2% of V remained tacky for more than 1 week, while the original raw linseed oil dried in 5 days. The wrinkling of films reported by Swehten is also not confirmed, and his exptl. conditions are queries. The field of application of V as a com. drier is considered to be problematical. B. C. A.

Oil absorption of lithopone. E. KLUMPP. *Farben-Ztg.* 32, 1491-2(1927).—A general discussion on lithopones of high and low oil absorption and their suitability for various purposes. The opacity of paints based on lithopone of low oil absorption is gained at the expense of durability, whereas lithopone paints of high oil absorption are durable, but have relatively poor hiding power. B. C. A.

Formulation of nitrocellulose lacquers. H. E. HOFMANN AND E. W. REID. *Ind. Eng. Chem.* 20, 687-93(1928).—By means of triangular coordinate charts, the properties of lacquers as influenced by the nature and proportion of volatile and non-volatile constituents are studied. The effect of possible variation in nitrocellulose, resin, plasticizer, solvent and thinner upon such properties as gloss, adhesion, flexibility, hardness, durability, blushing, lifting and brushing properties is discussed from the standpoint of the formulation of new lacquers. Data obtained from tests are used to formulate a com. lacquer, having the compn. before thinning: nitrocellulose 10, ester gum 10, dibutyl phthalate 5, Titanox pigment 10 and solvent mixt. 65% (toluene 70, denatured alc. 10, Et acetate 10, cellosolve 10%). This gives a satisfactory clear, smooth film. H. STOERTZ

Characteristics and treatment of insulating varnishes. P. B. COCHRAN AND H. J. GRAHAM. *Ind. Eng. Chem.* 20, 698-701(1928).—Oil varnishes of the type contg. gum rosin ester, asphalt or copal, and used in the insulation of coils and impregnation of tape or cloth, are treated with ozonized air in the baking process with a resultant saving in time of 40-50%. A prebake of the unvarnished piece in ozonized air also shortens the drying time, an asphalt varnish drying in 60 min. at 110° dried in 18 min. at 140°. The effect of ozone on cotton insulation was tested, an increase in tensile strength of 20 to 30% being obtained. H. STOERTZ

Manufacture and use of amberol-type resin varnish. A. E. STAUDERMAN AND H. L. BEAKES. *Ind. Eng. Chem.* 20, 674-6(1928).—A synthetic resin varnish for general interior and exterior use is formulated as follows: 100 lb. Amberol, 30 gals. China wood oil and 51 gals. thinner. Mineral spirits is the best thinner, followed by benzine as 2nd choice, solvent naphtha and turpentine giving soft cheesy films. A study of driers shows that liquids contg. single metals while slow in drying have no tendency to skin over. The drying time of this varnish is 4 to 5 hr., permitting 2 coats to be applied in 1 day. It is gas proof, draft proof, and stands up well in H₂O and NaCl solns. It also seems to have desirable properties as a primer under lacquers or enamels. H. STOERTZ

Demonstration of a method of measuring particle sizes in ground powders (RAMSDEN) 2. Decimal classification of colors (RUTHARDT) 2. The value of Pb paint for purposes of protection of iron (EIBNER, LAUFENBERG) 9. Aromatic amino compounds [for use as pigments] (Brit. pat. 279,283) 10. Iron oxide [pigment] (Can. pat. 278,167-8-9) 18.

INTERNATIONAL LABOUR OFFICE: **White Lead**—data in regard to the use of white lead in the painting industry. London: P. S. King. 414 pp. 9s., net.

Color bases for paints. J. S. WILSON, J. THOMAS and SCOTTISH DYES, LTD. Brit. 278,765, April 12, 1926. An aq. paste of a vat dye such as Caledon Blue, Caledon Jade Green or Caledon Red are mixed with liquids such as castor or linseed oils or turpentine and the water is distd. (preferably *in vacuo*) to obtain a color for use in varnishes or paints.

Titanium pigments. C. A. KLEIN and R. S. BROWN. Brit. 278,791, July 8, 1926. In a process such as described in Brit. 243,081 (C. A. 20, 3826), BaCO₃ is added to the water into which the paste of Ba and Ti sulfates is run and is converted into BaSO₄ by the H₂SO₄ liberated by the hydrolysis which occurs. Small quantities of HCl or BaCl₂ or NaCl also may be added.

Paint emulsion. C. L. YOUNG and C. A. PROSSER. Can. 279,341, Apr. 10, 1928. A plastic and paint consists of a mixt. of the following approx. proportionate quantities: 40 lbs. whiting, 2 gals. water, 1.5 lbs. hide glue, 1 gal. linseed oil, 8 lbs. resin, 1 gal. benzine, 0.25 lb. salicylic acid and 1 oz. cobalt blue.

Printing ink. J. J. JAKOSKY. U. S. 1,673,245, June 12. A C-bearing oil such as a hydrocarbon oil suitable for use as a vehicle in printing ink is locally heated (in an app. which is described and which may include an elec. resistance heater) to dissoc. a portion of the material into C black and gaseous products and the C thus formed is distributed through the undissocd. portion of the body of oil under treatment; this

treatment is continued until sufficient C is formed and distributed in the oil to form a printing ink.

Printing ink. IWAQ KAWABATA. Jap. 69,035, Aug. 2, 1926. Lake pigments are kneaded with rosin-oil and mixed with gum soln. in volatile oil. $MgCO_3$, $CaCO_3$, $Al(OH)_3$, ZnO , etc., may be added. The product is used as a gravure printing ink for mono- or multicolor printing.

Nitrocellulose lacquer. C. L. GABRIEL and C. BOGIN (to Commercial Solvents Corporation). U. S. 1,673,111, June 12. Nitrocellulose 1 lb. is dissolved in 1 gal. of a solvent mixt. contg. normal $BuOAc$ 10, $EtOAc$ 30, benzene 25, toluene 20 and xylene 15%.

Lacquer composition. J. G. DAVIDSON. Can. 278,931, Mar. 27, 1928. A lacquer compn. contains a polymerized vinyl ester of an $AcOH$ compd., a solvent therefor and a cellulose ester.

Resins from gutta-percha or balata. A. B. CRAVEN and YORKSHIRE DYEWARE & CHEMICAL CO., LTD. Brit. 278,922, Jan. 1, 1927. The semi-fluid resin extd. from crude gutta-percha or balata may be treated with a small quantity of lime to neutralize free acids and may be treated with a small proportion of a siccativ such as Mn resinate and then blown with air while heated to about $80-100^\circ$ for 10 hrs. to obtain a solid resin.

Molded articles of fabric and phenolic resin. S. BROWN (to Bakelite Corporation). U. S. 1,673,797, June 19. In making articles such as sheets, gears or gaskets, threads of fibrous material are impregnated with a phenol resin in colloidal suspension, and after drying and weaving, the resulting fabric is molded.

Resinous composition. E. A. DANIELS and H. S. SNELL (to Western Electric Co.). U. S. 1,673,803, June 19. A compn. suitable for use as a binder in mixts. for molding is formed by condensation of a guanidine such as triphenylguanidine with shellac or other suitable resinous exudation. U. S. 1,673,804 specifies aldehyde ammonia instead of the guanidine. U. S. 1,673,805 specifies an aminonaphthalene. U. S. 1,673,806, specifies diphenylamine or other secondary amine of the aromatic series. U. S. 1,673,807 specifies an addn. product of piperidine and CS_2 . U. S. 1,673,808 specifies $Na \beta$ -naphtholate.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Trend of chemical research in the oil industry. DAVID WESSON. *Oil and Fat Ind.* 5, 165-6(1928). L. C.

Composition of the fatty acids of palm oil. ARCHIBALD RAYNER and SIDNEY G. CAMPBELL. *J. Soc. Chem. Ind.* 47, 149-50T(1928); cf. *C. A.* 21, 2195--. The titer and I no. and solid acid content of palm oils may vary considerably according to the source of the oil. The difference in these characteristics is due to variations in the amt. of solid acids present, and not to any great variation in the compn. of the latter. The proportion of stearic acid in the solids is considerable and varies from 12.5 to 18.5%. The liquid acids calcd. from the I no. contain, on an av., 20% linoleic and 80% oleic acid.

E. SCHERUBEL

The Halphen reaction for cottonseed oil as a general reaction for oils of the Malvaceae, Tiliaceae and Bombacaceae. SERGIUS IVANOV. Mendeleejew Institute, Moscow. *Ber. deut. botan. Ges.* 45, 588-91(1927).—The Halphen reaction (cf. *C. A.* 7, 3245) was positive with the oils of the families mentioned. Oils from the Sterculiaceae gave a negative reaction.

LAWRENCE P. MILLER

A micro-analytical method for rapid determination of the saponification number. EWALD MATTHIES and HERMANN ZIEGENSPECK. *Bot. Archiv.* 15, 187-8(1926); *Biol. Abstracts* 1, 240. —By use of a concd. KOH soln. (6:10 in water), sapon. of fats and oils takes place smoothly and rapidly. From this M. and Z. developed a micro-method which enabled them to det. accurately the sapon. no. of 3 drops or even of 1 drop of fat. Into a dry reagent glass put 3-4 drops of fat; weigh, by difference of container before and after, on a Pregel micro-balance; add 0.15 cc. KOH (6:10 in water) and the same quantity in a 2nd reagent glass as blank. To the 1st glass add 6 drops alc. and saponify on a flame until bubbles arise. After cooling, dissolve the soap in 2 cc. acid-free alc. to which phenolphthalein has been added (3 drops to 20 cc.). Titrate from microburet with 0.25-0.1 N acid. Titrate the blank, and from the difference, calculate the sapon. no. in the usual way.

H. G.

The colloid principle as applied to creams, soaps and pastes. W. VAN ALAN CLARK. California Perfume Co. *Aromatics* 9, No. 1, 19, 46(1928).—The "rotor" type of colloid mill is more simple and effective for general cosmetic uses than is the high-pressure type. The clearance space of 0.005 in. between the grinding faces of such a mill reduces the material to particles of about 3 to 5 microns. This not only insures perfect distribution of the ingredients, but sometimes greatly affects the chem. reactions involved, thus necessitating a new technic in premixing the ingredients. For instance, a shaving cream made by introducing stearic acid and coconut oil simultaneously produces lumps of stearic acid soap floating in a mixt. of alkali soln., free coconut oil and some coconut oil soap, whereas cooking coconut oil and alkali with steam for 1 hr., adding melted stearic acid to alkali for a few min., mixing the two soaps and transferring immediately to the colloid mill produces a neutral shaving soap of extra fine quality and does away with aging. The varying speed with which different soaps are saponified sets the procedure to be used.

WILHELM SEGERBLOM

Soaps for silk. FRED GROVE-PALMER. *Dyer, Calico Printer* 59, 210-1(1928).—In the silk mill, a curd soap of high quality is satisfactory for the soaking, but not for the degumming process. Typical analyses of three types of soap found satisfactory for the latter process are given. The soaps include one made from a sol. sulfonated linseed or castor oil, a pure oil soap and a green olive oil soap.

RUBY K. WORTNER

"Physiol." K. RIETZ. *Seifensieder Ztg.* 55, 157-9(1928); cf. *C. A.* 22, 1867.—R rejects "Physiol" as a soap accessory, since it is expensive and practically useless.

P. ESCHER

Seed fats of the Umbelliferae (HILDITCH, JONES) 11D. Electrolytic method for a stationary Ni catalyst for a continuous hydrogenation process (SVIZUIN) 4.

Fat or oil emulsion. O. RÖHM. *Can.* 280,578, May 29, 1928. An emulsion comprises a mixt. of fat or oil, freshly pptd. $Al(OH)_3$ and urea.

Refining fats and oil. HONEN OIL CO., LTD. *Jap.* 69,084, Aug. 11, 1926. Fats and oils are decolorized and deodorized by heating in two stages, first at a lower temp. and then at a higher temp. under reduced pressure by superheated steam at 200°. They are cooled out of contact with air.

Oil and food products from oleaginous seeds. E. A. ANDRE. *Brit.* 279,122, Oct. 15, 1926. Seeds such as linseed, sunflower and sesamum seeds or their cakes are defatted with solvents and then milled; e. g., linseed meal, after treatment with a neutral solvent, is divided by sifting into episperm and kernel and the latter may be treated with proteolytic enzymes.

Apparatus for distillation and recovery or solvents used in oil extraction. L. J. SIMON and SIMON BROS. (ENGINEERS), LTD. *Brit.* 278,815, July 19, 1926.

Apparatus and system for extracting oils with solvents. J. SAVAGE. *Brit.* 278,891, Oct. 22, 1926. Moist oleaginous materials are subjected to extrn. by circulating through them the vapors of a volatile solvent; the extd. water and solvent are condensed and sepd. and the solvent is returned to the extrn. chamber at a temp. just below its b. p. at the pressure existing in the app. Various details of the app. are described.

Cleansing composition for removing grease paints and other "make-up." H. BÖHM (to Chesavon-Fabrik Chem. Techn. Pharm. Präparate Ges.). *Brit.* 279,454, Oct. 19, 1926. Compns. are formed mainly of soap and $NaHCO_3$. The $NaHCO_3$ may be in much larger proportion and the compn. may also contain Na_2CO_3 , water, glycerol or other suitable substances.

Montan wax. W. PUNGS and M. JAHRSTORFER. *Can.* 279,448, Apr. 17, 1928. The properties of montan wax are improved by treatment with CrO_3 in the presence of glacial $AcOH$ and small quantities of H_2SO_4 .

Montan wax. W. PUNGS and M. JAHRSTORFER. *Can.* 279,449, Apr. 17, 1928. The wax esters are sepd. by treatment with concd. $AcOH$.

28—SUGAR, STARCH AND GUMS

F. W. ZERBAN

Electricity in sugar refining. LOUIS LEUREY. *Elec. World* 91, 1003-9(1928).—Thirteen illus.

C. G. F.

The importance of decolorizing carbon in the production of glucose from starch. F. EDEL. *Z. Spiritusind.* 50, 351-2(1927).—An activated carbon, Carboraffin, its

action and regeneration are discussed. By means of this carbon a process requiring 3 days with boneblack can be completed in 1 day.

C. N. FREY

Centrifugal treatment of cane juices. P. HONIG AND W. F. ALEWYN. *Arch. Suikerind.* 36, III, 333-70(1928).—During the last crop several expts. were made with a centrifugal to treat juices and molasses for the purpose of finding out at which station of the factory the use of a separator would be most profitable. Most of the expts. were run with a small De Laval centrifugal, type 300, 16.5 cm. diam.; a few were made with a larger type. The results are given in tables, recalcd. for a com. machine. It is not considered practical to centrifuge raw juice, defecated juice or muds contg. too much suspended matter, because the cleaning causes too much loss in capacity. Centrifuging thin juice is not advisable because during evapn. a new ppt. is formed. But treatment of sirups and run-offs will give the best results. The quantity of suspended matter was in 2 expts. as high as 15 g. per l. in sulfitated sirup. Special attention was paid to the sepn. of the wash of white sugar centrifugals which have always given much trouble. Though the quantity of sepd. matter was not as great as in the case of sirup, its nature was entirely different. To study the effect of centrifugal sepn. on the boiling process, several tests were made in a small vacuum pan, of 75 l. capacity. In 2 of these tests the boiling time for centrifuged sirup was less than the time for the untreated sirup; the sugar from the centrifuged sirup was of a brilliant white color, while that from the original sirup was a gray, dull product. The difference in boiling time and in the appearance of the product in the tests with wash of white sugar centrifugals was even greater. The boiling of the centrifuged wash resulted in a massequite of even grain, very easy purging, while the strike from the untreated wash took much more time, purged badly and gave a very uneven grain. Boiling tests with molasses showed a favorable effect of centrifuging on the crystn. and on the quality of the product. The sucrose content of the sediment from sirup and wash may be too high to let it go to waste; but mixing with a small amt. of H₂O, liming to p_H 8.5 and filter pressing gave satisfactory results. Analytical methods used. M. v. D. KREKE. *Ibid* 370-5.

P. R. PEKELHARING

Unifying cane-sugar fabrication and refining. W. D. HORNE. *Ind. Eng. Chem.* 20, 680-2(1928).—One concern in Cuba makes raw sugars of 99 purity and over by super-defecation (*C. A.* 18, 1402, 2615) in several plants. The sugar is dried in single granulators, stored and transported in bulk and washed from gondola cars directly into the melter of the refinery, without further affination. The melt is very easy to filter, and the bone char lasts much longer than when used on ordinary raws. The yield is better, and remelts are greatly reduced. Overhead expenses are also lessened by combining the 2 operations. "This movement may bring about a radical redistribution of the cane-sugar refining industry of the world."

F. W. ZERBAN

Experiments with imported sugar canes. G. L. FAWCETT. *Rev. ind. agr. Tucumán* 17, 235-64(1927); cf. *Rev. ind. agr. Tucumán* 14, 89-108(1924).—A tabulated report of expts. extending over the years 1923-6.

MARY JACOBSEN

Preservation of cane and orange juice with sodium benzoate. ALEJANDRO S. ÁLVAREZ. *Rev. ind. agr. Tucumán* 18, 35-7(1927).—Fermentation of cane juice was prevented for 24 hrs. by 0.01%, for 48 hrs. by 0.05% BzONa. With increasing BzONa concn. the tendency to fermentation decreased. It was delayed 1 month by 0.11% and even longer by 0.12-0.14%, but the juices were bitter, the glucose content increased from 0.88 to 2.579% and the purity decreased from 81.17 to 58.62%. Orange juice was preserved 11-14 days by 0.01-0.05% BzONa. After 3 weeks decompn. was indicated by cloudiness and slightly altered taste. Juices contg. 0.1% BzONa presented after 1 month a normal appearance but an altered taste. The content in reducing sugars rose from 3.97 to 4.63%; the polarization fell from 3.61 to 2.73%. M. J.

Influence of hyposulfites on [beet] sirups. J. ZAMARON. *Bull. assoc. chim. suc.* 44, 426-8(1927).—In lab. tests on beet sirups of about 65° Brix, treated with hyposulfite and then heated to 95° before filtration, no improvement in color was perceptible with less than 1 g. of hyposulfite per l., and the purity of the sirups was practically unchanged. Sulfited factory sirups treated with 40 g. of hyposulfite per hectoliter at 70° and then heated to 95° before filtration underwent a slight amt. of inversion although alk.

B. C. A.

Influence of the hydrogen-ion concentration and of lead salts on saccharase and the preservation of beet pulp for analysis. E. PARISI. *Ist. Superiore Agrario Bologna. Ann. chim. applicata* 18, 99-103(1928).—Attempts to preserve pulp and juice by org. antiseptics (thymol, HCHO, Et₂O and salicylic acid) and by HgCl₂ have given unsatisfactory results, for the polarization decreases rather rapidly in their presence. A survey of earlier expts. by other investigators suggested that the destruction of sucrose

might be prevented by metallic ions, provided that the p_H value was high enough (cf. Euler and Myrbäck, *C. A.* 17, 113). Very active saccharase solns. prepd. by the method of Willstätter and Racke (*C. A.* 16, 938, 3320) were first tested. Thus a fraction of a cc. of the soln. added to 100 cc. of 10% aq. sucrose inverted all the sucrose rapidly at room temp. When the same sucrose soln. was made alk. with 4 cc. of Pb acetate (p_H 7.1) before addn. of the enzyme, its optical rotation remained unaltered after 48 hrs. at 40°, but if then acidified with AcOH, the polarization began to diminish at once. The same preservative action of Pb(OAc)₂ in alk. medium was found with beet pulp and juice. Expts. indicate that excellent results are obtained by using 177 cc. of 4% aq. basic Pb acetate per 26 g. of pulp or juice, the polarization remaining unchanged at the end of 1 month (the longest time tested). Samples may thus be preserved sufficiently long for all exigencies arising in analytical practice. Pulp prepd. by grating, treated with toluene and sealed immediately from air showed a diminishing sucrose content, as judged by polarization measurements. Since under these conditions microorganisms cannot develop and form invertase, it is possible that an invertase is originally present in the roots. This problem is under investigation. C. C. DAVIS

Desaccharification of molasses by the acetic acid method. G. MEZZADROLI, I. MUTTI AND A. PIOMBO. *Zymologica* 2, 121-36(1927).—The exptl. results obtained confirm the possibility of desaccharifying molasses by the acetic acid process (cf. Rajtóra, *C. A.* 19, 743). The industrial feasibility of the process depends on the prices of sugar, molasses and acetic acid, the extent of the loss of acetic acid and the cost of redistilling and cong. the recoverable acid. B. C. A.

Modified scale for Pfund color grader for use on dark sirups. J. J. WILLAMAN. *Ind. Eng. Chem.* 20, 701(1928).—Dark sorghum sirups cannot be read on this instrument. But when the thickness of the wedge was increased by inserting plates made of the same glass, the logs of the color values plotted against the no. of the glass plates inserted gave straight lines. On the basis of this observation the scale of the app. has been extended, showing color values with 1, 2 and 3 glasses inserted. The plot and the new scale are illustrated. F. W. ZERBAN

Action of formaldehyde on sodium hydroxide. P. MALVEZIN. *Bull. assoc. chim. ser.* 44, 441-2(1927).—The reactions described by Mestre (*C. A.* 22, 1870) were studied previously by M. B. C. A.

Identification of mill starches by the use of the microscope and camera. A. H. GRIMSHAW. *Textile World* 73, 3692-5(1928).—A description of app. and method. Illustrated. RUBY K. WORNER

The determination of soluble carbohydrates (APPLEMAN, *et al.*) 7.

29—LEATHER AND GLUE

ALLEN ROGERS

Fixation of aluminum by hide substance. ARTHUR W. THOMAS AND MARGARET W. KELLY. Columbia Univ. *Ind. Eng. Chem.* 20, 628-32(1928).—When hide substance is treated with the normal chloride or sulfate of Al and then washed with H₂O, practically all the adhering Al salt is removed. Upon raising the p_H value of the soln., increasing amts. of Al are irreversibly fixed. Up to p_H 3.65 the chloride excels the sulfate as a tanning agent, but above this p_H value the sulfate excels, since the chloride is pptd. by further additions of alkali. The max. fixation obtained was 3.5 g. Al₂O₃ per 100 g. hide substance. Optimum concn. of Al salt is about 0.2 N. Complete tannage is obtained in a few hrs. NaCl decreases slightly and Na₂SO₄ decreases markedly the fixation of Al. H. B. MERRILL

Fixation of iron by hide substance. ARTHUR W. THOMAS AND MARGARET W. KELLY. Columbia Univ. *Ind. Eng. Chem.* 20, 632-4(1928); cf. preceding abstract.—In contrast to Al, Fe is irreversibly fixed by hide substance from solns. of the normal salts. Fixation increases with the basicity of the salt. Fixation is exceedingly rapid. NaCl diminishes the fixation, but Na₂SO₄ shows either a slight inhibiting or a slight accelerating effect upon the fixation of Fe, depending upon the basicity of the Fe salt. This behavior of sulfate is different from its behavior in solns. of Al or Cr salts. H. B. MERRILL

The soaking of dried hides. VITTORIO CASABURI. *Cuir tech.* 17, 178-83(1928); cf. *C. A.* 22, 2487.—Forty g. portions of Bahia dried skin were immersed in 300 cc. of solns. of various salts. At intervals of 24 hrs. they were allowed to drain for 1 hr. and

weighed: soaking was considered complete when the wt. did not increase during 24 hrs. The vol. of the remaining liquid was then measured and its p_H , solid matter and N were detd. Expts were conducted at 15° and 24°, with distd. H_2O , with 0.02 *N* NaOH, NaSH, KCNS, NaCl, Na_3AsO_3 , and Na citrate, and with 0.6 g. $CaCl_2$ per l. The best results were obtained with KCNS, Na_3AsO_3 and Na citrate. J. G. N.

Tanning materials from cellulose. RENÉ ESCOURROU. *Cuir tech.* 17, 155-66 (1928) — Exts obtained as by-products in the sulfite process of paper manuf. are of value only when used in conjunction with other tannins. Liquid exts. are preferable; the acidity, p_H , tannin and non-tannin content ought to be such that when blended with other tanning materials the resulting liquors will have desirable properties. Analytical figures are given. J. G. NIEDERCORN

The microscopic examination of vegetable tannins by means of polarized light. B. AVENATI-BASSI AND G. A. BRAVO. *Boll. ufficiale staz. sper. ind. pell. mat. concianti* 6, 108-16 (1928).—Woods from chestnut, oak-tree, quebracho and bark from larch, silver fir, red fir, mangrove and mimosa were examd. under the microscope and polarization microscope. G. SCHWOCH

Vegetable tanning. III. The mechanism of the dehydration of lyophilic colloid by tanning agents. H. G. BUNGENBERG DE JONG. *Rec. trav. chim.* 46, 727-38 (1927); cf. *C. A.* 17, 3622; 18, 599, 2263.—Data are reported for 0.08% agar solns. treated at 40° and at 50° with tannin in concns. from 0 to 39.58% Tannin dehydrated this hydrophilic colloid and produced opalescence in concns below 1%. At concns. of about 22% flocculation occurred. At concns. above 35% the sols were again clear. Viscosity measurements show that the viscosity due to addn. of tannin decreases as opalescence and flocculation appear and increases again as the sol becomes clear. At 50° the changes occur at lower concns. of tannin than at 40°. Some electrolytes were present in the tannin. When aq. solns. of tannin are cooled, they sep into 2 liquid phases. The heterogeneous region lies toward the water side of the system. Other "amorphous" and cryst. tanning agents show similar phenomena of heterogeneity. All factors which influence heterogeneity of aq. tannin solns. (such as temp., p_H , or presence of glycol or glycerol) also affect in a similar way the dehydration of hydrophilic colloids induced by tannin. This is readily explained if one assumes that tannin seps. in the tannin-rich layer on the particles dehydrated. The active part of the mol. would be toward the article dehydrated and the phenolic group would not take up water readily. The tannin might be one or more than 1 mol. layer in thickness. If the tannin is so concd. that there is but one phase present the lyophilic condition is re-established. Max. dehydration should increase with decreasing temp. Expts. verify this assumption. F. E. BROWN

Effect of egg yolk on the distribution of oil in chrome calf leather. HENRY B. MERRILL. *Ind. Eng. Chem.* 20, 654-6 (1928).—By means of the technic previously described (*C. A.* 22, 1248) it is shown that when egg yolk, white or whole egg is added to a sulfonated neatsfoot oil fat liquor a larger fraction of the total oil absorbed by the leather is taken up by the flesh side as compared to the grain side. A tentative explanation, based on the effect of egg in coarsening the texture of the emulsion, is offered. H. B. MERRILL

Bactericidal action [in tanning processes] of chromium salts and its general origin. S. HILPERT, L. PANETH AND E. SCHLUMBERGER. *Z. angew. Chem.* 40, 1080-9 (1927).—Two factors must be considered separately, viz., the direct action of acidity on bacteria, and the influence of acidity on the action of Cr salts on protein. With *Staphylococci* the action of acidity persists up to p_H 3, and with *B. coli* up to p_H 2; beyond this the action of the Cr salt supervenes. With *Staphylococci* and a 0.01% soln. of chrome alum there is a feeble bactericidal action up to p_H 4, due to acidity. At p_H 4.29 the reaction between the Cr salt and protein begins, and reaches a pronounced max. at p_H 4.46. As neutrality is more nearly approached this action disappears again. *B. coli* gives a max. at the same p_H value, but is more resistant to acidity. Com. green $Cr_2(SO_4)_3$, which is a stronger tanning agent than chrome alum, exerts a more powerful bactericidal action at the optimum p_H value than the latter. B. C. A.

The manufacture of glace kid. G. HUGONIN. *Cuir tech.* 17, 150-5, et seq. (1928).—A description. J. G. NIEDERCORN

Progress in the glue industry, in 1927. R. KISSLING. *Chem. Umschau* 35, 109-11 (1928).—A brief review of the literature of 1927, with a list of 67 references. P. E.

Tanning. F. S. Low. *Can.* 278,390, Mar. 6, 1928. In the tanning of leather, the hide is exposed to the action of a soln. contg. chromous chloride under conditions per-

mitting oxidation of the chromous chloride to basic chromic chloride. Cf. C. A. 21, 3140.

Tanning shark skins and similar fish skins. A. EHRENREICH. Brit. 278,885, Oct. 14, 1926. The skins are tanned previous to removal of the dermal armor, the latter is then removed, and the skins are then subjected to a supplementary tanning, e. g., by sumac, sulfite cellulose ext., chrome alum or other tanning substances.

Composition for treating hides and skins. H. DODGE. Can. 279,525, Apr. 24, 1928. A compn. of matter for the treatment of hides and skins consists of Na_2CO_3 , Na_2SO_4 , niter and CH_2O . Cf. C. A. 22, 1494, 1701.

Transparent gelatin sheet. E. M. KRATZ. Can. 277,373, Jan. 24, 1928. A gelatin sheet comprises 40–94% gelatin, 5–60% of 4–10% sulfonated castor oil, 1% or less of orthophosphoric acid and a dyestuff.

Gelatin solutions. I. G. FARBERIND. A.-G. Brit. 279,443, Oct. 20, 1926. Gelatin is peptized in the presence of water by an alkali or alk. earth hydroxide and an org. solvent or diluent is added. By mixing the soln. thus prepd. with an org. acid such as HIOAc the p_{H} of the product may be varied. MeOH , EtOH , C_6H_6 and Ba(OH)_2 may be used in prepg. different solns.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

The use of the analytical quartz lamp in the rubber laboratory. F. KIRCHHOFF. *India Rubber J.* 75, 791–3(1928).—See C. A. 22, 2291. C. C. DAVIS

The distribution of compounding ingredients in rubber mixings. ST. REINER. *India Rubber J.* 75, 795–6(1928).—See C. A. 22, 2290. C. C. DAVIS

New rubber compression testing machine. C. L. HIPPENSTEEL. *Bell Labs. Record* 5, 153–5(1928).—A new type of machine of improved mech. construction has been developed for use in the compression test already described (C. A. 20, 1921).

The resistance to extension of vulcanized rubber. II. R. ARIANO. *India Rubber J.* 75, 759–61(1928); cf. C. A. 20, 3362.—An English version of C. A. 22, 2081. C. C. DAVIS

C black from mixtures of C_2H_2 and other hydrocarbons (U. S. pat. 1,673,496) 18. Non-oxidizing jelutong product (U. S. pat. 1,674,435) 18. Surgical plaster (Brit. pat. 279,030) 17. Insulated electric wires and cables (U. S. pat. 1,674,156) 13.

MORELLET, F.: Étude sur la dévulcanisation du caoutchouc. Paris. G Doin et Cie. 16 pp. F. 2.

VISSER, W. DE. The Calendar Effect and the Shrinking Effect of Unvulcanized Rubber. Translated from the original Dutch. London: Crosby Lockwood & Son. 152 pp. 15s. Reviewed in *J. Franklin Inst.* 205, 901(1928).

Treating latex. M. R. DAY (to Rubber Latex Research Corporation). Brit. 279,336, Jan. 3, 1927. Stabilization of latex is effected by adding a small proportion of blood or its constituents such as defibrinated blood, serum or "red end" (hemoglobin). The product may be coagulated by acids when desired but does not coagulate by agitation or addn. of fillers.

Treating latex. W. A. GIBBONS and J. MCGAVACK (to U. S. Rubber Plantations). U. S. 1,673,672, June 12. Latex is treated with a material such as a salt of sulfonated undecylinic acid which prevents coagulation but permits bacterial action and is allowed to stand until the protein constituents of the latex are substantially decompd. and is then dried to form a film which has a pitted surface and is substantially transparent

Rubber latex packing or gaskets. F. CARL. Brit. 279,342, May 24, 1927. In making packings, gaskets, bottle closures and the like as described in Brit. 259,987 (C. A. 21, 3490), the fillers are omitted and thickened or concd. vulcanized latex is used with or without addn. of unvulcanized latex. S, ZnO, etc., may be used for vulcanizing.

Uniting fabric seams with latex. C. C. LOOMIS and G. E. PERRY (to U. S. Rubber Co.). U. S. 1,673,573, June 12. A partially coagulated latex in paste form and contg. vulcanizing ingredients is applied between superposed fabric edges such as those of cotton or jute and the material is pressed and vulcanized.

Electrodeposition of rubber, etc. ANODE RUBBER CO., LTD. Brit. 279,474, April 15, 1926. In electrodeposition of rubber or the like from dispersions, substances are incorporated with porous molds which increase the cohesion of the rubber particles, *e. g.*, compds of Ca, Mg, Ba, Zn, Fe or Al, or highly absorptive org. bases, esters or urethans. The addn. of NH_3 or NH_4 salts assists soln. and renders the soln. alk. Carbonates produced in molds are removed by an acid to prep. the molds for further use.

Retarding oxidation of rubber. S. M. CADWELL (to Naugatuck Chemical Co.). U. S. 1,673,549, June 12. Before vulcanization there is incorporated with rubber an accelerating aldehyde-aliphatic amine condensation product in excess of that required to secure proper vulcanization. Cf. C. A. 21, 2200.

Sponge rubber. T. W. MILLER (to Faultless Rubber Co.). U. S. 1,674,053, June 19. A quantity of vulcanized sponge rubber particles is incorporated into unvulcanized sponge rubber stock together with addnl. "blowing agent" and the mixt. is formed and vulcanized.

Rubber articles from aqueous rubber dispersions. M. C. TEAGUE (to American Rubber Co.). U. S. 1,673,649, June 12. In forming coatings or other articles a body of dispersion such as latex is disposed in a relatively thick layer in the presence of a hydrophilic agent such as glycerol or an NH_4 soap and is exposed to drying conditions so that moisture is substantially uniformly withdrawn from all parts of the body without formation of a dried surface film.

Tanks lined with guayule or its mixtures with rubber, etc. SOC. ELECTROMECANIQUE D'APPAREILLAGE POUR L'ESSENCE. Brit. 279,291, Dec. 31, 1926

Vulcanization. D. H. POWERS. Can. 278,942, Mar. 27, 1928. Rubber is combined with a vulcanizing agent and a compd. obtainable by the chem. combination of not less than 2 mols. of an aldehyde and 2 mols. of a primary amine with a whole number of mols. less than 3 of CS_2 .

Vulcanizing rubber. D. H. POWERS (to E. I. du Pont de Nemours & Co.) U. S. 1,674,122, June 19. Oxyethyl- (or butyl-) thiocarbonic monosulfide or similar compd. is used as an accelerator. Conjoint use of an amine such as aniline further expedites the vulcanization.

Vulcanizing rubber. A. C. BURRAGE Brit. 279,280, Jan. 4, 1927. As an accelerator there is used an aryl substituted guanidine having an alkyl substituent in the *o*-position, *e. g.*, di-*o*-tolylguanidine (which may be made by heating di-*o*-tolylthiourea, produced by the reaction of CS_2 on *o*-toluidine, with PbO in the presence of NH_4NO_3 and alc. and neutralizing the filtrate with NaOH) Cf. C. A. 21, 1724.

Vulcanizing rubber. S. M. CADWELL (to Naugatuck Chemical Co.). U. S. 1,673,550, June 12. Dimethylthiocarbamyl-*p*-toluenethiolsulfonate or other compds. contg. the group S.SO_2 are used as accelerators.

Accelerator for vulcanizing rubber. H. O. CHUTE. U. S. 1,673,801, June 19. In prepg. an accelerator, magnesia and an aromatic amine such as aniline are mixed without heating and CS_2 is gradually added while keeping the mixt. cold and without evolution of substantial quantities of H_2S and the material is then heated to a temp. not exceeding 140° until evolution of gas has substantially ceased.

Vulcanization accelerator. W. SCOTT. Can. 278,941, Mar. 27, 1928. A rubber vulcanization accelerator is made by treating with CH_2O the condensation product of aniline and a straight-chain aldehyde contg. a plurality of C atoms.

Apparatus and method for vulcanizing rubber tire tubes, etc. W. L. FAIRCHILD. U. S. 1,673,352-3, June 12. Steam is injected into the tube for vulcanization and the tube is subjected to a swinging movement to dislodge any deposits of water which may condense within the tube.

Rubber compound. A. M. KINNEY. Can. 280,213, May 15, 1928. A rubber compd. contains rubber, vulcanizing constituents and naphthenic compds.

Adhesive rubber composition. M. C. TEAGUE. Can. 280,523, May 29, 1928. An adhesive compn. comprises an aq. suspension of rubber and an emulsified resinous polymerization product of a higher fraction of coal tar distillate.

Rubber-like synthetic product. J. BARR. Brit. 279,406, Oct. 20, 1926. An elastic rubber-like product is obtained by the polymerizing action of S or S-yielding compds. such as alkali sulfides upon satd. halogenized hydrocarbons of the $\text{C}_n\text{H}_{2n+2}$ group, *e. g.*, methylene or ethylene dichloride, dibromide or iodide. Several examples are given.

Gum composition. MEIJI GUM CO., LTD. Jap. 69,058, Aug. 7, 1926. Plant fiber and wood are dried and powdered. Gum, distd. matter or latex is absorbed by the powder, wax, asphalt, etc. are added, the mixt. is heated and pressed, then rubber and vulcanizer are added and the mixt. is vulcanized by heating. Soft or hard gum compn. is obtained.

CHEMICAL ABSTRACTS

Vol. 22.

AUGUST 20, 1928

No. 16

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Sodium peroxide bomb calorimeter. ANON. *Engineering* 125, 623(1928).—Parr's calorimeter as modified by Griffin & Sons and by Baird & Tatlock is described.

J. H. MOORE

The Wulff indicator-foil calorimeter for the determination of hydrogen-ion concentration. ALBERT DIEM. Johs. Eckart Konservenfabrik München. *Konserven-Ind* 14, 93-4; *Chem Zentr.* 1927, I, 2111.—The Wulff indicator-foil consists of a colloidal membrane with the adsorbed indicator. The colloidal structure is so chosen that an aq. soln. can readily diffuse into the membrane and yet the indicator can diffuse out only very slowly. Therefore it is suitable for colloidal, viscous, highly turbid solns colored with colloidal dyes and in the presence of oxidizing or reducing agents. The readings are obtained by means of a comparative scale over the range $\pm 0.2 p_H$, with further extn. to $\pm 0.1 p_H$ and with the aid of buffer solns. to $\pm 0.05 p_H$. Foil and app. are obtainable from F. & M. Lautenschlager, G.m.b.H., München.

C. C. DAVIS

A new equilibrator: a device for the determination of the distribution ratio of a volatile solute between two miscible solvents. GRINNELL JONES AND B. B. KAPLAN. Harvard Univ. *J. Am. Chem. Soc.* 50, 1600-3 (1928).—By rotating (16 r. p. m.) the device described, a gas or vapor may be made to circulate continuously through 2 sepd. liquids. It may also be rocked to and fro to produce the same results. The app. may also be used, besides its use for detns. of the distribution ratio of I_2 between H_2O and aq. KI solns., for Br_2 between aq. KBr solns. and H_2O , for CO_2 between H_2O and any aq. salt soln. of H_2CO_3 , and for SO_2 between H_2O and any aq. solns. of its salts.

J. BALOZIAN.

An electrolytic stand for use with rotating electrodes. A. GUNDER. *Z. anal. Chem.* 73, 444-5(1928).—The app. described is similar in principle to that of Böttger but is more sturdy in construction.

W. T. H.

One-meter vacuum spectrograph. R. A. SAWYER. *J. Optical Soc. Am.* 15, 305-8 (1927).—A convenient type of vacuum spectrograph designed to use the standard Natl. Phys. Lab. one-meter grating and to operate from 3000 to 1700 Å. U. is described.

B. C. A.

Hand spectroscope with new reagent-tube condenser. F. LÖWE. *Chem. Fabr.* 1928, 3-4.—Two tubes for the soln. to be examd. are mounted in the prism, which is fixed relatively to the lamp and condenser. The spectra corresponding with the 2 tubes appear in the eye-piece as vertical bands side by side and having a common boundary; a wave-length scale is projected so as to appear at one side of the double band.

B. C. A.

Report of committee D-15 on thermometers. W. H. FULWEILER, et al. *Proc. Am. Soc. Testing Materials, Preprint* 80, 1-5(1928).—Specifications are proposed for thermometers to be used for (a) heat test of raw tung oil, (b) sp. gr. of petroleum products and (c) Ringler viscometer (4 ranges).

W. C. EBAUGH

Some further uses for the neon grid-glow tube. T. R. WILKINS AND F. B. FRIEND. *J. Optical Soc. Am.* 16, 370-3(1928).—A three-electrode Ne tube can be used for the registration of α -rays and as a sensitive voltmeter.

D. G.

Tube apparatus for crystallization and evaporation. O. ZAHN. *Chem. Fabr.* 1928, 4-6.—The plant consists essentially of a slowly rotating iron tube, very slightly inclined to the horizontal, and provided with annular end pieces, by adjustment of which the height of the liquid passing through the tube is controlled. A current of air is drawn through in the direction opposite to that in which the liquid flows. The hot satd. soln. is fed in at one end; the crystals formed are carried through with the mother-liquor and discharged continuously on to a filter or centrifugal. Brick or ebontite lining is specified for corrosive materials. When used as an evaporator, the tube is

enclosed in suitable flues for heating. By connecting a heated tube with one through which cold air is drawn, evapn. and crystn. can be effected continuously and automatically. B. C. A.

Continuous vacuum-distillation apparatus. R. KUMMER. *Chem. Fabr.* 1927, 7.—The app. is entirely of glass, with ground joints, all parts being standardized. Two receivers are provided, so arranged that the distillate can be passed from the first to the second, and thence withdrawn, without interrupting the distn. By means of a dropping funnel with joint ground into the distg. flask, continuous addn. of fresh liquid to the latter can be made. B. C. A.

Filtration apparatus for washing nickel catalyst. Y. SOSENSKII. *Leningrad Oil and Fat Ind.* (Russia) 1926, No. 7-8, 68-70.—The Ni catalyst is usually prepd. from Na_2CO_3 and NiSO_4 with the addn. of pumice stone. The product always contains chlorides and sulfates. A filter press eliminates these impurities. Three containers are used: container A is open on top and has a discharge pipe and valve leading in to the second container B. Close to the bottom of A are fixed 2 perforated plates with a filtering cloth between; a stirrer agitates the catalyst and soln. above these plates. The drum-shaped container is connected to a vacuum pump. The liquid is sepd. quickly by the vacuum from the ppt., which can be washed repeatedly. This drum has a gage tube to indicate the level of liquid. As soon as the drum is filled, the vacuum pump is stopped and air led in. Container C receives the liquid from B. This invention is covered by the Russian (Soviet) patent No. 2364, May 11, 1925.

A. A. BOEHTLINGER
Comparison of attack and utility of modern filtering apparatus. A. SIMON AND W. NETH. *Chem. Fabr.* 1928, 41-9.—The resistance of Jena, Berlin, Haldenwanger and quartz filtering crucibles to attack by various reagents has been compared by observing losses in wt. suffered under comparable conditions. A study has also been made of the rapidity and efficiency with which the various types of filter can deal with the different kinds of ppt. commonly obtained in analysis, e. g., $\text{Al}(\text{OH})_3$, BaSO_4 , AgCl , etc. There is little difference between the types of crucible examd. as regards resistance to attack by reagents other than hot alkali. For hot alkalies quartz and Jena glass are considered best. The authors do not recommend the use of Jena blue frit crucibles. B. C. A.

New indicating equipment for industrial p_{H} measurements. HENRY C. PARKER. *Ind. Eng. Chem.* 20, 676-80(1928).—A new "Portable Acidity Meter" which when used with a H_2 electrode is direct-reading in p_{H} (but is provided with a voltage scale for use with other electrodes), a new " p_{H} indicator" with a quinhydrone electrode for routine work and a "H-ion field kit" completely equipped for making field measurements with H_2 or quinhydrone electrodes are described. The manipulations required for industrial measurement of p_{H} with a field kit are described. J. BALOZIAN

Table column molding machine with air pressure. MAX BERGER. *Apparatebau* 40, 127-8(1928).—An app. for working celluloid and casein products, or insulating materials that are plastic while hot. J. H. MOORE

Overhead process piping in chemical laboratories. F. C. VILBRANDT. *J. Chem. Education* 5, 738-40(1928).—One hundred per cent visible process piping in a college lab. is described and illustrated. Lines for water, steam, gas, air, H_2S and electricity start from a central location, rise to a 17-ft. level in the saw-tooth type building, are supported on cross members of the bays, branch off in different parts of the building, and then in each room come down to the level of the specific piping for the desks (above the desk tops) and then branch off at the wall end of each set of desks. W. C. H.

Removing "frozen" glass stoppers. JAMES C. RICE. *J. Chem. Education* 5, 756(1928).—Invert the bottles and permit the contd. soln. to exert its solvent action for about a week. The method succeeds in about two-thirds of the cases tried, and the remaining third will scarcely respond to any treatment. W. C. EBAUGH

Apparatus for classifying powdered materials contained in dilute pulps (Brit. pat. 280,121-2-3) 13. **Apparatus for hydraulic and mechanical classification of finely divided solids in pulp form** (Brit. pat. 279,932) 13.

Autoclave and digester cover construction. R. K. G. ACHENBACH (trading as Achenbach & Schulte). Brit. 279,706, March 31, 1927.

Calorimeter and centrifugal apparatus for supplying it with gas and air for combustion together. GAS RESEARCH CO. Brit. 280,010, May 4, 1926.

- Air filter.** GEORGE S. DAUPHINEE (to The Cooling Tower Co.). U. S. 1,674,764, June 26.
- Rotary filter for separating solids from liquids.** A. WRIGHT and F. W. YOUNG. Brit. 280,389, Dec. 14, 1926.
- Liquid-meter.** NAAMLLOOZE VENNOOTSCHAP MAATSCHAPPIJ VOOR UITVINDINGEN. VAN DIKKERS EN BARGEBOER and A. BARGEBOER. Brit. 280,100, April 14, 1927.
- Manometer.** J. H. SHAW. Brit. 279,773, Nov. 1, 1926.
- Radiation pyrometer.** A. SCHWARTZ. Brit. 280,454, May 27, 1927.
- Contact thermometer and associated temperature alarm device.** C. PÖHLMANN. Brit. 279,853, Oct. 27, 1926.
- Drying apparatus.** FABRIKANTERNE AV TÖRRINGSMASKINER NIRO A. S. Danish 36,540, Sept. 20, 1926. The app. is designed for the drying of substances not to be used as nutrients. The substances are atomized in such a way that only the particles smaller than a certain size are allowed to pass through the process, the larger particles being caught by a moist catching body placed at suitable distance from the atomizer while the smaller particles are carried away with a current of air flowing at an angle to the direction of the particles.
- Apparatus for spray evaporation of solutions.** J. A. REAVELL. Brit. 279,544, July 27, 1926.
- Drum apparatus for cooling or drying liquid or plastic materials.** STUART P. MILLER (to The Barrett Co.). U. S. 1,675,274, June 26.
- Apparatus for aerating liquids.** M. GUGGENBUHL. Brit. 280,141, July 14, 1927.
- Devices for regulating the level of liquids in evaporating apparatus.** A. M. DIKKERS and A. BARGEBOER (to Naamllooze Vennootschap Maatschappij voor Uitvindingen. van Dijkers en Bargeboer). Brit. 280,155, Nov. 6, 1926.
- Apparatus for sterilizing milk (or other liquid treatments) by radiation.** F. HOFFMANN. Brit. 279,902, Oct. 30, 1926.
- Pasteurization apparatus.** BUAAS MEJERIMASKINFABRIKKER. Danish 37,280, March 28, 1927.
- Drum drier for fluid egg material or other liquids.** J. HUNTER and J. MC GOUGAN. Brit. 279,722, May 4, 1927. Heated air is blown through a drum on the inner surface of which the liquid material to be dried is first carried up as a film and then allowed to fall in a shower through the heated air.
- Emulsifying apparatus.** PEDER K. NIELSEN. Danish 37,883, Aug. 29, 1927.
- Emulsifying machine.** INGEMAN LARSEN. Danish 37,702, July 11, 1927.
- Emulsifying apparatus.** PETER MOGENSEN. Danish 37,997, Sept. 9, 1927.
- Emulsifying machine.** JENS B. JENSEN. Danish 37,741, July 25, 1927.
- Apparatus for carbonating water or other liquids.** OTIS C. RILEY, PAUL W. JOEL and CHARLES B. POAR. U. S. 1,674,993, June 26.
- Control device for air-humidifying systems.** JULIUS ROEMER. U. S. 1,675,302, June 26.
- Indentation apparatus for testing hardness of materials.** J. C. B. FIRTH and F. G. DICKINSON. Brit. 280,292, Aug. 12, 1926.
- Impact and rebound device for testing hardness of materials.** ÉTABLISSEMENTS VALLAROCHE. Brit. 280,182, Nov. 2, 1926.
- Apparatus with rotary cylinders for separating solid materials.** KALKER TRIEUR-FABRIK UND FABRIK GELOCHTER BLECHE MAYER ET CIE., A.-G. Brit. 280,092, Nov. 19, 1926.
- Extrusion or extraction press (with radially adjustable jaws to choke the outlet).** V. D. ANDERSON CO. Brit. 280,422, March 19, 1927.
- Apparatus for mixing fire-extinguishing chemicals or other powdered substances with liquid flowing through pipes.** FOAMITE FIREFOAM, LTD. Brit. 280,407-8, Sept. 1, 1926.
- Apparatus for mixing powdered fire-extinguishing chemicals or other materials with streams of liquid.** FOAMITE FIREFOAM, LTD. Brit. 280,313, Sept. 1, 1926.
- Apparatus for catalytic gas reactions and associated heat-exchange system.** A. O. JARGER (to Selden Co.). Brit. 279,819, Oct. 27, 1926.
- Tubular heat exchange apparatus for flue gases, air, water, etc.** A. E. LEEK. Brit. 279,663, Dec. 8, 1926.
- Dehydrating or separating constituents of gases by spraying with adsorbent material.** J. A. REAVELL. Brit. 280,268, Aug. 6, 1926. An app. is described.
- Pressure-reducing device for use on receptacles containing carbon dioxide or other liquefied or compressed gases.** R. M. L. LEMOINE (née TROUILLET). Brit. 279,906, Oct. 29, 1926.

Electrodeposition of rubber, etc. ANODE RUBBER CO., LTD. Brit. 279,474, April 15, 1926. In electrodeposition of rubber or the like from dispersions, substances are incorporated with porous molds which increase the cohesion of the rubber particles, *e. g.*, compds. of Ca, Mg, Ba, Zn, Fe or Al, or highly absorptive org. bases, esters or urethans. The addn. of NH_3 or NH_4 salts assists soln. and renders the soln. alk. Carbonates produced in molds are removed by an acid to prep. the molds for further use.

Retarding oxidation of rubber. S. M. CADWELL (to Naugatuck Chemical Co.). U. S. 1,673,549, June 12. Before vulcanization there is incorporated with rubber an accelerating aldehyde-aliphatic amine condensation product in excess of that required to secure proper vulcanization. Cf. C. A. 21, 2200.

Sponge rubber. T. W. MILLER (to Faultless Rubber Co.). U. S. 1,674,053, June 19. A quantity of vulcanized sponge rubber particles is incorporated into unvulcanized sponge rubber stock together with addnl. "blowing agent" and the mixt. is formed and vulcanized.

Rubber articles from aqueous rubber dispersions. M. C. TEAGUE (to American Rubber Co.). U. S. 1,673,649, June 12. In forming coatings or other articles a body of dispersion such as latex is disposed in a relatively thick layer in the presence of a hydrophilic agent such as glycerol or an NH_4 soap and is exposed to drying conditions so that moisture is substantially uniformly withdrawn from all parts of the body without formation of a dried surface film.

Tanks lined with guayule or its mixtures with rubber, etc. SOC. ELECTROMECANIQUE D'APPAREILLAGE POUR L'ESSENCE. Brit. 279,291, Dec. 31, 1926.

Vulcanization. D. H. POWERS. Can. 278,942, Mar. 27, 1928. Rubber is combined with a vulcanizing agent and a compd. obtainable by the chem. combination of not less than 2 mols. of an aldehyde and 2 mols. of a primary amine with a whole number of mols. less than 3 of CS_2 .

Vulcanizing rubber. D. H. POWERS (to E. I. du Pont de Nemours & Co.). U. S. 1,674,122, June 19. Oxyethyl- (or butyl-) thiocarbonic monosulfide or similar compd. is used as an accelerator. Conjoint use of an amine such as aniline further expedites the vulcanization.

Vulcanizing rubber. A. C. BURRAGE. Brit. 279,280, Jan. 4, 1927. As an accelerator there is used an aryl substituted guanidine having an alkyl substituent in the *o*-position, *e. g.*, di-*o*-tolylguanidine (which may be made by heating di-*o*-tolylthiourea, produced by the reaction of CS_2 on *o*-toluidine, with PbO in the presence of NH_4NO_3 and alc. and neutralizing the filtrate with NaOH). Cf. C. A. 21, 1724.

Vulcanizing rubber. S. M. CADWELL (to Naugatuck Chemical Co.). U. S. 1,673,550, June 12. Dimethylthiocarbamyl-*p*-toluenethiolsulfonate or other compds. contg. the group $\text{S}\cdot\text{SO}_2$ are used as accelerators.

Accelerator for vulcanizing rubber. H. O. CHUTE. U. S. 1,673,801, June 19. In prepg. an accelerator, magnesia and an aromatic amine such as aniline are mixed without heating and CS_2 is gradually added while keeping the mixt. cold and without evolution of substantial quantities of H_2S and the material is then heated to a temp. not exceeding 140° until evolution of gas has substantially ceased.

Vulcanization accelerator. W. SCOTT. Can. 278,941, Mar. 27, 1928. A rubber vulcanization accelerator is made by treating with CH_3O the condensation product of aniline and a straight-chain aldehyde contg. a plurality of C atoms.

Apparatus and method for vulcanizing rubber tire tubes, etc. W. L. FAIRCHILD. U. S. 1,673,352-3, June 12. Steam is injected into the tube for vulcanization and the tube is subjected to a swinging movement to dislodge any deposits of water which may condense within the tube.

Rubber compound. A. M. KINNEY. Can. 280,213, May 15, 1928. A rubber compd. contains rubber, vulcanizing constituents and naphthenic compds.

Adhesive rubber composition. M. C. TEAGUE. Can. 280,523, May 29, 1928. An adhesive compn. comprises an aq. suspension of rubber and an emulsified resinous polymerization product of a higher fraction of coal tar distillate.

Rubber-like synthetic product. J. BAER. Brit. 279,406, Oct. 20, 1926. An elastic rubber-like product is obtained by the polymerizing action of S or S-yielding compds. such as alkali sulfides upon satd. halogenized hydrocarbons of the $\text{C}_n\text{H}_{2n+2}$ group, *e. g.*, methylene or ethylene dichloride, dibromide or iodide. Several examples are given.

Gum composition. MEIJI GUM CO., LTD. Jap. 69,058, Aug. 7, 1926. Plant fiber and wood are dried and powdered. Gum, distd. matter or latex is absorbed by the powder, wax, asphalt, etc. are added, the mixt. is heated and pressed, then rubber and vulcanizer are added and the mixt. is vulcanized by heating. Soft or hard gum compn. is obtained.

CHEMICAL ABSTRACTS

Vol. 22.

AUGUST 20, 1928

No. 16

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Sodium peroxide bomb calorimeter. ANON. *Engineering* 125, 623(1928).—Parr's calorimeter as modified by Griffin & Sons and by Baird & Tatlock is described.

J. H. MOORE

The Wulff indicator-foil calorimeter for the determination of hydrogen-ion concentration. ALBERT DIEM. Johs. Eckart Konservenfabrik München. *Konserven-Ind.* 14, 93 4, *Chem. Zentr.* 1927, I, 2111.—The Wulff indicator-foil consists of a colloidal membrane with the adsorbed indicator. The colloidal structure is so chosen that an aq. soln. can readily diffuse into the membrane and yet the indicator can diffuse out only very slowly. Therefore it is suitable for colloidal, viscous, highly turbid solns. colored with colloidal dyes and in the presence of oxidizing or reducing agents. The readings are obtained by means of a comparative scale over the range $\pm 0.2 p_H$, with further estn. to $\pm 0.1 p_H$ and with the aid of buffer solns. to $\pm 0.05 p_H$. Foil and app. are obtainable from F. & M. Lautenschläger, G.m.b.H., München.

C. C. DAVIS

A new equilibrator: a device for the determination of the distribution ratio of a volatile solute between two miscible solvents. GRINNELL JONES AND B. B. KAPLAN. Harvard Univ. *J. Am. Chem. Soc.* 50, 1600-3 (1928).—By rotating (16 r. p. m.) the device described, a gas or vapor may be made to circulate continuously through 2 sepd liquids. It may also be rocked to and fro to produce the same results. The app. may also be used, besides its use for detns. of the distribution ratio of I_2 between H_2O and aq. KI solns., for Br_2 between aq. KBr solns and H_2O , for CO_2 between H_2O and any aq. salt soln. of H_2CO_3 , and for SO_2 between H_2O and any aq. solns. of its salts.

J. BALOZIAN,

An electrolytic stand for use with rotating electrodes. A. GUNDER. *Z. anal. Chem.* 73, 444-5(1928).—The app. described is similar in principle to that of Böttger but is more sturdy in construction.

W. T. H.

One-meter vacuum spectrograph. R. A. SAWYER. *J. Optical Soc. Am.* 15, 305-8 (1927).—A convenient type of vacuum spectrograph designed to use the standard Natl Phys Lab. one-meter grating and to operate from 3000 to 1700 Å. U. is described.

B. C. A.

Hand spectroscope with new reagent-tube condenser. F. LÖWE. *Chem. Fabr.* 1928, 3 4.—Two tubes for the soln. to be examd. are mounted in the prism, which is fixed relatively to the lamp and condenser. The spectra corresponding with the 2 tubes appear in the eye-piece as vertical bands side by side and having a common boundary; a wave-length scale is projected so as to appear at one side of the double band.

B. C. A.

Report of committee D-15 on thermometers. W. H. FULWEILER, et al. *Proc. Am. Soc. Testing Materials, Preprint* 80, 1-5(1928).—Specifications are proposed for thermometers to be used for (a) heat test of raw tung oil, (b) sp. gr. of petroleum products and (c) Engler viscometer (4 ranges).

W. C. EBAUGH

Some further uses for the neon grid-glow tube. T. R. WILKINS AND F. B. FRIEND. *J. Optical Soc. Am.* 16, 370-3(1928).—A three-electrode Ne tube can be used for the registration of α -rays and as a sensitive voltmeter.

D. G.

Tube apparatus for crystallization and evaporation. O. ZAHN. *Chem. Fabr.* 1928, 4-6.—The plant consists essentially of a slowly rotating iron tube, very slightly inclined to the horizontal, and provided with annular end pieces, by adjustment of which the height of the liquid passing through the tube is controlled. A current of air is drawn through in the direction opposite to that in which the liquid flows. The hot satd. soln. is fed in at one end; the crystals formed are carried through with the mother-liquor and discharged continuously on to a filter or centrifugal. Brick or ebonite lining is specified for corrosive materials. When used as an evaporator, the tube is

enclosed in suitable flues for heating. By connecting a heated tube with one through which cold air is drawn, evapn. and crystn. can be effected continuously and automatically. B. C. A.

Continuous vacuum-distillation apparatus. R. KUMMER. *Chem. Fabr.* 1927, 7.—The app. is entirely of glass, with ground joints, all parts being standardized. Two receivers are provided, so arranged that the distillate can be passed from the first to the second, and thence withdrawn, without interrupting the distn. By means of a dropping funnel with joint ground into the distg. flask, continuous addn. of fresh liquid to the latter can be made. B. C. A.

Filtration apparatus for washing nickel catalyst. Y. SOSENSKII. *Leningrad Oil and Fat Ind.* (Russia) 1926, No. 7-8, 68-70.—The Ni catalyst is usually prepd. from Na_2CO_3 and NiSO_4 with the addn. of pumice stone. The product always contains chlorides and sulfates. A filter press eliminates these impurities. Three containers are used: container A is open on top and has a discharge pipe and valve leading in to the second container B. Close to the bottom of A are fixed 2 perforated plates with a filtering cloth between; a stirrer agitates the catalyst and soln. above these plates. The drum-shaped container is connected to a vacuum pump. The liquid is sepd. quickly by the "vacuum from the ppt., which can be washed repeatedly. This drum has a gage tube to indicate the level of liquid. As soon as the drum is filled, the vacuum pump is stopped and air led in. Container C receives the liquid from B. This invention is covered by the Russian (Soviet) patent No 2364, May 11, 1925.

A. A. BOEHTLINGK

Comparison of attack and utility of modern filtering apparatus. A. SIMON AND W. NETH. *Chem. Fabr.* 1928, 41-9.—The resistance of Jena, Berlin, Haldenwanger and quartz filtering crucibles to attack by various reagents has been compared by observing losses in wt. suffered under comparable conditions. A study has also been made of the rapidity and efficiency with which the various types of filter can deal with the different kinds of ppt. commonly obtained in analysis, *e. g.*, $\text{Al}(\text{OH})_3$, BaSO_4 , AgCl , etc. There is little difference between the types of crucible examd. as regards resistance to attack by reagents other than hot alkali. For hot alkalies quartz and Jena glass are considered best. The authors do not recommend the use of Jena blue frit crucibles. B. C. A.

New indicating equipment for industrial p_{H} measurements. HENRY C. PARKER. *Ind. Eng. Chem.* 20, 676-80(1928)—A new "Portable Acidity Meter" which when used with a H_2 electrode is direct-reading in p_{H} (but is provided with a voltage scale for use with other electrodes), a new " p_{H} indicator" with a quinhydrone electrode for routine work and a "H-ion field kit" completely equipped for making field measurements with H_2 or quinhydrone electrodes are described. The manipulations required for industrial measurement of p_{H} with a field kit are described. J. BALOZIAN

Table column molding machine with air pressure. MAX BERGER. *Apparatebau* 40, 127-8(1928).—An app. for working celluloid and casein products, or insulating materials that are plastic while hot. J. H. MOORE

Overhead process piping in chemical laboratories. F. C. VILBRANDT. *J. Chem. Education* 5, 738-40(1928).—One hundred per cent visible process piping in a college lab. is described and illustrated. Lines for water, steam, gas, air, H_2S and electricity start from a central location, rise to a 17-ft. level in the saw-tooth type building, are supported on cross members of the bays, branch off in different parts of the building, and then in each room come down to the level of the specific piping for the desks (above the desk tops) and then branch off at the wall end of each set of desks. W. C. E.

Removing "frozen" glass stoppers. JAMES C. RICE. *J. Chem. Education* 5, 756(1928).—Invert the bottles and permit the contd. soln. to exert its solvent action for about a week. The method succeeds in about two-thirds of the cases tried, and the remaining third will scarcely respond to any treatment. W. C. EBAUGH

Apparatus for classifying powdered materials contained in dilute pulps (Brit. pat. 280,121-2-3) 13. Apparatus for hydraulic and mechanical classification of finely divided solids in pulp form (Brit. pat. 279,932) 13.

Autoclave and digester cover construction. R. K. G. ACHENBACH (trading as Achenbach & Schulte). Brit. 279,706, March 31, 1927.

Calorimeter and centrifugal apparatus for supplying it with gas and air for combustion together. GAS RESEARCH CO. Brit. 280,010, May 4, 1926.

- Air filter.** GEORGE S. DAUPHINEE (to The Cooling Tower Co.). U. S. 1,674,764, June 26.
- Rotary filter for separating solids from liquids.** A. WRIGHT and F. W. YOUNG. Brit. 280,389, Dec. 14, 1926.
- Liquid-meter.** NAAMLIOOZE VENNOOTSCHAP MAATSCHAPPIJ VOOR UITVINDINGEN. VAN DIKKERS EN BARGEBOER and A. BARGEBOER. Brit. 280,100, April 14, 1927.
- Manometer.** J. H. SHAW. Brit. 279,773, Nov. 1, 1926.
- Radiation pyrometer.** A. SCHWARTZ. Brit. 280,454, May 27, 1927.
- Contact thermometer and associated temperature alarm device.** C. PÖHLMANN. Brit. 279,853, Oct. 27, 1926.
- Drying apparatus.** FABRIKANTERNE AV TÖRRINGSMASKINER NIRO A. S. Danish 36,540, Sept. 20, 1926. The app. is designed for the drying of substances not to be used as nutrients. The substances are atomized in such a way that only the particles smaller than a certain size are allowed to pass through the process, the larger particles being caught by a moist catching body placed at suitable distance from the atomizer while the smaller particles are carried away with a current of air flowing at an angle to the direction of the particles.
- Apparatus for spray evaporation of solutions.** J. A. RÆAVELL. Brit. 279,544, July 27, 1926.
- Drum apparatus for cooling or drying liquid or plastic materials.** STUART P. MILLER (to The Barrett Co.). U. S. 1,675,274, June 26.
- Apparatus for aerating liquids.** M. GUGGENBUHL. Brit. 280,141, July 14, 1927.
- Devices for regulating the level of liquids in evaporating apparatus.** A. M. DIKKERS and A. BARGEBOER (to Naamllooze Vennootschap Maatschappij voor Uitvindingen. van Dikkers en Bargeboer). Brit. 280,155, Nov. 6, 1926.
- Apparatus for sterilizing milk (or other liquid treatments) by radiation.** F. HOFFMANN. Brit. 279,902, Oct. 30, 1926.
- Pasteurization apparatus.** BUAAS MEJERIMASKINFABRIKKER. Danish 37,280, March 28, 1927.
- Drum drier for fluid egg material or other liquids.** J. HUNTER and J. Mc GOUGAN. Brit. 279,722, May 4, 1927. Heated air is blown through a drum on the inner surface of which the liquid material to be dried is first carried up as a film and then allowed to fall in a shower through the heated air.
- Emulsifying apparatus.** PEDER K. NIELSEN. Danish 37,883, Aug. 29, 1927.
- Emulsifying machine.** INGEMAN LARSEN. Danish 37,702, July 11, 1927.
- Emulsifying apparatus.** PETER MOGENSEN. Danish 37,997, Sept. 9, 1927.
- Emulsifying machine.** JENS B. JENSEN. Danish 37,741, July 25, 1927.
- Apparatus for carbonating water or other liquids.** OTIS C. RILEY, PAUL W. JOEL and CHARLES B. POAR. U. S. 1,674,993, June 26.
- Control device for air-humidifying systems.** JULIUS ROEMER. U. S. 1,675,302, June 26.
- Indentation apparatus for testing hardness of materials.** J. C. B. FIRTH and F. G. DICKINSON. Brit. 280,292, Aug. 12, 1926.
- Impact and rebound device for testing hardness of materials.** ÉTABLISSEMENTS VALLAROCHE. Brit. 280,182, Nov. 2, 1926.
- Apparatus with rotary cylinders for separating solid materials.** KALKER TRIEUR-FABRIK UND FABRIK GELOCHTER BLECHE MAYER ET CIE., A.-G. Brit. 280,092, Nov. 19, 1926.
- Extrusion or extraction press (with radially adjustable jaws to choke the outlet).** V. D. ANDERSON CO. Brit. 280,422, March 19, 1927.
- Apparatus for mixing fire-extinguishing chemicals or other powdered substances with liquid flowing through pipes.** FOAMITE FIREFOAM, LTD. Brit. 280,407-8, Sept. 1, 1926.
- Apparatus for mixing powdered fire-extinguishing chemicals or other materials with streams of liquid.** FOAMITE FIREFOAM, LTD. Brit. 280,313, Sept. 1, 1926.
- Apparatus for catalytic gas reactions and associated heat-exchange system.** A. O. JARGER (to Selden Co.). Brit. 279,819, Oct. 27, 1926.
- Tubular heat exchange apparatus for flue gases, air, water, etc.** A. E. LEEK. Brit. 279,663, Dec. 8, 1926.
- Dehydrating or separating constituents of gases by spraying with adsorbent material.** J. A. RÆAVELL. Brit. 280,268, Aug. 6, 1926. An app. is described.
- Pressure-reducing device for use on receptacles containing carbon dioxide or other liquefied or compressed gases.** R. M. L. LEMOINE (née TROUILLET). Brit. 279,906, Oct. 29, 1926.

Filler for storing acetylene or like gases in tanks. PERCY C. AVERY (to Pressed Steel Tank Co.). U. S. 1,675,083, June 26. A tank with an orifice at one end is packed with resilient fibrous material such as flax fiber and gypsum or fuller's earth and a screen at the orifice-end of the tank distributes the flow of fluid between the filler and the orifice.

Apparatus for mixing, compacting, degassing or grinding viscid material. A. SONSTHAGEN and G. PÖVERUD. Brit. 279,707, April 6, 1927.

Safety cut-out for Röntgen-ray apparatus. W. OTTO. Brit. 279,838, Oct. 26, 1926.

Heat-exchange apparatus for heating water, etc. W. ST. JOHN'S-FINDLAY. Brit. 280,266, Aug. 5, 1926.

Apparatus for heat-treatment of springs, bolts or other small articles. CARL L. IPSEN (to General Electric Co.). U. S. 1,675,271, June 26.

Apparatus for drying veneer or other sheet materials. ARTHUR J. VANCE (to The Coc Mfg. Co.). U. S. 1,675,284-5, June 26.

Apparatus (with tank and rotatable drum) for acidulating wool or other materials. ÉMILE MOLINGHEN and JULES GAYE. U. S. 1,674,786, June 26.

Tungsten filaments coated with thorium. JOHN W. MARDEN, THOMAS P. THOMAS and JOHN E. CONLEY (to Westinghouse Lamp Co.). U. S. 1,675,120, June 26. Filaments for electron emission are formed of W free from Th compds. which is thermally plated with metallic Th, *e. g.*, by deposition from Th acetylacetonate vapor. An app. is described.

Use of metallic magnesium to produce a high vacuum in vacuum tubes. S. LOEWE. Brit. 279,844, Oct. 26, 1926. Mech. features.

Annular tunnel kiln construction. WOODALL-DUCKHAM (1920), LTD. and A. M. DUCKHAM. Brit. 280,044, Dec. 3, 1926.

Apparatus for making marbles or other spherical bodies from glass or other plastic material. W. J. MILLER, INC. Brit. 279,920, July 1, 1926.

Electric discharge device. E. F. LOWRY (to Westinghouse Electric & Mfg. Co.). Brit. 279,890, Oct. 28, 1926. A thermionic cathode comprises an alk. earth oxide coating on a core of Co, Ni and Co, or an alloy of these metals with Si or another metal such as a metal of the Fe group, Ti or V in sufficient quantity to render the alloy malleable. Details are given of the prepn. of various alloys.

Electric discharge device. SIEMENS & HALSKE A.-G. Brit. 279,501, Oct. 23, 1926. In gas discharge devices such as rectifiers, the anode is made at least partly of refractory conducting material such as Ta or Mo which absorbs impurities, *e. g.*, water vapor, N or CO₂, at high temps., and of such dimensions that it attains this temp. The cathode operates at incandescence and rare gases are used as filling.

Electric discharge vacuum tube. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 280,236, Nov. 6, 1926. An incandescent cathode contains alk. earth metals and also compds of such metals such as the oxides; these may be carried on a core of Pt or W.

Multiple-hearth rabble furnace for calcining. ROBERT D. PIKE. U. S. 1,674,919, June 26.

Reversible regenerator for furnaces. H. SMITH. Brit. 279,505, Oct. 23, 1926.

Actuating mechanism for selective control thermostat systems. CHARLES L. FORTIER (to Johnson Service Co.). U. S. 1,675,213, June 26. An app. is described suitable for controlling various heating systems.

Thermostatic control for gas burners. JAMES ROSS. U. S. 1,674,800, June 26.

Thermostatic valve for proportioning hot and cold water. A. S. D. HANTON and J. DICK. Brit. 279,804, Oct. 28, 1926.

Thermostatic electric switch. I. McCABE. Brit. 280,179, Nov. 8, 1926.

Thermostatic electric switch. G. S. LANE. Brit. 280,338, Oct. 8, 1926.

Thermostatic electric switch. BRITISH THOMSON-HOUSTON Co., LTD. Brit. 280,323, Sept. 15, 1926.

Thermostatic electric switch. HERBERT J. SAUVAGE (to Electro Thermostatic Control Co.). U. S. 1,675,137-8, June 26.

2—GENERAL AND PHYSICAL CHEMISTRY

GEORGE L. CLARK AND J. H. REEDY

Edgar Fahs Smith. WALTER T. TAGGART. *Science* 68, 6-8(1928).—Obituary.

The life and the works of Otto Billeter. H. RIVIER. *Helv. Chim. Acta* 11, 700-10 (1928).—A portrait and a bibliography are included.

E. H.

Johannes Gadamer. W. SCHLENK. *Ber.* 61A, 80-2(1928).—Obituary. E. H. Gustav Schultz. H. BUCHERER. *Ber.* 61A, 82-3(1928).—Obituary. E. H. The Cambridge University chemical laboratory. F. G. MANN. *Chemistry & Industry* 47, 690-6(1928). E. H.

The behavior of Debye electrolytes at high field strengths. G. JOOS AND M. BLUMENTRITT. *Physik. Z.* 28, 836-8(1927).—The cause of the deviation of electrolytes from Ohm's law in strong elec. fields, as observed by Wien (cf. *C. A.* 22, 906) was investigated mathematically in the light of the Debye-Hückel theory. The deviation increases with the valencies of the ions and is approx. proportional to $1/\sqrt{D}$, where D is the dielec. const. Numerical calcns. were in good agreement with the exptl. results of Wien. E. R. SMITH

Isotherms of diatomic gases and their binary mixtures. XXXIV. Isotherm of hydrogen at temperatures from 0° to 100°. G. P. NIJHOFF AND W. H. KEESOM. *Verlag Akad. Wetenschappen Amsterdam* 36, 1278-80(1927).— B_A and C_A values are given for the isotherms of H_2 and compared with previously obtained data. B. J. C. v. D. H.

Thermophile bacteria and the radiation pressure of the sun. SVANTE ARRHENIUS. *Z. physik. Chem.* 130, 516-9(1927).—The pressure of the sun's rays might have driven thermophile bacteria from Venus to the earth when Venus was between the sun and the earth. F. E. BROWN

The atomic volume of zirconium and of hafnium. A. E. VAN ARKEL. *Z. physik. Chem.* 130, 100-4(1927).—The at. vol. of Zr was detd. from photographs made with the aid of x-rays ($\lambda = 1.537$ A. U.) and a precision camera. Two samples of Zr were used. One (I) was a drawn wire, the second (II) was a thin rolled sheet. The data for the 2 are: I, $a = 3.223$, $c = 5.123$, $V = 13.97$, $\rho = 6.53$; II, $a = 3.224$, $c = 5.128$, $V = 14.00$, $\rho = 6.515$. For Hf, the corresponding data are: I, $a = 3.201$, $c = 5.077$, $V = 13.66$, $\rho = 13.08$; II, $a = 3.200$, $c = 5.061$, $V = 13.61$, $\rho = 13.12$. ρ indicates density, and V at. vol. With powder the values are: Zr $a = 3.223$, $c = 5.150$; Hf $a = 3.186$, $c = 5.037$. The final values are Zr $a = 3.223 \pm 0.002$, $c = 5.123 \pm 0.003$, $V = 13.97 \pm 0.02$, $\rho = 6.53 \pm 0.01$; Hf $a = 3.200 \pm 0.002$, $c = 5.007 \pm 0.005$, $V = 13.66 \pm 0.06$, $\rho = 13.08 \pm 0.05$. The accuracy may not be very high but the at. vol. of Hf is definitely smaller than that of Zr. F. E. BROWN

The structure of zirconium silicide. HELMUT SEYFARTH. Univ. München. *Z. Krist.* 67, 295-328(1928).— $ZrSi_2$ is orthorhombic bipyramidal. The unit cell contains 4 mols. and has the dimensions $a = 3.72$, $b = 14.61$ and $c = 3.67$ A. U. The Zr atoms occur with pairs of Si atoms, forming definite $ZrSi_2$ mols., in which the distance Zr-Si is apparently 0.56 A. U. This extremely small distance is explained by the homopolar binding, which makes the center of gravity of the electron distribution of the Si atoms much closer to the Zr atom than the actual center of gravity of the Si atoms. The x-ray data locate the electrons rather than the nucleus. L. S. R.

The crystal structure of ethylammonium bromide and iodide. STERLING B. HENDRICKS. Rockefeller Inst. Med. Research. *Z. Krist.* 67, 119-30(1928).— $NH_4C_2H_5Br$ and $NH_4C_2H_5I$ are monoclinic, with 2 mols. in the unit cell. The dimensions are $X = 4.63$, $Y = 8.32$, $Z = 6.24$ A. U., $\gamma = 86^\circ 59'$ and $X = 4.81$, $Y = 8.68$, $Z = 6.63$ A. U., $\gamma = 87^\circ 54'$, resp. The general positions of the halogen, N and C atoms are vyz and $\bar{x}\bar{y}, z + \frac{1}{2}$, with $x_{Br} = 0.11$, $y_{Br} = 0.15$ and $x_I = 0.12$ and $y_I = 0.16$. The structure is unlike that of other substituted NH_4 halides. The corresponding chloride is isomorphous, but gave indeterminate results. L. S. RAMSDALL

The crystal structure of tetramethylammonium halides. R. W. G. WYCKOFF. Rockefeller Inst. for Medical Research. *Z. Krist.* 67, 91-105(1928).— $N(CH_3)_4I$, $N(CH_3)_4Br$ and $N(CH_3)_4Cl$ are tetragonal, with the dimensions $a = 7.96$, 7.76 , 7.78 A. U. and $c = 5.75$, 5.53 and 5.53 A. U., resp. The space group is 4 Di-7, and if 4 C atoms are assoc. with each N atom, the at. positions are as follows: halogen atoms at $\frac{1}{2}0u$ and $0\frac{1}{2}u$, with $u_I = ca. 0.39$, $u_{Br} = 0.37$ and $u_{Cl} = 0.35$; N atoms at 000 , $\frac{1}{2}\frac{1}{2}0$; C atoms at $u0v$; $0u\bar{v}$; $u + \frac{1}{4}, \frac{1}{4}, \bar{v}$; $\frac{1}{2}, u + \frac{1}{4}, v$; $u0v$; $0u\bar{v}$; $\frac{1}{2} - u, \frac{1}{2}, v$; $\frac{1}{2}, \frac{1}{2} - u, v$, with u about 0.15 and v between 0.10 and 0.17. The CH_3 groups form an irregular tetrahedron about the N atoms. This arrangement is like the NH_4Cl grouping, elongated in a vertical direction to accommodate the large $N(CH_3)_4$ radicals. L. S. RAMSDALL

The crystal structures of the methylammonium halides. STERLING B. HENDRICKS. Rockefeller Inst. Med. Research. *Z. Krist.* 67, 106-18(1928).— $MeNH_2Cl$, $MeNH_2Br$ and $MeNH_2I$ have tetragonal unit cells contg. 1 mol. The dimensions are $a = 4.28$, 5.09 , 5.11 A. U. and $c = 5.13$, 8.76 , 8.97 A. U., resp. In the chloride the positions are: Cl at 000 , N at $\frac{1}{2}, \frac{1}{2}, u$ ($u = ca. 0.24$), C at $\frac{1}{2}, \frac{1}{2}, v$ ($v = ca. 0.50$). For the other

two: Br and I at $0\frac{1}{2}u$, $\frac{1}{2}0u$ ($u_B = ca\ 0.18$, $u_I = 0.19$), N and C at $0\frac{1}{2}w$, $\frac{1}{2}0\bar{w}$. The former is a distorted "low" NH_4Cl structure; the latter 2 correspond to the "high" form. L. S. RAMSDELL

The crystallography of double nitrates of neodymium and praseodymium. R. B. ELLESTAD AND F. A. GRAY. *Z. Krist.* **65**, 140-1 (1927).—Crystals of double nitrates of Nd and Pr are trigonal trapezohedral, with axial ratios as follows: Nd-Zn 1.569, Nd-Ni 1.579, Nd-Mg 1.576, Nd-Mn 1.580, Nd-Co 1.584, Pr-Zn 1.584, Pr-Ni 1.576, Pr-Co 1.567, Pr-Mn 1.565, Pr-Mg 1.562. L. S. RAMSDELL

X-ray investigation of *o*- and *m*-nitroaniline. K. HERRMANN AND M. BURAK. Berlin, Inst. phys. chem. and electrochem. of tech. Hochschule. *Z. Krist.* **67**, 189-225 (1928).—*o*-Nitroaniline is holohedral orthorhombic—space group V_h^{17} . There are 16 mol. wts. in the unit cell, with $a = 10.09$, $b = 29.44$ and $c = 8.52$ A. U. The compd. is polymerized. *m*-Nitroaniline is hemimorphic orthorhombic, space group C_{2v}^5 . There are 4 single mols. in the cell, which has $a = 19.23$, $b = 6.48$ and $c = 5.06$ A. U. L. S. RAMSDELL

The crystal structure of the water-soluble modification of germanium dioxide. WM. ZACHARIASEN. Mineral. Inst. Univ. of Oslo. *Z. Krist.* **67**, 226-34 (1928).—The ordinary form of GeO_2 (sol. in H_2O) is hexagonal (trigonal trapezohedral) and isomorphous with quartz. There are 3 mols. in the unit cell, which has the dimensions $a = 4.972$ and $c = 5.648$ A. U., $c/a = 1.136$. The space group is D_3^4 or D_3^6 , and the Ge atoms are at $u00$, $\bar{u}\bar{u}\frac{1}{3}$, $0u\frac{2}{3}$, with $u = 0.43 \pm 0.01$. L. S. RAMSDELL

Simple methods for the qualitative detection of piezoelectricity in crystals. P. TERPSTRA. University Groningen, Netherlands. *Natuurwetensch. Tijdschr.* **10**, 89-92 (1928).—The crystal to be examd. is placed between the plates of a piezo-condenser, in the circuit of an emitting radio set, advantage being taken of length modifications of the crystal. A. L. HENNE

Uncommon common salt. A. F. DUFTON AND C. G. WEBB. *Nature* **121**, 942 (1928).—The crystals are cubes with hollow faces and beveled edges, the form being {110}. L. C.

The evaporation and solution phenomena of zinc. G. AMINOFF. *Z. Krist.* **65**, 23-7 (1926).—On evapn. of Zn the following faces are sufficiently developed to give reflections: 0001, 1011, 1120 and 1010. The rate of soln. in H_2SO_4 is least in the direction of the c axis. L. S. RAMSDELL

Monocrystalline metals: their preparation and their properties. MARC PRIVAULT. *Rev. g n. sci.* **39**, 363-9 (1928).—A review F. H.

Solid solutions between compounds of elements of different valence. G. BRUNI AND A. FERRARI. R. Politecnico, di Milano. *Z. physik. Chem.* **130**, 488-94 (1927). (Italian).—When compds. of elements of different valences form solid solns. with one another the equiv. vols. of the pure compds. are very nearly equal. This is shown to be true in the molybdates of Pb and the rare earths: LiF and $MgCl_2$; and $LiCl$ and $MgCl_2$. The case of complete solid soln. between $LiCl$ and $MgCl_2$ is considered in detail with reference to the manner in which substitution occurs in the lattice between different nos. of atoms, and between atoms of different valences. $LiCl$ is isometric, of the NaCl structure. $MgCl_2$ is birefringent, shows basal cleavage, and seems to be rhombohedral, hexagonal, having a characteristic angle of nearly 90° , and therefore pseudo-cubic. Because of this, its lattice structure may be very similar to that of $LiCl$. In explanation of the complete solid soln. between $LiCl$ and $MgCl_2$ it is suggested that the lattice in each case is essentially made up of an equal distribution of neg. ions in contact with each other, and that in the voids between these ions are disposed the relatively much smaller metallic ions. The distribution of different nos. of the latter leads to the different symmetry of the 2 lattices. R. H. LOMBARD

An investigation of mixed crystals and alloys. I. VEGARD AND HJALMAR DALE. *Z. Krist.* **67**, 148-61 (1928).— $Pb(N_2O_2)$ and $Ba(NO_3)_2$ form a complete series of mixed crystals, which follow the additive law exactly in regard to dimensions of the unit cells. With $NaBr$ and NH_4Br there is no demonstrable formation of mixed crystals. Cu and Ni form a complete series and follow the additive law. Although Co has similar radius to Ni, there is only a limited miscibility with Cu-Co. The Cu lattice will take up 13% Co, and the Co 8% of Cu. The cubic form of Co seems to be stabilized by a trace of Cu, and none of the hexagonal type was formed. The cubic form is probably due to slight impurities. Careful measurements on quickly cooled Cu-Au alloys showed a complete series approx. following the additive law. The great discrepancies of Bain (cf. C. A. **17**, 1940) are explained by intermetallic compds. L. S. RAMSDELL

The diffusion problem for a solid in contact with a stirred liquid. H. W. MARCH AND WARREN WEAVER. Univ. of Wis. *Phys. Rev.* 31, 1072-82(1928).—A cylindrical solid of length a in a direction x and arbitrary cross section normal to x is in contact on its plane face $x = a$ with a well-stirred liquid. The face $x = 0$ of the solid and the lateral face are impervious to heat. The liquid extends from $x = a$ to $x = a + b$, there being no loss of heat across the face $x = a + b$. The initial temp. of the solid and liquid being given, a Volterra integral equation of the second kind with discontinuous kernel is obtained for the temp. of the liquid as a function of the time. The soln. of this integral equation is obtained. The connection of this problem with a case of material diffusion is shown, and a numerical illustration is given. The theory suggests a new method of detg. directly and accurately the thermal cond. of solids. BERNARD LEWIS

The effect of temperature on the dielectric constants of some gases at different pressures. Remarks on the paper by Magdalene Forró. H. A. STUART. *Z. Physik* 48, 747(1928); cf. *C. A.* 22, 1897.—Mol. polarization in gases cannot be proportional to the sq. of the d . as claimed by F. but is independent thereof. This is substantiated by further exptl. results. H. F. JOHNSTONE

Ring method in changing surface tension. LECOMTE DU NOUY. *Science* 67, 607(1928).—Reply to criticisms of Bigelow and Washburn (*C. A.* 22, 2697).

L. W. RIGGS

The density of molten magnesium. KURT ARNDT AND GEORG PLOETZ. *Tech. Hochsch., Charlottenburg. Z. physik. Chem.* 130, 184-6(1927).—The d . was detd. by the sinking of an egg-shaped silvered-iron bob in melted Mg in a tall, unglazed porcelain crucible. The temps. and corresponding d s. are resp: 666°, 1.58; 678°, 1.55; 696°, 1.54; 710°, 1.53; 720°, 1.51. From the curve given, the estd. values are 650°, 1.601; 700°, 1.536; 750°, 1.470. The d . of Mg at room temp. is about 1.74. The vol. of Mg increases about 6% on melting. Mg poured at 700° shrinks about 11.5% on cooling to room temp.

F. E. BROWN

Internal friction in solids. A. L. KIMBALL AND D. E. LOVELL. Gen. Elec. Co. *Phys. Rev.* 30, 948-59(1927).—Tests on 18 different solids, including several metals, glass, celluloid, rubber and maple wood, show that the internal friction for streams below the elastic limit does not obey the liquid-viscosity law, as is usually assumed, according to which the frictional force depends upon the velocity strain, but is entirely independent of strain velocity, as far as can be observed. It was found to depend upon the amplitude of strain during the strain cycles and approx. to obey the law: Energy loss per cycle per unit vol. equals ξf_m^2 . f_m is the max. value of the stress during the stress cycle and ξ a proportionality factor called the internal-friction const. The method used was to measure the transverse deflections of the end of a rod, about 1 m. long, of the material being studied, which deflections were produced during rotation of the rod, when its end was deflected downward by suitable loads on it. The expts. differ from most previous work in that relatively large masses of material were employed, tending to reduce surface effects, which are likely to enter in the case of vibration decrement expts. on wires and on thin strips. A table of the internal-friction consts. obtained is given and also a table of similar internal friction consts. calcd. from data of previous investigators. A reasonable agreement is found. BERNARD LEWIS

The melting temperature of calomel. OTTO RUFF AND REINHARD SCHNEIDER. *Z. anorg. allgem. Chem.* 170, 42-4(1928).—M. ps. of mixts. of HgCl and HgCl₂ were detd. for various ratios of the components. Extrapolated to 100% HgCl the m. p. would appear to be about 543°, which is nearly 40° higher than previously recorded.

R. H. LAMBERT

Change of compressibility with pressure. I. H. ADAMS. *J. Washington Acad. Sci.* 17, 529-33(1927).—The compressibilities, β , of a no. of elements and minerals have been detd. directly or, when possible, from the change in length produced by pressure, P , the latter method being the more sensitive. When β is plotted against $d\beta/dP$ a curve is obtained from which the order of magnitude of the pressure coeff. of compressibility can be detd. if the mean compressibility over a given pressure range is known. Te and the alkali halides do not fall on the curve. B. C. A.

Investigations on the one-component system SiO₂. II. Catalysts for the slow transformations. C. J. VAN NIEUWENBURG AND C. N. G. DE NOOIJER. *Rec. trav. chim.* 47, 627-34(1928); cf. *C. A.* 22, 1265.—A discussion is given of Fenner's stability diagram for the 3 modifications of SiO₂. That cristobalite has a stable region above 1470° is still questioned. The results obtained by Fenner may be influenced greatly by the large excess of Na₂WO₄ used as a catalyst. Studies with other catalysts show surprising results, especially with the carbonates of Li, Na and K, the former converting

... of the SiO_2 . The oxides of Ca, Mg and B are not good catalysts. Na_2SiF_6 was found very effective even though a greater part of it volatilizes. R. H. LAMBERT

Refractometry of binary liquid systems. I. V. YA. ANOSOV. *Ann. inst. anal. physico-chim. (Leningrad)* **3**, 379-404(1926); cf. C. A. **20**, 2612.—Three types of n curves are distinguished: (1) for ideal mixts.—a straight line or a curve closely approx. thereto; (2) for systems in which dissoen. of the component occurs—a curve convex to the axis of concn.; and (3) for systems with reciprocal chem. action—a curve concave to the concn. axis. Results are given for 6 binary liquid systems. For EtOAc-SnCl_4 and piperidine-allylthiocarbimide in which the components react strongly, chem. combination is characterized by change in direction and by a max. divergence from additivity. The piperidine-allylthiocarbimide curve exhibits a singular point. II. *Ibid* 455-7.—The n of mixts. of Me_2CO and CHCl_3 at 13° gives a curve slightly concave to the axis of compn. (cf. Zawadzki, *Z. physik. Chem.* **35**, 129-203(1900)). The values for the system: $\text{Ac}_2\text{O-H}_2\text{O}$ show a min. for the compn. $\text{C}_2\text{H}_5\text{O}_2$ and a max. between 60 and 70 mol % H_2O , possibly indicating the formation of the compd. orthoacetic acid, $\text{CMe}(\text{OH})_3$. For $\text{BzH-C}_3\text{H}_5(\text{NO}_2)_3$, the n isotherm at 12.5° exhibits concavity toward the axis of compn., the $\text{C}_3\text{H}_5(\text{NO}_2)_3$ probably undergoing assocn. B. C. A.

Azeotropism in binary systems containing an amide. M. LECAT. *Ann. soc. sci. Bruxelles* **47B**, ii, 87-97(1927); cf. C. A. **22**, 1712.—The azeotropic data for binary systems contg. acetamide or propionamide are collected and discussed. Empirical formulas are given for the azeotropic lowering in systems contg. hydrocarbons, esters, halogen compds. or ethers and acetamide. B. C. A.

Sols with structure-viscosity. I. Viscometry of the ammonium oleate sol. W. O. OSTWALD, R. AUERBACH AND J. FELDMANN. *Kolloid-Z.* **43**, 155-81(1927); cf. C. A. **19**, 2288-9, 3045; **20**, 3607.—When rate of flow of NH_4 oleate sols through a capillary is plotted against driving pressure an S-shaped curve is formed. When η , the coeff. of viscosity, is plotted against driving pressure, the curve for water is a straight line, but the curve for NH_4 oleate sols is V-shaped. At very low pressures η increases very rapidly with decreasing pressure. The point of inflection at which increase of η begins with decreasing pressures depends on the concn. of the NH_4 oleate and its previous history. Mech. treatment reduces the viscosity of these sols under large or medium pressures. The anomalous effects at low pressures may be due to a kind of gelatinization which is temporarily experienced under low pressures and slow flow. The curve for NH_4 oleate sols (viscosity plotted against pressure) become similar to those for water when the NH_4 oleate sols are heated to 65° for a few minutes. Oleate sols have a less stable structure than gelatin sols and therefore show turbulence effects more readily. II. **Structure turbulence of cotton yellow sols and Hg thiosalicylic acid sols.** *Ibid* 81-7.—Sols of cotton yellow and of Hg thiosalicylate show an anomalous viscosity similar to that reported for NH_4 oleate in the preceding paper. The presence of Na_2SO_4 in the cotton yellow did not prevent the anomalous viscosity at low concns. (below 0.75%). At a concn. of 0.75% cotton yellow, such sols have only a slight abnormality and near a concn. of 1.3% cotton yellow (the concn. of max. viscosity) there is no structure turbulence. At higher concns. (1.56 and 1.69%) anomalous viscosity explained by structure turbulence reappears. All sols known to show structure turbulence also show elastic shear. These papers include 18 tables of data and 52 curves formed by plotting the data. F. E. BROWN

The dependence of the viscosity of starch suspensions on velocity. R. KÖHLER. *Kolloid-Z.* **43**, 187-90(1927); cf. preceding abstr.—The Ostwald pressure viscometer (cf. C. A. **18**, 3510; **19**, 1641) was modified by using a larger capillary. This instrument was used to det. the viscosity of a mixt. of CCl_4 and paraffin oil ($d_{20} = 1.519$) and the viscosities of suspensions of 10, 15, 20 and 25% starch in this medium. The starch was prepd by drying rice starch over P_2O_5 in a desiccator at 90° . The finely sieved starch remained stably suspended for a day. Viscosity increases with the addn. of starch. The time of flow for equal vols. of 25% starch are from 3 to 5 times that for the suspension medium. In all cases the apparent viscosity increases with decreasing pressure. The equation of Waele and Ostwald ($\eta \cdot p^{n-1} = k$) is applicable.

F. E. BROWN

The viscosity anomalies of sols in the Couette apparatus. WOLFGANG OSTWALD. *Kolloid-Z.* **43**, 210-4(1927); cf. preceding abstrs.—Hatschek found a viscosity hysteresis when he measured the viscosity of sols by Couette's app. (cf. C. A. **8**, 281). That is, when the rate of rotation of the cylinder was changed from the original rate and later returned again to it, an increase in viscosity was indicated. This is due to the adsorption of colloidal particles on the walls of the cylinders and the consequent decrease of the effective distance between them. The second anomaly is, starting

with a slow rotation of the cylinders and gradually increasing the rate, there is first a decrease in apparent viscosity, then an increase in apparent viscosity. This is due to a high viscosity produced by the structure of the colloid. At low rates of rotation this structure is not destroyed. A more rapid rate of rotation destroys the structure and decreases the viscosity of the colloid. Rates of rotation still more rapid set up turbulent flow, which increases the apparent viscosity. All of these causes should operate in capillaries as well as between cylinders. Ostwald and his coworkers have been able to reproduce these phenomena in their capillary app. F. E. BROWN

The gelatinization of lyophilic sols and the structure of lyophilic gels. H. G. BUNGENBERG DE JONG. Leyden. *Z. physik. Chem.* 130, 205-16(1927).—The gelatinization of an agar sol seems to be of the nature of a deflocculation, even though in the first stages of the process both stability factors (the elec. charge and the hydration) persist in nearly their original magnitude. In explanation of deflocculation under such conditions it is suggested that at the moment of gelatinization the charge and the hydration become localized on certain areas of the particles, and that deflocculation results by virtue of contact between the remaining unprotected areas. The charged and hydrated areas would form the walls of the voids between the particles. Such a structure for a gel demands the pressing out of water when the gel undergoes permanent deformation, and this was observed with viscose gels. Also, a gel which swells isotropically should, after undergoing permanent deformation, exhibit anisotropic swelling. In confirmation of this, it was found that if threads of viscose gel were stretched permanently and subjected either to phys. swelling by H_2O or to chem. shrinking caused by destroying the hydration centers by H_2SO_4 , then the swelling or shrinking was less in the direction of the permanent stretching than in the cross-section of the thread. Threads of viscose gel which had been stretched very severely swelled abnormally in that their length decreased and their diam. increased. This phenomenon seemed to be accompanied by a simultaneous alteration of the state of deformation of the gel which occurred only once. After its occurrence the reversible swelling had the same sign in both directions, and was much smaller along the length than across the diam., as would be expected. The significance of the forces of adhesion present at the contact surfaces of the particles, and of the hydration and charge of the free surfaces, is discussed with reference to swelling equilibrium and gelatinization in general. R. H. LOMBARD

Soaps as colloidal electrolytes. JAMES W. MCBAIN. *J. Am. Chem. Soc.* 50, 1636-40(1928).—The contention of Linderstrom-Lang (cf. *C. A.* 21, 8) that soap solns. consist only of the dissociated salts of fatty acids rather than colloidal micelles is held to be untenable. J. G. McNALLY

The liquid-liquid separation of gelatin by thiosalicylic acid and the relation of these systems to the phase rule. WOLFGANG OSTWALD AND RUDOLF KÖHLER. *Kolloid-Z.* 43, 131-50(1927).—The purpose of this study was to det. whether gelatin is or is not molecularly dispersed in the 2 liquid phases which exist when thiosalicylic acid is added to a suspension of gelatin in water. If a seemingly homogeneous system has the same no. of degrees of freedom after a sepn. into layers as it had before sepn., both phases must have existed before the sepn., though one of them may have consisted of microscopic particles. When thiosalicylic acid is used to sep. the gelatin-poor, from the gelatin-rich soln., both layers are liquid at room temps. This makes sepn. and analysis easy. Solns. or suspensions were made to contain 15, 14, 13, 10, 5 and 2% gelatin. Each of the gelatin solns. was also made 0.3, 0.4 and 0.6 *N* with thiosalicylic acid, and the concns. of acid were extended to more dil. and more concd. solns. if a sepn. occurred. The 15% gelatin remained in 1 layer. The 14% gelatin formed 2 layers when the acid was 0.4 *N*. The 13% gelatin formed 2 layers when the acid was 0.3, 0.4 and 0.5 *N*. The 10% gelatin and the 5% gelatin formed 2 layers when the acid was 0.3, 0.4, 0.5, 0.6 and 0.7 *N*. The 2% gelatin formed 2 layers when the acid was 0.2, 0.3, 0.4, 0.5 and 0.6 *N*. The concn. of gelatin approached 20% in all of the lower more concd. layers. The variations are, for max. concns., 22.6% in the 5% soln. of gelatin to 17.5% in the 14% soln. The min. concns. in the lower layer were between 10.4% in the 10% soln. and 19.3% in the 13% soln. A moderate concn. of thiosalicylic acid (0.3-0.4 *N*) produces a greater difference in concn. between the layers than a more or less concd. acid soln. A rise in temp. decreases the difference in compn. of the layers. There are fundamental differences between the diagram of the system K_2CO_3 - $EtOH$ - H_2O and the diagram of the system gelatin-thiosalicylic acid- H_2O . The compn. of the mixt. det. the compns. of the layers in the last-named system. Also, the system gelatin-thiosalicylic acid- H_2O has more degrees of freedom than it could have if it were a 2-phase system, and it cannot, therefore, be a molecularly dispersed soln. F. E. BROWN

The influence of neutral salts on the separation of gelatin by thiosalicylic acid. WOLFGANG OSTWALD and RUDOLF KÖHLER. *Kolloid-Z.* **43**, 151-5 (1927); cf. preceding abstr.—Solns. were prepd from 20% gelatin soln., 2 *N* thiosalicylic acid, and about 4 *M* solns of appropriate salt solns. The final concns. were gelatin 10%, thiosalicylic acid 0.2-0.7 *N* by intervals of 0.1 *N*, salt solns. 0.04 to 1.4 *M*. The salts used were K citrate, $(\text{NH}_4)_2\text{SO}_4$, KCl, KBr and KSCN. At low concns. each salt either produced no change or aided in the sepn. into 2 phases. With increasing concn., each salt first hindered sepn. and then at still higher concns. again promoted sepn. into layers. The bromide was an exception. No sepn. into layers occurred at any concn of bromide investigated, but no concns. of less than 0.2 *M* are reported. Anions near SCN in the Hofmeister series are more effective in promoting the sepn. into layers by thiosalicylic acid than citrate-ion and those near it. The ions near SCN in acid solns. produce a sepn. of gelatin suspensions into layers in the absence of thiosalicylic acid. F. E. BROWN

The permeability of gelatin membranes. RUNAR COLLANDER. Univ. of Hel-singfors. *Protoplasma* **3**, 213-22 (1927).—The membranes were prepd. by soaking extrn. thimbles (S & S, 94 \times 33 mm) in 30% gelatin soln. The treated thimbles were then air-dried and hardened by immersion in a 1:5 mixt. of formalin and EtOH. This gave membranes 0.8-1 mm. thick. Org. substances of high mol. wt. were used in the expts. A surface-active and an inactive substance, such as fructose and trimethyl citrate, were allowed to diffuse simultaneously through the same membrane. Measurements were made with aq. and MeOH solns. The data show that mol. size, as measured by mol. refraction, was the main factor governing the rate of diffusion. The capillary-active or inactive nature of the substance was relatively unimportant. The differences between the present results and those obtained with living protoplasm are briefly discussed and the present data interpreted as supporting the lipid theory.

M. H. SOULE

The theory of viscometry of colloidal systems. WOLFGANG OSTWALD. *Kolloid-Z.* **43**, 190-209 (1927).—A review of viscosity detns., and especially viscosity detns. of colloids, reveals abnormalities in results by all methods. Some of these have been supposed to be due to the app. (cf. *C A* **2**, 1086; **7**, 3873) used and consequently incapable of investigation by other types of app. Anomalies such as structure turbulence have been reproduced in capillary viscometers and hence are properties of colloidal substances and not due to kinds of app. Any information about viscosity which can be obtained by Couette's app. can be obtained just as validly by a capillary viscometer. Both the capillary and Couette's app. depend for the validity of their results on one layer of liquid slipping on another—laminar streaming. Both are subject to turbulent streaming when the velocity is too great. The stream profile in the Couette app. is distorted by turbulent streaming in much the same way as the stream profile in a capillary tube is distorted by the same phenomenon. In a capillary the entire central part of the cylinder of flowing liquid seems to be pushed through the outer layers which cling to the walls of the tube. The stream lines are blunt instead of parabolic over the front of the cylinder of flowing liquid. In the Couette app. the liquid seems to cling to the outer cylinder and slip on the inner cylinder. The face is almost perpendicular to the surfaces of the cylinders. These departures from the conception of Poiseuille, that each mol. layer slips on both its neighboring layers in the same way, are never entirely true in colloids. When the irregular structures of colloidal substance, including feather-like bodies, are distorted, such simple slipping is impossible and turbulent streaming is the rule, not the exception. F. E. BROWN

Ionization and adsorption isoelectric points. R. B. HARVEY. Univ. of Minn. *Plant Physiology* **2**, 220 (1927).—For clearness H. proposes that the isoelec. points of membranes produced (1) by the ionization of ampholytes and (2) by differential adsorption, which takes place without appreciable soln. of the membrane, be designated as *ionization isoelec. points* and *adsorption isoelec. points*, resp. WALTER THOMAS

The theory of adsorption. TH. SEXL. *Z. Physik* **48**, 607-10 (1928).—On the basis of statistical considerations, which are analogous to those used by Stern in deriving his vapor-pressure formula (*C. A.* **13**, 2623), the equation for the adsorption of gases by solid bodies is derived. The result is in agreement with the Langmuir equation. The const. of the L. equation assume a mol. kinetic significance. H. F. J.

Surface boundary action in anisotropic liquids. W. KAST. *Physik. Z.* **29**, 293-5 (1928).

M. R. FENSKE

Pseudo-electrolytes. Condition of ammonia in aqueous solution. E. BAARS. *Sam. chem. u. Chem.-tech. Vorträge* **29**, 53 pp. (1927).—The equil. between NH_3 and water in an indifferent medium (nitrobenzene) was investigated; the solubilities of NH_3

in dry and aq. nitrobenzene and of water in benzene were detd. Values of $K = [\text{NH}_4\text{OH}]/[\text{NH}_3][\text{H}_2\text{O}]$ increase with the NH_3 concn. Values of K' for the reaction $2\text{NH}_3 + \text{H}_2\text{O} = 2\text{NH}_4\text{H}_2\text{O}$ change to a similar extent, but in the opposite sense. Hence both hydrates are considered to be present. The partial pressures of water and NH_3 over solns. of NH_3 , and the contraction on admixture of NH_3 and water vapor at the ordinary temp. were also investigated. B. C. A.

The solubility of the barium salts of α -sulfocarboxylic acids. H. J. BACKER. Reichs-Univ., Groningen. *Z. physik. Chem.* 130, 177-83(1927).—All solubilities were detd. at $25^\circ \pm 0.02^\circ$, by evapg. a portion of a soln. formed by shaking with excess solute for about a week in a thermostat. The data are as follows:

Formula	Gs. salt in 100 gms. of H_2O		Molar soly. of dry salt
	Water free	Crystallized	
$\text{C}_2\text{H}_2\text{O}_5\text{SBa} \cdot \text{H}_2\text{O}$	0.296	0.315	1.07×10^{-3}
$\text{C}_3\text{H}_4\text{O}_5\text{SBa} \cdot \frac{3}{2}\text{H}_2\text{O}$	7.28	8.02	25.2×10^{-3}
$\text{C}_4\text{H}_6\text{O}_5\text{SBa} \cdot 2\text{H}_2\text{O}$	6.04	6.81	19.9×10^{-3}
$\text{C}_5\text{H}_8\text{O}_5\text{SBa}$	5.70	5.70	17.9×10^{-3}
$\text{C}_2\text{H}_3\text{O}_5\text{ClSBa} \cdot \text{H}_2\text{O}$	1.51	1.61	4.88×10^{-3}
$\text{C}_3\text{H}_5\text{O}_5\text{BrSBa} \cdot \frac{3}{2}\text{H}_2\text{O}$	3.14	3.38	8.85×10^{-3}
$\text{C}_3\text{H}_5\text{O}_5\text{ClSBa} \cdot 3\text{H}_2\text{O}$	2.88	3.38	8.89×10^{-3}
$\text{C}_3\text{H}_5\text{O}_5\text{BrSBa} \cdot 3\text{H}_2\text{O}$	4.36	5.03	11.84×10^{-3}

The corresponding carboxylic acids are from about 3 to 300 times as sol. as these sulfocarboxylic acids. The substitution of a halogen (Cl or Br) increases the soly. of the sulfacetate but decreases the soly. of the sulfopropionate. In both cases the soly. of the salt of the Br-substituted acid is greater than that of the Cl-substituted acid.

F. E. BROWN

Simplified method of study of salt equilibria in solutions. I. YA. BASHILOV. *J. Chem. Ind. (Moscow)* 3, 1212-5(1926).—B. recommends a rapid method for studying equil. of various systems of salt solns. and drawing their isothermic curves. Instead of having to make a complete analysis at each change of components of the system, B. uses titration. Thus, in order to obtain an isothermic curve of the system $\text{BaCl}_2 + \text{HCl} + \text{H}_2\text{O}$ at 10° , B. takes an accurately measured amt. of a soln. of 295 g. BaCl_2 per liter, and drops in from a buret a soln. of 379 g. HCl per l. until a trace of a cryst. ppt is formed. The amt. of the HCl soln. employed is noted, a measured amt. of water is added which exceeds the quantity necessary to redissolve the cryst. ppt. The HCl soln. is again added until a ppt. is formed. These alternate operations of pptn. by HCl and resoln. by measured quantities of water are continued until sufficient data are obtained to draw an isothermic curve. B. operates in the same manner to study the equil. of the system $\text{BaCl}_2 + \text{Al}_2\text{Cl}_6 + \text{H}_2\text{O}$ and gives 3 diagrams of curves and 2 tables of figures. The results obtained by this simplified method compare favorably with those obtained by the old method, which involves lengthy analytical detns. The new method, however, cannot be applied to systems in which there is no sepn. of the solid phase, as $\text{BaCl}_2 + \text{ZnCl}_2 + \text{H}_2\text{O}$, or $\text{BaCl}_2 + \text{NH}_4\text{Cl} + \text{H}_2\text{O}$. B. N.

The saturation of sugar-lime solutions. II. A. H. W. ATEN, P. J. H. VAN GINNEKEN AND E. VERWEY. *Z. physik. Chem.* 130, 365-77(1927); cf. C. A. 21, 666.—Sugar is a weak acid whose dissocn. const. is 14.6×10^{-4} . The activities of the metal ions of LiOH , KOH and Ba(OH)_2 are not materially changed by the addn. of sugar. These metals probably form dissocd. saccharate mols. The compns. of some mols. might be S-Ca-O-Ca-OH or $\text{S(CaO)}_n\text{CaOH} \cdot m\text{H}_2\text{O}$, where S represents the univalent saccharate ion. All of the Ca saccharates are more sol. than CaO ; so the addn. of sugar increases the amt. of Ca in soln. The S-Ca soln. was put into a closed flask, treated for a few min. with a measured vol. of CO_2 , and weighed to det. the amt. of CO_2 absorbed. Let R represent the ratio of the normality of the absorbed CO_2 to the normality of the original soln. and N represent the ratio of the titration value of the filtrate after treatment with CO_2 to the titration value before treatment. When a soln. contg. 3.5 mols. of sugar and 0.1 N with CaO was treated with CO_2 in different cases so that R varies from 0.15 to 0.95 at room temp., at 80° and at 95° , N did not vary inversely as R, but remained unchanged until R was 0.2 to 0.4. After R reached 0.6, N was less than the inverse proportion would indicate. If the soln. and ppt. were vigorously shaken together, the values of N were above the theoretical for all values of R above 0. When a soln. contg. 0.7 mols. of sugar and 1.7 N with CaO is treated with CO_2 until $R = 0.2-0.4$, a ppt. forms. At higher and lower values of R, no ppt. forms until $R = 0.7$. If the ppt. formed when $R = 0.2-0.4$ is left in contact with the soln. while more CO_2 is added it is redissolved. The ppt. formed at $R = 0.7$ is jelly-like, difficultly sol. and is

not dissolved by warming. If the soln. is more concd., as for instance one contg. 1 mol. of sugar and 2.3 N CaO, the second ppt. does not form until R is very nearly 1, but when $R = 0.77$ the soln. gelatinizes. A ppt. forms when R is 0.2-0.4 as in the other concd. soln. The compn. of the ppt. formed when $R = 0.2-0.4$ varied from $6\text{CaO} \cdot 3\text{S} \cdot 1\text{CO}_2$ to $6\text{CaO} \cdot 3\text{S} \cdot 2\text{CO}_2$. The ppt. forming at $R = 0.7$ can be represented by the formula $3\text{CaO} \cdot 2.5\text{XCaCO}_3$, where X increases with increasing R and 8 is the lowest value of X found at room temp. The final ppt. after treatment is $\text{CaCO}_3 \cdot 6\text{H}_2\text{O}$. Complexes from $2\text{CaCO}_3 \cdot \text{Ca}(\text{OH})_2$ to $\text{CaCO}_3 \cdot 2\text{Ca}(\text{OH})_2$ exist in the sugar soln., and sugar adds to the complexity of the mols. $\text{Ca}(\text{OH})_2$ and Ca saccharate also form complexes. Some of complexes suggested are $6\text{CaCO}_3 \cdot 3\text{Ca}(\text{OH})_2 \cdot 2\text{S}$; $3\text{CaCO}_3 \cdot 6\text{Ca}(\text{OH})_2 \cdot 4\text{S}$; $\text{Ca}(\text{OH})_2 \cdot \text{S}$; $3\text{Ca}(\text{OH})_2 \cdot 2\text{S}$. The existence of such complexes would explain the proportions of sugar and CaO without assuming the existence of disaccharates and trisaccharates.

F. E. BROWN

The osmotic pressure of salt-containing protein solutions. J. A. CHRISTIANSEN. *Compt. rend. lab. Carlsberg* 17, No. 6, 17 pp. (1928); cf. Polanyi, *C. A.* 9, 389; 19, 1800; Bjerrum, *C. A.* 18, 3131. - It is shown by mathematical analysis using the method of Gibbs (Scientific Papers I, 1st ed., 1906) that the osmotic pressure of proteins as measured by Sorenson (*C. A.* 12, 2575) is practically independent of barometric pressure; and that the compn. of protein hydrate varies with the protein concn. at const. salt concn. in the outer liquid.

DAVID DAVIDSON

The thickness of the passive surface layer and the velocity of solution of aluminum. MIECZYSLAW TZENTNERSHVER. *Roczniki Chem.* 6, 383-95 (1926); cf. *C. A.* 8, 2834. - An Al disk 1.1 cm diam and 0.3 cm thick contg. 0.24% Si and 0.45% Fe was cemented on a stirrer and agitated in acids of varying concns. The velocity const. of the reaction was calcd. according to Boguski's equation $K = [11,026 V/F(t - t_0)] \log [11,206 C(V - v_0)/(11,206 C(V - v) + 11,206 C(V - v_0))]$, C being the initial acid concn., F the free surface of the disk, V total vol. of the fluid, v_0 the H_2 evolved in the induction period, v the total H_2 evolved. There is a typical induction period before the velocity becomes const. The thickness of the passive layer $d = (26.97 v_0/3) \times 11,206 \times 2.58 \times F$. ($2.58 = \text{sp. gr. of Al}$) was found to be 30.84μ . The smoothest surface obtained by polishing with a knife, with Al_2O_3 or a grease corresponds with the thickest passive layer. $58-84\mu$. The duration of contact with air, immersion in benzene or concd. HNO_3 , has no effect on either d or the length of the induction period. The latter fact makes the hypothesis of a protective Al_2O_3 layer appear doubtful. d is considerably reduced by polishing the surface with emery or by treating it with Al solvents such as I-KI or HCl. The induction period in 2 N HCl is 28 min., in N HCl 1300 min. d is independent of the acid concn. K increases rapidly with the initial acid concn. in accordance with Hantzsch's theory that the reaction does not take place between Al and H^+ , but between metal and undissoc. acid. K is not influenced by the rate of stirring, but it increases rapidly with the temp., the temp. coeff. being 1.7-2.4 for each 10° . The reaction is, therefore, not detd. by diffusion but is a true homogeneous chem. reaction. It does not depend on the dissocn. of the acid, since the ratios of K for 2 N HCl, HBr and HI are 1300:6:0; for 2 N H_2SO_4 $K = 2$. In a soln. contg. 2 equivs. HCl and 1 equiv H_2SO_4 per l., K is the same as in 2 N HCl, another evidence against the theory of protective layers. When the dissocn. of HCl is reduced by the addn. of chlorides K increases; the addn. of $1/3$ mol. AlCl_3 to 1 l. of N HCl increases K from 41 to 514. The addn. of sulfates or nitrates reduces K by lowering the HCl concn.

MARY JACOBSEN

Equilibrium relations in the water-gas reaction in the temperature range from 300° to 1000° . BERNHARD NEUMANN AND GOTTHARD KÖHLER. *Z. Elektrochem.* 34, 218-37 (1928). - Equil. values for the reaction, $\text{CO} + \text{H}_2\text{O} \rightleftharpoons \text{CO}_2 + \text{H}_2$, were accurately detd. at temps. from 300° to 1000° by a dynamic method. The catalyst used was Co oxide, this was replaced at the lower temps. by iron oxide in order to avoid the formation of CH_4 . Small amts. of Al_2O_3 and KOH were present in the catalyst to increase its hardness and to act as a promoter. The values obtained for the equil. const., $K = [\text{CO}][\text{H}_2\text{O}]/[\text{CO}_2][\text{H}_2]$, were reproducible and they were practically the same at each temp. regardless of the direction in which the equil. was approached. From the value $K_{986^\circ} = 1.61$, a value slightly higher than that obtained by Hahn, the integration const. of the reaction isochore was found to be 0.84 and $\Delta H_0 = 9500$ cal. The curve obtained from the isochore with these values agrees with the exptl. data. The value of the integration const. also agrees with that obtained from vapor pressure data according to the Nernst heat theorem. The consts. calcd. by combination of the equilibria Fe-O-H and Fe-O-C, from the results of Eastman and of Hofmann (*C. A.* 16, 1901; 19, 2293), agree only partially with the observed values. H. F. J.

The determination of temporarily inaccessible kinetics of reaction by the division of the reactions. E. ABEL AND R. SIERRENSCHNEIN. *Techn. Hochschule, Wien Z. physik. Chem.* 130, 631-57(1927).—A reaction of unknown mechanism is studied by sepg, the reaction into parts. The reaction, $\text{IO}_4^- + 7\text{I}^- + 8\text{H}^+ \rightarrow 4\text{I}_2 + 4\text{H}_2\text{O}$ was studied by a comparison with the reaction, $\text{IO}_4^- + 5\text{I}^- + 6\text{H}^+ \rightarrow 3\text{I}_2 + 3\text{H}_2\text{O}$. The paper is largely mathematical but more than 3 pages of tables of data are given. HIO_4 does not react directly with I^- to form I_2 . Iodates or HIO_4 is formed as an intermediate product. In a H_2SO_4 soln. the differential equation for the first reaction is, $d[\text{IO}_4^-]/dt = [\text{IO}_4^-][\text{I}^-](1.3 \times 10^3 F_1 + 1.4 \times 10^7 F_2 [\text{H}^+]^2)$, where F_1 and F_2 are coeffs. dependent on the total ionic concn. The decompn of the iodate is slower than its formation, so iodate accumulates in the reacting soln. In strong H_2SO_4 soln. HIO_4 does not react with I^- to produce I_2 but the reaction produces only iodate ions and I_2 . In a soln. of AcOH and an acetate where the H^- ion concn is 10^{-6} to 10^{-8} the completed reaction may occur.

F. E. BROWN

The dynamics of the reduction of oxides by carbon. G. TAMMANN AND A. YA. ZVORUKIN. *Z. anorg. allgem. Chem.* 170, 62-70(1928).—The decompn. of oxides of the metals in the presence of C begins at a temp. depending on the nature of the carbon used. Only exothermic reactions proceed rapidly. The decompn. of the oxides of Cu, Mn, Fe, Co, Cd, Ni, Pb and Zn, was studied. C in the form of graphite, lamp black and sugar carbon was studied. Graphite gives the highest temp. of initial reaction. The rate of heating is of great importance in obtaining the pure metal.

R. H. LAMBERT

Organic catalysts with hydrogen-ion optimum. G. LJUNGGREN. *XII Int. Cong. Physiol.* 1926, 97-8.—Amino compds. exert a catalytic effect on the decompn. of acetoacetic acid; the optimal pH , which is near the neutral point, varies for different amines. The reaction is unimol. The effect is due chiefly to the primary amino group; the total concn. of the soln. is of importance.

B. C. A.

A study of the oxidation of some dicarboxylic acids by hydrogen peroxide in the presence of certain catalysts. JAMES H. WALTON AND DONALD P. GRAHAM. *Univ. of Wisconsin. J. Am. Chem. Soc.* 50, 1641-8(1928); cf. *C. A.* 20, 3375.—The progress of the oxidation reaction was detd. by removing and titrating at intervals with alkali and KMnO_4 samples of the acid soln. contg. catalyst and H_2O_2 . The expected rapid oxidation of *oxalic acid* by H_2O_2 in the presence of catalysts did not materialize because of the formation of a stable equimolar $\text{Fe}^{+++} \text{C}_2\text{O}_4^{--}$ complex. FeCl_3 is a better catalyst for the oxidation of *formic acid* (to CO_2 and H_2O) than Cu salts and CO_2 in soln. decreases the rate of oxidation with FeCl_3 . Succinic, malic, tartaric and lactic acids show increased oxidizability and tend to decrease the decompn. of H_2O_2 by the catalysts. Increase in acidity decreases the rate of decompn. of H_2O_2 and the rate of oxidation of the acid by the suppression of the formation of *ferric acid*. With acids contg. $-\text{CH}_2\text{CH}(\text{OH})\text{COOH}$ (lactic and malic) the concn. of the catalyst has little effect on either the oxidation or the rate of decompn. of H_2O_2 . In oxidation of glycerol and ethylene glycol the acidity due to the intermediate HCOOH (or HOAc) rose to a max., showing the protecting action of the primary carbinol group.

ALBERT THOMAS FELLOWS

The rate of oxidation of hydrogen peroxide by bromine and its relation to the catalytic decomposition of hydrogen peroxide in a bromine-bromide solution. WM. C. BRAY AND ROBERT S. LIVINGSTON. *Univ. of Calif. J. Am. Chem. Soc.* 50, 1654-65(1928); cf. *C. A.* 17, 2220.—The rate of reduction of Br_2 by H_2O_2 as measured by a new convenient flow method applicable to reactions having half times of the order of magnitude of ones ec., conforms to the equation: $-d[\text{H}_2\text{O}_2]/dt = \chi_1[\text{H}_2\text{O}_2][\text{Br}_2]/[\text{H}^+][\text{Br}^-]^2$, even where the concns. of acid and bromide are small. The values of χ_1 are 0.018 and 0.043 at 25° and 35° , resp. The equation and the values of χ_1 at 25° are concordant with and were predicted from exptl. work on the catalytic decompn. of H_2O_2 . Balint's results (Thesis, Budapest, 1910) have been reviewed and χ_2 at 0° recalcd. to give 0.00062 and Christiansen's (*C. A.* 20, 324; 22, 12) hypobromite-ion mechanism is rejected as unsatisfactory. An *iodometric* analytical method for H_2O_2 is described.

ALBERT THOMAS FELLOWS

Anomalies of palladium in its electromotive behavior in hydrochloric acid solution. FRIEDRICH MÜLLER. *Z. Elektrochem.* 34, 237-40(1928); cf. *C. A.* 13, 2319; 17, 37; 19, 795.—The abnormally low electrode potential of Pd at the equiv. point when used in oxidimetric titrations is connected with the presence of Cl^- in the soln. and cannot be attributed to a time effect. The low values are not observed in H_2SO_4 solns. Exptl. results suggest that the effect is due to the formation of a difficultly sol. subchloride of Pd. Equations are derived to show the dependence of the potential on the soly. product

of this compd. The same abnormality is noted with Pd electrodes in HBr solns. contg. free Br and with Ag electrodes in HCl. Attempts to find the new Pd compd. by reduction of PdCl_2 were unsuccessful.

H. F. JOHNSTONE

The relation between reactive power and electrical conductivity in the solid state.

J. ARVID HEDVALL. *Z. anorg. allgem. Chem.* 170, 71-9(1928).—The double decompn. of cuprous halides and BaO was examd. at many temps. A sharp increase in the reaction occurs at 270°, 312° and 340° for chloride, bromide and iodide, resp. These temps. correspond to the temp. at which a sharp increase in elec. cond. is found. This would imply that conduction is not only electronic but also by the at. and mol. lattice, since pure electronic conduction occurs at much lower temps. A discussion is given of the sulfates in which the SO_4 is greatly deformed. The temp. of reaction with BaO for such sulfates was found to be higher than that for the cuprous halides. Since, however, the lattice structure of Ca^{++} , Sr^{++} and Mg^{++} is that of the rare-gas types, these ions are very little deformed and therefore are not readily opened. Of this type Li^+ and Be^{++} are most deformed and should react with BaO at much lower temps. in the sulfate compds. This has not yet been confirmed.

R. H. LAMBERT

Dispersion of metals in solid salts under the action of an electric current. T. PECZALSKI. *Compt. rend.* 185, 1588-91(1927).—An Fe tube filled with a salt (KCl , BaCl_2 or SrCl_2) and contg. a Cu rod placed axially, was heated to a temp. below the m. p. of the salt, and the Fe and Cu portions were then connected to a source of current. Above 300° the cond. increased rapidly after 1 hr. when the Cu was made pos., and Cu was detectable in the salt. When the Cu was neg. the increase was slower and Fe was detectable in the salt. The use of Al and Al_2O_3 in place of the Cu and the salt, resp., gave neg. results except for an increase in cond. in the former case when the Fe was pos. The results are explainable by emission of ions of the metal, while there is also evidence of electrolysis of the salt vapors, with the formation of unstable compds. between the metal and the cations and subsequent deposition of the former in the salt.

B. C. A.

Electrolytic reduction potentials of organic compounds. I. Polarographic method. M. SHIKATA. *Mem. Coll. Agr. Kyoto* 4, 1-8(1927).—A description is given of the use of polarograms, produced by the automatic registration of current-voltage curves on a rotating drum, for the detn. of the reduction potentials of org. compds. at the dropping Hg cathode. II. Isovaleraldehyde. M. SHIKATA AND I. TACHI. *Ibid* 9-8; see C. A. 21, 1917. III. Pyridine. *Ibid* 19-33; see C. A. 22, 720. IV. Nicotinic acid. *Ibid* 35-48; see C. A. 22, 1894.

B. C. A.

Reduction potential of selenious acid and the free energy of aqueous selenic acid. M. S. SHERRILL AND E. F. IZARD. *Mass. Inst. Tech. J. Am. Chem. Soc.* 50, 1665-75(1928).—Equil. studies of the reaction $\text{X}_2 + \text{H}_2\text{SeO}_3 + \text{H}_2\text{O} = 3\text{H}^+ + \text{HSeO}_4^- + 2\text{X}^-$ lead to values of 1.42×10^9 and 0.88, resp., for the equil. const. where Cl_2 and Br_2 are used. The reduction potential of the reaction $\text{H}_2\text{SeO}_3 + \text{H}_2\text{O} = 3\text{H}^+ + \text{HSeO}_4^- + 2\text{E}^-$ was calcd. to be -1.088 v., which in turn leads to a free-energy value ($\Delta F_{298.0}^\circ$) of -107,710 cal. for HSeO_4^- (or one mole of aq. H_2SeO_4). Redetns. of the soly. of Cl_2 in aq. HCl and the concn. of Cl_3^- present were made, and the activity and distribution consts. of Br_2 between CCl_4 and aq. KBr and HBr measured.

A. T. FELLOWS

Observations on the hydrogen electrode. SHIGEHARN SEKINE. *Z. Elektrochem.* 34, 250-3(1928).—Measurements of the current obtained through different external resistances from the cell, $\text{H}_2(\text{Pt})/\text{H}_2\text{SO}_4/\text{PbO}_2$ show that the voltage of the cell is not const. A small decrease in resistance causes first a normal increase in amperage and then a quick decrease. A further decrease in resistance produces fluctuations in the current strength between certain max. and min. values. The periods of fluctuation were of several min. duration and were easily reproducible. The abnormality is interpreted as a relation between the rate of adsorption of H by Pt and the ionization of the adsorbed gas. These results were not noticed when a Pd sheet was substituted for the Pt.

H. F. JOHNSTONE

Investigations on paramagnetism—the magnetic moments of the ions of the elements of the transition groups. D. M. BOSE AND H. G. BHAR. *Z. Physik* 48, 716-21 (1928).—The magnetic susceptibilities of various salts of the elements of the transition groups were measured with a Curie balance, and the no. of Weiss magnetons assocd. with each metallic ion was computed. Pd^{II} , Ta^{V} , Os^{III} , Pt^{IV} , Pt^{IV} , Th^{IV} and U^{VI} were diamagnetic. The moments of the others were: V^{III} , 12.6; Mo^{++} , 18.1 and 18.4; Rh^{III} , approx. 1.5; Ru^{III} , approx. 1.5; W^{III} , approx. 2; W^{IV} , 8.9; Ir^{IV} , 9.5; Ir^{III} , approx. 2.4; U^{IV} 12.1. The interpretation of these results in terms of Hund's theory and of B.'s modification of Hund's theory is discussed, and tables are given in which exptl. and computed values are compared.

W. W. STILES

The determination of specific heats and heat tone from temperature-time curves. W. M. COHN. *Z. angew. Chem.* 40, 1557-9(1927); cf. *C. A.* 21, 2773.—The substance under examn. is placed in a small crucible contg. also a thermoelement within an elec. furnace. The method is intended principally for silicates and ceramic masses for which variations in the thermal cond. may be neglected. Then the rate of transmission of heat to the substance $dQ/dt = f(t, G)$, where t is the temp. of furnace and G the temp. difference between the furnace walls and the crucible. This function is a const. for a given furnace. A substance is chosen, the sp. heat of which has been ascertained. For the same substance the temp.-time curve is measured and thus dQ/dt is obtained. A series of curves is produced for varying values of G , and the temp.-time relations for various substances are transformed into temp.-heat quantity relations. Sp. heats are detd. by tangents and the thermal effect of any chem. reactions which occur can be measured.

Thermal conductivities of certain liquids. G. W. C. KAYE AND W. F. HIGGINS. *Proc. Roy. Soc. (London)* A117, 459-70(1928).—The thermal conductivities of a no. of common liquids have been detd. by a plate method, over a range of temps. up to 200° (where feasible). The app. consisted of 2 Al blocks, the upper "hot block" contg. an elec. heating coil and the lower "cold block" being provided with radiating fins. The test liquid was contained in a small trough running round the upper end of the cold block, and formed a layer about 20 sq. cm. in area and up to 0.5 mm. thick, between the 2 blocks. An Al guard plate contg. a subsidiary heating coil was mounted above the hot block and sepd from it by a thin film of air, and by adjusting the current through the subsidiary coil it was arranged that the energy supplied to the main heating coil should be almost all transmitted downwards through the test liquid. Corrections were applied for lateral heat loss from the hot block, heat transferred through the liquid in the trough, and heat lost by evapn. from the liquid in the trough. The following results were obtained for the cond. at 20° and the temp. coeff. α in the expression $K_t = K_0(1 + \alpha t)$, resp.: water, 0.0014, +0.001; glycerol, 0.00068, +0.0005; castor oil, 0.00043, -0.0005; aniline, 0.00041, 0.0000; olive oil, 0.00040, -0.0003; cylinder oil, 0.00036, 0.0004; transformer oil, 0.00032, -0.0006; "B.P." paraffin, 0.00030, -0.0001; paraffin oil, 0.00029, -0.0005.

The determination of the reaction temperature by heating curves in powder mixtures. J. ARVID HEDVALL AND E. GUSTAFSSON. *Z. anorg. allgem. Chem.* 170, 80-4 (1928).—The temp. at which the reaction of a powd. mixt. takes place can be obtained either in the center of the mass or near the surface, although the time to reach that temp. is different in the 2 cases. When BaO reacts with the halides of Cu, a measure of the amt. of reaction may be obtained by noting the red Cu_2O formed. The temp. for the reaction of BaO with $CuSO_4$ was found to be 346°.

Flame and combustion. G. I. FINCH. *Nature* 120, 694(1928).—The combustion of CO to CO_2 , both moist and dry, was studied in a steady high-tension d. c. discharge. Both cathodic and pos.-column combustion were examd. The former depends on the current and is independent of gas pressure or moisture. Moisture accelerates combustion in the pos.-column region.

An investigation as to the accuracy of Stohmann's thermodynamical data. P. E. VERKADE AND J. COOPS, JR. *Rec. trav. chim.* 47, 606-18(1928).—The heats of combustion of a long series of materials have been studied in regard to at hermochem. specification as agreed to by international stipulations. These are compared with the data of Stohmann, which are incorrect. The ratio of the 2 values ranges from 1.0031 to 0.9892. Homogeneity in S.'s data is quite evident but no single correction coeff. is sufficient as proposed by Sweitoslawski. The heat of combustion of diphenylamine as given by Stohmann is also shown to be incorrect. By using a large no. of comparison substances V. and C. conclude that no method is available for a systematic correction of the investigations of one source in order to have the data conform to international standards.

Thermodynamics, wave-theory and Compton effect. C. V. RAMAN. *Nature* 120, 950-1(1927).—Objections to Compton's explanation of the nature of the Compton effect are summarized and R.'s views which are being presented and developed elsewhere, are indicated.

Absorption of ultrasonic waves by various gases. T. P. ABELLO. Univ. of Chicago. *Phys. Rev.* 31, 1083-91(1928); cf. *C. A.* 22, 1901.—A beam of ultrasonic waves with a frequency of 612 kilocycles from an oscillating quartz crystal was passed through a mixt. of gas and air contained in a brass absorption tube with ends covered by thin celluloid films. The design of the tube greatly reduced the effect of resonance and allowed the use of 2 different lengths of absorbing gas leaving the geometrical arrange-

ment of openings and absorbing screens the same. The emergent beam was allowed to fall upon another quartz crystal which had a natural frequency very nearly equal to the frequency of the waves and which was connected to the grid of a triode. The intensity of the receiving signal was measured by a previously calibrated vacuum-tube voltmeter. A logarithmic decrease in the transmitted energy with increase in the percentage of the gas in the mixt. was found with CO_2 , N_2O , H_2 and He. The increase in the absorption coeff. (cm^{-1}) at 612 kilocycles when air was replaced in a mixt. contg. 1% by vol. of the gas was found for CO_2 to be 0.029; for N_2O , 0.034; for H_2 , 0.014; for He, 0.0025. For argon mixts. no absorption was observed. *Reflection of ultrasonic wave by a thin celluloid film.* The fractional part of the beam which was transmitted by the films at the ends of the absorption tube increased with increase in percentage of CO_2 and N_2O but decrease with increase in percentage of H_2 and He, agreeing qual. with Rayleigh's theory.

BERNARD LEWIS

Pumice impregnated with anhydrous magnesium perchlorate as a drying agent. JOHN H. YOE, RANDOLPH W. MCGAHEY AND WM. T. SMITH. *Ind. Eng. Chem.* **20**, 656-7(1928). -Pumice granules impregnated with anhyd. $\text{Mg}(\text{ClO}_4)_2$ absorbed water perfectly up to about 25% the weight of the $\text{Mg}(\text{ClO}_4)_2$ present. T. S. CARSWELL

Alcohol tables. F. WRATSCHKO. *Pharm. Presse* **33**, 175-6(1928).—Four tables are given showing, resp., the wt. % and d_{15}^{15} , and d_4^{25} of aq. alc. mixts., interpolation values with formula for their use, and finally the d. of H_2O from 10° to 25°. W. O. E

Molybdenum blue, its properties and composition. LLOYD A. MUNRO. Dalhousie Univ., Halifax, N. S. *Proc. Trans. Nova Scotian Inst. Sci.* **16**, 9-24(1928).—Mo blue is more readily prepd. with SnCl_2 and H_2S . Green and brown colors are due to a further reduction compd.; the action is reversible. Mo blue is obtained only in acid soln.; it is a negative colloid; it also exists as a crystalloid; it forms cubic crystals from alc., and transparent cubes bearing octahedral faces from the blue filtrate obtained after pptn. of the gel with NH_4OH . Mo blue is insol. in Me_2CO , CHCl_3 , C_6H_6 , CS_2 or Me_2CO , sol. in H_2O , abs. EtOH and MeOH. The hydrogel has the formula $\text{Mo}_3\text{O}_8\cdot\text{H}_2\text{O}$; the blue = Mo_3O_8 . The sensitivity of the Sn test is 1 part in 1,423,000. A. L. HENNE

3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

S. C. LIND

Significance of minimum ionizing potentials of gases in relation to their molecular volumes. S. C. BISWAS. *Quart. J. Ind. Chem. Soc.* **4**, 441-7(1927).—From a consideration of the relationship between the dielec. const. K and the mol. const. v of gases it

appears that $v \propto \sqrt{K-1}$ in contrast to Landolt's equation $\sqrt{(K-1)/d} = \text{a const.}$ or the Lorentz-Mosotti equation $(K-1)/(K+2)d = \text{a const.}$ V_r (the min. ionization potential) $\div d$ is const.; this means that the sp. work required to displace an electron measured by the sp. min. ionizing potentials for different gases, can be calcd.

H. B. W.

An apparent failure of the Hund theory. A. G. SHENSTONE. Princeton Univ. *Nature* 121, 619(1928).—The predictions of Hund's theory in regard to the designations of the levels of an ion to which the term sequences of an atom converge are not fulfilled by the 1P and 3P terms of Ne I, nor by the 1D and 3D terms of atoms and ions having 9 d -electrons, such as Ni I, Cu II, Pd I, Ag II. By assuming Paschen's 1s series for Ne I, it is found that 3P_2 and 3P_1 converge to one limit, and 3P_0 and 1P_1 to a higher limit. The two limits are the 2P term of Ne II. According to the theory, the limits of 3P_1 and 1P_1 should be interchanged. An explanation given by Hund is shown to be incompatible with intensity relations in the far ultra-violet series $^1S_0 - n s$. In Cu II, Ni I and Ag II, only 2 members of the 3D and 1D terms are known, but the calculated limits agree in pairs $^3D_3, ^3D_2; ^3D_1, ^1D_2$. The theoretical pairs are $^3D_3, ^1D_2; ^3D_2, ^3D_1$. For Pd I, an identification of more terms has been made, with results for the middle set of terms in agreement with those of Bechert and Catalan, but not with those of McLennan and Smith. The D term-sequences converge as above, the difference between the calcd. limits of 3D_3 and 3D_2 being 80 cm. $^{-1}$ and between 3D_1 and 1D_2 20 cm. $^{-1}$, whereas the difference between the terms 3D_3 and 3D_2 of Pd II is more than 3500 cm. $^{-1}$. No explanation is attempted for these failures of the theory in the case of atoms having nearly completed electron groups.

F. A. JENKINS

The fundamental state of the helium atom. E. GIL A. HYLLEAAS. *Z. Physik* 48, 469-94(1928).—A process for the accurate calcn. of the ionization potential of the He atom is outlined. It involves a soln. of the Schrodinger wave equation for bi-electron systems which corresponds to the Ritz process for the soln. of variation problems. The calcs. are carried out by 11 successive approximations which lead nearly to convergence. The ionization potential is calcd. to be 24.35 v., while that observed by Lyman was 24.46 v. The agreement is better than for the values calcd. by Slater (*C. A.* 22, 1721) and by Kellner (*C. A.* 21, 3823).

H. F. JOHNSTONE

Secular changes in electronic orbits in a magnetic field. W. M. HICKS. *Phil. Mag.* [7], 5, 801-23(1928).—The use which has been made of Larmor's theorem to explain the Zeeman effect on the quantum basis is well known. On the supposition that the effect of H^2 (H = magnetic field) on the motion may be neglected, the motion of a single electron round a nucleus is compounded of an elliptic orbit in some plane inclined to H which at the same time regresses with angular velocity $w = HE/2 mc$. Now, such an electron in orbits of at. dimensions makes about a billion circuits in $1/1000$ sec. Thus during the life even of an excited orbit there is time for secular effects to produce very large changes in the orbital consts. It is the purpose of the present investigation to det. these changes, and at the same time to find the conditions that H^3 and higher powers may be neglected. The principal results may be summarized as follows: If the initial orbits are parallel or perpendicular to H their planes remain fixed, but the line of apsides regresses. If the initial orbit be a circle, it will remain a circle, with the inclination of its plane unaltered, but the nodal line progresses at a const. rate of the second order of magnitude. In other cases the nodes, apsides, eccentricity and inclination of plane all change. There are two categories of cases: where the apsides continually regrede, or where they oscillate on either side of the line perpendicular to the node.

GEORGE GLOCKLER

Experimental test of Maxwell's distribution law. JOHN A. ELDRIDGE. Univ. of Iowa. *Phys. Rev.* 30, 931-5(1927).—A method is described for obtaining a velocity spectrum of a metallic vapor. The app. consists of a no. of coaxial disks with radial slots which rotate at high speed and serve as a velocity filter for the mols. The velocity can be measured directly. The app. has been used to measure the distribution law of mol. velocities in Cd vapor and it is found to agree with that of Maxwell within exptl. error.

BERNARD LEWIS

The composition, pressure, temperature and electric conductance of the higher atmosphere in relation to the nature of the propagation of radio waves. P. O. PEDERSEN. *Kgl. Danske Videnskab. Selskab Math.-fysiske Medd.* 8, No. 4(1927).—Short waves (15 to 20 m.) will travel around the earth and still possess appreciable intensity when received. Radio waves are transmitted through and by means of the atm. the upper strata of which may serve as a "shell," preventing complete radiation into space and reflecting the waves back to the earth. The waves may be reflected back and forth a few times between the surface of the earth and the "shell," but on account of the great

loss of energy in a single reflection (75 to 90%) long distances must be covered in one or, at the most, a very few reflections or "steps," and the path would consequently be located mainly in the higher atm. along the shell, practically parallel to the earth's surface. Reference is made to the possible relationship between certain values such as the damping const. of the waves, the av. electron velocity, the av. length of the free electron path, the av. no. of electron collisions per second, and a const. depending on the wave length and the concn. of electrons in the atm. The partial pressure of each of the constituents of the upper atm. (H, O, N, He) may be calcd. for different elevations based on certain assumptions regarding the temp. and nature of the constituents. The elec. cond. of the atm. in the direction of the earth's magnetic field at elevations of 120, 140 and 160 km. is, resp., 300, 4000, 9000 times as great as the corresponding cond. at right angles to the field. P. believes that radio wave transmission studies will bring about the solution of such problems as the detn. of the extent of ionization caused by the very penetrative cosmic rays and by the ultra-violet astral rays. The former kind of ionization is involved in the damping effect on very long waves; the latter causes the greater damping of long waves on winter days than on summer days.

E. O. ELLINGSON

The homopolarity of the hydrogen halides. V. KONDRAT'EV. *Z. Physik* **48**, 583-5(1928); cf. Lewis, *C. A.* **22**, 2112.—The energy of dissocn. of the H halide mol can be calcd. from its infra-red vibration spectrum. Based on the results of Randall and Imes (*C. A.* **14**, 2296) the calcd. values are found for HF, HCl and HBr to be, resp., 185, 111 and 80.5 cal. per mole. These results agree with those found in thermochem. data. The H halides, therefore, are homopolar compds. H. F. JOHNSTONE

A new optical method of investigating powders or substances with a fibrous structure. G. P. VORONKOV AND G. I. POKROVSKII. *Kolloid-Z.* **45**, 1-7(1928).—The intensity of the reflected component of a light ray incident on coarse suspensions of chalk, mica, glass, filter paper, talc and silk was measured. From these data the consts. of several given equations were evaluated. Preliminary results indicate that these consts. may be related to the shape of the particles in the suspensoid. J. G. McNALLY

Investigation of a mercury-thallium molecule. R. K. WARING. Johns Hopkins Univ. *Nature* **121**, 675(1928).—Two kinds of evidence are obtained for the existence of a Hg-Tl mol. When a mixt. of Hg and Tl vapors is condensed in an empty bulb, there being an excess of solid Tl in the system, more Tl is found than when pure Tl is condensed, starting at the same temp. Also the absorption spectra of mixts. of Hg and Tl vapors at 300-1100° contain new bands shaded to the red, of which several lie in the ultra-violet and one in the green. They are not found with the pure vapor of either substance. With rising temp. and vapor density, the bands broaden, principally towards the red.

F. A. JENKINS

Magnetism and the structure of some simple and complex molecules. D. M. ROSE. *Phil. Mag.* [7], **5**, 1048-67(1928).—In this paper the recent theories of the structure of diatomic mols. proposed by Birge and Mulliken (*Molecular Spectra in Gases*, *Bull. Nat. Res. Council* **11**, Part 3, (1926)) and of the nature of coordination links in Werner's coordination compds. proposed by Sidgwick (*Electron Theory of Valence*, Univ. of Oxford Press 1927), have been tested by the investigation of the magnetic properties of the coordination compds. of the elements belonging to the first transition group. Sidgwick has proposed to account for the linkage of the 6 at. groups to the central atom in a sixfold compd. by supposing that in general each of the at. groups contributes two electron orbits to the latter; all of them taken together form a valency group of 12 electrons round the core of the central atom, which has been stripped of its own valency electrons. From magnetic evidences it is concluded that if there are vacancies in the M_3 shell of the central atom for four electrons, then 4 of the 12 shared electrons occupy the M_3 shell, while the remaining 8 form an octet shell round the core. When the M_3 shell of the core cannot accommodate all of the 4 electrons, they move in orbits outside the latter. In the case of fourfold compds. the valency shell of 8 electrons contributed by the 4 at. groups forms an octet shell outside the core of the central atom. The at. groups which are usually found in coordination compds. include, among others, the following: OH, OH₂, NH₃, CN, CO, NO, O₂ and N₂H₄. Birge and Mulliken have, from band spectra evidence, given a new theory of the structure of diatomic non-polar mols. like those included in the above group. It is shown that the no. of coordination bonds contributed by these groups can be satisfactorily accounted for on their structures proposed by the new theory. GEORGE GLOCKLER

Electronic theory of valency. T. M. LOWRY. *Phil. Mag.* [7], **5**, 1072-80(1928); cf. *C. A.* **22**, 724.—Compds. in which neutralization of the ionic charges is prevented by the laws of valency generally behave as "strong electrolytes" in soln. Badly con-

ducting solns. can, however, be obtained by dissolving a salt in a medium with a low dielec. const., when abnormal variations of cond. with dila. are generally observed. Many fused salts are good conductors, giving values for the "coeff. of ionization" which may be above 100%, perhaps as a result of the formation of multiple-charged ionic aggregates. Other fused salts, however, are poor conductors, probably because the crystal lattice breaks down into neutral ionic doublets on fusion. The term "hydrolysis" has no significance, from the point of view of the theory of complete ionization, unless the H^+ or OH^- ion of water can be fixed by one of the ions of the salt, with formation of a covalent compd.

GEORGE GLOCKLER

Note on the work of V. A. Sokolov: "The laws of radioactive decompositions." II TH. WOLFF. *Z. Physik* 48, 745-6(1928); cf. *C. A.* 22, 1902.—The relation between the decompn. consts. of α -radiators and their position in the decompn. series given by S. follows from a previously published equation of the author (*C. A.* 14, 3356) together with the Geiger-Nuttall formula.

H. F. JOHNSTONE

The disintegration of radium E from the point of view of wave mechanics. G. P. THOMSON. Univ. of Aberdeen. *Nature* 121, 615-6(1928).—Ellis and Wooster (*C. A.* 22, 537) found that the initial energy of a β -particle from Ra E may vary from 4×10^4 to 1.05×10^6 v. This result may be interpreted by the wave mechanics, according to which such an electron corresponds to a wave group of the nature of a single pulse, the damping factor being of the order of the wave length. Such a wave group is far from monochromatic and would spread rapidly in the direction of propagation, implying a considerable range of possible velocities for the electron. If the waves traverse a magnetic field (dispersive medium), the group would be split up into monochromatic waves. The observed continuous spectrum of velocities can thus be understood on this point of view. By using Heisenberg's uncertainty relation, and assuming the no. of β -particles with momentum g to be proportional to $\exp. - [(g - 1.25m_0c)/0.65m_0c]^2$, the uncertainty of momentum of the β -particles is found to be $0.65m_0c$, and the corresponding uncertainty of position $\sigma = h/2\pi \times 0.65m_0c$. The mean de Broglie wave length is 2×10^{-10} , and hence $\lambda = 3.3\sigma$. The group is, therefore heavily damped, the amplitude of the first min. being only 7% of that in the middle of the group. Since σ is much larger than the nuclear diam., the latter does not determine the uncertainty of position.

F. A. JENKINS

Purification of radon. L. WERTENSTEIN. *Phil. Mag.* [7], 5, 1017-27(1928).— H_2 is removed quickly by CuO and P_2O_5 . CO_2 is not readily removed by KOH in a boat at room temp. It may take 24 hrs. or more to remove the CO_2 by these means. Hydrocarbons are oxidized by CuO but the resultant CO_2 is slow to remove. G. G.

The present state of the chemistry of polonium. MARIE CURIE. *Roczniki chem.* 6, 357-61(1926).—Po is suitably prepd. from dead radon tubes. Ra D with a half time value of 16 years can be easily kept in labs. as a source of supply of Po. The ampoules are ground and extd. with warm, dild. acid. The soln. contg. besides Ra D and Po a little Pb from the glass and Hg from the app. in which the radon was purified is pptd. with H_2S in small quartz crucibles in the presence of a few mg. Pb, washed with $K_2S \cdot (NH_4)_2S$ and sepd. from Cu with NH_3 . Po is sepd. from Pb with concd. HNO_3 in which it is sol. It is recovered either by electrolysis from HNO_3 with a Au electrode or—in considerably higher yield—by deposition on a rotating Ag disk from a HCl soln., in which Pb remains dissolved. After dissolving in HNO_3 the Ag is pptd. with HCl, retaining only a little Po, provided the soln. is sufficiently acid. Ni or Cu may also be used, but the sepn. from Ag is easier. A disk carrying a large quantity of Po imparts to the air a strong O_3 odor and causes lively fluorescence of a ZnS screen. A current of several million amp. is produced by 0.001 mg. The HCl soln. of Po thus obtained is pure and may serve for the study of its chem. properties. The pptn. of Po in the presence of another metal is detd. by both chem. analogy and adsorption. It is difficult to sep. the phenomena, but it may be safely assumed, that the pptn. by H_2S in acid soln. is characteristic for Po, since it is practically quant. for minute quantities of Po and in the presence of minute quantities of metals which act as adsorbents under these conditions. Further the % relation of pptd. Po sulfide (I) and PbS (II) or Bi_2S_3 (III) is const., which points to isomorphism, and almost = 1 (it would be 1 with isotopes). I cannot be sepd. from II or III by an excess of the solvent from which it was pptd. It is on the inside of the ppt. rather than on its surface, while with Au_2S_3 and TeS adsorption alone takes place. On the other hand the pptn. of Po hydroxide (IV) on $Bi(OH)_3$ or $Fe(OH)_3$ decreases with the concn. of the NaOH. C as an adsorbent behaves similarly. IV may be partly redissolved by fresh N NaOH and from such a soln. Po is deposited at the anode (complex anion?). It may be concluded that the analogy with Bi is borne out by I, that with Te by IV, but that Po is not an analog

of Te, since its sulfide is insol. in $(\text{NH}_4)_2\text{S}$. Its salts are acid-sol.; it is a noble metal. Its individual characteristics do not permit identification with any neighboring element. The method described will prove useful in the study of adsorption generally.

Ranges of α -particles of uranium I and II. G. C. LAURENCE. *Phil. Mag.* [7], 5, 1027-38(1928); cf. *C. A.* 22, 537.—The ranges of the α -particles of U, I and II were detd. by the Wilson cloud chamber method, with modifications made necessary by the small activity of the radioactive material. The method was satisfactorily checked by its application to the range of Po. The ranges at 15° and 760 mm. of Hg were found to be: U I 2.73, U II 3.28, with a probable error of less than 1%. From the range of U II its decay const. was calcd. to be 1.7×10^{-12} sec. $^{-1}$, or a half-life of 13,000 yrs.

MARY JACOBSEN
GEORGE GLOCKLER

The radium content of Stone Mountain granite. CHARLES S. PIGGOT. *J. Wash. Acad. Sci.* 18, 313-6(1928).—This material contains 4.826×10^{-12} g. of Ra per g. of granite. The Lind interchangeable electroscope was used. The detn. was made on a gray biotite-muscovite granite from Stone Mountain, Ga. L. D. ROBERTS

Spectrography of γ -rays by crystalline diffraction. FRILEY. *Compt. rend.* 186, 137-9(1928).—An app. is described for applying the rotating-crystal method to the diffraction of γ -rays. An optical bench 1.5 m. long is used to support 3 sliding mounts, one carrying the source of radiation and the slit system, the other the crystal and mechanism for rotation, and the third the camera. The radiation is obtained from small ampoules of Rn placed in a Pb block. Between the slits a p. d. of several hundred v. is established to remove the β -rays. The crystal rock salt, is rotated at the rate of one turn in 24 hrs., the angle being variable. Provision is made for micrometer adjustments, and cross wires are substituted for the crystal in lining up the app. The distances from source to plate were 65 to 110 cm., and the exposures lasted 2 to 5 days. By this technic, wave lengths between 35 and 284 X. U. have been measured. *Ibid* 425-7.—Bv using the app. described above, a spectrographic study has been made of the γ -rays emitted by Ra. Twenty-one different wave lengths are listed varying from 20 to 284 X. U., corresponding to quantum voltages from 617 to 43.5 kv. The more intense lines have the following wave lengths in X. U.: 20, 35, 42, 51.5, 140, 144, 155, 161, 166, 232. The origin of the different lines is indicated. The results are in good agreement with data on corpuscular spectra obtained in the same region, except for the 2 triplets (nuclear Ra B and triplet of fluorescence) where the analysis by corpuscular spectra is still uncertain. Both these groups of lines are very intense in this new method. A. W. KENNEY

A method for the direct experimental determination of the magnetic moment of a single electron. TH. SEHL. *Z. Physik* 48, 729-30(1928).—A possible exptl. arrangement of condenser and electromagnet is described by which it might be possible to measure the magnetic moment of a single electronic charge. This would make it possible to check directly the hypothesis put forward by Uhlenbeck and Goudsmit to explain the anomalous Zeeman effect. W. W. STIFLER

Theory of the magnetic electrons. I. D. IVANENKO AND L. LANDAU. *Z. Physik* 48, 340-48(1928).—Mathematical. A. L. HENNE

Dirac's theory of spinning electrons. A. LANDÉ. *Z. Physik* 48, 601 6(1928); cf. *C. A.* 22, 1535.—Mathematical. A more general form of the coupling matrix is set forth. Analogs in classical mechanics are shown. H. F. JOHNSTONE

The refraction quotients of the de Broglie waves of the electron. A. JOFFÉ. *Z. Physik* 48, 737-8(1928); cf. Klemperer, *C. A.* 22, 1903.—J. shows that the refraction exponent calcd. by K. on the basis of the wave theory follows as well from pure electrostatic considerations. The reflection of electrons therefore cannot be considered a proof for the wave theory. H. F. JOHNSTONE

A note on A. Sommerfeld's paper: "The electron theory of metals on the basis of the Fermi statistics." ERICH KRETSCHMANN. *Z. Physik* 48, 739-44(1928); cf. *C. A.* 22, 1538.—The validity of the formula derived by S. for elec. and heat conductance is not dependent on the assumption that the mean free path of the electrons is, in the first approximation, independent of the temp. H. F. JOHNSTONE

A note on the distribution of electrons among atomic levels. E. C. STONER. Univ. of Leeds. *Proc. Leeds Phil. Lit. Soc., Sci. Sect. 1*, Pt. 6, 226-31(1928).—A new distribution is not proposed. It is pointed out that some unjustifiable applications of a scheme previously given (*C. A.* 19, 209) have been made. Recent work has cleared up many points, but electrons cannot be subdivided into groups specified by n , k and j values appropriate for x-ray levels. W. ALBERT NOYES, JR.

Predicted ionization potential of niton. S. C. BISWAS. *Phil. Mag.* [7], 5, 1094-

98—B. calcs. the ionization potential for Rn to be 14 v. He takes into account the fact that in other groups of the periodic system there are found cases where the ionization potential of an element near the bottom of the table increases. Glocker (C. A. 20, 145) and Struwe (C. A. 20, 2450) have previously calcd. the ionization potential of Rn to be about 10 v. by extrapolation *within* the rare-gas group only. G. G.

Mobility of positive ions formed by α -rays in air, hydrogen and helium. J. S. ROGERS. *Phil. Mag.* [7], 5, 881-903(1928).—The method used has the following advantages: The mobility values are found from straight-line intercepts on the potential axis and not from discontinuities in the curves. The ions investigated are not produced in a subsidiary chamber, but directly in the chamber in which they are at once measured. The ions are not entering the measuring-chamber continuously but only for limited times (on account of the sectored wheel). Adequate precautions are taken to remove those positive ions which are approaching the top plate but which fail to reach it. In general the values obtained for the mobilities are the same as obtained by others (C. A. 16, 3256, 3806; 19, 930, 1986, 2778). The mobility of the positive ion depends on its life but this dependence is not a continuous function of the life but for certain ranges of lives the mobility remains const. In each of the gases investigated 3 different mobilities have been found and the change from one to the next occurs at very nearly the same lives. There is still no theoretical equation which will give satisfactorily the mobility of ions but the present expts. indicate that, whatever the ion is initially, *after a very short time it has developed into some kind of cluster.* GEORGE GLOCKLER

Space-charge effects. H. W. B. GILL. *Phil. Mag.* [7], 5, 859-65(1928).—The effect of space charge on the potential distribution between grid and plate in a triode was studied (cf. C. A. 19, 2447). GEORGE GLOCKLER

Primary dark space of a Geissler discharge. K. G. EMELEUS, AND N. M. CAR-MICHAEL. *Phil. Mag.* [7], 5, 1039-48(1928).—The primary dark space on the cold cathode of a Geissler discharge is similar in appearance to the positive-ion sheaths present on negative exploring electrodes. A number of its properties can be accounted for by application of the equations developed by Langmuir for the latter, but there are discrepancies between the observed and calcd. current densities which indicate that the cathode is receiving fast electrons from adjacent parts of the discharge, which, in turn, could produce a secondary emission of electrons from the metal. The primary dark space may be the analog in a glow discharge of the cathode sheath in an arc (cf. C. A. 19, 1531). GEORGE GLOCKLER

The passage of electrons through hydrogen at low pressures. H. JONES AND R. WHIDDINGTON. Univ. of Leeds. *Proc. Leeds Phil. Lit. Soc., Sci. Sect.* 1, Pt. 6, 239-41(1928); cf. C. A. 21, 2221.—Magnetic analysis of electrons passed through H at low pressures shows that some have lost energy corresponding to 12.2 v. and others to 9.1 v. The latter occurs when potentials in excess of 16 v. are used. It is suggested that the 9.1 v. value corresponds to an excitation potential of H₂. The 9.1 level may form an end state for certain bands of the many-lined spectrum. Evidence indicates that transition to the lower vibrational levels of the C state is the most probable (cf. Dieke and Hopfield, C. A. 21, 1062). W. ALBERT NOYES, JR.

Change in the refractive index of air when an electric glow discharge is passing through it. J. B. SETH. *Nature* 120, 880(1927).—The change, which is local, and maximal at a pressure of 25 mm., was studied by observing the shift in the interference fringes obtained by Jamin's plates. B. C. A.

Ionic rays. E. WEITKAMP. *Physik. Z.* 29, 217-23(1928).—A study was made of ion radiation from salts in the liquid state. The app. used is described. A parallelism exists between the m. p. of a salt and the temp. at which emissions begin. The emission decreases with time below the m. p. while near and above it the radiation is const. Graphite added to the salt anode increases ionization enormously. I added to iodides slightly increase emissions unless added to a great amt. of the salt; radiation then decreases. Dry air has no influence on ionic emissions. Moist air reduces them. Occluded gases do lower emissions, thus verifying the statement of Schmidt. R. H. LAMBERT

The disappearance of gases into glass under the action of the electric discharge. JAMES TAYLOR. Cambridge Univ. *Nature* 121, 708-9(1928).—In previous work (*J. Sci. Instruments* 3, 12,400(1926)) it was found that a small quantity of H contained in a Ne discharge tube disappears in about 5 minutes' run. A further study of the phenomenon is now made, extending to include O, N and He. In a specially constructed soda-glass app., positive ions are obtained from the pure gases at low pressures by a 7m wave electrodeless discharge, and drawn by an elec. field to the walls of a thin bulb immersed in molten NaNO₃. The current flowing through the glass wall and the

of Te, since its sulfide is insol. in $(\text{NH}_4)_2\text{S}$. Its salts are acid-sol.; it is a noble metal. Its individual characteristics do not permit identification with any neighboring element. The method described will prove useful in the study of adsorption generally.

MARY JACOBSEN

Ranges of α -particles of uranium I and II. G. C. LAURENCE. *Phil. Mag.* [7], 5, 1027-38(1928); cf. *C. A.* 22, 537.—The ranges of the α -particles of U, I and II were detd. by the Wilson cloud chamber method, with modifications made necessary by the small activity of the radioactive material. The method was satisfactorily checked by its application to the range of Po. The ranges at 15° and 760 mm. of Hg were found to be: U I 2.73, U II 3.28, with a probable error of less than 1%. From the range of U II its decay const. was calcd. to be 1.7×10^{-12} sec.⁻¹, or a half-life of 13,000 yrs.

GEORGE GLOCKLER

The radium content of Stone Mountain granite. CHARLES S. PIGGOT. *J. Wash. Acad. Sci.* 18, 313-6(1928).—This material contains 4.826×10^{-12} g. of Ra per g. of granite. The Lind interchangeable electroscope was used. The detn. was made on a gray biotite-muscovite granite from Stone Mountain, Ga.

L. D. ROBERTS

Spectrography of γ -rays by crystalline diffraction. FRILEY. *Compt. rend* 186, 137-9(1928).—An app. is described for applying the rotating-crystal method to the diffraction of γ -rays. An optical bench 1.5 m. long is used to support 3 sliding mounts, one carrying the source of radiation and the slit system, the other the crystal and mechanism for rotation, and the third the camera. The radiation is obtained from small ampoules of Rn placed in a Pb block. Between the slits a p. d. of several hundred v. is established to remove the β -rays. The crystal rock salt, is rotated at the rate of one turn in 24 hrs., the angle being variable. Provision is made for micrometer adjustments, and cross wires are substituted for the crystal in lining up the app. The distances from source to plate were 65 to 110 cm., and the exposures lasted 2 to 5 days. By this technic, wave lengths between 35 and 284 X. U. have been measured. *Ibid* 425-7.—By using the app. described above, a spectrographic study has been made of the γ -rays emitted by Ra. Twenty-one different wave lengths are listed varying from 20 to 284 X. U., corresponding to quantum voltages from 617 to 43.5 kv. The more intense lines have the following wave lengths in X. U.: 20, 35, 42, 51.5, 140, 144, 155, 161, 166, 232. The origin of the different lines is indicated. The results are in good agreement with data on corpuscular spectra obtained in the same region, except for the 2 triplets (nuclear Ra B and triplet of fluorescence) where the analysis by corpuscular spectra is still uncertain. Both these groups of lines are very intense in this new method.

A. W. KINNEY

A method for the direct experimental determination of the magnetic moment of a single electron. TH. SEHL. *Z. Physik* 48, 729-30(1928).—A possible exptl. arrangement of condenser and electromagnet is described by which it might be possible to measure the magnetic moment of a single electronic charge. This would make it possible to check directly the hypothesis put forward by Uhlenbeck and Goudsmit to explain the anomalous Zeeman effect.

Change in the refractive index of air when an electric glow discharge is passing through it. J. B. SETH. *Nature* 120, 880(1927).—The change, which is local, and maximal at a pressure of 25 mm., was studied by observing the shift in the interference fringes obtained by Jamin's plates. B. C. A.

Ionic rays. R. WEITKAMP. *Physik. Z.* 29, 217-23(1928).—A study was made of ion radiation from salts in the liquid state. The app. used is described. A parallelism exists between the m. p. of a salt and the temp. at which emissions begin. The emission decreases with time below the m. p. while near and above it the radiation is const. Graphite added to the salt anode increases ionization enormously. I added to iodides slightly increase emissions unless added to a great amt. of the salt; radiation then decreases. Dry air has no influence on ionic emissions. Moist air reduces them. Occluded gases do lower emissions, thus verifying the statement of Schmidt.

R. H. LAMBERT
The disappearance of gases into glass under the action of the electric discharge. JAMES TAYLOR. Cambridge Univ. *Nature* 121, 708-9(1928).—In previous work (*J. Sci. Instruments* 3, 12,400(1926)) it was found that a small quantity of H contained in a Ne discharge tube disappears in about 5 minutes' run. A further study of the phenomenon is now made, extending to include O, N and He. In a specially constructed soda-glass app., positive ions are obtained from the pure gases at low pressures by a 7m wave electrodeless discharge, and drawn by an elec. field to the walls of a thin bulb immersed in molten $NaNO_3$. The current flowing through the glass wall and the

gas disappearance are measured concurrently. For H, O and N the gas disappearance is proportional to the quantity of electricity transferred through the walls. For H, every electron charge passed involves the disappearance of 1 H₂ mol. For O and N, 2 electron charges correspond to the disappearance of 1 atom of O and N, resp. For He, a current flowed, but no disappearance of gas took place. The cond. of both quartz and glass was considerable, and the mechanism largely electrolytic. Only a small quantity of the gas is recovered on heating, and the electric action is not reversible (Na is introduced on reversing the current). An attempt to collect the gas passing through the walls was unsuccessful. The non-disappearance of He shows that the action is not an accelerated diffusion through the glass pores, for in that case He should pass through 20 times as quickly as H. It is suggested that an electrolytic decompn. of the glass takes place, resulting (for H) in the formation of H₂O which penetrates the glass. With a Hg discharge, gas is usually brought out of the walls.

F. A. JENKINS

Hydrogen activated by the electrical discharge. A. DE HEMPTINNE. *Ann. soc. sci. Bruxelles* [1], 47B, 143-9(1927).—In a continuation of previous work on the reduction of metallic oxides by H in presence of an elec. discharge (cf. C. A. 17, 2815) it is shown that PbO₂ and HgO, but not CuO or PbO, are reduced when not directly exposed to the electronic or ionic bombardment. The values of N/N' are, however, smaller. These observations are interpreted as indicative of the existence of non-ionized, active H, monatomic, triatomic or excited, in the tube. Reduction at the cathode is effected by means of pos. ions and at the anode by the intervention of neg. ions or by non-ionized active H. Actual bombardment favors the reduction.

B. C. A.

The radiation emitted from the point of incidence of hydrogen-canal rays on metals. CHR. GERTSEN. University of Kiel. *Ann. Physik* 85, 881(1918).—H positive rays, produced at 20 to 60 kv., were directed at metallic targets (Be, Mg, Al) to see if the characteristic radiation of the metal was emitted from the point of incidence. A weak wave radiation originated from this spot, but no est. of wave length could be made, and it is uncertain whether it represents a characteristic emission from the metal, or an emission of the Lyman series. The effect of wave radiation was largely masked by scattered corpuscular emission. In an effort to sep. the corpuscular from the wave emission, it was found that a part of the canal rays was scattered with approx. unchanged velocity; the no. of positive particles of high velocity scattered by different metals in a direction of from 80° to 100° with the incident beam is proportional to the product of the no. of atoms per cc. in the metal and the square of its at. no., *i. e.*, the same law of scattering as for α -particles by the nucleus. W. W.

The role of positive ions in the spontaneous discharge in air. WALTHER MÜLLER. *Z. Physik* 48, 624-46(1928).—The object was to find whether positive ions are capable of producing ionization of neutral mols. by collision or whether they liberate from the cathode electrons which in turn produce ionization by collision. Current-potential curves for air were detd. for pressures ranging from 9 mm. to 4 atm. and with voltages from those at the satn. values to above the sparking potential. Two coaxial cylinders were used as electrodes. The results confirm the Townsend relation for the ionization by electrons, *viz.*, that the ionization no. is proportional to the pressure and to a function of the ratio, field strength: pressure. The effect of the positive ions, however, depends on the strength of the field surrounding the cathode, on the character of the cathode metal and on the temp. of the cathode. The results show that positive ions produce no ionization by collision but liberate electrons from the electrode. This was further confirmed by measuring the amt. of electricity carried by brief discharges above the sparking potential when the inner cylinder was positive. A formula for finding the no. of electrons liberated under different conditions was derived. H. F. J.

Presence of charges at an electrode surface. W. C. CLARKSON. *Phil. Mag.* [7], 5, 1104-10(1928).—The possibilities of a charge or field existing at an electrode surface after a discharge are investigated. It is shown that with brass in air no field greater than $\frac{1}{100}$ v. was present $\frac{1}{10}$ mm. distant after a spark, and no charge as great as $\frac{1}{100}$ v. for a capacity of some cm. was given up by a steel needle after $\frac{1}{1000}$ sec. Impurities, etc., caused no appreciable change. A résumé is given of related work, and it shows that if charges actually are involved they must be immeasurably greater than those detectable here. From this it is concluded that, with respect to elec. charges, the system responsible for polarization, whether reversible or irreversible, must be a closed one. When this conclusion is applied to the charged cathodic layers which are shown to correlate and explain contact potential, sparking potential and lag variations, it follows that reversible polarization, like them, is a manifestation of "double layers" at

the cathode surface. Such layers may be expected to attend dynamic equil. of the gas-electrode interface. "Wall" and insulator effects are discussed. GEORGE GLOCKLER

Emission of particles from hot platinum in air at atmospheric pressure. W. D. FLOWER. *Phil. Mag.* [7], 5, 1084-94(1928).—An ultra-microscopic study of air contg. large ions and nuclei emitted by a hot Pt wire has been made. After the source nuclei had been removed the no. visible increased to a max. and then diminished. This is explained if at emission the nuclei are too small to be seen but subsequently coagulate. Reliable results on the rate of coagulation of these nuclei were obtained by using them as nuclei for condensation and photographing the droplets formed. The equation of the coagulation time-curves is hyperbolic and is given by $dn/dt = -kn^2$, where n is the no. present and k is a const. equal to 0.15×10^{-8} cc./sec. This value is in reasonable agreement with the value 0.13×10^{-8} cc./sec. obtained by Kennedy for large ions and nuclei from a Bunsen flame. The application of the coagulation theory of Smoluchowski to these results is discussed. GEORGE GLOCKLER

Cause of the loss of thermionic activity of thoriated tungsten filaments under certain voltage conditions. A. C. DAVIES AND R. N. MOSS. *Phil. Mag.* [7], 5, 989-1010(1928); cf. C. A. 17, 3830.—The object of the present investigation was to inquire more closely into the cause of the deactivation of thoriated W filaments, in a high vacuum, by the application of voltage encouraging emission, at temps. well below the minimum necessary to cause any decrease of emission due to the temp. alone. To this end a thorough investigation was first made of the way in which the emission from an activated thoriated W filament varied with time during the application of various different arrangements of elec. fields, at a series of different filament temps. and concn. gradients of Th in the filament. Valves of the type V. S. 8 B. were employed for this purpose. These are triode valves with cylindrical electrodes, the filament being enclosed by an open spiral grid of about 3 mm. diam., and a cylindrical anode of about 1 cm. diam. and 2 cm. length. GEORGE GLOCKLER

Influence of various gases upon wire vibration in a corona discharge tube. J. E. SNYDER AND G. M. EVANS. *J. Sci. Instruments* 5, 166-7(1928).—When a 60-cycle corona discharge of 2.5 to 3.5 milliamp. occurred in an all-glass discharge tube of the wire-coaxial cylinder type, the wire did not vibrate when the surrounding gas was air, NH_3 , O_2 , H_2 or a mixt. of N_2 and H_2 , but when surrounded by pure N_2 the wire vibrated so violently that the tube could not be used. CO_2 and CH_4 produced results similar to N_2 . The vibration in N_2 was partially prevented by sealing in the wire while heated electrically and under tension. W. W. STIFLER

Resistance of sputtered films. R. S. BARTLETT. *Phil. Mag.* [7], 5, 848-59(1928).—The aging of sputtered films is shown to depend on the temp. to which the film is raised. The resistance decreases to a min. value and then increases as the temp. is further increased. The dependence of the temp. coeff. of resistance on degree of aging and on temp. is shown. Other exptl. evidence is brought forward in support of the theoretical considerations suggested below. It is shown that the peculiar elec. properties of thin metallic films on glass may be attributed to 3 principal causes. Occluded gas contributes toward the high sp. resistance, and particularly the decrease in resistance with aging, brought about by the outgassing of the metal. A granular or irregular structure explains the dependence of sp. resistance on thickness and the negative aging of very thin films. A state of tension in the film, produced by unequal coeffs. of expansion of film and backing, opens or closes gaps in the film as the temp. changes, giving rise to the low or negative temp. coeff. of resistance and other peculiarities. Exptl. evidence of B. and others is advanced to justify these proposals. The importance of the conditions of deposition in detg. the properties of the film is pointed out. GEORGE GLOCKLER

Shadowgraph method as applied to a study of the electric spark. H. A. ZINSZER. *Phil. Mag.* [7], 5, 1098-1104(1928).—Optimum conditions for studies of the early stage of the spark discharge and also of sound-pulses were discovered, the former by the use of an auxiliary gap, the latter by the use of a low variable inductance. Diffusion of metallic vapor into the gap-space are verified by instantaneous photography. Photographic life-histories of various spark discharges have been obtained. A new method is suggested for detg. the lag of a needle-gap, for the study of steep wave-front impulses and for the study of vortex rings and explosions. GEORGE GLOCKLER

The determination of ionization by x-rays on the basis of the absolute R-unit. HANS KÜSTNER. *Physik. Z.* 28, 797-803(1927).—An app. for the practical detn. of x-ray doses is described which was built upon request of the Deutsche Röntgen Gesellschaft. It depends upon the comparison of ionization in air produced by x-rays with that by a small Ra standard. EMIL KLARMANN

Quantitative Röntgen spectrum analysis by means of cold excitation of the spectrum. R. GLOCKER AND H. SCHREIBER. *Ann. Physik* 85, 1089-1102(1928).—A method of quant. x-ray analysis is described in which the sample to be analyzed is excited to emission of characteristic x-rays by exposure to a stream of primary x-rays from the anticathode of the tube. The advantages of this method are that the sample remains cold and undergoes no change in its compn., as might be the case if it were excited by cathode particles, with consequent increase in temp. The disadvantage lies in the prolonged exposure time required to get spectrograms of suitable d. for measurement. The method has been applied successfully to the analysis of steels contg. V, Ti and W, the proportions of each being detd. from the relative intensities of their K_{α} lines. In expts. with a mixt. of oxides of Sb and Sn in CaSO_4 , contg. the same no. of Sb and Sn atoms, the ratio of intensities of the L_{α} lines was Sb:Sn = 1.1, while with exposure made with the sample on the anticathode and excited by cathode rays the ratio was Sb:Sn = 1:6. The effect on the line intensities of the tube voltage and the presence of foreign substances was also investigated and was found to have no detrimental influence on the method of analysis. C. C. KRESS

Progress of systematics and theory of spectra of molecules. F. HUND. *Physik. Z.* 28, 779-84(1927).—A review of recent accomplishments. E. K.

Recent progress in the theory of band spectra. EDWIN C. KEMBLE. Harvard Univ. *J. Franklin Inst.* 206, 27-42(1928). E. H.

Apparent irregularities in experiments with heterogeneous x-ray beams, with special reference to the J-phenomenon. R. T. DUNBAR. *Phil. Mag.* [7], 5, 962-89(1928); cf. *C. A.* 22, 21.—Two expts. are described which aimed at discovering the J-discontinuities in the absorption of scattered x-radiation (heterogeneous). The results were negative. The results obtained by Barkla and his collaborators are discussed. It is shown that much of the irregularity they observe is only apparent, that is, possibly arises largely, if not altogether, from the assumption that a heterogeneous beam should give sufficiently nearly the same results as a homogeneous beam, the latter having an absorption-coeff. equal to the half-value absorption-coeff. of the former. The progressive absorption method, for instance, frequently used by them to test for the Compton effect, is not suitable unless the radiation is homogeneous, or nearly so; for very heterogeneous beams it is unable to distinguish between classical and Compton scattering. It is suggested that the pronounced irregularities observed by the above authors are assocd. with the varying amts. of extremely soft radiation which may succeed in reaching the electrosopes. GEORGE GLOCKLER

Positions of x-ray spectra as formed by diffraction grating. A. W. PORTER. *Phil. Mag.* [7], 5, 1067-71(1928).—In the calcn. of the positions of x-ray spectra as formed by a diffraction grating, it is customary to consider them as Fraunhofer spectra, such as are obtained with gratings in ordinary spectroscopy. In such cases the incident light is a parallel bundle, and so also is the diffracted bundle which is afterward brought to a point (or line) by a lens. But when x-rays are used, there is no means of producing this parallelism; the incident beam is always divergent, and the diffracted beam that reaches any one point is convergent. For ordinary measurements this is of small importance; but when the extreme accuracy with which x-ray spectral measurements are now being made is considered, the question arises as to what will be the consequence of the lack of parallelism. The object of the paper is to find a first approximation to the correction which the usual formula needs. GEORGE GLOCKLER

Fluorescent secondary x-radiation and the J-phenomenon. W. H. WATSON. *Phil. Mag.* [7], 5, 1145-63(1928).—The ionizations produced by 2 secondary beams from a radiator whose K-characteristic x-radiation was excited have been compared with equal amts. of absorbing material in the paths. Under the proper conditions of tube control, the ratio of the ionization did not alter continuously when the amt. of absorbing material (X) was increased, but exhibited discontinuities in its relation with X, which seem identical with the J-absorption discontinuities observed in former expts. It is shown that, except for the effects of crystal reflection in the radiator, the radiation studied is composed almost entirely of the K-characteristic radiation of the radiator. The effect of changing the orientation of the radiator with respect to the primary beam is to displace a discontinuity, so that a different amt. of absorbing material is required to produce it. The results show that the J-phenomenon may recur periodically in absorption without appreciable change in the absorption coeff. of the beam in its passage through the absorber. GEORGE GLOCKLER

Modified scattered x-radiation and superposition. The J-phenomenon. C. G. BARKLA. *Phil. Mag.* [7], 5, 1164-71(1928).—The results exhibit the change from "unmodified" to "modified" scattered radiations, not by passing through a certain

crit. av. frequency as measured by an av. absorption coeff. (illustrated previously by many examples of the J-discontinuity), but by a change in the other factor involved. In this case it was produced by the superposition of radiations of the same frequencies, and in almost exactly the same proportions. An unmodified radiation was found from air or thin paper, but the degree of modification as measured by absorption methods rapidly developed with increasing thickness of the scattering substance, and approached a limiting value. The expts. appear to link up the classical and the quantum results, though it may be only by a combination of the 2 in various proportions dependent on the relative duration of 2 processes in the time required for an expt. The modification, however, depends on some kind of coherence of the whole radiation. What this means fundamentally is not yet apparent: it may, as previously suggested, depend on a certain degree of continuity or of superposition in the whole stream of radiation (C. A. 22, 21).

GEORGE GLOCKLER

Spectra and atoms. A. FOWLER. *J. Chem. Soc.* 1928, 764-80.—Explanations of spectroscopic terms and their correlation with electronic configurations are given. An application of the theory to the field of astrophysics is shown. H. F. J.

The intensity of reflection of x-rays by crystals at low temperatures. R. W. JAMES. *Mem. Proc. Manchester Lit. Phil. Soc.* 71, 7-13(1926); cf. C. A. 22, 2691.—Theoretical deductions indicate that the intensity of x-ray diffraction spectra is proportional to e^{-M} according to Debye, or to e^{-2M} according to Waller, M in both cases being a function of the temp., the wave length and the angle θ . Exptl. evidence on the variation of intensity with the temp. was, therefore, desired; and in a new series of expts. the intensity of reflections from rock salt at liquid air temp. was obtained for the 400, 600, 800 and 1000 spectra (referring to the true unit cell). According to either Debye's or Waller's theory, the exptl. points, if plotted with the abs. temp. as abscissae and the expression $(\lambda/\sin \theta_1)^2 \log_{10}(\rho_T/\rho_1)$ as ordinates (ρ indicating intensity) should give a straight line, the slope according to Waller's theory being twice that according to Debye's. The results of these and previous expts. at higher temps. are in fair agreement with Waller's predictions up to 500° or 600° abs.; but above that temp. the decrease of intensity with temp. is more rapid than the theory predicts.

A. W. KENNEY

Additional information on the intensity relationships in the L series x-rays. AXEL JÖNSSON. *Z. Physik* 46, 383-91(1928); cf. C. A. 21, 2428.—In this work the relative radiant energies of the stronger lines in the L spectra of Mo, Rh, Pd and Ag are presented. The data were obtained with the most recent Siegbahn high-vacuum spectrograph by means of a quartz crystal and a Geiger chamber. The intensities of the satellite lines such as α_2 and α_3 were obtained by graphical methods, since the maxima are not distinctly marked in the direct exptl. data. The relative measure of line intensity was taken as the product of the max. intensity and the half value breadth corrections being made for absorption by the anticathode. Corrected intensities are recorded for 9 lines of each of the 4 metals with α_1 as the standard. These intensities were compared with intensities calcd. by means of the new quantum mechanics which have been so successful in the optical region. The doublets L , α_1 , α_2 , β_1 and l , η agree very well with these calcs.; but the calcd. doublet $\beta_2\gamma_1$ does not agree at all with the exptl. values. Apparently for this doublet it is only those metals where the $N_{1v,v}$ level is filled with electrons to which this method of calcn. is applicable.

A. W. KENNEY

Influence of form and polarity of molecules on the x-ray spectrum of liquids. II. The occurrence of two intense, amorphous rings with substances whose molecules contain several of the same groups or parts. J. R. KATZ and J. SELMAN. *Z. Physik* 46, 392-405(1928).—Does the av. distance between mol. centers constitute the only identity period in a liquid, or do the av. distances between similar parts of the mol. also constitute an identity period? The authors attempt to answer this question by studying liquids whose diffraction diagrams contain more than one ring, and, in particular, substances in the following groups: (A) those having a central atom carrying 3 or 4 identical side chains; (B) benzene or pyridine rings having 3 identical side chains; (C) closed C rings contg. many (e. g., 15) C atoms; (D) polymerized substances. In all these materials, the presence of more than one diffraction ring has been established by photographic methods using cylindrical slits 6 cm. long and 0.7 to 1.0 mm. bore. Tripropyl-, tributyl-, triisobutyl- and triisomylamines showed inner rings giving interplanar distances corresponding rather closely to mol. diams. calcd. by assuming spheres. The outer rings gave distances corresponding very closely with the length of the side chain. Tripropylamine, e. g., shows an interplanar distance of 5.2 Å. U., and ProH itself gives a distance of 5.3 Å. U. The triethyl-, triisobutyl and triisomy

orthoformic esters, tetraethyl orthocarbonate and tetramethyl and tetraethyl orthosilicic acid esters, trimethyl, triethyl and triisobutyl orthoboric acid esters, and triethyl and tricresyl orthophosphates were studied with similar results. In the case of tricresyl phosphate there were secondary rings corresponding in magnitude to toluene and to MeOH. It is noted in these cases that the heavier the central atom the more intense is the inner ring, and the heavier the side chains the more intense is the outer ring. The three isomeric trimethylbenzenes gave nearly identical results except for the 1,3,5-isomer, in which the intermol. spacing is exceptionally high. Triethylbenzene (mixt.) and trimethylpyridine (1,3,5) gave spacings indicating side chains of the expected magnitudes. Methylcyclopentadecane and several of its derivs. were investigated. The small side chains, as might be expected with such a large mol., had very little effect. There was perceptible a spacing of 5.6 A. U. corresponding to 4 C atoms, and this was more intense than the longer spacing. This suggests that the ring is made of chains of 4 C each. Several polymerized materials, such as metastyrene, paraindene, and coumarone resin were investigated. In each of these the polymerized material showed a spacing practically identical with the spacing characteristic of the unpolymerized material, and, in addn., a much larger spacing (about 12.5 A. U.). Synthetic rubber was an exception to this, giving the same spacing as isoprene. Paraldehyde and parapropionaldehyde gave spacings corresponding to the intermol. distances and to the unpolymerized substance. In general, it is true that the intermol. distances as calcd. from mol. diams. are somewhat smaller than those indicated by the x-rays. A possible reason for this is the invalidity of the assumption that the mols. are spherical. Possibly also small aggregates exist in which the mols. are regularly arranged. The triglycerides of the fatty acids gave only one spacing which was equal to the spacing characteristic of the acid itself, and the dialkylamines behaved similarly. Distances corresponding to mol. diameters do not appear in these cases. A. W. KENNEY

Using x-rays to inspect materials for internal defects. HERBERT R. ISENBURGER. *Foundry* 56, 171-3(1928).—This article is a brief description of the methods of studying materials with x-rays, (1) by radiographic methods, (2) by means of absorption spectra, (3) by means of emission spectra and (4) by means of diffraction spectra. The appropriate app. is described, and the information to be obtained by the different techniques is briefly stated. A. W. KENNEY

The law of absorption of x-rays by matter. P. VILLARD. *Compt. rend.* 185, 1415-9(1927).—The law for the variation of the fluorescent absorption coeff. of x-rays, $\tau/\rho = C\lambda^3$ where λ is the wave length and C is a const. proportional to the 4th power of the at. no. and inversely proportional to the mass of the at., has received inadequate exptl. verification. Putting this in the form $C = C_0\theta(\lambda)$, i. e., $\tau/\rho = C_0\theta(\lambda)\lambda^3$, yields a simple form for study, since it indicates directly variations in the "const." C ; and a comparison of data plotted in this way suggests a similarity to the resonance curve of the potential in a damped elec. circuit excited by waves damped to a negligible extent. The following expression is thus obtained: $C = C_0(4\lambda^2 + d^2\lambda_0^2/\pi^2) / \sqrt{(4\lambda^2 - 4\lambda_0^2 + d^2\lambda_0^2/\pi^2)^2 + 16d^2\lambda_0^4/\pi^2}$, where d is a const. (dN being the coeff. of damping) and λ_0 is the wave length appropriate to the resonator. Data obtained with Zn by Allen in 1924 and 1926 (cf. *C. A.* 18, 3317; 20, 1942) are used to test this equation, in which case $C_0 = 168$, $\lambda_0 = 0.093$ A. U. and $d^2 = 2.1\pi^2$. The agreement between exptl. results and calcn. is very good over the range $0.102 < \lambda < 0.710$. The hypothesis of an at. resonance which thus appears to be verified utilizes the theoretical exponent 3 for the law of Bragg and Peirce; and at the same time gives a phys. significance to the formula. A. W. KENNEY

X-ray investigation of passive metals. F. KRÜGER and E. NÄHRING. *Ann. Physik* 84, 939-48(1927).—Since a completely satisfactory explanation of the phenomenon of the passivity of metals has not been realized, and, in particular, the oxide-film theory has not received adequate proof, the authors proposed to exam. passive metals in powder form by means of x-rays, with the expectation that the large surface would produce enough oxide to give a characteristic x-ray spectrum, calcns. indicating that a film as thin as 10^{-7} cm. should be sufficient to give a definite indication. A special x-ray tube with a hot cathode and a Cu target was used, the casing being metal. The Debye-Scherrer and Bohlin-Seemann methods were both employed. Fe was rendered passive by treatment with strong HNO_3 , and pressed into a pellet. Its passivity was tested repeatedly, but it gave no indication of the presence of oxide. Ni was made passive by electrolytic treatment, and pictures of the powder were taken in a small rubber tube. Neither it nor Cr, which was also made passive electrolytically, showed any indication of the presence of oxide. On the other hand, a mixt. made up of Ni-NiO in the proportions 50:1 clearly indicated oxide lines. These expts. seem direct evidence

that the passivity of metals is not to be explained on the basis of a surface layer of the metal oxide. The possibility of a mol. layer of O_2 is not excluded. A. W. KENNEY

Absorption of x-rays in various elements. F. K. RICHTMYER. *Nature* 120, 915-6 (1927).—Jönsson's note (*C. A.* 22, 1098) stated that the jump of the absorption coeff. in passing the K absorption limit equals E_K/E_L . If this is true, it follows, according to the commonly accepted mechanism of absorption, that this ratio equals the ratio of the no. of $(K + L + M + \dots)$ photoelectrons to the number of $(L + M + \dots)$ photoelectrons expelled, whence it follows that the relative nos. of K and of L photoelectrons must be independent of the relative nos. of K and L electrons in the atom. This would be a very unexpected result. The difficulty of measuring with precision the true fluorescent absorption coeffs. makes exptl. data somewhat uncertain. An empirical relation may well be accepted, even though it conflicts with theory.

A. W. KENNEY

Density necessary to produce the nebular spectrum. C. T. ELVEY. *Nature* 121, 12(1928).—It is not known whether a nebular spectrum can be produced when the d. of a mixt. of O and N becomes sufficiently low; from astrophysical observations, however, and certain assumptions, it is computed that the mean d. at which the nebular spectrum appears is 1.8×10^{-17} g./cc.

B. C. A.

The density necessary to produce the nebular spectrum. DONALD H. MENZEL. Lick Observatory. *Nature* 121, 618(1928).—A calcn. of the density of the expanding gaseous shell of a nova at the moment when the nebular lines appear was given by Elvey (cf. preceding abstr.). It was necessary to assume a value of 10^{-9} g./cc. for the original density, ρ_0 , of the shell when coincident with the stellar atm. This is equiv. to the assumption that the phenomenon of the nova originates in a particular layer of the star's atm. and according to M. is not justified. The value used may be 10^4 times too small, and the resulting crit. densities for the nebular lines and life periods for the metastable atoms may be in error by a corresponding factor. The densities obtained were close to those known for planetary nebulae, a fact which indicates that the ρ_0 used by E. may be approx. correct. The photoelec. ionization of the gas by the intense stellar radiation should also be taken into account.

F. A. JENKINS

The origin of the spectrum of the solar corona. MEGHINAD SAHA. *Nature* 121, 671-2(1928).—A study of the relative intensities of the *Tl* lines $2p_1 - 3s$ and $2p_2 - 3s$ in the spectrum of the vapor heated to 2500° A. U. in a graphite furnace shows that the former line is at least 10 times stronger. The reverse order of intensities would normally be expected. Therefore it is assumed that, to maintain the necessary concn. of atoms in the $2p_1$ state, the forbidden transition $2p_2 \rightarrow 2p_1$ must occur under the influence of the field of radiation. Applying analogous reasoning to the case of Si in the sun, S. concludes that the forbidden line $\lambda 6527.05$ ($^3P_1 - ^1S_0$) should appear in the light from the solar corona, as well as in the Fraunhofer spectrum. Also the Si lines $\lambda 4102.95$, 3905.67 should be high chromospheric lines. The exptl. verification of these points is doubtful. It should be possible for metastable atoms of lighter elements (e. g., C or Si in the 1S_0 state) to be ejected into the corona by light pressure and there undergo forbidden transitions for the same reason that such transitions occur in nebulae. The corona spectrum may also contain forbidden lines of N, O, P, S, P^+ and S^+ , but the spectroscopic data are inadequate for their positive identification.

F. A. JENKINS

Tesla luminescence spectra of the halogens. S. S. BHATNAGAR, D. L. SHRIVASTAVA, K. N. MATHUR AND R. K. SHARMA. *Phil. Mag.* [7], 5, 1226-39(1928).— I_2 has been examd. spectroscopically by excitation under electrodeless Tesla discharge. The spectrum obtained has a bright continuous background from $\lambda 4800$ to 2130 with a no. of electronic emission bands superposed on it. Four different systems of bands have been located. One of these systems has been analyzed and shown to conform to the equation $\nu = 29,078 + (710 n' - 8n'') - (213.7 n'' - 0.6 n''')$, where $29,078$ is the wave number of the head of the system. The presence of the fluorescence term $(213.7 n'' - 0.6 n''')$ has been shown to indicate that this system is given in emission as the mol. returns from a higher excited state to the metastable 3p_1 state. A brief discussion is given of the bands at $\lambda 4800$ and 3400 , which have been frequently called the "electron affinity" bands. An attempt has also been made to explain the continuous background.

GEORGE GLOCKLER

Variation of intensity ratios of optically excited spectrum lines with the intensity of the exciting light. E. A. BAKER. *Nature* 120, 917-8(1927); cf. Wood, *C. A.* 22, 1726.—Expts. on photographic action give results similar to those obtained by Wood for Hg vapor, and place the photographic action among the phenomena of phosphorescence.

B. C. A.

A change of wave length in light scattering. C. V. RAMAN. Calcutta. *Nature* 121, 619(1928); cf. C. A. 22, 1907.—By a method of complementary color filters, the presence of new wave lengths in the light scattered from dense org. vapors is established. The modified scattered radiation from pentane vapor is strongly polarized, but that from naphthalene vapor is only slightly polarized, in agreement with the previous results with liquids. When a cloud is formed by expansion, both the unmodified and the modified scattered light are brighter, and hence the radiations of altered wave length from neighboring mols. are coherent with each other. With a suitable filter for the incident light, the scattered light is found to show a dark region in the spectrum between the unmodified and the modified wave lengths. The new lines observed with scattered Hg radiation (cf. following abstr.) are accompanied by a continuous spectrum. The intensity of the modified lines and of the continuous spectrum varies with the chem. nature of the scattering substance.

F. A. JENKINS

The optical analog of the Compton effect. C. V. RAMAN AND K. S. KRISHNAN. Calcutta. *Nature* 121, 711(1928); cf. C. A. 22, 1907 and preceding abstract.—Two spectrograms are shown, (1) of the light from a quartz Hg arc from which wave lengths $> 4358 \text{ \AA}$. U. have been filtered out, (2) of the same light scattered from liquid toluene. In (2) several new lines occur, some of which are farther toward the red than $\lambda 4358$. Of these, the group of longest wave length disappears when the 4358 line is cut out of the incident light. The next group (at about $\lambda 4500$) disappears when the group $\lambda 4047, 4078$ and 4109 is removed from the incident light by a quinine soln. filter, while $\lambda 4358$ can still be seen. The phenomenon is regarded as analogous to the Compton effect in x-rays, but the wave-length shifts for visible rays appear to be much larger. It is suggested that the incident quantum may be scattered by the mols. of the liquid either as a whole or in part, in the former case giving the original wave length and in the latter an increased wave length. The decrease in frequency is of the same order of magnitude as the mol. infra-red absorption frequency. It is not quite the same for different mols. Accurate measurements are in progress.

F. A. JENKINS

Relative intensity of the principal doublet (H, K) and of the diffuse doublet (X) in the spectrum of the calcium chromosphere. C. DAVIDSON. *Month. Not. Roy. Astr. Soc.* 88, 30-3(1927).—A series of photographs with varying exposures of the chromospheric spectrum in the neighborhood of these lines has been obtained by focusing an image of the sun tangential to the slit of the spectrograph. After correcting for the superimposed continuous spectrum from Planck's formula, for $T = 5000^\circ$, it was found that the intensity of the line, 8542 \AA . U. of the diffuse doublet is somewhat greater than that of K_1 at a level between 1000 and 2000 km. above the photosphere. At heights above 4000 km., X rapidly ceased to be recorded. The results, although incomplete, are therefore in agreement with Milne's prediction, derived from a consideration of the mechanics of the ionized Ca atom, that the infra-red lines (X) should be more intense than H, K at low levels, while at high levels they should be fainter.

B. C. A.

Absolute intensity measurements in a sodium flame and periods of excitation. L. S. ORNSTEIN AND E. F. M. VAN DER HELD. Univ. Utrecht. *Ann. Physik* 85, 953-60(1928).—The no. of quanta radiated per Na atom per sec. in a Na_2CO_3 flame was estd. photographically by comparing the density of the image of the Na flame with the yellow light from a relatively calibrated nitra lamp, which was in turn, simultaneously compared with the Hg green, calibrated in abs. intensities. The flame was produced with air-coal gas and a liquid atomizer; temps. were measured by a compensation pyrometric method, accurate to 20° . The curve of quantum yield per atom per sec. against concn. shows that at concns. below which further diln. causes no appreciable increase in the yield (below $10^{-4} N$) 250 quanta are emitted per atom per sec. at 197° abs . Substitution of this value in the Einstein Equation for the life period of an atom in an excited state gives a value for τ of $5 \times 10^{-8} \text{ sec}$. A composite filter for the Hg green is described.

W. WEST

Structure of the Swan bands. JOHN D. SHEA. Univ. of Cal. *Phys. Rev.* 30, 825-43(1927).—Data obtained by several other investigators have been used in a detailed quantum analysis of the Swan bands (*Trans. Roy. Soc. Edin.* 21, 411(1857)). The data by Johnson (C. A. 21, 1760) have been employed only in the multiplicity of the lines. Tables of the frequencies of the lines and their combination differences are given for the (0,0), (0,1), (1,0), (1,1) and (1,2) bands. Quantum nos. have been assigned to all lines of the R and P branches of the above bands. The Q branch is not observed in these bands. The combination principle is verified in the case of all the above bands. A new method for obtaining accurate numerical values of the consts. of the rotational energy function, $E = B_0 m^2 + D_0 m^4 + F_0 m^6 + H_0 m^8 + \dots$ has been

developed by assuming the theoretical relations between rotational and vibrational consts. recently derived by Kratzer, Kemble and Birge. The so-called method of zero sums has been reformulated for rapid use in band-spectra computations. The moment of inertia of the Swan-band carrier for infinitely small vibration is found to be 15.84×10^{-40} g. cm.² for the initial state in the emission process, and 17.03×10^{-40} g. cm.² for the final state, with a probable error of less than 0.1%. The consts. of an assumed law of force of the form $F = k_1(r - r_0) + k_2(r - r_0)^2 + k_3(r - r_0)^3 + \dots$ are evaluated. For small values of j the R branches consist of triplets, the P branches of doublets, the sepn. decreasing as j increases. Empirical formulas for the sepn. as a function of j are given. The sepn. for corresponding j values in the various bands shows interesting numerical relations. The well-known "staggering" of alternate lines has been investigated quant. for the (0,0) band, and can be explained by the assumption of a double moment of inertia, either in the initial or final state, in agreement with Mulliken's (C. A. 21, 3541) prediction of σ -type doubling for these bands. The necessary difference of the 2 values of the moment of inertia is 0.012%. The mol. C⁻ - C⁻ is suggested as the probable carrier of the Swan bands, provided such a doubly charged mol. can exist.

BERNARD LEWIS

The absorption of light by silver bromide and silver chloride layers. J. EGGERT AND RICHARD SCHMIDT. *Z. Physik* 48, 541-4(1928).—Microcrystals of AgBr and AgCl, prepd. by mixing very dil. solns. of AgNO₃ and the Na halide, were used in the detn. of the max. limit of absorption of these salts. The cryst. structure of the preps. could not be observed under a microscope, but according to the Debye-Scherrer diagrams it is invariable. The source of light was a nitra lamp. Exposure was made on panchromatic plates for 24 hrs. The max. limit of absorption for AgBr was found at $\lambda = 480\mu$, and for AgCl at $\lambda = 400\mu$. These results agree with those of Eggert and Nodack (C. A. 18, 1090). The absorption spectrum of AgBr is not affected by the color change produced in the salt by ordinary light. The amt. of Ag liberated under such conditions is $10^{-6} - 10^{-4}\%$ of that present in the AgBr. H. F. JOHNSTONE

The Zeeman effect of the symmetrical top according to wave mechanics. EDWARD U. CONDON. *Phys. Rev.* 30, 781-4(1927).—The alternation of the quantum-theoretical energy levels of a symmetrical top due to the action of a magnetic field on the charge which is fixed to the top, is investigated by means of the perturbation theory of the wave mechanics. A formula is given for the change in the energy levels. B. L.

The spark spectrum of copper. A. C. MENZIES. *Proc. Roy. Soc. (London)* A119, 249-56(1928).—A vacuum grating spectrograph was used to photograph light emitted by the fusing of 2 Cu wires. The 3 lines observed at wave lengths 1358.76, 1367.92, and 1472.38 have been identified as combinations between the hitherto unknown lowest term of Cu II, ¹S₀ and the terms ³P₁, ³D₁ and ³P₁ established by Shenstone (C. A. 22, 1542). The character of other lines observed in the fused-wire spectrum—absorbed or self-reversed—is regarded as confirming Shenstone's classification. The values of new terms found for Cu II are given together with a list of the newly classified lines.

C. C. KRESS

The existence of intermetallic compounds in the vapor state. The spectra of the alkali metals and of their alloys with each other. J. M. WALTER AND S. BARRATT. *Proc. Roy. Soc. (London)* A119, 257-75(1928).—Comprehensive tables list the wave lengths of heads of bands observed in absorption in the vapors of the alkali metals. These data show not only that Li, Na, K, Rb and Cs form binary mols. in the vapor state, but also that they combine with each other to form the mols., LiK, LiRb, LiCs, NaK, KRb, RbCs, etc. (No bands attributable to LiNa have been observed). With the exception of mols. contg. Li the observed bands lie near the principal series lines of the constituent atoms. Most of the alkali metal mols. also exhibit in absorption isolated diffuse bands without fine structure, which are regarded as analogous to the continuous absorption bands of the halogen mols. If so, they correspond to the dissocn. of the mol. into one normal and one excited atom, and supply the data from which tentative values of the heats of formation of the mols. have been calcd. During the course of the work the concn. of K₂ mols. in K vapor was detd. by the Victor Meyer method, and was found not to exceed 5% at 935°.

C. C. KRESS

Fine structure of Balmer lines. G. HANSEN. *Ann. Physik* 84, 688(1927).—Statements criticizing Hilger's Lummer-Gehrcke plates appearing in a communication of the author (C. A. 20, 1177) are withdrawn.

B. C. A.

Fine structure of the spectrum lines of thallium in the ultra-violet. W. MOHAMMAD. *Phil. Mag.* [7], 5, 1111-4(1928).—Tl is not very rich in lines. There are 21 between λ 6550.15 and 2580.25. Out of these, 11 are very weak, having an intensity less than 4 (max. intensity 500) and thus, except 2580.25, these could be not photo-

graphed. The structure of the remaining lines has been detd. for the first time (C. A. 21, 3560).

GEORGE GLOCKLER

Ultra-violet absorption spectrum of cod-liver oil. J. W. WOODROW. *Phil. Mag.* [7], 5, 944-6(1928).—It has been shown that the characteristic ergosterol absorption bands can be observed in a thin film of cod-liver oil by means of a sensitive photoelec. spectrophotometer.

GEORGE GLOCKLER

Infra-red oscillation spectrum of water molecules and its variation with state. J. W. ELLIS. *Phil. Mag.* [7], 3, 618-21(1927).—A collection of data for the infra-red spectrum of water showing that the spectra for the various states can be explained as being combinations of two primary bands, each pair being characteristic of the special state.

B. C. A.

Characteristic infra-red vibrations of certain crystals of the rock-salt type. L. G. CARPENTER AND L. G. STOODLEY. *Phil. Mag.* [7], 5, 823-32(1928).—Using the data of Lennard-Jones (C. A. 20, 3599) regarding the force fields of rare-gas-like ions (Na^+ , K^+ , Cl^- , Br^-), C. and S. calc. infra-red frequencies and compare them with the calcns. of Born and Brody (C. A. 17, 1183), who obtained these frequencies from density and compressibility data. The 2 methods check within about 10%.

G. G.

The Stark effect of the fine-structure of hydrogen. R. SCHLAPP. *Proc. Roy. Soc. (London)* A119, 313-34(1928).—A theoretical investigation of the influence of an elec. field on the fine-structure of the levels of the H atom based on the equations of Darwin and Dirac. The formula which is developed for the intensity of a line corresponding to a given transition between the levels of 2 different quantum states is applied fully to the calcn. of all the components of $\text{H}\alpha$ in weak and strong fields.

C. C. K.

Observations on the band spectra of mercury. LORD RAYLEIGH. *Proc. Roy. Soc. (London)* A119, 349-57(1928).—Hg vapor excited to fluorescence by the continuous H spectrum exhibits not only the well-known broad structureless bands in the visual and ultra-violet, but also the narrow band at 2540 A. U., the resonance line at 2537 A. U. being absent. In the region of the bands 2345, 2338, 2334 A. U., etc., all of which appear prominently in absorption, only the first appears in the fluorescence light. It is followed by a continuous spectrum which extends into the ultra-violet as far as 2150 A. U. The 2345 bands in absorption are accompanied by another set of narrow bands degraded to the red and spaced at about 1 A. U. (C. A. 22, 541). When produced in emission by exciting Hg vapor with a high-voltage discharge, there is no trace whatever of these narrow, underlying bands. The band in the region 2482 to 2476 A. U., which appeared in the high-potential discharge, and which had previously been described as continuous, was observed to have a structure consisting of alternate max. and min. The wave lengths of the max. and the wave-no. differences between them are given in a table.

C. C. KIESS

Stark effect and series limits. JANE M. DEWEY AND H. P. ROBERTSON. Princeton Univ. *Nature* 121, 709-10(1928).—The Stark effect for highly excited states is investigated with particular reference to the existence of conditionally periodic orbits. A negative upper limit is found for the energy of quantized orbits in a H-like atom. Various types of non-quantized orbits with negative energies can also exist. The lower limit of the energy of a certain class of these periodic orbits is given by $-2e\sqrt{eF}$, where F is the applied field. This limit may be less than the upper limit for the periodic orbits. As a result, the line spectrum will not be continued to the normal series limit, but will end on the long-wave side at a point depending on the field. Also the continuous spectrum associated with ionization or recombination will extend to the red of the normal limit. From the above expression, the limit of the continuous spectrum is calcd. for the series of H (Balmer), He (2s), Cs (2P and 2D), for which the max. of the continuous spectrum has been measured under conditions which allow an estimate of the mean stray field existing in the ionized gas. The positions of the apparent series limits as calcd. from the theory agree with the measured maxima as well as can be expected in view of the uncertainty in the estd. field strengths.

F. A. J.

Multiplets in the Co II spectrum. WM. F. MEGGERS. *J. Wash. Acad. Sci.* 18, 325-30(1928).—New measurements of the Co spark spectrum have been made the basis for an analysis of Co II. The multiplets found represent combinations between high quintet D', F and G' terms with a low F' term, of high triplet P, D' and F terms with a low D term, and of the intersystem combinations ^3D with $^1\text{D}'$ and ^1F . Practically all the intersystem lines are to be found in Rowland's list of solar lines (the other multiplets being beyond the range of Rowland's tables) thus indicating the existence of ionized Co atoms in the sun. The lowest term of Co II, not yet found, is $^3\text{F}'$ arising from the electron configuration d^8 , the terms $^3\text{F}'$ and ^3D already established being metastable terms arising from d^7s .

C. C. KIESS

Absolute intensity of the 2537 line of mercury. PAUL KUNZE. *Ann. Physik* 85, 1013-57(1928).—An exptl. procedure is described in which the intensity of the 2537 line of Hg is measured by means of a photoelec. cell. The light, emitted by a resonance chamber contg. excited Hg atoms, is measured both without and with the interposition of an absorbing cell in its path. This cell, of quartz, contains Hg vapor of various densities corresponding to different temps. The results of the measurements show a small variation of the abs. intensities, k , with vapor pressure (expressed in terms of that at 20°), and when extrapolated to vapor pressure zero, give $k_{20} = 5.78$. This value differs greatly from previous detns. by others which range from 2.97 to 3.77, because numerous corrections, heretofore neglected, have been applied. The effect on the abs. intensity of the Doppler widening of the line, produced by raising the absorption cell to high temps., was investigated and found to be negligible, the same limiting value for vapor pressure zero being obtained as for the lower temps.

C. C. KIESS

The excitation of the D lines by the green sodium band. E. L. KINSEY. *Nature* 121, 904-5(1928).—The green band at 5200 Å. U. emitted by the Na mol. on passing through a tube of pure Na vapor will excite the vapor to fluorescence with emission of the D lines. There is only a narrow temp. range between 400° and 450° for which the effect occurs, with max. at 410°. This is accounted for as the result of a collision between an atom and an excited mol. which leaves the atom in the 2P state. The effect of the presence of a foreign gas is to retard diffusion of the Na vapor to the cooler parts of the tube and thus increase the probability of the collisions.

C. C. KIESS

New regularities in the band spectrum of helium. W. E. CURTIS. *Nature* 121, 907-8(1928).—The analysis of addnl. bands of He₂ has led to the establishment of new energy levels of which the effective electronic quantum nos. are given. These appear to be addnl. to the ordinary at. levels, and furnish supporting evidence for Hund's view that in mol. spectra the term type is detd. by the component in the line joining the nuclei of the resultant orbital moment of momentum of the electrons.

C. C. KIESS

The sun's outer atmosphere. E. A. MILNE. *Nature* 121, 911-3, 943-5(1928).—An address.

C. C. KIESS

Infra-red emission of carbon dioxide. C. R. BAILEY AND K. H. LTH. *Nature* 121, 941(1928).—The infra-red emission spectrum of CO₂ has been remeasured, the source being burning CO. A table contains the new wave-length detns. between 1.70μ and 187.4μ. The band at 2.40μ is new. Comparison of the emission bands with those observed in absorption shows that the emission spectrum is shifted redward. The frequencies of the bands are multiples of $\nu = 16 \times 10^{-11}$.

C. C. KIESS

The spectrum of ionized sodium. OTTO LAPORTE. *Nature* 121, 941(1928).—Numerous strong lines of Na II have been classified as combinations of the terms ²P_{3/2,1,0} and ¹P₁ with its higher terms designated provisionally as p_1, p_2, \dots, p_{10} . The difference ³P₂ - ¹P₀ = 1357 cm.⁻¹ gives a screening const. 3.20 identical with that given by the corresponding difference 780 of Ne I. (For a similar classification cf. Majumdar, *C. A.* 22, 2716.)

C. C. KIESS

A nitrogen after-glow. S. P. MCCALLUM AND W. E. PERRY. *Nature* 121, 942(1928).—If pure A at about 1 mm. is admixed with air at 0.1 mm. in a discharge tube without electrodes, a glow of greenish yellow color appears when the tube is excited and persists for a few secs. after cessation of the discharge. Such a tube retains this property for a long period. No glow appears when Ne and He are the foreign gases.

C. C. KIESS

The pure rotation spectrum of ammonia. RICHARD M. BADGER. *Nature* 121, 942(1928).—Between 55μ and 130μ NH₃ had 6 absorption lines presumably due only to changes in the rotational energy of the mol. The wave nos. of the lines are given by $1/\lambda_m = 19.957m - 0.00508m^3$.

C. C. KIESS

The light-sensitivity of dyes II, 2. ALBERT STEIGMANN. *Kolloid-Z.* 44, 249-50(1928).—The presence of dyes accelerates the formation of vitamins in ergosterol and possibly does so even in ultra-violet light as well as in light of long wave lengths. Alc. eosin solns. are quickly bleached in quartz vessels when exposed to ultra-violet light. Methylene blue is affected differently than fluorescein on exposure; although the visible effect on dyes is the same as on ergosterol, the reaction is actually quite different.

R. H. LAMBERT

Excitation of the auroral green line in active nitrogen. JOSEPH KAPLAN. Princeton Univ. *Nature* 121, 711(1928).—The spectrum of the after-glow produced by a condensed discharge in a mixt. of N and 4% O shows the auroral green line λ5577.35 (5577.5 actually measured) as intense as the N₂ band at λ5442. Decreasing the amt.

of O causes the line to disappear gradually. A line at $\lambda 6654.8$ is also observed under the same conditions as the green line, although less O is necessary to bring it out. It is as intense as the N_2 band at $\lambda 6185$, and is probably due to O, as is the green line. The occurrence of the latter line with considerable intensity in active N suggests that the dissociation of O_2 and excitation of an atom occur in a single act. Other strong arc lines of O are absent, as in the spectrum of the aurora. F. A. JENKINS

The action of "active" nitrogen on iodine vapor. L. H. FASSON AND R. W. ARMOUR. *Proc. Roy. Soc. Edinburgh* **48**, 1-9(1928).—The fact that the yellow glow of N produced by elec. discharge disappears so slowly that its rate of decay can be measured, suggests that this rate might be studied in the presence of other substances. The description of N as being in the "active state" is rather vague, since there are possibly a number of different states of activation present simultaneously. The spectrum of I excited by active N shows a line at $185m\mu$ and also the I line at $206m\mu$. This indicates the presence of some form of N capable of imparting energy sufficient to dissociate the I and raise the atom to the energy level necessary to emit this line, which is calculated as 8.4 volts. This is somewhat higher than any previously recorded voltage for I lines and supports the view that the glow is produced by the combination of N atoms. When the pressure of I vapor is comparable to that of the active N, the visible reaction is an instantaneous flash, cinema studies indicating that even with imperfect mixing the duration of this reaction is less than 0.01 sec. It is extremely unlikely, however, that there is any chem. action. The I merely receives energy and radiates it again. A. W. KENNEY

Photophoresis in liquids. SATYENDRA RAY. *Kolloid-Z.* **45**, 7-9(1928).—Positive photophoresis was observed with emulsions of oil in water, water in oil and colloidal S. J. J. McNALLY

Some further notes on the hydrolysis of starch grains under polarized light. ELIZABETH S. SEMMENS. *Plant Physiol.* **1**, 201-2, (1926); *Physiol. Abstracts* **12**, 588.—Some added notes and photographs in regard to work already published (cf. *C. A.* **20**, 3133). H. G.

4—ELECTROCHEMISTRY

COLIN G. FINK

The electric-furnace industry of Sweden. ANON. *J. four elec.* **37**, 175-7(1928).—Statistics are given covering recent years up to 1926 inclusive. About 84,000 tons of pig Fe is now produced annually. The ferro-alloy production in 1926 was 38,532 metric tons, ferro-Si constituting almost half of this total. About 10% of the steel produced in Sweden in 1926 was electric. C. G. F.

Large electric baking ovens. W. ELLERD-STYLES. *J. (Brit.) Inst. Elec. Eng.* **66**, 569-95(1928).—Constructional details of elec. ovens are dealt with as an indication of the suitability of each type for particular locations. British, American and Continental ovens are reviewed and compared. C. G. F.

Electric enameling used in Packard plant. R. J. GAUDY. *Elec. World* **91**, 1289-91(1928).—A modern installation is fully described. Elec. ovens for continuous process effect large savings. Filtered air in counterflow to work assures product of high quality and economy of heat. C. G. F.

Electrochemical oxidation of cerous salts solutions. I. A. ATANASIU. Univ. de Bucarest. *Bul. chim., soc. romând stiinte* **30**, 61-7(1928).—Cerous sulfate or nitrate can be quant. oxidized by electrolysis. The electrochem. yield is 4 times larger with the nitrate than with the sulfate; in both cases it is proportional to the reciprocal of the c. d. Dild. ceric solns. are perfectly stable. A. L. HENNE

The electrical resistance of the electrode-electrolyte transition layer. O. SCARPA and E. DENINA. School of Eng., Turin. *Z. physik. Chem.* 130, 449-71 (1927). (Italian).—The impedance, and very probably also the elec. resistance of the electrode-electrolyte transition layer, referred to a unit area of the electrode surface, depend on the sign of the polarization of the electrode, on the nature of the electrolyte and of the electrodes, on the current d . at the electrode, on the degree of the polarization of the electrodes, that is, on the time elapsed since the beginning of the polarization, on the history of the polarizing current, and on the temp. and probably the pressure. When H_2 and O_2 are evolved at the cathode and anode, resp., as a result of electrolysis, the relationship between the electrode-electrolyte resistance and the polarizing current depends essentially on the acidic or basic character of the electrolyte. These results were arrived at by using a special method for detg. the electrode-electrolyte resistance while the electrode was being subjected to various polarizing conditions. A variety of electrodes in solns. of NaOH and of H_2SO_4 were studied.

R. H. LOMBARD

Decomposition potentials of zinc sulfate and iron sulfate. BOGDAN KAMIENSKI. *Przemysl Chem.* 11, 374-81 (1927).—From thermochemical and electrochemical data K. calcs. that the decompn. potentials of Zn and Fe sulfates should be lowered by using the respective sulfides as anodes. His expts. substantiate these predictions. When a sulfide is conducting, as that of Fe, then it can be used directly; when not conducting, as that of Zn, then a C anode covered with a ground powder of that sulfide can be used. In electrolyzing $ZnSO_4$ soln. K. reduced the decompn. potential from 2.62 v. at a PbO_2 anode to 1.8 v. at a C anode covered with ground blende powder and moistened with the $ZnSO_4$ soln. By gently moving the C anode the voltage was further reduced to 1.7 v., and the resistance of the electrolyte was lowered from 20 ohms to 12 ohms. By such methods Zn has been extd. from a sulfate soln. under a potential of only 2 v. in place of the usual 3.5 v. The effect of c. d. on voltage for an Fe soln. is shown by a graph. The reactions taking place are discussed, and it is shown how this method helps purify the ore. A description of the app. is given. K. concludes that this method of Zn extn. provides a saving of blende roasting. High-grade (53.4%) Zn ores (Klauebegut und Stufenblende) were used.

A. C. ZACHLIN

Condition of thorium in thoriated tungsten filament. ANCEL ST. JOHN. Amer. Inst. Mining Met. Eng., *Tech. Publication* No. 22, 10 pp. (1927).—Examn. of a high-emission filament supposed to contain about 0.75% thoria indicated the presence of metallic Th, and in some cases an "alloy of W in Th." There is no evidence of Th as oxide, and none of an "alloy of Th in W." The "alloy of W in Th" has a characteristic parameter and probably a characteristic compn. During the investigation, methods were devised for detecting as small a quantity as 0.2% of a minor constituent.

W. H. BOYNTON

Electrolytic Cu (KÖSTER) 9. Purifying molasses and sugar juices electrolytically (Brit. 280,321) 28. Insulation for electric conductors (Brit. pat. 279,876) 13.

Electric dry cell batteries. CARL T. SCHUNK (to The Peerless Paper Box Mfg. Co.). U. S. 1,674,745, June 26. Structural features.

Storage battery. JAMES H. CHANNON. U. S. 1,674,887, June 26. Structural features.

Storage battery. EDISON SWAN ELECTRIC CO., LTD., and G. E. WEBSTER. Brit. 279,926, July 8, 1926. Positive electrodes of batteries of the Planté type are prepd. by subjecting them to electrolytic treatment in a forming soln. which may consist of H_2SO_4 with the addn. of $HClO_4$, and subsequently drying by heat without previous washing.

Storage battery. M. KUGEL. Brit. 280,197, Nov. 6, 1926. The electrolyte is formed of H_2SO_4 and ortho-, meta- or pyro-phosphoric acid. Pb phosphate, alone or with Pb oxides, may be used as active material. A mixt. of Pb oxide and H_3PO_4 may also be used.

Photoelectric cell. W. S. SMITH and N. W. McLACHLAN. Brit. 279,937, Aug. 3, 1926. The cathode may be formed of Na, K or Rb and in addn. to an anode and a control electrode, an earthed electrostatic screen is provided and a graded light filter is inserted in the path of the incident beam of light so that the cell current may vary as the beam moves.

Battery seal composition. LAUCHLIN M. CURRIE (to The Can. National Carbon Co.) Can. 281,108, June 19, 1928. A battery seal compn. consisting of 0.5% glycerol 1.5% tung oil, 0.17% paraffin, 0.01% lead resinate and up to 4% coloring matter, and the remainder about equal parts of rosin and mineral filler.

Rotating barrel apparatus for nickel-plating small articles. J. G. NEWBY and C. B. JERRED. Brit. 279,616, Oct. 9, 1926.

Electrolysis of zinc sulfate solutions. U. C. TANTON. Brit. 280,103, April 29, 1927. In electrolysis of ZnSO_4 solns. such as those obtained from ores and contg. Mn sulfate, anodes of Pb with a small proportion of Ag are used. The Zn deposit is free from Pb and the formation of "trees" is avoided. Mn, when present, is pptd. as MnO_2 at the anode in the form of a fine powder contg. so little Pb that it may be directly used in dry-cell batteries, for varnish or ink manuf. or for other purposes. Mn sulfate may be added to the electrolyte to produce addnl. H_2SO_4 for use in leaching the ore.

Electrolytic rectifier. H. ANDRE. Brit. 279,810, Oct. 29, 1926. In an electrolytic rectifier of the type described in Brit. 224,871, comprising a cathode coated with a layer of oxide conducting in one direction only and an anode of colloidal metal, the cathode is heated before immersion in the electrolyte to thicken the layer of oxide and in setting up the cell it is caused to exert pressure on the anode, to diminish internal resistance of the rectifier. The anode may comprise a Ag disk surrounded by powd. Ag and the cathode is formed of a rod of Ni-Si alloy which is heated to redness and pressed into the powder. Sand or other absorbent is placed around the cathode and concd. H_2SO_4 is added. Various other features are described.

Mercury-vapor rectifier. GENERAL ELECTRIC CO., LTD. AND E. WEINTRAUB. Brit. 280,438, May 6, 1927. Structural features. Cf. C. A. 22, 1550.

Low-pressure metallic-vapor electric rectifier. AKT.-GES. BROWN, BOVERI, ET CIE. Brit. 279,910, Nov. 1, 1926.

Electric induction furnace. E. F. NORTHRUP (Electric Furnace Co., Ltd.). Brit. 279,733, May 21, 1927.

Electric induction furnace. M. SURJANINOFF. Brit. 279,883, Oct. 30, 1926

Electric crucible furnace. MAGNUS UNGER (to General Electric Co.) U. S. 1,675,237, June 26. A crucible with a ring-shaped reservoir is provided with an annular depending channel which surrounds a primary winding with which it is inductively associated.

Electric furnace for use in glass manufacture or for other purposes. H. GEORGE. Brit. 279,818, Oct. 27, 1926. A furnace is heated by a conducting body such as Sn or Ga which is liquid under working conditions; this body is heated by electrodes in contact with it or forming one or more arcs above it or by induced currents. Various structural details are described.

Electric arc furnace for treating iron or other metals. WILLIAM E. MOORE (to Pittsburgh Research Corporation). U. S. 1,674,982, June 26. In carbonizing a metal charge, it is mixed with carbonaceous materials, heated until molten, and then agitated.

Electric resistance furnace adapted for making zinc oxide. EARL H. BUNCE and GEORGE T. MAHLER (to New Jersey Zinc Co.). U. S. 1,674,947, June 26.

Electric resistance apparatus for making hollow bodies of quartz or similar material. I. G. FARBERIND. A.-G. Brit. 280,291, Aug. 12, 1926.

Flexible braided and laminated electric contacts of copper or bronze, etc. G. A. JUHLIN and METROPOLITAN VICKERS ELECTRICAL CO., LTD. Brit. 279,960, Aug. 13, 1926.

Electrical conductor comprising titanium oxide. SIMON J. LUBOWSKY. U. S. 1,675,117, June 26. TiO_2 of a gray-black color, which has been subjected to a high temp. in a reducing atm., e. g., rutile heated to 800–1000°, is used for electrodes, conductors or containers.

Protecting electrical transformers and similar apparatus against overload. M. BUCHHOLZ. Brit. 280,209, Nov. 2, 1926. Gases of decompn. formed in the app. are caused to diffuse into a cell with porous walls so that the resulting change in pressure operates an elec. switch, which controls a signal or cut-out device.

Apparatus for generating ultra-violet radiations from electric arcs between tungsten or other metallic electrodes. G. G. BLAKE. Brit. 279,680, Jan. 4, 1927.

Electric incandescent lamp base. GENERAL ELECTRIC CO., LTD., G. H. IDE and R. J. KAULA. Brit. 279,654, Nov. 26, 1926. Molded parts are formed of a phenol- CH_2O synthetic resin and a filler; structural features are specified.

5—PHOTOGRAPHY

C. E. K. MEES

CLERC, L. P.: *La technique photographique*. Tome I. 459 pp. Tome II. Pp. 461-850. Paris: Paul Montel The. 2 vols. F. 90.

Photographic reduction. P. FLAGWITZ. Can. 278,039, Feb. 21, 1928. Photographic negatives, positives, films, bromide prints and gaslight prints are treated with a soln. of I, KI and $K_2Cr_2O_7$.

Photographic emulsion. H. MAUERHOFF. Can. 278,364, March 6, 1928. Protein decompn. products prepd. by acid hydrolysis are incorporated in photographic Ag halide emulsions.

Photographic emulsion. W. DIETERLE, O. MATTHIES and J. REITSTÖTTER. Can. 278,365, Mar. 6, 1928. Protein decompn. products prepd. by alk. and enzymic hydrolysis and a simultaneous partial oxidation are incorporated in photographic Ag halide emulsions. Cf. C. A. 22, 1918.

Photographic silver halide emulsion. O. MATTHIES, P. WULF, W. DIETERLE AND B. WENDT (to I. G. Farbenind. A.-G.) U. S. 1,673,522, June 12. There is added to the emulsion Na trithionate or other suitable water-sol. salt, the anions of which contain at least 3 atoms of an element of the S group, and which serves to increase the sensitivity.

Photographic and cinematographic films. I. G. FARBENIND. A.-G. Brit. 279,033, Oct. 16, 1926. The production of the film base and the coating and intermediate drying operations are carried out in daylight and in one continuous process (which may be combined with subsequent treatments for sensitizing, etc., with exclusion of light). App. is described.

Cinematographic films. J. H. THORNTON. Brit. 279,241, Sept. 11, 1926. Structural features.

Photomechanical printing surfaces. H. ENTWISTLE and W. ENTWISTLE. Brit. 279,186, Aug. 4, 1926. From a positive screen enlargement prints may be made on paper sensitized with ferro-prussiate or other ferric chromic or similar salts and these prints placed, without development or fixing, in contact with a layer contg. gelatin and ferrous or similar salts, as in the "true to scale" process. By this contact the gelatin layer is hardened at the parts in contact with the unreduced portions or the ferro-prussiate or like print. Various other details of procedure also are described.

System for producing composite photographs. R. J. POMEROY (one-half to Famous Players-Lasky Corpn.). U. S. 1,673,019, June 12.

Photographs in monochrome or in natural colors. S. M. PHELPS. U. S. 1,673,300, June 12. A matrix film is prepd. in which a dye is held by a mordant which is sensitive to light, a negative is printed upon the film thus prepd., and the dye thus released is transferred from the matrix film to another surface.

Color photography. R. GSCHÖPF. Brit. 279,381, Oct. 22, 1926. Three-component color-record images are successively printed from different color-record negatives on a single gelatin-coated base sensitized before each printing with a soln. contg. Fe and Ag salts such as Fe oxalate and Ag nitrate; after each printing, development is effected with a soln. contg. Cu thiocyanate and a salt of an org. acid such as NH_4 oxalate or with a soln. of I in alkali iodide or an alkali iodide and ferricyanide. Various details and modifications are given.

Color photography. W. V. D. KELLEY and D. TRONOLONE (to Kelley Color Laboratory). U. S. 1,674,174, June 19. An image is first formed in one section of a coating and the image is toned to a color such as blue-green; without fixing, a second image is formed in the same coating in a different section of the coating and the colloid surrounding the reduced light-sensitive salt of the second image is then rendered receptive to an acid or azo dye and is dyed to a color substantially complementary to the color of the first image. U. S. 1,674,175 (W. V. D. KELLEY) also specifies color photographs consisting of 3 separately developed and colored Ag images in one emulsion. Cf. C. A. 22, 1918.

Color photography. W. WITTE. Brit. 279,882, Oct. 28, 1926. A system is described involving the resensitization and reprinting, one from another of different color-selective reproductions.

Color photography. M. MARTINEZ. Brit. 280,252, May 17, 1926. Sensitive layers which print out, resp., in red, blue and yellow, comprise: (a) for red, a deriv. of

urea such as alloxan, alloxanic acid, alloxantine or murexide, which may be mixed with each other or with metal salts such as alkali oxalates, or Ag, ferric or Hg salts; (b) for blue, a mixt. comprising ferric salts together with a cyanide such as that of Hg or K, and $K_3FeC_6N_6$; and (c) for yellow, Ag lactate together with metal oxalates and ferric salts and preferably also an excess of lactic acid. The layers require no treatment after printing except washing in water, except with the red-sensitive layer, which may be treated with a fixing agent such as $HgCl_2$ or Sn chloride or $AgNO_3$. Various details are given.

Color-photography system using superimposed films of different speeds and color sensitivities. M. MARTINEZ. Brit. 280,053, May 11, 1926.

Polychromatic screens for color photography. R. C. M. DE BERCEGOL. U. S. 1,673,349, June 12. The surface of a plate or film is treated with a coloring agent and superfluous portions of the latter are removed; a waxy insulating material is then superposed on the layer of coloring agent, and parallel lines are cut across the film or plate and through the layers of coloring agent and waxy insulating material to produce parallel grooves. A layer of differently colored material is then applied to fill the grooves. An app. is described.

Color screen for use in photography. L. DUFAY. U. S. 1,673,350, June 12. Color screens are formed with separable layers with similarly colored parts in register and of different intensities for prepg. and viewing photographs in natural colors by reflection.

6—INORGANIC CHEMISTRY

Titanium and titanium compounds. JOSEPH OTT. *Metallborse* 18, 91-2, 148-9, 481-2(1928).—A discussion of Ti and Ti compds. with special reference to the patent literature. J. BALOZIAN

Univalent iron, cobalt and nickel. III. The reduction of iron. W. MANCHOT AND H. GALL. *Ber.* 60B, 2318-22(1927); cf. *C. A.* 22, 199.—Ferrous mercaptide (I) reacts with NO with formation of dinitroso-iron mercaptide according to: $Fe(S.C_2H_5)_2 + 3NO = Fe(NO)_2.S.C_2H_5 + NO.S.C_2H_5$. I is obtained by treating $FeCl_3$ with an excess of C_2H_5SH and NH_3 . The role of S in the formation of compds. with univalent Ni, Co and Fe depends upon the affinity of S for NO, which enables the latter to remove from compds. of the general type $M(SR)_2$ the S.R.-radical as NO.S.R. Therefore, the following equation holds for Fe, Ni and Co: $Me(SR)_2 + nNO = (NO)_{n-1} M.S.R. + ON.S.R.$ where $n = 3$ for Fe and Co and 2 for Ni. EMIL KLARMANN

The action of aqueous ammonia on mercurous chloride. HAROLD S. KING. Dalhousie Univ. *Proc. Trans. Nova Scotian Inst. Sci.* 16, 115-27(1928).—The action of NH_4OH on Hg_2Cl_2 gives Hg and $HgNH_2Cl$. If the gray ppt. is centrifuged in cold glycerol, it may be sepd. into a black component and a white one, thus proving that the initial material was not a definite chem. compd. such as Hg_2NH_2Cl . A. L. H.

Combination of sulfur with amorphous carbon; comparison with the behavior of sulfur toward graphite and diamond; the carbon sulfide of Ciusa. J. P. WIBAUT AND E. J. VAN DER KAM. *Verslag Akad. Wetenschappen Amsterdam* 37, 395-409(1928).—S combines with amorphous C on heating in a sealed tube at 500-600°. The resulting compd. contains 15-25% S. By heating at 600°, 50% of the combined S is removed; at higher temp., more S is liberated. After a long heating at 1100°, it is impossible to remove 2 to 3% S. No definite compd. has been isolated. The prepn. from tetraiodothiophene of $C_8I_4S_2$ and C_4S described by Ciusa (*C. A.* 20, 736) could not be duplicated. Native graphite or diamond will not combine with S. A. L. HENNE

Preparation of vanadium-ammonium salt from residues of radium manufacture. N. N. EFREMOV AND A. M. ROZENBERG. Northern Chemical Trust. *J. Chem. Ind. (Moscow)*, 4, 44-7(1927).—A V concentrate has been prepd. from by-products and residues of Ra manuf. which, on being dried, had the following compn.: V_2O_5 32.48, V_2O_4 29.63, U_2O_8 6.78, Al_2O_3 14.01, Cu 0.37, As 0.01, SO_3 0.14, Pb 8.69, Fe 2.06, Ni 0.01, CaO 0.95, SiO_2 0.25, Cl 5.59, org. matter 0.35%. To obtain pure V salts from this mixt. E. and R. first triturated it and obtained a homogeneous powder which was introduced in small portions under stirring into boiling HNO_3 , sp. gr. 1.24. Four cc. of the acid was taken per 1 g. of the powder. The latter dissolved rapidly with the exception of SiO_2 , Al_2O_3 and a portion of org. matter. The soln. was concd. by evapn.,

whereupon V_2O_5 gradually pptd. and the liquid thickened to the consistency of a paste, which was filtered hot over a thin asbestos plate by suction. The filtered-off V_2O_5 , while still hot, was washed 3–4 times with small quantities of 40° water; neither colder nor hotter water should be used. The filtrate and the wash-waters contg. a small quantity of V and all the U were evapd. until the nitrates began to decomp. for the purpose of removing the excess of HNO_3 , which increased the soly. of V_2O_5 . The evapd. substance was diluted with water and heated to 60° , whereupon everything dissolved except V_2O_5 ; the latter was filtered off and added to the first V_2O_5 ppt. The new filtrate still contained 4–5% of the total amt. of V_2O_5 contained in the concentrate. The combined V_2O_5 ppts. were, after washing, purified by mixing with a small quantity of hot water to form a paste which was poured under stirring and warming into a small excess of NaOH 1:3. $NaVO_3$ was formed and went in solution, leaving in suspension impurities which, after settling, were filtered off by suction. The filtrate, which contained $NaVO_3$, $Al(ONa)_3$ and an insignificant amt. of Na_2SO_3 , was, after being exactly neutralized by HNO_3 1:4 and heated to boiling, further purified by introduction of a very slight excess of Na_2CO_3 and boiling 1–1½ hrs., whereupon $Al_2(OH)_6$ pptd. The last traces of dissolved Al were removed by NH_3 , followed by filtration and the filtrate was heated to boiling and treated with a small excess of a hot satd. soln. of NH_4Cl . The reaction $NaVO_3 + NH_4Cl \rightarrow NH_4VO_3 + NaCl$ took place; the metavanadate pptd. The soln. was evapd. to thickness, a little water was added and, after 24 hrs., NH_4VO_3 was filtered off, washed at first 4 times with a soln. of NH_4Cl , then rapidly twice with cold water and dried in a desiccator. NH_4VO_3 was obtained as a white cryst. salt. The yield was 96–7% of the theoretical. U which remained in the HNO_3 filtrate may be recovered as $Na_2U_2O_7$.

BERNARD NELSON

The nature of complex compounds. FRITZ EPHRAIM. *Helv. Chim. Acta* 11, 431–6 (1928).—A discussion of the structure of complex compds., such as the Co ammonia chlorides, from the standpoint of the theory of field valence.

LOUISE KELLEY

The electromotive behavior of complex cyanides of manganese; potassium manganese cyanide containing univalent manganese. G. GRUBE AND W. BRAUSE. *Techn. Hochschule Stuttgart. Ber.* 60B, 2273–8 (1927).—Electrolytic reduction of $K_3Mn(CN)_6$ leads to $K_2Mn(CN)_6$, which was isolated in dry state. Thus the results of Manchot are corroborated according to which a soln. of a complex cyanide of univalent Mn is obtained by reduction of a complex cyanide of bivalent Mn by means of granulated Al or Devarda' alloy (cf. *C. A.* 21, 869).

EMIL KLARMANN

The composition of a series of bismuth sodium tartrates. W. F. VON OETTINGEN AND Y. ISHIKAWA. *J. Am. Pharm. Assocn.* 17, 124 (1928).—A bitartrate was prepd. by pptg. a soln. of $BiONO_3$ in $C_2H_5O_2$ with $Na_2C_4H_4O_6$, and washing the ppt. with H_2O . The product contained 58.3% of Bi. The formula is approx. $C_4H_5O_{12}Bi_2$; it is not sol. in H_2O but sol. in NaOH. The Na salt is formed by soln. of the compd. in NaOH and pptg. with EtOH. It is a white powder, with a Bi content 67–9% and approx. formula $C_4H_5O_8Bi_2Na$. Slight variations in the method of pptn. and washing tend to produce products of variable compn. The BiO group attached to the COOH group in the tartaric acid is named "bismuthyl" while the same group attached to the central OH group is named "bismutho." Twelve theoretical compds. are discussed: Some contain Na and some do not; some are anhydrides (produced in drying the ppts.). In general they are variants of bismuthyl-bismutho Na tartrates or of dibismuthyl-dibismutho Na tartrate.

L. E. WARREN

Stannic dichloride diacetate and related salts. FR. FICHTER AND SAMUEL HERSZBEIN. *Helv. Chim. Acta* 11, 562–7 (1928); cf. *C. A.* 19, 735.—To a mixt. of 40 g. glacial AcOH and 5 g. Ac_2O was added drop by drop 40 g. $SnCl_4$. After distg. off part of the liquid, stannic dichloride diacetate (I) sepd. (yield 10 g.). It is very sensitive to moisture, but stable in a dry atm. With dry HCl gas and I the products formed are $SnCl_4$ and AcOH. I reacts rapidly with pyridine giving the stannic chloride pyridine discovered by WERNER AND PREIFFER (*Z. anorg. Chem.* 17, 103 (1898); 71, 97 (1911)). F. and H. suggest that the first step in the reaction between $SnCl_4$ and AcOH may be the formation of an addn. compd., which then decomp. into I and HCl. Other salts prepd. were stannic dichloride dipropionate and stannic dichloride dibutyrate (3 g. from 40 g. $SnCl_4$).

LOUISE KELLEY

The occurrence of titanium tetrachloride in commercial disilicon hexachloride. FREDERIC S. KIPPING AND REGINALD A. THOMPSON. *J. Chem. Soc.* 1928, 1137.—The addn. of a small amt. of crude or of twice-fractionated Si_2Cl_6 (I) to purified Et_4O develops a yellow color in the mixt. When one cc. of Et_4O is added to 100 cc. of I a little yellow cryst. ppt. forms, which melts at $42-45^\circ$ and is probably $TiCl_4 \cdot (C_2H_5)_2O$ (II). This has been obtained by direct combination of $TiCl_4$ and Et_4O . That $TiCl_4$ is present in I

is also proved by the H_2O_2 reaction, and with thymol and H_2SO_4 . The twice-fractionated I contains 1.6% TiCl_4 . For complete sepn. of TiCl_4 (b. 135°) from I (b. 147°) repeated fractionation is required; after 5 or 6 operations the I gives no color reaction with H_2O_2 . II (b. $118\text{--}120^\circ$) is sepd. with difficulty from I by distn.; when it is decomposed by alkali and the aq. soln. then distd. the distillate shows a marked iodoform reaction.

7—ANALYTICAL CHEMISTRY

WILLIAM T. HALL

Potentiometric stannometry. ERICH MULLER AND JOHANNES GÖRNE. *Z. anal. Chem.* **73**, 385–400(1928).—One objection to the use of SnCl_2 as a standard soln. in volumetric analysis is the difficulty in detg. the end points. This difficulty disappears when the end point is detd. potentiometrically. Excellent titration curves were obtained in the titration of SnCl_2 against I_2 , Fe^{+++} , $\text{Cr}_2\text{O}_7^{--}$, Au^{+++} , Pt^{+++} , Hg^{++} in $\text{Hg}(\text{ClO}_4)_2$ and MnO_4^- . In titrating $[\text{Fe}(\text{CN})_6]^{--}$ with SnCl_2 , the break in the e. m. f. curve was dependent upon the H^+ concn. of the soln. and the ppt. of $\text{Sn}[\text{Fe}(\text{CN})_6]$ also was troublesome.

W. T. H.

Behavior of indicators in the titration of ammonia, sodium and calcium phosphates, the methylamines, pyridine bases and boric acid. R. T. THOMSON. *Analyst* **53**, 318–21(1928).—An account of some expts. with about 12 different indicators, in titrating solns. of weak acids or bases. It is pointed out that a knowledge of the p_{H} range of an indicator does not always suffice and expts. are necessary to det. whether a given indicator is really suitable. Thus, bromophenol blue has about the same p_{H} range as methyl orange but is unsuitable for the titration of free acid present in $(\text{NH}_4)_2\text{SO}_4$, although methyl orange gives satisfactory results. In the main, however, the results are as would be expected from the theory of indicators.

W. T. H.

The use of pinachrome as a one-color indicator. I. M. KOLTHOFF. *Univ. Minn. J. Am. Chem. Soc.* **50**, 1604–8(1928).—Pinachrome, a deriv. of cyanine, proves to be an excellent one-color indicator for indicating p_{H} values between 5.8 and 7.8, e. g., for detg. the H-exponent of tap water and of distd. water. The salt error is negligibly small at low concns. but with large amts. of electrolyte the p_{H} value indicated is a little too low. A simple test is described by which the adsorption of a substance at the interface of water and air can be demonstrated and the increased concn. of the capillary active substance shown at this interface.

W. T. H.

Ceric sulfate as a volumetric oxidizing agent. Preparation and standardization of solutions. H. H. WILLARD AND PHILENA YOUNG. *J. Am. Chem. Soc.* **50**, 1322–38(1928); cf. *C. A.* **22**, 2123.—A correction. To prep. a stable soln. of $\text{Ce}(\text{SO}_4)_2$, dissolve CeO_2 in dil. H_2SO_4 . The bismuthate and persulfate oxidation of cerous salt causes the formation of ceric salt, and such an oxidation is useful in the analysis of Ce compds., but the resulting soln. is not stable enough to serve as a standard soln.

W. T. H.

Electrometric titrations: chloramine-T as a titrating agent. A. McMILLAN AND W. EASTON. *J. Soc. Chem. Ind.* **46**, 472T(1927).—"Chloramine-T" may be used for analytical work (*C. A.* **19**, 793) in the oxidizing operations involving the use of I to replace the latter if a few drops of KI contg. a little starch are added to serve as indicator. The same substance may be used as titrating reagent in conjunction with the electrometric app. for the detn. of As, Sb, Sn and Fe, no indicator being required in this case.

B. C. A.

Use of the centrifuge in quantitative analysis. A. GUNDER. *Z. anal. Chem.* **73**, 441–4(1928).—Expts. with ppts. of BaSO_4 , AgCl and CaC_2O_4 show that the analytical chemist can save time by means of the centrifuge. In these expts. the ppts. were washed, dried and weighed in the centrifuge tubes.

W. T. H.

The reaction between atmospheric oxygen and strongly acid iodide solutions in the absence of arsenic acid. FRIEDRICH L. HAHN. *Z. anal. Chem.* **73**, 412–3(1928).—The air error in iodometric titrations can be increased very markedly by the addn. of

a small quantity of Fe salt, but this catalytic effect can be prevented by adding phosphate or pyrophosphate ions. Probably the reason the air error is not noticeable in the titration of considerable arsenate is that the arsenate has a similar effect to that of the phosphate anion.

W. T. H.

Regulation of flow of carbon dioxide through a combustion train. J. C. RICE. *Ind. Eng. Chem.* 20, 627(1928).—To prevent too much backing up of acid in a Kipp generator used for developing CO₂ in a N detn., fit a small rubber balloon to a small glass tube and insert the tube through a stopper placed at the top of the generator.

W. T. H.

Methods of analysis in use in the metallurgical industry. L. PERSOZ. *Rev. chim. ind.* 37, 152-5(1928).—Detailed methods are given for the analysis of raw materials, finished products and by-products of this industry.

P. THAMASSET

Applications of the polarographic method. I. Analysis of abnormal mineral constituents. M. SHIKATA, I. TACHI AND N. HOZAKI. *Mem. Coll. Agr. Kyoto* 4, 49-57(1927); cf. *C. A.* 22, 930.—The polarographic method is applicable to the micro-detection of lead and copper. **II. Copper complex salts.** *Ibid* 59-74.—The deposition potentials of Cu complexes have been detd. On the assumption of the formation of Li trichlorocuprate in solns. of cupric and Li chlorides, the equil. const. $K = [\text{Cu}^{++}][\text{Cl}']^3/[\text{CuCl}_3']$ is 3.98×10^{-9} for LiCl concns. from 0.05 *N* to *N*. The equil. consts. of sulfate complexes are in general greater than those of chloride complexes. The existence of current max. and min. in the current-voltage curves is ascribed to varying adsorption of the Cu complexes. **III. Microanalysis of reducible substances in fermentation products.** M. SHIKATA AND K. SHOJI. *Ibid* 75-90.—Reducing substances such as cinnamaldehyde, furfuraldehyde and acetaldehyde in various fermented liquids can be detected by the polarographic method.

B. C. A.

The deposition of metals on copper from cyanide solutions. I. A new method for the separation and determination of small amounts of lead. B. S. EVANS. *Analyst* 53, 267-75(1928).—If a Cu spiral is dipped into an alk. cyanide soln., Pb and Bi deposit on the Cu even in the cold. Quantities of Pb ranging from 0.5 to 4.0 mg. were added to 5 g. of electrolytic Cu and nearly perfect recovery of the Pb was accomplished by the following method. Place 5 g. of sample in a 750-cc. flask and treat with 60 cc. of 6 *N* HNO₃ (except when Sn is present, when 35 cc. of HNO₃ and 25 cc. of HCl should be used). When the sample has all dissolved, boil off some of the excess acid and add 9 g. of KHC₈H₄O₆. Cool, make alk. to litmus with NaOH and add a satd. soln. of KCN until the ppt. first produced has all dissolved and the soln. is no longer blue if Cu is present. (Since K₂S in the KCN would cause pptn. of PbS it is best to treat the satd. KCN soln. with a few drops of Br-H₂O until a little of the soln. will not give the NaNO₂-Fe(CN)₅ test for S²⁻.) Prep. a deposition tube, as for the detn. of Hg (Evans and Clark, *C. A.* 20, 2631), using Cu filings which will not pass through a 30-mesh sieve. Make the tube 8.5 cm. long and constricted at one end. Plug the constricted end tight with cotton wool, about 1 cm. in depth, pushing it in through the open end. On top of this plug place about 4 cm. of Cu filings and on this place another plug, leaving about 3 cm. clear at the top to facilitate washing. Do not ram the packing too tight or the percolation will be too slow. Clean the tube and its contents by slowly sucking through it 10 cc. of acid soln. which is 3 *N* in HCl and 3 *N* in HNO₃. Finally wash with water and attach the tube to the end of the stem of the main funnel. Cause the soln. to percolate through this tube for 2 hrs. Then allow the contents of the main funnel to run completely through into the flask, detach the deposition tube and wash the contents 4-5 times with cold water. Transfer the contents to a small beaker, cover with 10 cc. of glacial AcOH and allow to stand for 15 min. Decant off the soln. from the Cu and wash twice with water. Finally drain off the acid as completely as possible and give a final washing. Add 12 drops of 9 *N* H₂SO₄ and 2-3 cc. of HNO₃ to destroy org. matter. Evap. to fumes, add more HNO₃ and repeat the evapn. Cool the residue and take up in 10 cc. of NH₄OAc soln. Dil. with 30 cc. of 5% KNO₃ soln., add a few drops of AcOH and an excess of K₂Cr₂O₇ soln. Boil 5 min., allow to stand overnight, filter through asbestos and wash with 5% KNO₃ soln. Dissolve in 30 cc. of 6 *N* HNO₃ which has been boiled to remove HNO₂ and cooled. Transfer the soln. to a Nessler tube and match the color with 0.01 *N* K₂Cr₂O₇ in another tube contg. HNO₃. A slight modification of the procedure is advised when large amts. of Sn, phosphate or mechanically interfering substances are present.

W. T. H.

Modification of Risdale's method for determining phosphoric acid. A simple device for washing the ammonium phosphomolybdate precipitate. A. SCOTT DODD. *Analyst* 53, 276-8(1928).—Treat 4 g. of fertilizer as directed in *Official Methods of Analysis*. Make the soln. up to 250 cc. and filter. Take 25 cc. and transfer to a special

flask which is provided with wash-bottle fittings with a cotton-wool pad on the bottom of the tube through which the water leaves the flask and a long piece of glass tubing replacing the usual exit tip. To the soln. add 30% NaOH until a slight ppt. forms and dissolve this in 4 *N* HNO₃, adding 5 cc. in excess. Place the flask in a water bath and, while heating, add 1% KMnO₄ soln. until there is a permanent coloration. Then add 1.75 g. of NH₄NO₃, 1.6 g. of NH₄Cl, 0.25 g. of (NH₄)₂C₂O₄ and enough water to make 60 cc. Next add 25 cc. of nitro-molybdate reagent (290 cc. of 15% NH₄ molybdate soln. poured into 110 cc. of concd. HNO₃) and 25 cc. of water. Rotate for 1 min. and allow the mixt. to settle 10 min. Attach the wash-bottle fittings and siphon off the supernatant soln. Refill with 0.1% KNO₃ soln., allow to settle for 2 min. and again siphon. Repeat the washings until they are neutral to litmus. Dissolve the ppt. in a measured vol. of *N* NaOH and titrate back with 0.5 *N* H₂SO₄ using phenolphthalein as indicator.

W. T. H.

The "Knight test" for feathers. HARLEY F. KNIGHT. *Analyst* 53, 278-9 (1928).—To test the cleanliness of feathers, weigh out 20 g. into a wide-mouthed bottle and shake with 1 l. of distd. water. After an hr. withdraw some of the water and filter through glass wool. To 100 cc. of the filtrate add 1 cc. of 6 *N* H₂SO₄ and 2 drops of 0.1 *N* KMnO₄. Should the color disappear in 1 min. add more KMnO₄, 2 drops at a time, until a persistent color is obtained. The O value thus obtained together with the Cl value gives pretty good evidence as to the cleanliness of the feathers and it is felt that both tests should be used.

W. T. H.

Method for determining small quantities of antimony in copper. HERBERT BLUMENTHAL. *Z. anal. Chem.* 74, 33-9 (1928).—To ppt As from a soln. contg. considerable Cu, it is common practice to add a little Fe⁺⁺⁺ to the fully oxidized soln. and enough Na₂CO₃ to ppt. the Fe⁺⁺⁺ as basic salt. The Fe ppt. carries with it, probably as a result of adsorption, all the AsO₄⁻⁻⁻ and PO₄⁻⁻⁻ present. A similar treatment has been recommended for the removal of Sb but the expts. here described show that only 0.038 g. of Sb is pptd. when 0.0486 g. is present. Similar expts. with other trivalent metal ions such as Bi⁺⁺⁺ and Al⁺⁺⁺ were likewise unsuccessful and so the attempt was made, this time with success, to accomplish the adsorption of the antimonious acid by an acid colloid. The colloid chosen was MnO₂ thrown down by the Guyard-Volhard reaction between Mn⁺⁺ and MnO₄⁻. The following method, therefore, is recommended for the rapid detn. of Sb in samples of commercial Cu. Dissolve 25-100 g. of metal in barely sufficient concd. HNO₃ and boil the soln. till no more oxides of N are evolved. If a turbidity due to sepn. of metastannic acid or antimonious acid appears, pay no attention to it at this time. Dil the soln. to 250-600 cc (according to the wt. of sample) with cold water and add dil. NH₄OH until a slight ppt. is formed. Redissolve this in a little HNO₃ and add 5 cc. of 5% MnSO₄ soln. Next add 3 cc. of *N* KMnO₄ and boil with frequent shaking. When the soln. has cleared and a ppt. of MnO₂ has coagulated add another 3 cc. of KMnO₄ soln. and again boil and shake. After a short time, filter and wash with hot water. The filtrate should be clear but will contain traces of Sb. Add 2 cc. more of the MnSO₄ and follow with 3 cc. of KMnO₄. Unite the ppts. and treat them with dil HCl contg. a little H₂O₂. Boil until no more Cl₂ is evolved and filter. Fuse the insol. residue with a little Na₂O₂ in a small Fe crucible, ext. the melt with water, make acid with HCl and add the soln. to the one previously obtained. Add NH₄OH until the soln. is only slightly acid and sat. with H₂S. Filter off the ppt. which contains all the Sb together with some Sn, As, Bi, Pb and Cu. Ext. it with 20 cc. of hot Na₂S soln. (1-5) and wash with water. From this alk. sulfide soln. reppt. Sb₂S₃ by adding acid. Filter and wash with hot water. Dissolve the ppt. in HCl-Br₂, evap. off the Br₂ and bring the vol. to about 30 cc. Add 40 cc. of concd. HCl and 3 g. of Na₂SO₃. Boil and again reduce the soln. to about 30 cc. Hereby the As is all volatilized as AsCl₃ and the Sb reduced to the trivalent condition. Add 30 cc. of water and titrate with KBrO₃ using indigo or methyl orange as indicator.

W. T. H.

Determination of cobalt and other alloyed elements in cobalt metal, cobalt steel, and high-speed tool alloys. E. SCHIFFER. *Stahl u. Eisen* 47, 1569-71 (1927).—The detn. of Co in the com. metal is most satisfactorily effected by electrolysis in the usual way after removing heavy metals and Fe; the deposited Co is subsequently tested for Ni by the dimethylglyoxime method. Equally good results are obtained by detg. the impurities and taking the Co by difference provided that O, S and included water-sol. salts are tested for. Co steel with a low content of Co is dissolved in HCl with the help of an oxidizing agent, the Fe pptd. with ZnO twice or as basic acetate, and the Co detd. by means of α -nitroso- β -naphthol in the first case or by electrolysis; for rapid control work the cyanometric method gives sufficiently accurate results. For the sepn. of Fe from Co in a high-Co steel the ether process is most satisfactory; the aq.

layer is evapd. with HNO_3 to convert the metals into nitrates and the soln. boiled with HNO_3 and KClO_3 to remove Mn and oxidize Cr to chromate, Co being subsequently sepd. by addn. of KOH and finally detd. by electrolysis. Stellite and similar tool alloys are preferably dissolved by fusion with peroxide in a porcelain crucible; the soln. is used for the detn. of W, Mo, Cr and V and the insol. residue for the detn. of Ni, Co and Mn by electrolysis. B. C. A.

Determination of aluminum as aluminum oxide. L. N. MURAVLEV AND O. V. KRASNOVSKII. State Exptl. Inst. of Silicates. *J. Chem. Ind. (Moscow)* 3, 1146-7 (1926).—Blum's procedure (cf. *C. A.* 10, 1970, 2564) is recommended using filter paper pulp to aid in filtration. BERNARD NELSON

Potentiometric determination of copper as cupric ferrocyanide. S. TAKEGAMI. *Z. anal. Chem.* 74, 39-41 (1928).—An attempt to titrate Cu^{++} with Na or Mg ferrocyanide was not wholly successful. The titration curves do not indicate the correct end point. W. T. H.

Potentiometric determination of gallium. H. DARWIN KIRSHMAN AND J. B. RAMSEY. Univ. Calif. *J. Am. Chem. Soc.* 50, 1632-5 (1928).— GaCl_3 solns. can be titrated electrometrically with standard $\text{K}_4\text{Fe}(\text{CN})_6$ in the presence of ferricyanide. The results are accurate within 0.2-0.3%. Under the conditions recommended the ppt. has the formula $\text{Ga}_4(\text{Fe}(\text{CN})_6)_3$ as was detd. by 2 independent methods. W. T. H.

The determination of gases in iron and steel. PAUL KLINGER. *Stahl u. Eisen* 46, 1245-54, 1284-88, 1353-8; *Chem. Zentr.* 1926, II, 2933.—Earlier work on the subject is reviewed, following which the hot extn. process *in vacuo*, and, with the aid of exptl. results, the evaluation of analytical data are discussed critically. Chem. methods, including those of Gontal and Vita, and the cold vacuum method are also considered. Expts. on the soly. of CO and CO_2 in Fe, which gave negative results, are described. So far, expts. on the detn. of gases in Fe and steel have had no practical value. N in steel can be detd. almost without loss by conversion to NH_3 . C. C. DAVIS

The potentiometric determination of iron by a new method. THEODOR HECZKO. *Z. anal. Chem.* 73, 404-11 (1928).—The Fe^{++} soln. is placed in a beaker and connected with a stirrer and electrode holder such as is used in electrolytic work with a rotating electrode. In each of the two electrode clamps of the electrode stand, place a bright Pt wire of 0.3-0.5 mm. diameter. Dip one of these wires into the soln. to be titrated and wind the free end of the other wire around a piece of pumice, so that it hangs in a vertical position. Connect the 2 wires with one another through a galvanometer, making the wire that dips into the soln. the positive pole. Before beginning the titration lower the pumice into the soln. and after a short time raise it a little above the level of the liquid. Now begin to titrate. Just before the end point is reached, again allow the soln. to wet the pumice for a few min., then raise it and continue titrating. There will be a marked change in the e. m. f. between the electrodes at the end point. By the added KMnO_4 the Fe^{++} ions in the beaker are oxidized, whereas those on the pumice are not. The e. m. f. of the couple thus formed is indicated by the galvanometer. Because of the strong polarization effect the galvanometer needle soon goes back to the position representing the strength of the residual current. This decreases with the lapse of time. The concn. changes, or the strength of the initial current, in the neighborhood of the end point with equal amts. of added KMnO_4 are in agreement with the well-known laws governing potentiometric titrations. In the course of the titration, as the liquid rises in the beaker, the internal resistance changes, as the projecting part of the little rod becomes smaller. The ratio of current/cc. is not seriously affected thereby if proper precautions are taken. Near the end point the KMnO_4 should be added dropwise so that the internal resistance will remain practically the same. The dipping of the pumice into the soln. at the start and again toward the end of the titration is necessary because of the residual current. Otherwise, it would assume such intensity that the galvanometer needle would be driven off the scale. The chief practical value of this method of titrating lies in the fact that the method is applicable to the titration of colored solns. W. T. H.

Determination of ferrous iron in silicate rocks. BYRON A. SOULE. Univ. Mich. *J. Am. Chem. Soc.* 50, 1691-4 (1928).—Pt ware is not essential for the detn. of ferrous Fe in rocks by the HF method. A sample of silicate can be boiled with HF and H_2SO_4 in Pyrex flasks, and, subject to the usual interference, the resulting soln. can be titrated with KMnO_4 . A correction factor for the Pyrex glass is given. W. T. H.

Volumetric determination of ferrous iron by means of potassium iodate. G. B. HESSIG. Univ. of Minn. *J. Am. Chem. Soc.* 50, 1687-91 (1928).— Fe^{++} is oxidized quantitatively by ICl and the liberated I_2 can be titrated with standard KIO_3 soln. after adding enough HCl to make the soln. at least 3 N. It is important not to add the

HCl first because of the ready oxidizability of Fe^{++} in HCl solns. Or, the Fe^{++} can be titrated by adding an excess of standard KIO_3 to the Fe^{++} soln. in dil. H_2SO_4 and then, after adding some concd. HCl, titrating with standard KI soln. The presence of acetic, succinic or tartaric acid, EtOH, filter paper or AcH does no harm. The iodate soln. does not change its titer on standing so that the method is good for those having to make only occasional detns. of Fe^{++} . W. T. H.

The estimation of iron in red lead. L. SPRINGER. *Glastech. Ber.* **4**, 458(1927); *J. Soc. Glass Tech.* **11**, 287A.—The values for Fe obtained by testing 10 g. of red lead colorimetrically in HNO_3 -perhydrol soln., as suggested by Heinrichs, were lower than when 2 g. was dissolved in HCl. By the use of only 2 g. in the first process, intermediate values were obtained. The loss was partly due to an Fe-contg. residue insol. in HNO_3 , partly owing to a mech. action of the acid. If HNO_3 were employed, 10 g. of the sample should be tested, after dissolving in HNO_3 -perhydrol, and the residue dissolved in HCl and also detd. for Fe. Most factories specified a red lead with not more than 0.005% Fe_2O_3 , since higher proportions gave a green color to the glass. H. G.

Gravimetric determination of molybdenum. IRWIN WENDEHORST. *Z. anal. Chem.* **73**, 452-7(1928).—The method of Hillebrand which depends on pptg. $\text{H}_2\text{g}_2\text{MoO}_4$ and igniting to MoO_3 requires considerable manipulative skill and is subject to a positive error due to adsorption and a negative error due to the soly. of the ppt. Pptn. of alk. earth molybdate, as recommended by Smith and Bradbury, is unsatisfactory because the ppts. are too sol. Rose's method of weighing MoO_2 is only useful for the analysis of pure Mo solns. with volatile components. Similarly, heating in H_2 in a Pt tube till metallic Mo is produced can hardly be regarded as useful in ordinary analytical practice. The method of v. d. Pfordten, however, gives accurate results and pure Mo when MoSe_2 is heated in H_2 . Treatment of the ammoniacal soln with yellow $(\text{NH}_4)_2\text{S}_2$ soln., allowing to stand 12 hrs., and then pptg. MoS_3 by adding acid and igniting to MoS_2 in H_2 , gives very accurate results. The best method of all, however, for ordinary work is that of weighing as MoO_3 after pptn. as MoS_3 as just outlined or by satg. the acid soln. with H_2S under pressure. The ppt. is likely to adsorb some alkali salts. W. T. H.

Test for platinum. F. DURDIK. *Chem. Listy* **21**, 10 2(1927).—To carry out the touchstone test for Pt heat the stone at $110-120^\circ$ in an air bath, placed in a wooden support and coated with almond oil. Then make streaks on the hot stone with the sample to be tested and with a standard and test the behavior of these streaks towards aqua regia. B. C. A.

Separation of the platinum metals. ANON. *Chem. Eng. Mining Rev.* **20**, 142-3, 170-1(1928).—A correction. This paper was copied without credit from one previously published by S. C. OGBURN, JR., in *J. Am. Chem. Soc.* **48**, 2507 (cf. *C. A.* **20**, 3663). In the abstract last published KNO_3 is recommended instead of KNO_2 for pptg. Rh and in the final treatment of Os and Ir, it is the Os and not the Ir that dissolves in NaClO soln. W. T. H.

A specific reagent for the rapid gravimetric determination of sodium. H. H. BARBER and I. M. KOLTHOFF. Univ. of Minn. *J. Am. Chem. Soc.* **50**, 1625-31.—Uranyl zinc acetate solns., prepd. by mixing AcOH solns. of $\text{UO}_2(\text{OAc})_2 \cdot 2\text{H}_2\text{O}$ and $\text{Zn}(\text{OAc})_2 \cdot 3\text{H}_2\text{O}$ when added to aq. soln. contg. not more than 8 mg. of Na per cc. gives a ppt. of the compn. $(\text{UO}_2)_2\text{ZnNa}(\text{OAc})_6 \cdot 6\text{H}_2\text{O}$, which can be weighed as such after washing with 95% alc. and ether and drying in the air. Both wash liquids should be satd. with the reagent. Alk. and alk. earth ions do not interfere seriously. Phosphate (arsenate) and large amts. of oxalate or tartrate anions must be absent. The method described appears to be the most satisfactory yet given for the direct detn. of Na in small quantities. W. T. H.

The volumetric determination of small quantities of thallium. J. PROSZT. *Z. anal. Chem.* **73**, 401-4(1928).—The volumetric detn. of Tl depends either upon the oxidation of Tl^+ to Tl^{+++} or upon the reduction of Tl^{+++} to Tl^+ . For the oxidation, a strong oxidizing agent is required and to make sure that the oxidation is complete it is best to add an excess of oxidizer. A test of the direct oxidation method with KMnO_4 showed that it is difficult to obtain good results on account of a coloration appearing before the oxidation is complete. This false end point is partly dependent on the acidity of the soln. but it is difficult to regulate the acidity so that only the true end point will be obtained. Better end points can be obtained by oxidizing first with Br aq. , removing the excess Br_2 with phenol, adding KI and titrating the liberated I_2 with thiosulfate. By this method the results are far from satisfactory, however. W. T. H.

Estimating tin by titration with iodine. W. FRAYNE. *Eng. Mining J.* **125**, 1019-20(1928).—To prevent oxidation after the hot soln. has been reduced, place in the

neck of the container a stopper carrying tubing that dips into alkali carbonate soln. Then, on cooling, alkali carbonate soln., will be sucked into the flask and provide an atm. of CO_2 . The device recommended has been in use for at least 35 years. W. T. H.

The potentiometric analysis of binary, ternary and quaternary tin alloys. H. BRINTZINGER AND F. RODIS. *Z. Elektrochem.* **34**, 246-50(1928); cf. *C. A.* **22**, 367.—The use of CrCl_2 as a reducing agent in the potentiometric analysis of Sn-Sb alloys is extended to include the analysis of other Sn alloys. For Cu-Sn systems the potential drop after the reduction of Cu^{++} to Cu^+ is marked; the drop after the reduction of Sn^{++++} to Sn^{++} is less apparent but is noticeable if a 3-min. period is allowed between the addn. of the CrCl_2 and the reading of the potential. In Bi-Sn systems, Bi^{+++} is first reduced to Bi and then the reduction of Sn^{++++} follows. The end points are both distinct. In Fe-Sn systems, Fe^{+++} is first reduced to Fe^{++} and then Sn^{++++} to Sn^{++} . The end point of the former is distinct, while that of the latter is made apparent by a period of wait. The addn. of Bi ions to the soln. makes the Sn end points more distinct in each of the above cases as well as in titrations of Sn alone. By similar methods the ternary systems, Cu-Sn-Bi, Fe-Sn-Bi and Sb-Cu-Sn may be analyzed accurately. Since CrCl_2 has no action on Pb and Cd ions, quaternary alloys contg. these metals can be detd. only by difference. In all cases the analyses were made in the presence of CaCl_2 and HCl at $90-100^\circ$ and with a Pt electrode. A comparison of the potentiometric with the gravimetric method shows the former to be more accurate and much faster.

H. F. JOHNSTONE

Investigations into the analytical chemistry of tantalum, columbium and their mineral associates. X. The separation of SiO_2 from the earth acids. W. R. SCHOELLER AND A. R. POWELL. *Analyst* **53**, 258-64(1928); cf. *C. A.* **22**, 201.—Treatment of a mixt. of SiO_2 , Cl_2O_6 and Ta_2O_6 with HF and H_2SO_4 is satisfactory only when the mixt. is chiefly SiO_2 . It is probable that some TaF_6 and CbF_6 are lost by volatilization unless an excess of H_2SO_4 is used and it is not good procedure to det. a minor constituent by difference. Accurate results can be obtained in the SiO_2 detn. if the oxides of Si, Cb and Ta are fused with $\text{K}_2\text{S}_2\text{O}_7$, the melt extd. with oxalic or tartaric acid soln., the insol residue weighed and treated with HF and H_2SO_4 . The residue from the SiO_2 detn. should then be fused with $\text{K}_2\text{S}_2\text{O}_7$ again to dissolve the last traces of Cb and Ta. **XI. The precipitation of titanium by tannin.** *Ibid* 264-7.—Tannin produces a red ppt. in oxalic or tartaric acid solns. of Ti and the pptn. is complete if the soln. is neutralized. Ti, therefore, interferes with the tannin sepn. of Cb and Ta if the Ti content is more than 1% of the Ta_2O_6 ; the Ta ppt. is discolored.

W. T. H.

Electrotitration of lanthanum, cerium and thorium as ferrocyanides. I. A. ATANASIU. *Inst. Ind. Chem. Bucarest. Bul. chim. soc. română stiinte* **30**, 51-9(1928).—The potentiometric curve indicates the formation of $\text{KLaFe}(\text{CN})_6$ in alc. soln. for equimolar quantities of $\text{K}_4\text{Fe}(\text{CN})_6$ and $\text{La}(\text{NO}_3)_3$. In the case of Th, $\text{ThFe}(\text{CN})_6$ is formed but the compds. vary with an excess of alkali salt; the presence of alc. causes perturbations in the curve. The electrotitration of a mixt. of La, Th and Ce salts is practically impossible.

A. L. HENNE

Titrimetric determination of potassium. O. PFUNDT. *Z. anal. Chem.* **73**, 439-49(1928).—Jander and Pfundt (cf. *C. A.* **21**, 3852) have published a method for the visual conductometric titration of K salt with NaClO_4 soln. One difficulty encountered in connection with the method was the necessity of vigorous shaking and if the vessel contg. the soln. was held in the hand it was likely to become heated somewhat, whereby the cond. of the soln. would change. This difficulty can be overcome by a mechanical shaking device which is described here.

W. T. H.

Zirconium sulfate as a reagent for the detection of potassium. RUFUS D. REED AND JAMES R. WITHEROW. *Ohio State Univ. J. Am. Chem. Soc.* **50**, 1515-22(1928).—A satd. soln. of $\text{Zr}(\text{SO}_4)_2$ will detect 0.5 mg. of K^+ in the absence of Na^+ and 1.76 mg. of K when Na is present. If the test is allowed to stand for a long time the reaction is nearly as sensitive for K^+ as the $\text{Na}_2\text{Co}(\text{NO}_2)_2$ as ordinarily applied.

W. T. H.

The electrometric determination of peroxide of hydrogen and the associated peracids. A. RIJUS. *Trans. Am. Electrochem. Soc.* **54**, preprint, 14 pp.(1928).—With Na_2SO_3 soln. as standard, a new electrometric titration method is described for the detn. of total H_2SO_5 and H_2O_4 in solns. contg. $\text{H}_2\text{S}_2\text{O}_8$, H_2SO_5 and H_2O_4 . H_2O_4 is detd. in the presence of H_2SO_5 by R.'s modification of Birkenbach's KMnO_4 method. An analogous method can be employed for monoperphosphoric acid. In mixts. of $\text{H}_2\text{S}_2\text{O}_8$, H_2SO_5 and H_2O_4 , $\text{H}_2\text{S}_2\text{O}_8$ is detd. by difference. The detection of small amounts of H_2O_4 with the aid of a calomel- H_2SO_5 cell is very sensitive.

C. G. F.

A procedure for the qualitative analysis of the magnesium, potassium, sodium group. HAROLD S. KING. Dalhousie Univ., Halifax, N. S. *Proc. Trans. Nova Scotian Inst.*

Sci. 16, 30-4(1928).—The following simple procedure gives satisfactory results with untrained students. After removal of the alk. earth metals, evap., add NH_4OH and H_3PO_4 . Filter. Extract the ppt. with H_2SO_4 , and ppt. Mg as MgNH_4PO_4 . To $1/4$ of the soln., add $\text{Na}_2\text{CO}(\text{NO}_3)_6$, detecting K; to the remaining, add $\text{K}_2\text{H}_2\text{Sb}_2\text{O}_7$, to detect Na. W. T. H.

A modification of the procedure for the qualitative separation of the metals of the alkaline-earth group. C. B. NICKERSON. *Proc. Trans. Nova Scotian Inst. Sci.* 16, 25-9(1928).—The procedure involves no new feature but is satisfactory for students in elementary qual. analysis. The ppt. of CaCO_3 , SrCO_3 and BaCO_3 is dissolved in HOAc and the Ba^{++} pptd. as BaCrO_4 . In the filtrate, the Sr is pptd. as SrSO_4 with NH_4OH and $(\text{NH}_4)_2\text{SO}_4$ and the Ca is pptd. as CaC_2O_4 in the usual way. A. L. HENNE

Ceric salts as oxidizing agents in electrometry. I. A. ATANASIU. *Inst. Ind. Chem. Bucarest. Bul. chim. soc. română stinte* 30, 73-6(1928).—In the titration of nitrites with a ceric salt, the potential curve exhibits a very sharp break, which is independent of the temp. and H_2SO_4 concn. Better results are thus obtained with a ceric salt than with permanganate. A. L. HENNE

The albumin reactions of different metaphosphates. D. BALAREFF. *Z. anal. Chem.* 73, 411-2(1928).—Solns. of 4 different metaphosphates were prepd.—the tri- and tetrametaphosphates of Tammann, the metaphosphate prepd. by heating microcosmic salt to dull redness and that obtained by dissolving P_2O_5 in water. To 2 cc. of albumin soln. 1 cc. of the aq. metaphosphate soln. was added and 2 cc. of 0.2 N AcOH . The diln. at which the coagulation of albumin could be accomplished was detd. with each metaphosphate. The test with the trimetaphosphate was obtained in 0.005 N soln., with the tetraphosphate in 0.0004 N soln., with the metaphosphate from microcosmic salt in 0.00008 N soln., and with the phosphate from P_2O_5 in 0.000037 N soln. It appears that each metaphosphate is characterized by a limit beyond which it does not have the power of coagulating albumin. W. T. H.

Acidimetric determination of pyrophosphoric acid. E. V. BRITSKE AND S. S. DRAGUNOV. *J. Chem. Ind. (Moscow)* 4, 49-51(1927).—A rapid method of detg. $\text{H}_4\text{P}_2\text{O}_7$, which is also applicable to mixts. in which HPO_3 and H_3PO_4 are present, is based on the reaction $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7 + 2 \text{ZnSO}_4 = \text{Zn}_2\text{P}_2\text{O}_7 + \text{Na}_2\text{SO}_4 + \text{H}_2\text{SO}_4$. To a definite vol. of pyrophosphate soln. or of a mixt. of ortho-, meta- and pyrophosphates, add 5-10 drops of bromophenol blue and 0.1 N NaOH till a blue coloration is obtained. (If the soln. was originally alk. it is best to acidify it first and then add NaOH till the color changes from yellow to blue.) Then add 2.5-3 times the amt. of ZnSO_4 necessary for reaction with $\text{H}_4\text{P}_2\text{O}_7$ and titrate the liberated H_2SO_4 with 0.1 N NaOH . If HPO_3 is absent, titrate rapidly; otherwise titrate slowly and allow the soln. to stand for 5 min. toward the last before adding the final drops of NaOH . In the presence of much HPO_3 the exactness of the analysis is somewhat impaired; otherwise very exact results are obtained. BERNARD NELSON

Sulfur dioxide and its aqueous solutions. I. Analytical methods, vapor density and vapor pressure of sulfur dioxide. Vapor pressure and concentrations of the solutions. CAROL E. MAASS AND O. MAASS. *McGill Univ. J. Am. Chem. Soc.* 50, 1352-68(1928).—A method for analyzing H_2SO_3 in which the use of sugar is necessary, is described, giving very accurate results. The vapor ds. from -6° to 32° , vapor pressures from 1° to 27° and those of aq. solns. from -5° to 35° of SO_2 are detd. by new methods. The vapor pressures of the two-liquid-phase system SO_2 - H_2O are measured from 10° to 27° . A method is devised for more exactly detg. the concns. of H_2O in the SO_2 phase. J. BALOZIAN

Comparison of methods for the analysis of potassium ferrocyanide. PETER P. BUDNIKOV. *Z. anal. Chem.* 73, 433-8(1928).—The analysis of a sample of yellow prussiate of K gave conflicting results with different methods so that it was thought desirable to study the various methods experimentally. The gravimetric methods proved tedious and not very accurate. Volumetric methods depending upon the pptn. of ferrocyanide of Zn or Ag proved unsatisfactory and it was impossible to obtain good results by the iodometric method. On the other hand, good results were obtained by KMnO_4 titration if the soln. was not stronger than 0.05 N. To 15 cc. of the dil. ferrocyanide soln., 10 cc. of 20% H_2SO_4 was added before titrating. The reverse titration of permanganate with ferrocyanide also gave good results. W. T. H.

Applications of ceric sulfate in volumetric analysis. IV. The potentiometric titration of vanadyl ion alone or in the presence of ferric and chromic ions. Note on the stability of vanadyl solutions. N. HOWELL FURMAN. *Princeton Univ. J. Am. Chem. Soc.* 50, 1675-80(1928).—Dil. vanadyl chloride or sulfate solns. are found to be stable for at least a year. The potentiometric titration of VO^{++} solns. with standard

$\text{Ce}(\text{SO}_4)_2$ soln. gives accurate results even in the presence of Fe^{+++} and Cr^{+++} . The reaction is slow at room temp.; so it is best to work at $50-60^\circ$. The titration of a soln. contg. VO^{++} and Fe^{++} with $\text{Ce}(\text{SO}_4)_2$ gives accurate results for both Fe and Cr; so the method is suitable for detg. V directly and Cr indirectly in Fe alloys. W. T. H.

Electrometric titration of the nitrite ion with potassium permanganate. I. A. ATANASIU. *Inst. Ind. Chem. Bucurest. Bul. chim. soc. română științe* 30, 69-71(1928).—This titration is essentially the same as the conventional Lunge method, except that the end point is indicated by a sharp break in the potentiometric curve which corresponds exactly to the color change. The best results are obtained at 45° . A. L. H.

Electrometric titration of the uranyl ion with potassium ferrocyanide. I. A. ATANASIU. *Inst. Ind. Chem. Bucurest. Bul. chim. soc. română științe* 30, 77-81(1928).—The results obtained in the electrometric titration of UO_2^{++} with $[\text{Fe}(\text{CN})_6]^{4-}$ are affected by the other anion present. The break in the e. m. f. curve is not sharp, except in the presence of alc., when $(\text{UO}_2)_2\text{Fe}(\text{CN})_6$ is formed. A. L. HENNE

Reaction between iodic and hydriodic acids in very dilute solution and the titration of the liberated iodine with thiosulfate. P. PUTZEYS. *Ann. soc. sci. Bruxelles* [i] 47B, 159-72(1927); cf. Vosburgh, C. A. 16, 2120-30; Rice, Kilpatrick, and Lemkin, C. A. 17, 2249; Bray and Miller, C. A. 19, 21; Popoff and Whitman, C. A. 19, 2921.—An investigation of reactions involved in iodometry, primarily concerned with their application to microanalysis. The reaction occurring in solns. about 0.001 N with respect to iodate and contg. excess of iodide and acid has been investigated, special attention being devoted to the elimination of the O error, and it is shown that the theoretical quantity of I is liberated and a satisfactory end point obtained on subsequent titration only when the product of the concns. of iodide and acid lies between certain limits. In the present instance these limits are 0.01 and 0.075 and apply to measurements made in artificial light. The limits are narrower for daylight. As the concn. of iodate is increased the quantity of I detd. by titration becomes more independent of these factors. Reacting mixts. should be kept for 5 min. before titration. Although reaction between $\text{Na}_2\text{S}_2\text{O}_3$ and I is practically instantaneous it is nevertheless, advisable to add the thiosulfate rather slowly toward the end of the titration, especially when extremely dil. solns. are involved. Because of the relative slowness of the reaction, titration with very dil. solns. of arsenite should be avoided. Alk. absorption of I commences at pH 6. Dil. solns. of thiosulfate should be prepd. by diln. of 0.1 N soln. with water approximating to conductivity water, and although when protected against acid vapors such solns. are not markedly unstable, they should be standardized immediately prior to use by means of a soln. of KIO_3 of corresponding concn., the quantities of KI and acid added to this latter being in accordance with the conditions stipulated above. 0.1 N solns. of thiosulfate should be standardized by the dichromate-iodide method (Vosburgh; Bray and Miller, *loc. cit.*) B. C. A.

Zinc chloride nitroprusside reaction of cysteine. YUZURU OKUDA AND YURAKU NISHIJIMA. *Bul. Sci. Fakultat Terakultura, Kjusu Imp. Univ.* 2, 209-12(1928).—This reaction is similar to the well-known nitroprusside reaction of cysteine, except that ZnCl_2 is added, which renders the color more stable and the test more sensitive. To a small amt. of cysteine soln. in a test tube, add a few drops ZnCl_2 soln. faintly acidified with HCl, and a freshly prepd. aq. soln. of sodium nitroprusside. Neutralize with NH_4OH or NaOH until $\text{Zn}(\text{OH})_2$ ppts. A ruby-red color results, which remains for a few hrs.; in the absence of Zn salt, it would turn yellowish. As the reaction is based on the absorption of the coloring matter and the cysteine by the white ppt. of hydroxide, $\text{Mg}(\text{OH})_2$ or $\text{Al}(\text{OH})_3$ are suitable also, but the results are much more satisfactory with $\text{Zn}(\text{OH})_2$. A. L. HENNE

Color reactions of certain alcohols. LAD. EKKERT. *Pharm. Zentralh.* 69, 289-96 (1928); cf. C. A. 22, 1933.—A study of the color changes observed in the interaction of the aldehydes vanillin, furalfural salicylaldehyde, sucrose, piperonal and anisaldehyde with normal and isopropyl alc.; normal, secondary and tertiary butyl alc.; normal and tertiary amyl alc., normal heptyl; and normal and secondary octyl alc. in the presence of H_2SO_4 . W. O. E.

Microchemical detection of lactic acid. J. GRÜSS. *Wochschr. Brau.* 45, 16-18 (1928).—The method consists in distg. 3 cc. of liquid with 1 cc. of concd. H_2SO_4 , collecting 2 cc. of the distillate, dividing it into 2 parts, and testing separately for acetaldehyde with $\text{NaNOFe}(\text{CN})_6$ and for formic acid by means of $\text{Ce}(\text{NO}_3)_3$. A. S.

Determination of methylglyoxal by alkaline iodine solution and the chemical mechanism of this reaction. F. FISCHLER AND R. BOETTNER. *Z. anal. Chem.* 74, 28-32 (1928).—F. (C. A. 20, 3722) published a method for the detn. of AcCHO in aq. soln. which was based on the assumption that the following equation was correct: $\text{CH}_3\text{CHO} + \text{I}_2 + \text{OH}^- \rightarrow \text{CH}_3\text{COO}^- + \text{I}^- + \text{H}^+$

$\text{COCHO} + 3\text{I}_2 + 5\text{OH}^- = \text{CHI}_3 + 2\text{HCO}_2^- + 3\text{I}^- + 3\text{H}_2\text{O}$. It is here shown, however, that $\frac{1}{3}$ more I_2 is required and that the true equation is: $\text{CH}_3\text{COCHO} + 4\text{IO}^- = \text{CHI}_3 + \text{C}_2\text{O}_4^{--} + \text{I}^- + \text{OH}^- + \text{H}_2\text{O}$. It was proved that 1 $\text{C}_2\text{O}_4^{--}$ is formed from each mol. of AcCHO , that 8 atoms of I are required for the oxidation and that the increase in alkyl also corresponds to the equation. W. T. H.

Determination of cresols. II. K. K. JÄRVINEN. *Z. anal. Chem.* **73**, 446-51 (1928).—J. has described (cf. C. A. **21**, 2451) a bromination method for the analysis of phenols and cresols. In this paper various notes are given regarding difficulties that are likely to arise. For drying the cresol, 30 min. at 100° has proved to be inadequate. Sometimes 2 hrs. is necessary. To obtain perfectly dry cresol it is best to heat to boiling for a short time until some of the cresol has distilled. The bromination method is not directly applicable to the analysis of very impure cresols. To purify these samples it is sometimes desirable to take about 5 g. and dissolve it in 25 cc. of 2 *N* NaOH and 300 cc. of water. Then, to ppt. soaps, add 10 cc. of *N* BaCl_2 soln., make up to 500 cc., mix and filter. A small aliquot can then be taken for the analysis. To recover large quantities of cresol a similar treatment can be carried out by using 50 g. of material, dissolving in 25 cc. of 15 *N* NaOH and pptg. hot with 20 cc. of 3 *N* BaCl_2 soln. Then, after filtering, the filtrate can be made acid with HCl and the cresols salted out with 40 g. of NaCl. After sepg. them, distil, collect the fraction that comes over above 180° and remove all moisture from the distillate by boiling it gently. To analyze this product bromometrically, take 10 cc. in a 500-cc. reagent bottle with 100 cc. of water and add 50 cc. of 0.2 *N* KBr-KBrO₃ soln. and 25 cc. of 5 *N* HCl. After half an hr. add 10 cc. of 20% KI soln. and titrate with thiosulfate. Titrate similarly a portion of the product obtained by the first purification method given above and a third portion of KBr-KBrO₃ soln. alone. A direct detn. of the vol. of cresol present can be made with the aid of graduated tubes such as those used in the detn. of butter fat by the Babcock method. Thus a suitable method is the following: Treat 10.2 g. of cresol with 8 cc. of 15 *N* NaOH and water to make 100 cc. Of this mixt. pipet off 10 cc. into a butyrometer tube and shake with 11 cc. of 6 *N* HCl which is satd. with cresol. Add 2 g. of NaCl, insert a rubber stopper in the tube, shake till the salt has all dissolved and allow to stand 15 min. at 50° before centrifuging. Various other helpful details are given which will be of interest to any one having similar analyses to make. W. T. H.

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

The occurrence of pure arsenic in Chodskirudnik, Vladikavkaz district. P. CHIRVINSKII. *Rozprawy Čes. Ak.* **31**, Kl. II, No. 14, 1-4; *Chem. Zentr.* **1927**, I, 2640.—The As, which is assocd. with calcite, sphalerite and galenite in reniform masses, is probably of colloidal origin. Its d. is 5.78. The calcite contains 2.73% FeO and 0.06 MgO. C. C. DAVIS

Occurrence of native mercury at Lautersheim, Pfalz. HANS HIMMEL. *Centr. Mineral. Geol.* **1927A**, 409-10.—Droplets occur in a yellow, sandy, upper Oligocene conglomerate. J. E. GILL

The crystal structure of foliated dyscrasite from Andreasberg and the artificial alloy Ag₃Sb. FELIX MACHATSKII. *Mineral. Inst. Univ. of Oslo. Z. Krist.* **67**, 169-76 (1928).—Both natural dyscrasite and artificial Ag₃Sb give x-ray patterns which indicate a hexagonal close-packed structure, with $a = 2.985$ and $c = 4.816$ A. U. This cell would contain 2 atoms of at. wt. = $\frac{1}{4}$ (3 Ag + 1 Sb), which indicates that it is not a true chem. compd., but rather a solid soln. with both atoms structurally equiv. This would correspond to the ϵ -phase in the systems Ag-Zn, Au-Zn, Cu-Zn and Ag-Sn. With increasing Ag content, the structure becomes cubic. L. S. RAMSDELL

Argentite and acanthite. H. SCHNEIDERHÖHN. *Am. Mineral.* 12, 210-11 (1927).—It is proposed that the name acanthite be dropped because optical and x-ray methods show argentite to be orthorhombic; to use β -argentite for the orthorhombic modification of Ag_2S existing at ordinary temp., and to use α -argentite for the isometric modification existing above 179° . β -Argentite as a paramorph after α -argentite would then be called "lamellar argentite," following the chalcocite analogy. C. B. SLAWSON

Variation of the refractive indices of sphalerites and their iron contents. SHIGERU NISHIO. Univ. of Tokyo. *J. Faculty Eng. Tokyo Imp. Univ.* 17, 183-9 (1928).—Pure sphalerite must be ZnS ; native sphalerite generally contains FeS as solid soln. in it, and its phys. properties change in accordance with the Fe content. The optical dispersion of some Japanese sphalerites, especially of fissure-filling deposits, have been measured. If the n_s of these minerals are plotted against their Fe content, a smooth curve is obtained, the n increasing with the Fe contents although the relation is purely empirical. A. L. HENNE

The occurrence of cinnabar in Dutch Guiana. CHARLES PALACHE. *Am. Mineral.* 12, 188-9 (1927).—Cinnabar has been found in placers at the headwaters of the Tempati River but the original deposit has not been located. C. B. SLAWSON

Löllingite from Franklin, N. J. L. H. BAUER AND H. BERMAN. *Am. Mineral.* 12, 39-43 (1927).—Excellent crystals give new interfacial values and axial ratio of 0.5438:1:1.130. The analysis given shows insufficient As to give the theoretical 2:1 ratio with Fe. C. B. SLAWSON

Crystal structure of pyrrargyrite. B. GOSZNER AND F. MUSZNUG. Univ. München. *Centr. Mineral. Geol.* 1928A, 65-73.—X-ray studies show that the unit cell is a rhombohedron with angle $\alpha = 104^\circ 1'$ and edge $r = 7.07 \text{ \AA}$. U. It contains 2 mols Ag_2SbS_3 . J. E. GILL

Andorite from Felsobanya. S. KOCH. *Centr. Mineral. Geol.* 1928A, 28-34.—Crystallographic data and a chem. analysis are given. J. E. GILL

A reexamination of the lead sulfo salt, keeleyite, from Bolivia. E. V. SHANNON AND M. N. SHORT. *Am. Mineral.* 12, 405-13 (1927).—From mineragraphic study and chem. analysis, in comparison with *zinkenite*, it is concluded that keeleyite deserves species rank. C. B. SLAWSON

The status of keeleyite. EDGAR T. WHERRY. *Am. Mineral.* 13, 29-30 (1928).—The formula derived from the analysis by Shannon and Short (preceding abstr.) is $\text{PbS} \cdot \text{Sb}_2\text{S}_3$, identical with that universally adopted for *zinkenite*. Minor replacements of Pb by other metals are shown in 8 recorded analyses of *zinkenite*, so this is not a distinctive feature of keeleyite. S. and S. gave no data as to the compn. of the sulfosalt with which they compared keeleyite mineragraphically. "Instead of establishing its specific rank, it seems that they have thus demonstrated that keeleyite is, as previously suggested, only an impure variety of *zinkenite*." E. T. W.

The crystal structure of chromite from Tiszafa, Hungary. L. TOKODY. Budapest. *Z. Krist.* 67, 338-9 (1928).—An x-ray powder photograph gave 8.05 \AA . U. as the edge of the unit cube of a chromite, which analyzed as follows: $\text{FeO } 25.94$, $\text{Cr}_2\text{O}_3 \ 54.22$, $\text{MgO } 9.77$, $\text{Al}_2\text{O}_3 \ 2.29$, $\text{MnO } 0.94$, $\text{TiO}_2 \ 0.68$, $\text{SiO}_2 \ 6.16$, $\text{H}_2\text{O} + \ 0.09\%$. The intensity of the lines agreed well with the magnetite pattern. L. S. RAMSDALL

Biaxial calcite. JOSEPH L. GILLSON. *Am. Mineral.* 12, 357-60 (1927).—Biaxial calcite was produced in the lab. by artificially twinning calcite on (0110). These twins show incomplete extinction with anomalous interference colors and strong $\rho > v$ dispersion similar to that found in biaxial metamorphic calcite. C. B. SLAWSON

A reaction for the distinction of magnesite and dolomite. F. FEIGL AND H. LEITMEIER. *Centr. Mineral. Geol.* 1928A, 74-87.—Place 1-2 g. diphenylcarbazine in a test tube half filled with alc., warm till all is dissolved, and add 3 cc. 25% NaOH or KOH soln.; the mixt. turns red. Add 5 cc. of this soln. to a small grain or the powder of the mineral to be tested, boil for 2-3 min., decant the liquid and add and boil water over the solid phase until the liquid remains colorless. Magnesite so treated is colored reddish violet, while dolomite remains uncolored. Results of tests on many other Mg-bearing minerals are presented in a table and discussed in the text. *Analyses of magnesite from Snarum; breunnerite from Tyrol, Greiner, Pfitsch, Ingelsberg; mesitile from Traversella; and dolomite from Prägratten, Bordö and Greiner are included.* J. E. GILL

Euhedral orthoclase crystals from Sierra Blanca, Texas. J. T. LONSDALE AND W. S. ADKINS. *Am. Mineral.* 12, 256-9 (1927).—Six types of crystals were found in 556 specimens. Analysis shows: $\text{SiO}_2 \ 61.30$, $\text{Al}_2\text{O}_3 \ 17.15$, $\text{Fe}_2\text{O}_3 \ 3.47$, $\text{CaO } 2.05$, $\text{K}_2\text{O } 11.58$, $\text{Na}_2\text{O } 4.20\%$; $\alpha = 1.5180$, $\beta = 1.5234$, $\gamma = 1.5260$; $X_{\text{aa}} \ 6^\circ 37'$, $Z = b$. C. B. SLAWSON

The acmitic pyroxenes. H. S. WASHINGTON AND H. E. MERWIN. *Am. Mineral.*

12, 233-52(1927).—Acmites are shown to have a high ZrO_2 and rare earth content while in aegirites these oxides are very low. The difference in color and pleochroism does not seem to be dependent on rare earth content. Complete analyses of 13 high-Na pyroxenes accompanied by full optical data are given, also optical data on artificial acmite. A nomenclature for members of this and similar isomorphous series is given.

C. B. SLAWSON

Aegirite from Libby, Montana. R. W. GORANSON. *Am. Mineral.* 12, 37-9 (1927).—The aegirite is found in a dike of coarse syenite pegmatite as a hydrothermal replacement along fractures in the microcline. Optical data and a complete analysis, which shows a high TiO_2 content, are given.

C. B. SLAWSON

The relation of French and American grunerites to similar ferromanganese amphiboles of Sweden. STEPHEN RICHARZ. *Am. Mineral.* 12, 351-3(1927); cf. C. A. 21, 3329.—By plotting Fe + Mn against Mg, R. attempts to show that French and American grunerites do not form a continuous series with the high-Mn amphiboles of Sweden, although optical and sp. gr. data seem to indicate such a series.

C. B. SLAWSON

Olivine from Monehegan Island, Maine. E. P. WHEELER, II. *Am. Mineral.* 12, 259-61(1927).—Partial analyses of olivine from an olivine-gabbro show a FeO-MgO ratio of 22.39. $\alpha = 1.6807$, $\beta = 1.7057$, $\gamma = 1.7185$.

C. B. SLAWSON

An x-ray study of the garnet group. C. H. STROCKWELL. *Am. Mineral.* 12, 327-44(1927).—From the length of the unit cube and the intensities of the diffraction lines the approx. chem. compn. can be detd. By including either sp. gr. or n detns. a very close approximation can be made. Tables for these detns. are given. S also found that sp. gr. calcd. from diffraction data gave uniformly high values.

C. B. SLAWSON

Uranothorite from the MacDonald mine, Hybla, Ontario. α - and β -Hyblite—new sulfatic alteration products of Hybla thorite. H. V. ELLSWORTH. *Am. Mineral.* 12, 368-72(1927).—This is the first known occurrence of thorite in Ontario. Some of the crystals are $1/2$ inch in cross section and all contain occasional pyrite inclusions. Analysis of selected material shows: PbO 1.32, UO_2 7.67, UO_3 9.46, ThO_2 46.33, (Ce, La, Di) $_2O_3$ 0.08, (Yt, Er) $_2O_3$ 0.36%; hardness = 4.5-5, sp. gr. = 4.414; $n = 1.710$. Because of intensive alteration the age values from the Pb:U ratio are very low. II. Two new alteration products, α - and β -hyblite, could be obtained pure only in microscopic ams. Microchem. tests show Th and U to be the most important constituents. α -Hyblite appears as a white porcelainic isotropic mineral with no cleavage; its $n = 1.545$. It contains minute bubbles, probably entrapped He. β -Hyblite is yellow-brown with conchoidal fracture and is isotropic, with $n = 1.610$, also with bubble inclusions.

C. B. SLAWSON

Piedmontite from the Sulphur Spring Valley, Arizona. CARL LAUSEN. *Am. Mineral.* 12, 283-7(1927).—Cherry-red piedmontite is found in fan-shaped rosetts of crystals. The outer ends of the crystals are epidote, showing that after the supply of Mn ceased, the crystals continued to grow. It occurs in narrow veinlets filling fractures in the andesite country rock.

C. B. SLAWSON

Additional data on the properties of pumpellyite, and its occurrence in the Republic of Hayti, West Indies. W. S. BURBANK. *Am. Mineral.* 12, 421-4(1927).—This mineral, which is found in an amygdaloidal basalt similar to the original occurrence at Calumet, Mich., is identified optically, although it shows slight variations. It is optically +, with $2V = 75-80^\circ$, $\rho > v$ strong, $\alpha = 1.700$, $\beta = 1.707$, $\gamma = 1.718$; α and γ colorless, β bluish green; the elongation is Y, and γ makes an angle of 31° with the (001) cleavage. Pumpellyite is probably monoclinic elongated along the b axis.

C. B. SLAWSON

The nature of louisite. T. L. WALKER. Royal Ontario Museum of Mineralogy, Toronto, Ont. *Proc. Trans. Nova Scotian Inst. Sci.* 16, 35-7(1928).—A thin section of "louisite," examd. between crossed nicols, shows that this mineral is an aggregate of radiating spherules of quartz in cleavable apophyllite. These 2 constituents can be separated by sp. gr. The chem. analysis verifies the results obtained by the optical examn.

A. L. HENNE

Further studies in the mica group. A. N. WINCHELL. *Am. Mineral.* 12, 267-79 (1927).—From an examn. of the analytical and optical data, W. suggests a K_2O-SiO_2 ratio of 1:7 for the phengite micas, and of 1:5 for the lepidolite micas.

C. B. S.

Study of the micas (not containing fluorine) by means of x-rays. CH. MAUGUIN. *Compt. rend.* 186, 879-81(1928).—It has been suggested that the important variations in the chem. compn. of the micas are due to the isomorphous mixt. of different mols., but the exact nature of these mols. has not been agreed on. A crystallographic study utilizing x-rays might therefore be profitable. The crystallographic index ratios and the thickness of the layers (d_{001}) being known for the different micas, the d. of the crystal

and the vol. of the crystal unit are used to calc. the no. of atoms of each of the elements given by chem. analysis which are associated with this unit cell. These data are given for margarite, muscovite, lepidolite, phlogopite and biotite. From these data it appears that there are always 12 atoms of O (the only electronegative element present) associated with the unit cell. The other elements are present in variable and, in general, in fractional numbers. Even the total number of electropositive atoms present in the elementary unit is variable, which suggests that the O atoms are the important structural elements forming a framework within which the other atoms are located irregularly.

A. W. KENNEY

Composition of two Madagascar minerals: amfangabeite and columbite. G. CHERNIK. *Bull. soc. franç. min.* 49, 127-35(1926).—Amfangabeite, d. 4.45, almost black, contained Cb_2O_3 50.78, Ta_2O_5 1.80, TiO_2 5.22, SnO_2 0.27, ThO_2 1.65, UO_2 11.98, Yt earths 4.71, Ce earths 0.67, Fe_2O_3 10.03, CaO 0.87, H_2O 11.04%; lighter-colored specimens had d. 4.39 and 3.36, resp. Columbite contained Cb_2O_3 62.71, Ta_2O_5 12.42, SiO_2 0.65, TiO_2 1.30, SnO_2 0.41, U_2O_5 2.28, FeO 11.02, MnO 8.24, Al_2O_3 0.11, CaO trace, $\text{K}_2\text{O} + \text{Na}_2\text{O}$ 0.09%.

B. C. A.

A new analysis of the Maberly, Ontario, euxenite. H. V. ELLSWORTH. *Am. Mineral.* 12, 365-7(1927).—An analysis of this radioactive mineral shows: PbO 1.01, UO_2 7.25, UO_3 1.51, ThO_2 2.64, (Ce, La, Di) $_2\text{O}_3$ 0.87, (Yt, Er) $_2\text{O}_3$ 24.95, TiO_2 25.04, Ta_2O_5 5.32, Cb_2O_3 22.28% and smaller amts. of more common elements. The Pb:U ratio gives an age of 870 million years, which is lower than that generally obtained for Ontario Precambrian, but higher than previous analyses of this mineral. E. believes that complex minerals such as this, which in general give low age values, have been subjected to leaching and possible replacement of Pb by silica. Microscopic examn. shows internal fractures developed by autooxidation, along which evidence of silicification may be found. E. concludes that the presence of 1.08 SiO_2 indicates the loss of lead, although not an equiv. amt.

C. B. SLAWSON

Lyndochite—a new mineral of the euxenite-polycrase group from Lyndoch Township, Renfrew Co., Ontario. H. V. ELLSWORTH. *Am. Mineral.* 12, 212-8(1927).—Lyndochite occurs in a dike composed chiefly of pink microcline, white and smoky quartz and green amazonstone. It is apparently rhombic, though it generally occurs in composite crystals which are reddish brown with a vitreous luster and perfect conchoidal fracture, hardness 6.5, sp. gr. 4.909, infusible. A very complete analysis includes oxides of U, Th, Ce, La, Di, Yt, Er, Zr, Ta and Cb, which comprise 73.53% of the mineral. The age detn. from the Pb/U ratio gives 1100 million years, which agrees with other Cambrian U values from this region.

C. B. SLAWSON

Ellsworthite crystals from Haliburton Co., Ontario. H. V. ELLSWORTH. *Am. Mineral.* 12, 48-53(1927).—Radioactive crystals showing the faces (111), (001), (110) and (311) were found in a high-temp. calcite vein. A very complete analysis includes UO_2 1.56, UO_3 20.46, (Ce, La, Di) $_2\text{O}_3$ 1.49, Cb_2O_3 23.54 and Ta_2O_5 9.97%. The CaO content, 8.94, shows the crystals to be ellsworthite rather than *belafite*. The Pb/U + Th ratio is 0.094.

C. B. SLAWSON

A chemical study of the yellow incrustations on the Vesuvian lava of 1631. F. ZAMBONINI AND G. CAROBBI. *Am. Mineral.* 12, 1-10(1927).—See C. A. 22, 1935.

C. B. SLAWSON

Holdenite, a new arsenate of manganese and zinc, from Franklin, N. J. CHARLES PALACHE AND E. V. SHANNON. *Am. Mineral.* 12, 144-8(1927).—Holdenite, $8\text{MnO}_2 \cdot 42\text{NaO} \cdot \text{As}_2\text{O}_5 \cdot 5\text{H}_2\text{O}$, occurs as small well-developed pink to red crystals assoc. with franklinite, calcite, barite, galena, prochlorite and willemite. It is orthorhombic with an axial ratio of 0.3802:1:0.2755; hardness = 4, sp. gr. = 4.07; optically +, optic plane parallel to (010), $\text{Bx}_a \perp (100)$, $2V = 30^\circ 20'$, $\rho > \nu$ perceptible, $\alpha = 1.769$, $\beta = 1.770$, $\gamma = 1.785$. The analysis given was made upon a sample containing willemite and calcite. A table of interfacial angles is given.

C. B. SLAWSON

Mcgovernite, a new mineral from Sterling Hill, N. J. C. PALACHE AND L. H. BAUER. *Am. Mineral.* 12, 373-4(1927).—Mcgovernite occurs in veins as a granular coarse grained mass. It has a reddish bronze color and is uniaxial + with submicaceous basal cleavage. $\omega = 1.754$; sp. gr. = 3.719. Analysis shows: SiO_2 8.92, MnO 42.72, FeO 1.53, MgO 11.27, ZnO 10.22, As_2O_3 4.45, As_2O_5 12.48, H_2O 8.49%. Mcgovernite is the principal filling of a vein in massive ore.

C. B. SLAWSON

Cahnite, a new borarsenate of calcium from Franklin, N. J. C. PALACHE AND L. H. BAUER. *Am. Mineral.* 12, 149-53(1927).—Cahnite, $4\text{CaO} \cdot \text{B}_2\text{O}_3 \cdot \text{As}_2\text{O}_5 \cdot 4\text{H}_2\text{O}$, occurs as penetration twins of tetrahedron-like sphenoids. The crystals are white to transparent with a distinct glassy luster. They are tetragonal with the axial ratio 1:0.615; hardness = 3; sp. gr. = 3.156; optically +, $\omega = 1.662$, $\epsilon = 1.663$; because

of strong dispersion and low birefringence, the mineral exhibits abnormal interference colors. Tables of interfacial angles and an analysis are given. C. B. SLAWSON

An occurrence of pitticite in Nevada. W. F. FOSHAG AND H. G. CLINTON. *Am. Mineral.* 12, 290-2(1927).—Pitticite has developed as a secondary deposit in crusts upon the walls and floors in abandoned mine workings at Manhattan, Nevada. The analysis shows that the constituents are not present in mol. ratio and it is suggested that pitticite may be considered as a colloidal mixt. of normal Fe arsenate and Fe sulfates. C. B. SLAWSON

Kernite, a new sodium borate. WALDEMAR T. SCHALLER. *Am. Mineral.* 12, 24-5(1927).—Kernite, $\text{Na}_2\text{B}_4\text{O}_7 \cdot 4\text{H}_2\text{O}$, was found in Kern Co. Calif. in the Kramer boron district. It is orthorhombic, with hardness = 3, sp. gr. 1.953 and is colorless with perfect prismatic cleavage resembling satin spar. $2V$ nearly 90° , —, elongation, c axis, +; optic plane parallel to elongation. $\alpha = 1.454$, $\beta = 1.472$, $\gamma = 1.488$. Analyses of kernite and assocd. *ulexite* are given. C. B. SLAWSON

The selenite caves of Naica, Mexico. W. F. FOSHAG. *Am. Mineral.* 12, 252-6(1927).—Two caves show large selenite crystals up to 6 ft. in length and weighing 60 lbs. The larger crystals are generally colored by inclusions of mud. C. B. SLAWSON

Voltaite from Jerome, Arizona. CHARLES A. ANDERSON. *Am. Mineral.* 12, 287-90(1927).—The voltaite occurs in a brecciated quartz. The sulfate ore in levels below has been burning for a no. of years and the voltaite is formed as sublimate from the ascending vapors. It occurs as simple cubes or in combination with (111) or rarely (110). The crystals are transparent and pale green, with $n = 1.604$. Analysis shows: SO_4 47.83, Al_2O_3 6.06, Fe_2O_3 14.34, FeO 8.82, MgO 1.55, K_2O 4.52, H_2O 16.13%. It alters rapidly in air to a yellow powder. C. B. SLAWSON

Roemerite from California. R. E. LANDON. *Am. Mineral.* 12, 279-83(1927).—This is the first American occurrence of this mineral. It was found as an alteration of pyrrhotite at Island Mt., Trinity Co. The mineral is triclinic and a table of interfacial angles is given. Analysis gave: SO_4 38.30, Fe_2O_3 20.60, FeO 6.94, H_2O 33.40%. Slightly pleochroic, with $2V = 49^\circ$, $\rho > v$ strong and distinctly crossed dispersion, —, and $\alpha = 1.526$, $\beta = 1.571$, $\gamma = 1.582$. C. B. SLAWSON

Ammoniojarosite, a new mineral of the jarosite group from Utah. R. V. SHANNON. *Am. Mineral.* 12, 424-6(1927).—This mineral occurs in a black lignitic shale near Panguitch, assocd. with ammonium alum. Analysis gives: Al_2O_3 0.02, Fe_2O_3 49.30, CaO 0.05, MgO 0.13, Na_2O 0.22, K_2O 1.56, $(\text{NH}_4)_2\text{O}$ 4.23, SO_4 34.49, H_2O 9.86, insol. 0.76%. Microscopically it shows transparent pale yellow tabular grains some of which have hexagonal outlines. Probably uniaxial, —, $\omega = 1.800$, $\epsilon = 1.750$. C. B. SLAWSON

The Florence meteorite of Williamson Co., Texas. JOHN T. LONSDALE. *Am. Mineral.* 12, 398-404(1927).—This meteorite, which fell Jan. 21, 1922, is a breccia-like chondrite, weighing 3640 g. and consists mainly of olivine, enstatite, metallic Fe and FeS. The compn. is: metallic 17.62, troilite 5.01, rock 77.37%. Analysis of the metallic portion gives: Fe 91.277, Ni 8.270, Co 0.426, Cu 0.009 and P 0.018%. Analyses of various portions of the rock material are also given. C. B. SLAWSON

Meteorite (aumalite) which fell on October 16, 1919 in the Bur-Hecaba region, Italian Somali. ANTONIO NEVIANI. *Boll. soc. geol. ital.* 40, 209-22(1921); *Chem. Zentr.* 1927, I, 1144-5.—Two stones weighing 8.05 and 15.40 kg., resp., were found. One had a mineral content of enstatite, olivine and small quantities of Ni-Fe and troilite. The structure was chondritic, and there was little glass substance present. The other stone had a d. of 3.76 and consisted of 23% Ni-Fe and 77% silicates, olivine and enstatite. C. C. DAVIS

Colombian glass meteorites. TH. DÖRING AND O. STUTZER. *Centr. Mineral. Geol.* 1928A, 35-41.—Further chem. and phys. evidence is given supporting the idea that certain glass spheres and splinters found in southern Colombia are meteorites. A new analysis of the glass is given. The gas contd. is largely CO_2 , CO and H, while Cl and HCl, considered to be characteristic of volcanic glasses, are absent. J. E. G.

Microscopic replacement versus injection in ores. G. M. SCHWARTZ. *Am. Mineral.* 12, 297-304(1927).—From a detailed microscopic study of polished ore section S. concludes that replacement is more important than injection in the formation of ore deposits. C. B. SLAWSON

Magnesite. A. SAVARIZKII. *Nutzbare Fossilien* 4, No. 31, 1-12; *Chem. Zentr.* 1927, I, 52.—Russian magnesite deposits are described and distinguished according to their origin. In Satka, Zlatoust district, a large deposit is being worked. This magnesite is white and coarse-grained and has the compn.: MgO 46.90, CaO 0.40, SiO_2 0.20, Al_2O_3 0.07, Fe_2O_3 0.54, CO_2 51.73, H_2O 0.16%. C. C. DAVIS

The abrasive garnet industry. MANUEL BOIX. *Quim. ind.* 5, 93-6(1928).—

Review of occurrence, production, uses and markets of almandites. The Spanish garnets of Almería are superior to any other quality on the market. The Spanish method of mining and concn. is essentially the same as that used in the N. Y. State mines, except for a few variations detd. by local conditions. The specifications for abrasive garnets are: hardness not < 7.5, preferably about 8. The crystals ought to be large in order to yield an angular, sharp-edged abrasive. Granular garnets usually yield rounded instead of angular pieces. The surfaces of fracture must not be too well developed, since this reduces cohesion. The color in itself has no effect on the technical properties, but there is a prejudice against the rhodolite of North Carolina, although expts. have shown that its quality is equal if not superior to that of the Adirondack almandite.

Chemical and geological hypothesis for the existence of larger available petroleum deposits in Germany and toward the edge of the Alpine and Bohemian massifs; petroleum formation from coal in deep geosynclines; a working hypothesis. ERICH SEIDL. *Z. deut. geol. Ges.* 1927B, 14-20.

J. E. GILL

The replaceable bases in the roofs of lignite seams. E. MCKENZIE TAYLOR. *Fuel in Science and Practice* 7, 227-8(1928); cf. *C. A.* 22, 1305.—In the roofs of bituminous coal seams, Na is the chief replaceable base present; in the roofs of lignite seams, the chief replaceable element is Ca. This indicates that the roofs of lignite seams have not undergone base exchange with solns. of Na salts and that they contain no Na-AlSi complex. The Ca-AlSi complex affords neither alk. nor anaerobic conditions to the underlying org. matter and therefore the products of decompn. are not fully reduced compds. The roof type detd. the product of bacterial decompn. of the org. matter beneath it—if the roof has undergone base exchange with Na, bituminous coal is formed; without this exchange, lignite.

D. A. REYNOLDS

The replaceable bases in the roofs of anthracite seams. E. MCKENZIE TAYLOR. *Fuel in Science and Practice* 7, 228-9(1928); cf. preceding abstr.—As bituminous and anthracite coals occur under similar roof conditions they are probably different products of similar reactions under alk. anaerobic conditions, the character of the reaction product being detd. by the decompn. of the accumulated material in the preceding stage. Base exchange and the formation of coal. *Ibid* 230-7.—The results of previous investigations (cf. above), are discussed together with older theories of coal formation. T. concludes that the final factor which detd. the conversion of peat to coal was the decompn. under alk. anaerobic conditions. The theory of coal formation by heat and pressure is discounted.

D. A. REYNOLDS

Contributions from the Mineralogical Institute of Bonn University. 57. The chemical composition of the granite and gneiss of the Fichtelgebirge. H. M. E. SCHÜRMANN. *Centr. Mineral. Geol.* 1927A, 310-3.—Analyses of granite from Ottengrün and gneiss from Seeberg are given.

J. E. GILL

The granite of Conway, New Hampshire, and its druse minerals. J. L. GILLSON. *Am. Mineral.* 12, 307-19(1927).—Characteristic minerals have been developed by emanations passing upward through the granite mass along pegmatitic zones. The same minerals are found in the granite mass showing that the emanations have penetrated the solid rock. The changing character of the emanations may be traced in variations in mineral deposition. No conclusions can be drawn as to the liquid or gaseous character of the emanations.

C. B. SLAWSON

Mineral replacements in pegmatites. WALDEMAR T. SCHALLER. *Am. Mineral.* 12, 59-63(1927).—Pegmatites are the result of 2 processes: (1) solidification by cooling to form a nearly pure K-feldspar rock, (2) subsequent hydrothermal replacement, the final pegmatitic rock being the resultant of the various solns., any one of which may have replaced the previous minerals in whole or in part. Evidence of this is found on detailed examn. of Calif. pegmatites.

C. B. SLAWSON

Alpine mineral deposits. IAN CAMPBELL. *Am. Mineral.* 12, 157-67(1927).—Hot carbonated aq. solns. have leached the country rock and upon cooling they have pptd. a series of minerals in cavities which were developed by tensional forces. The zone of leaching does not exceed twice the width of the cavities. The outer zone of deposition consists of small idiomorphic crystals of a quartz while the inner zone carries large well-developed crystals of typical alpine minerals. The total chem. compn. of each vein or cavity follows closely the total compn. of the adjacent rock. The deposition follows a "salt" soln. sequence and the order of deposition is that which would result from the cooling of a soln. whose compn. was the same as the country rock, the cooling range being from 450° down.

The basalt of Weitendorf, Steiermark, its exogenous inclusions and vein and cavity

fillings. FELIX MACHATSCHKI. *Centr. Mineral. Geol.* 1927A, 367-74, 413-22.—Analyses of the basalt, inclusions and cavity fillings are given. J. E. GILL

The so-called "porphyrite" of Klotzsche near Dresden. F. TRÖGER. *Centr. Mineral. Geol.* 1927A, 1-6.—Microscopic studies indicate that the rock is a member of the Lausitz lamprophyre series. An analysis of this rock and one of the Weiszig porphyrite are included. J. E. GILL

Chemical compositions of a few alkaline rocks from the eastern Arabian desert of Egypt. E. SCHURMANN. *Centr. Mineral. Geol.* 1928A, 121-6.—New analyses are given for coarse-grained riebeckite granite porphyry from Bir Dara, fine-grained riebeckite granite porphyry from Geb. Mongul, dense riebeckite porphyry from Geb. Gharib, riebeckite granite from Ras-Zeit, bostonite from the Egyptian "Hochgebirge" theralite from Wadi Melaha and melaphyres from Ras-Zeit, Cherm Nagga and Abu Had. Amphibole from the Ras-Zeit granite calcd. to riebeckite 50%, actinolite 50%; that from the Wadi Melaha theralite, barkevikite 25%, pargasite 75%. J. E. G.

The eruptive rocks of Muno, Prov. Luxembourg, and the resulting metamorphism. ARMAND L. HACQUAERT. Univ. of Ghent, Belgium. *Natuurwetenschap. Tijdschr.* 10, 73-88(1928).—Petrological examn. of eruptive rocks found at Muno (Belgium) and of the metamorphism produced on the surrounding shales and phyllites. A. L. H.

Lateritic substances in marine limestones. M. FRANK. *Centr. Mineral. Geol.* 1928B, 273-91.—Analyses are included. J. E. GILL

Presidential address [weathering of rocks]. W. G. WOOLNOUGH. *J. Proc. Roy. Soc. N. S. Wales* 61, 1-53(1927); *Australian Sci. Abstracts* 6, 32.—The general chem. principles involved in the weathering of rocks during the last stages of highly perfect peneplanation are discussed, and it is shown that, if the rainfall of the region is markedly seasonal in distribution, the conditions favor the production of: (1) a very deep zone of completely leached rock, consisting essentially of kaolin and silica, (2) a sub-surface deposit typically concretionary in structure of amorphous silica, alumina and Fe oxides. All the alkalis and alk. earths are completely removed in soln. An attempt is made to prove that the very widespread "lateritic" and siliceous (opalinic) crusts in western and northern Australia, are parts of a single chemically formed deposit, produced under the conditions postulated in the first part. Such crusts have been referred to a no. of different geological formations, and endless confusion has resulted. It is believed that "Desert Sandstone," "Laterite," "Upland Miocene" and other formations in different states may be brought into harmony with one another. For the formation thus produced the name of *Duricrust* is suggested. Reasons are adduced for assigning a Miocene age to the structure. The main body of the paper deals with the origin and distribution of the *Duricrust*. It is of economic importance as it yields precious opal, fireclays, road metals, water supplies in arid regions and, possibly, bauxites of economic value. Its surface is mostly extremely barren, and its destruction has given rise to the great stony plains (Gibber Plains) so widely developed in the interior of the continent. Remnants of it give rise to the "tent hills" and "table hills" so characteristic of Central Australia. H. G.

Explanation of the anomalies in the position of the innermost rings of pleochroic uranium halos. FRANZ LOTZE. Göttingen. *Centr. Mineral. Geol.* 1928A, 87-9.—L. believes that changes in the phys. properties (particularly the cohesion) of the medium in which the halos are produced are competent to explain the anomalies observed. J. E. GILL

The present condition of mercury production in Austria. F. REUSS. *Metallbörse* 18, 201-2(1928).—The method now in use for obtaining the Hg in Cu, Ag ores in the Schwaz district is described, 6000 kg. being produced in 1926. J. BALOZIAN

Past and present production of zinc west of the Mississippi River and to what extent has the recent improvement in flotation affected the same. HOWARD I. YOUNG. *Bull. Am. Zinc Inst.* 11, 106-12(1928). E. H.

Investigations on the concentrating of poorer German limonites. H. GRÜSSNER. *Metallbörse* 18, 313-4(1928).—The rough ore is dried and ground to grains of about $\frac{1}{10}$ mm. It is then mixed with about 15% of coke and heated in a sintering machine (Dwight-Lloyd) at 1000-1100° for 2-3 hrs. By this treatment the character of the ore is partly destroyed, some metallic Fe resulting from the reduction. The sintered cakes are cooled, broken up and powdered in a mill to about $\frac{1}{4}$ mm., and made into lumps capable of being smelted. The loss on heating the dried ore in the sintering machine to 900° is 11%, increasing to 22% at 1100°. The Fe content of the larger grains is about 26% greater than that of the smaller. The practicability of this method has been shown by a large no. of small-scale expts., one set being given in detail. When other methods of dressing have failed on ores of similar compn., this one should be considered. J. BALOZIAN

The production of refined lead from lead residues. EDMUND R. THEWS. *Am. Metal Market*, Mag. Sect. 35, No. 111, 1-5(1928).—The process of smelting lead residues and by-products in reverberatory or blast furnaces and the fire refining of the lead thus produced are described. C. L. READ

Flue dusts from copper smelters of the Southwest: Composition and methods of treatment. WILLIAM A. SLOAN. *Bur. Mines, Repts. Investigations* No. 2871, 40 pp.—Flue-dust samples from 7 smelters were analyzed and examd. Varying amounts of the original sulfide copper ores were found to be sulfated or oxidized, thus making the Cu sol. in water or in acid. By roasting the dusts at 580° to 625° at least 80% of the Cu was obtained in the water-sol. form and 93 to 99% was sol. in 4 to 6% H₂SO₄, while acid ferric sulfate soln. gave increased soly. of Cu. Methods of briquetting and sintering the dusts are discussed. C. L. READ

The manufacture of alloy steel. E. C. SMITH. *Am. Metal Market*, Mag. Sect. 35, No. 111, 20-3(1928).—The common methods of manufg. alloy steel are described. C. L. READ

Refined chrome steel at low heat. NICOLAUS N. MENSCH. *Iron Age* 121, 1817-8 (1928).—In making Cr steel from charges contg. Cr, data are given to prove that the amt. of Cr remaining in the refined steel from the scrap depends entirely on the method of melting and the temp. of the bath reached during the refining period, and is independent of the amt. originally contained in the scrap. If a high proportion of Cr is left in the steel from that contained in the charge, the quality of the steel is adversely affected, which is explained on the supposition that one of the Cr oxides is dissolved in the steel at a relatively high temp., and is not reduced when the metal cools down but remains in the finished steel as a harmful inclusion. DOWNS SCHAAF

Uniformity in duplex steel. FOLKE W. SUNDBLAD. *Iron Age* 121, 1812-3(1928).—To produce a more uniform and better quality duplex steel, it is necessary that the temp. of the bath and the nature of the slag be made stable for all heats. It is possible with tar, oil or producer gas to regulate operating conditions so that by the time all the blown metal is poured into the furnace, the slag has a certain fluidity and the bath a certain temp. Coke-oven gas in combination with any of these fuels makes it very difficult, if not impossible, to control the aforementioned conditions. DOWNS SCHAAF

Cupola control by auxiliary tuyères. ANON. *Engineering* 125, 744(1928).—The Poumay system of auxiliary tuyères, when applied to 2 cupolas melting metal for steel casting manuf., demonstrated a 32% saving in coke and a 22% saving in time of melt. An elevation of the cupola with sections through the wind belt and the main tuyères shows this system consists of a no. of small tuyères arranged helically around the cupola and connected to the wind belt by pipes of different lengths, the supply of air being controlled by regulating cocks, the plugs of which are set at different angles to give the sp. opening required. DOWNS SCHAAF

Blast-furnace data and their correlation. EDGAR C. EVANS and F. J. BAILEY. *Iron Steel Inst.* May, 1928 (advance copy), 64 pp.; *Engineering* 126, 29-30(1928).—

From a study of 120 blast-furnace operating results a common basis for correlating output and fuel consumption was found in comparing the effective time of contact between the reducing gases and the ore before the hearth is reached. The greater this time the lower the fuel consumption. Factors affecting the time of contact are: slow driving of the furnace, prepn. of the burden prior to charging, suitable methods of charging, suitable furnace construction, quality of coke used. Tables giving the operating data for a no. of blast furnaces are included. J. W. SHIPLEY

Blast-furnace practice in Natal. J. E. HOLGATE AND R. R. F. WALTON. *Iron Steel Inst.* May, 1928 (advance copy), 26 pp.—A description is given of the establishment by the Union Steel Corp. of the first South African iron blast furnace, including the ore body, coke and limestone supply, labor and market. The ore body is largely Fe carbonate contg. 40 to 50% Fe and 5% of free C. At first this carbonate ore, as in recognized practice, was mixed with an oxide ore before smelting, but later because of the free C in the ore, it was found economical to use the carbonate ore alone and without previous calcining. Coke was secured from nearby coal mines in Northern Natal. Dolomite from near Johannesburg made a satisfactory flux. Native Zulu labor proved very adaptable and hard working, this cheap labor making the establishment of the iron and steel industry in S. A. possible. After 15 months operation the furnace was closed down for 9 months because of the excess of stocks of pig Fe. Cheaper coke and railway transportation would make it possible to export pig Fe. The corporation provides practically all of the foundries in S. A. with foundry Fe and its steel works at Vereeniging produce all kinds of railroad Fe and mining equipment, while a steel tube works and sheet and rail mill are soon to be built. Tables are included showing working costs of production, analyses of ores, coal, dolomite, pig Fe and slag and also a consideration of the economic conditions governing the pig Fe industry in S. A. J. W. SHIPLEY

The rotary tube furnace for pyrite roasting. C. P. DEBUCH. *Chem. App.* 15, 25-6, 51-3, 75-6, 89-90, 121-3(1928).—A discussion of Kauffmann's method of pyrite roasting, with a description of the Gröppel furnace, its advantages and disadvantages, results of operation, capacity and power requirements. J. H. MOORE

The static and fatigue properties of some cast irons. J. B. KOMMERS. *Proc. Am. Soc. Testing Materials* (preprint), 40, 24 pp.(1928).—Ten different kinds of cast Fe were tested, with 31 A. S. T. M. arbitration bars of each, in tension, compression, impact and fatigue; and transverse and hardness tests were also made. Full data regarding the history, chem. compn. and microstructure of the samples, as well as the results of tests, and the methods of prepn. of the specimens, are recorded. The endurance limit was detd. by less than 20 million cycles in the standard R. R. Moore machine. The results of hardness, compression and transverse tests were fairly uniform for a given Fe, but not those of tensile, impact and fatigue tests, which showed considerable scatter. Specimens showing surface pits had abnormally low endurance. The strongest series showed an endurance limit of 24,100 lbs. per sq. in. No improvement was noted from addns. of Ni or Cr. Brinell hardness tests proved more delicate for these alloys than Rockwell. The endurance was roughly proportional to strength, hardness and modulus of rupture, being about 50% of the tensile strength. These properties all showed a fairly simple relation to each other, but in plotting the correlation curves, low values were disregarded. An outline of desirable further work on cast Fe is given. GEO. F. COMSTOCK

Influence of phosphorus on strength properties of cast iron pipe. JAMES T. MACKENZIE. *J. Am. Water Works Assoc.* 19, 747-59(1928).—Up to about 0.80% by increasing the fluidity of the molten Fe, P, in general, acts to improve the product. Beyond 1%, strength and resilience decrease rapidly because of its embrittling effect. D. K. FRENCH

Heredity of iron castings. L. GUILLET. *Compt. rend.* 185, 1598(1927).—More precise methods for the detn. of the properties, and especially of the chem. compn. of the castings described by Le Thomas (*C. A.* 22, 1125) are required, in order to detect any small differences between them. B. C. A.

The electrochemical action of inhibitors in the acid solution of steel and iron. E. L. CHAPPELL, B. E. ROETHLI AND B. Y. MCCARTHY. *Ind. Eng. Chem.* 20, 582-7(1928).—Chem. reactions in pickling Fe are discussed, and the previous literature on inhibitors, to prevent soln. of metal, is reviewed. The effect of quinoline ethiodide on H evolution in pickling was studied; also its effect on the reactions at anode and cathode. The app. is illustrated, and the results are tabulated and plotted. The cathode potentials increased on addn. of the inhibitor, and the c. d. and H evolution decreased. Other inhibitors gave similar results. H was evolved at grain boundaries,

scratch marks and inclusions. The inhibitor is adsorbed at the cathode areas and builds up a protective layer there. Quant. relationships may be computed from the data presented.

Geo. F. Comstock

Service is best test of steel. H. M. BOVLSTON. *Iron Age* 121, 1665-8 (1928).—Accelerated corrosion tests are not reliable indicators of service results. Comparative acid tests of 2 materials may give opposite results, depending on the kind of acid used. Other variables affecting acid tests are also discussed. Service tests alone are conclusive and authoritative.

G. F. C.

X-ray investigation of the density of quenched steels and the internal stress existing within them. SINKITI SEKITO. Tôhoku, Imp. Univ. Sendai. *Z. Krist.* 67, 285-94 (1928); cf. *C. A.* 21, 3589.—The expansion of quenched steels may be explained by the expansion of the space lattice, and was found to amount to 0.45% for 1% C steel. The internal stress calcd. from the diffusion of the spectral lines of quenched steel is of the same order of magnitude as the tensile strength, being 192 kg./per sq. mm. This supports the view of Honda that the diffusion of the lines is due to the distortion of the Fe lattice by C atoms in the interspaces, rather than that of Westgren, who considers it due to refinement of crystal grain. The plane at right angles to the plane of greatest at. density is subject to the greatest internal stress and lattice distortion. L. S. R.

Influence of grain size on the mechanical properties of steel, especially on the notched-bar test. H. HANEMANN AND R. HINZMANN. *Stahl u. Eisen* 47, 1651-61 (1927).—The tensile strength and hardness of a plain C steel (C 0.12, Si 0.26, Mn 0.64%) and of a hardened Ni-Cr steel (C 0.23, Si 0.26, Mn 0.38, Cr 0.67 and Ni 2.90%) varied only slightly for grain sizes between 600 and 13,000 sq. μ and between 90 and 25,000 sq. μ , resp. The impact test values for notched bars, however, are considerably altered by varying the grain size, although no definite relation between the 2 can be ascertained. For small test pieces the curve falls rapidly with increase of grain size to a const. value for medium-sized grains; then decreases rapidly above 4500 sq. μ . For large test pieces the impact strength is a min. for large and small grains and a max. for medium-sized grains. If the specimen is polished before testing, a fairly well-defined "area of flow" is discernible on the polished surface after impact; the work done in breaking the specimen divided by the area of flow is called the "work constant" of the metal. The "work velocity" is the quotient $50 A_2/A_1$, where A_1 and A_2 are the work consumed in breaking a small and a large test piece, resp. Both the "work constant" and "work velocity" are shown to be sp. properties of a metal, the values of which are dependent on the grain size. Beyond a certain grain size, which varies for every metal, the value of these functions falls suddenly, indicating a serious deterioration in the valuable properties of the metal.

B. C. A.

The incremental permeability method for the magnetic analysis of high-speed steel.

W. B. KOUVENHOVEN AND J. D. TEBO. *Proc. Am. Soc. Testing Materials* (preprint), 1928, 19 pp.—This paper describes a new method of magnetic analysis by which the magnetic properties of high-speed W steel bars were investigated. Data were obtained which make it possible to differentiate between the heat treatments received by the specimens.

E. J. C.

Wearing tests of twelve-percent manganese steel. J. H. HALL. *Proc. Am. Soc. Testing Materials* 32 (preprint), 6 pp. (1928).—Wear-test figures for 9 steels were obtained by dividing the loss in g. per sq. in. of jaw surface by the total no. in thousand lbs. of stone crushed, in a small lab. crusher with jaws cast of Mn steel, C steel, Cr steel and Ni-Cr steel.

Downs SchAAF

The properties of nickel steels, with special reference to the influence of manganese. J. A. JONES. *Iron Steel Inst.* (advance copy), May, 1928, 36 pp.; cf. *C. A.* 22, 566.—The crit. ranges and Brinell hardnesses of numerous steels contg. 0.2-0.5% C, 3-10% Ni, 0.1-1.6% Mn and 0-0.2% Cr were detd. A_{c1} was lowered 10° for each 1% of Ni; A_{r1} was lowered more, the amt. depending on compn. and the rate of cooling. These crit. points are lowered slightly by Mn only when over 0.3% is present. The heat-treating temps. of com. Ni steels are not affected appreciably by Mn up to 0.8%. The addn. of Cr caused a rise in A_{c1} only. The results of Brinell tests after different rates of cooling are tabulated and plotted. Mn above 0.5% increased the hardness materially, but Cr had a greater hardening effect. Bars $1\frac{1}{4}$ by $\frac{3}{4}$ in., quenched in oil from 850° , and tempered at 500° to 640° , were tested in tension and impact. The mech. properties were improved with Ni up to 6%, or in the presence of 0.8% Mn, up to 4.5%, if tempered below 600° . Raising the Mn from 0.4 to 0.7% gave in general improved elastic properties with no loss in ductility. For structural purposes, these steels should be tempered no lower than 500° to insure freedom from quenching strains and good elastic properties; and tempering at too high a temp. may also impair the elastic prop-

erties. With 3 to 4% Ni, 0.5 to 0.8% Mn is almost essential to secure adequate hardening of any but very small sections, and 0.8% Mn is much better than over 0.4% C. Cr up to 0.2% is more powerful than Mn in counteracting mass effect. Inadequate hardening may be partly allowed for in tempering, but elastic and impact values are never as good in such steel as in one properly hardened before tempering. Increase of either Mn or Ni resulted in less ferrite pptn. during a given heat treatment. G. F. C.

The rapid normalizing of overstrained steel. W. E. WOODWARD. *Iron Steel Inst.* (advance copy), May, 1928, 10 pp.—Mild steel bars were strained in tension, normalized by passing up to 600 amp. d. c. through them for 3 to 5 min., and tested with uniformly good results. The ordinary method of normalizing in a furnace did not give such good results in healing overstrain, as shown especially by fatigue tests. By using a large a. c. for 3 min. on strained steel bars contg. up to 0.48% C, the metal was well restored in properties, but not quite so well as by d. c. Photomicrographs show the uniform structures produced by this elec. normalizing. G. F. C.

Endurance of high-speed cut-off tools in relation to magnetic and other measurements. HAAKON STYRI. *Proc. Am. Soc. Testing Materials* 30 (preprint), 10 pp. (1928).—Magnetic and elec. tests, Rockwell hardness and durosopic readings were made on high-speed steel tools, and the relation between these values and the no. of rings of Cr ball-bearing steel cut per grind by them, are shown. The test results show good correlation of both the hardness figures and the elec. measurements with the endurance of the tool. The magnetic tests readily show deviation in heat treatment of the steels, but do not seem to be related in any way with tool life. DOWNS SCHAAF

Aluminum alloys in motor construction. H. STEUDEL. *Z. Metallkunde* 20, 165-78 (1928).—A table is included which lists the motor parts in which Al alloys can replace cast Fe or steel, with the type of alloy or desirable property required. In general a change in design is needed to take care of lower tensile strength, greater elongation and tendency toward fibrous structure. This is particularly true with cast alloys such as "German alloy" (10% Zn, 2% Cu, Fe and Si about 1%), "American alloy" (about 8% Cu), the Al-Si alloy *Silumin*, *KS*—sea water alloy (2.5% Mg, 3% Mn, a small quantity of Sb), *KS*—piston alloy (16% Cu, 0.5% Si, 0.5-1.0% Fe), and *Supra piston alloy* (5% Cu, 20% Si, 0.5-1.0% Fe). Particularly promising are the Al alloys which can be forged, rolled and heat-treated, such as *Duralumin* (4% Cu), *Skleron* (3% Cu, 6% Zn), *Aeron* (4% Cu, 1% Si), *Lautal* (4% Cu, 2% Si) and *Konstruktal* (1% Cu or 8% Zn). *Duralumin* and *Skleron* are self-hardening; *Konstruktal* is partially so. H. STOERTZ

Report of Committee B-2 on non-ferrous metals and alloys. WM. CAMPBELL, et al. *Proc. Am. Soc. Testing Materials* (preprint), No. 18, 1-31 (June, 1928).—Minor changes in tentative standards for various non-ferrous alloys are presented. New chem. requirements for bronze bearing metal in ingot form are recommended; also changes in the methods of chem. analysis of Mn bronze and of Al and light alloys. Appendices describe the methods planned for an investigation of die-castings, given dimensions of test-specimens, compns. of Al-base and Zn-base alloys to be tested, and specifications for Rockwell hardness tests on soft alloys. The nature, production and uses of die-castings are discussed by S. Tour, and European die-casting alloys and practice are described by E. V. Pannell, with a bibliography. G. F. C.

Aluminum casting alloys. A review of recent progress. GEORGE MORTIMER. *Metal Ind.* (London) 32, 593-6, 612-5 (1928); cf. *C. A.* 21, 1439. E. H.

Heat treatment of aluminum and its light alloys. IV. Aging treatment of aluminum alloys after quenching. ROBERT J. ANDERSON. Fairmont Mfg. Co., Fairmont, W. Va. *Fuels and Furnaces* 6, 763-4 (1928); cf. *C. A.* 22, 1941, 2738.—Al alloys contg. Mg_2Si will age-harden at ordinary temps. while those contg. no Mg_2Si but $CuAl_3$, require artificial aging. *Duralumin* will age-harden at room temp. in 4 days after quenching. By varying the heat treatment, variations in tensile strength, hardness, elongation and resistance to impact are obtained. The usual aging temps. for wrought alloys lie in the range 120-160°, while cast alloys may be aged up to 235°. The correct heat treatment for several specific alloys is given. J. W. SHIPLEY

The influence of sodium on the tensile properties of aluminum-copper alloys (cast aluminum alloys). WILLI CLAUS AND FRITZ GOEDERTZ. *Giesserei* 15, 3, 55-61 (1928).—Because of the unsystematic character of previous investigations, the influence of Na on Al-rich Al-Cu alloys is studied. In order to obtain a satisfactory exptl. method, preliminary expts. are made on the 86% Al, 14% Si alloy with Archer and Kempf's method (*C. A.* 20, 3424) of treating the melt. Various tensile properties of the 92/8 alloy are detd., with (0.1 or 0.2% acting for 5 or 10 min.) and without Na, melting at 800° and pouring at 700°, into sand and cast-Fe molds. Na causes a considerable lowering of the tensile properties. Photomicrographs show that the permanent-mold

castings, not previously treated with Na, have the largest grain size, those which have been acted on by 0.1% Na for 10 min. possessing a distinctly smaller one. There is no apparent change in the grain size of the sand castings. With the addn. of 0.2% Na the tensile properties of the sand castings decrease proportionately, while there is no effect on the permanent-mold type. There is a decrease in the grain size of the latter castings, the former showing a slight increase. *Ibid* 82-8.—The Al-rich Al-Cu 96/4, 80/20, 68/32 alloys are next investigated, the exptl. methods and conditions being similar to those used for the 92/8 alloy. From tensile tests it is apparent that, apart from a slightly greater hardness, the mech. properties of the 96/4 alloy are not affected by Na addns. The photomicrographs do not show the decrease in grain size, apparent in the castings of the 92/8 alloy when made in an Fe mold. Na, when added to the 80/20, does not change the elongation but decreases the tensile strength of castings made in sand or cast-Fe molds, the ball hardness decreasing in the first and increasing in the sec. case. Photomicrographs show a considerable decrease in the grain size of Fe-mold castings, with slight increase in the sand type. Tensile tests were limited to ball hardness detns. on the eutectic 68/32 alloy because of its brittle character, due to the high CuAl₂ content. The Na added shows no influence on the hardness values of both types of castings, but photomicrographs show the extremely fine eutectic structure. Castings made in Fe molds show a decrease in the grain size in the interior as well as at the exterior of the casting, while those in sand molds show a decrease at the exterior and an increase in the interior. In general Na is detrimental to all the tensile properties of both casting types.

J. BALOZIAN

The effect of heat treatment on some mechanical properties of 85:5:5:5 copper-tin-lead-zinc alloy. ROBERT J. ANDERSON. *Am. Metal Market Mag.*, Sect. 35, No. 111, 9-12(1928); cf. *C. A.* 22, 2537.—Tests of tensile properties of the 85:5:5:5 Cu-Sn-Pb-Zn alloy gave erratic results after annealing the specimens at specific temp. Annealing had little effect on the tensile properties of the 85:4:5:6 alloy but quenching from 500° had a harmful effect. The differences in properties are claimed to be due to variation in methods of melting and casting rather than chem. compn. C. L. R.

The structure of the iron-chromium-carbon system. A. WESTGREN, G. PHRAGMEN AND TR. NEGRESKO. *Iron Steel Inst.* (advance copy), May, 1928, 18 pp.—Analysis of the Fe-Cr-C system by x-rays proved that no true double carbide occurs in it. Alloys for this study were prepd. by remelting the fairly pure elements in a C-tube furnace, and the products were analyzed. The binary Fe-Cr and Cr-C systems are reviewed, the former being an unbroken series of solid solns, and 3 carbides being shown to exist in the latter. The ternary equil. diagram was constructed from microscopic and x-ray examns., and is described. Four carbides exist in this system, as follows: Fe₃C in which Cr may be present beyond 15%; Cr₃C in which Fe may occur up to 25%; Cr₇C₃ with Fe up to 55%; and Cr₃C₂ with possibly a little Fe. The α phase dissolves only a slight quantity of C. Numerous photomicrographs are presented to illustrate the micro-structures, and x-ray photographs are also shown. In cementite the lattice contracts with rising Cr. In annealed ball-bearing steel nearly all the Cr is in the cementite, and the groups of carbides often found in such steel are due to ordinary segregation of cementite. Large particles of this carbide may etch differently from smaller particles, though the compns. are practically the same. In stainless steel the carbide is Cr₇C₃, contg. Fe.; in ferro-Cr and some high-C steels, Cr₇C₃ occurs.

Advantages of electron metal. ANON. *Apparaturbau* 40, 131-2(1928).—Notes on Mg alloys.

J. H. MOORE

Recrystallization of α -brass. A. BASS AND R. GLOCKER. *Z. Metallkunde* 20, 179-83(1928).—Complete recrystn. diagrams of 70-30 and 63-37 brass were detd. for degrees of deformation up to 75% and temp. of treatment up to 850°. The lower limit of temp. for the beginning of recrystn. as detd. by grain size is 300° for rolled samples with 50 and 75% deformation. As detd. by Brinell hardness this lower limit is placed at 200° for 75% deformation and 250° for 50% deformation. In both brasses as the annealing temp. rises, grain growth is slow up to about 600°, after which it becomes very rapid. Thus for the 70-30 brass, rolled to 25% deformation, grain size is 0.0108 mm. at 300°, 0.040 mm. at 600°, 0.080 mm. at 700° and 0.212 mm. at 850°. The type and velocity of cold working have no influence upon the size of the recrystd. grains. X-ray photographs show that with a high degree of rolling the orientation of the newly formed crystals of α -brass is identical with that of recrystd. Ag rather than that of Cu. Pb admixts. up to 1.2% have practically no effect upon tensile strength elongation and grain size, while with Fe content up to 0.79%, the grain size remains very fine up to 700°, after which it increases rapidly.

H. SROGATZ

Structure of brass tubing. F. OSTERMANN. *Z. Metallkunde* 20, 186-8(1928).—Surface failures in brass tubing produced by bending were investigated photomicrographically. A desirable grain structure consisting of fine α -mixed crystals with β -residues between the grain boundaries is not obtained with less than 61% Cu. A Cu content of 61 to 61.3% with heat treatment not above 600° is recommended. In the zone of pure α -phase (above 63% Cu) the danger of coarse crystal structure is too great.

H. STOERTZ
Electrolytic copper. W. KÖSTER. *Z. Metallkunde* 20, 189-91(1928).—Com. electrolytic Cu plate, electrolytic Cu plate annealed at 600°, and rolled Cu were studied. The variation of hardness with annealing temp. for various degrees of rolling (3-93%) was detd. In each case there is a lower limit of annealing temp. below which, for a given degree of rolling, hardness is const. This lower limit of temp. falls as the degree of rolling increases. Thus for both electrolytic and rolled Cu it is about 425° at 3% rolling, and 75° at 93% rolling. With electrolytic Cu the max. hardness at 93% rolling is about 128, compared with about 108 for rolled Cu. The increased hardness of electrolytic Cu as compared with rolled Cu is attributed to its H content, which is given up on heating to 450-500°, thus accounting for the lower values of hardness obtained when this Cu is annealed to 600°. With rolled Cu, no change in d. occurs either on cold rolling or annealing, but with electrolytic Cu, with 1-hr annealing periods, the d. is const. at about 8.93 up to 600°, after which it falls rapidly to 8.60 at 1000°. Cold rolling to 67% decrease in thickness restores the original d.

H. STOERTZ
Metallurgical study of antique bronzes. D. BUTTESCU. Inst. of Ind. Chem., Bucarest. *Bul. chim. soc. română stinte* 30, 83-98(1928).—The analysis of archeologic bronze weapons found in Roumania indicates about 87% Cu and 12% Sn, no Zn and no Pb. They are thus older than the Roman period (possibly 1200 B. C.) Their compn. is comparable with the compn. of articles found in France and dating to that period.

A. L. HENNE
Wear and mechanical tests of some railroad bearing bronzes. H. J. FRENCH. *Proc. Am. Soc. Testing Materials* (preprint) 34, 28 pp(1928).—Two series of bronzes were studied: in one the ratio of Cu to Sn was 92.5 to 7.5, and the Pb varied from 0.25 to 25%; in the other the Cu-Pb ratio was 84 to 16, and the Sn varied from 0 to 10%. Tests were made under various kinds of friction, tension, impact and repeated pounding. The difficulties of wear testing are discussed. After a brief period of wearing-in, lubricated specimens of bearing showed very little wear, so that wear tests without lubrication were necessary to show differences between the samples. Chill castings wore more rapidly than sand castings. Cu-Pb alloys with little Sn wore rapidly; bronze with only 0.25% Pb also wore badly, except at normal temp. under lubrication, alloys contg. 5 to 10% Sn and 12 to 25% Pb showed in general the least wear. Pb had a bad effect on the notch-toughness, but Sn within the α -range improved it. In general with 10 to 25% Pb sand castings had better notch-toughness than chill-castings, but with very low Pb this difference was reversed. Above 350° F. the notch toughness was reduced. Increased Pb impaired the tensile properties, but increased Sn up to 10% improved them. Chill castings generally showed a higher strength and greater resistance to pounding than sand castings. Pb decreased, and Sn increased the resistance to pounding. In practice, chill castings are easier to machine, but fail more often from wear, while sand castings are apt to fail from breakage. Bearing bronze should contain over 5% Sn, and for most purposes variations in Pb between 12 and 25% make little difference. If wear is not considered, the best mech. properties were obtained with low Pb and 8 to 10% Sn. The present specifications for bearings used by many railroads are shown to be widely different, and considered unnecessarily precise. Methods of casting may be more important than certain changes in compn.

G. F. C.
Measurement of brittleness. P. L. IRWIN. *Proc. Am. Soc. Testing Materials* (preprint) 95, 8 pp.(1928).—Results of tests on spring steel embrittled by electrolytic cleaning are given, which show the effect of duration of treatment, c. d., and time and temp. recuperation. Flexure tests were made of straight flat spring material by measuring the load and deflection at the center of a span of 1½ in. The degree of brittleness is taken as the percentage decrease in normal load or deflection required to cause fracture.

DOWNES SCHAAF

The recovery and sinking-in or piling-up of material in the Brinell test, and the effects of these factors on the correlation of the Brinell with certain other hardness tests. A. L. NORBURY AND T. SAMUEL. *Iron Steel Inst.* (advance copy) May, 1928, 15 pp.—Various steels, other alloys and vulcanite were subjected to scleroscope, pendulum, cone and Brinell hardness tests, and the changes in shape of the tested surfaces were studied. The Brinell results on all except Mn steel obeyed Meyer's law (load = const.

$\times d^n$). The shape of the tested surface was derived from spherometer measurements of a larger ball placed in the impression. The sinking-in or piling-up for a given material was proportional to the depth of the impression, being up to 30% of the depth in some cases. It varied linearly with " n " in Meyer's formula. The flattening of the impression increased with the depth divided by the diam. Elastic recoveries on releasing the load increased generally with the hardness of the material tested. This recovery, if multiplied by the diam. and divided by the depth of impression, was a const. for a given material. Amsler depth-indicator readings require correction for agreement with ordinary Brinell readings. Factors affecting the correlation of Brinell results with scleroscope and Herbert pendulum values are discussed, both of the latter depending somewhat on elastic properties. Cone tests are comparable with Brinell tests at certain angles of impression.

GEO. F. COMSTOCK

Equilibrium diagrams. W. ROSENHAIN. *Iron Steel Can.* 11, 165-73 (1928).—The practical value and applications of the study of equil. diagrams for alloys are described in non-technical language. Technical terms are explained and some of the properties of alloys are discussed. Accuracy, even in exploratory work, is considered essential. Changes in solid soly., resulting in susceptibility to age-hardening, are treated in special detail.

GEO. F. COMSTOCK

Detection of plastic deformation in the interior of materials. G. TAMMANN AND M. STRAUMANIS. *Z. Metallkunde* 20, 184-5 (1928).—When the heat treatment and mech. working of a metal or alloy are such as to produce a definite crystallite orientation in the material, any alteration in this orientation, such as produced by the stamping of coins, can be detected on a section cut from the interior, by etching with a suitable reagent. Stamped Cu, Fe, Zn, Ni and Ag plates are examd. Fe and Cu plates rolled 60% and stamped show very clear etching impressions on interior sections, but if the samples had been previously heated to 800° producing recrystn., the impression of the stamping is hardly distinguishable.

H. STOERTZ

Pyrometric regulation of heat-treating operations. WM. P. WOOD. Univ. of Michigan. *Fuels and Furnaces* 6, 347-50 (1928).—A descriptive article drawing attention to the necessity for accurate heat treatment in the production of steel for modern construction purposes. A brief description of the thermocouple and its application in automatically controlling furnace temps. is included.

J. W. SHIPLEY

Some factors involved in corrosion and corrosion-fatigue of metals. D. J. MCADAM, JR. *Proc. Am. Soc. Testing Materials* (preprint) 41, 29 pp. (1928).—In the simultaneous action of corrosion and alternating stresses, if the stress is below the endurance limit, accelerated corrosion first causes pitting. The stress rises at the pits, eventually passing the endurance limit. When the stress is above the endurance limit, fatigue is accelerated by corrosion. Tests of various C and alloy steels and Al alloys were made by corrosion at low stresses to obtain pitting, followed by fatigue. The corroding effects of soft water, carbonate water and Severn River water were investigated. The chem. compn., heat treatment, tensile and impact values of all samples are tabulated. The elastic limits are all reported higher than the resp. proportional limits. Corrosion lowered the ordinary endurance graph, and the extent of lowering depended on the stress applied during the prior corrosion. Steels contg. Cr were possibly a little less damaged by corrosion than the plain C or Ni steels. In the corrosion period of the tests, increase of stress first caused increase in depth of pitting, but at a certain stress called the "notching limit," the depth of pitting ceased to increase until the corrosion-fatigue limit of stress was reached. Steels did not fail at the notching limit, but endured further increase of stress. The endurance limit at the bottoms of the notches was raised somewhat by previous stressing. Stainless Fe and Ni-Cu alloys did not form pits below the corrosion-fatigue limit, which was thus the same as the notching limit. Carbonate water and soft water gave similar results. Steel in salt water showed less difference between the notching and corrosion-fatigue limits than in fresh water; stainless Fe in salt water had a lower corrosion-fatigue limit than in fresh water. Most Al alloys showed severe pitting at no stress, so that stressless corrosion was nearly as damaging as corrosion-fatigue. The stress-concn. due to corrosion pits depends chiefly on the electrolytic soln. pressure of the alloy, but somewhat also on the hardness. The effect of time and no. of cycles on corrosion was studied by tests at from 100 to 1450 r. p. m. The penetration of corrosion pits per cycle increased with increase of stress. The notching limit is a variable, decreasing with increase in time and no. of cycles. The corrosion-fatigue limit of deep-pitting alloys is reduced by thinning the test-specimen. Tests with large specimens up to 2.3 in. in diam. showed that the corrosion-fatigue limit was slightly less than for the normal specimen $1/2$ in. in diam. In general this limit and the notching limit are concluded to be independent of size of specimen, provided

the diam. is large compared to the notch-depth. Torsional corrosion-fatigue tests of Cr-V steel showed a much lower limit than that detd. by the rotating cantilever tests. The notches in torsion are shown by photomicrographs to be shaped like crosses, and it is suggested that the torsional corrosion-fatigue limit may be near the notching limit of the rotating cantilever tests. G. F. C.

Prevention of sub-aqueous corrosion by electrochemical polarization process. O. W. CARRICK. *J. Am. Water Works Assocn.* 19, 704-13(1928).—By proper control of an externally applied current, As is plated upon Fe and furnishes a resistant protective film against corrosive action. As is used because of ease in deposition and for the high discharge potential it has when a protective H film has been formed. D. K. F.

Comparison of the most important methods employed in the cleaning of blast-furnace gas (HARBORD) 21. Decreasing corrosion in the ice tank (GIBBS) 13. Calculation of the combustion temperature in blast furnaces (MÜHLBRADT) 21. Impact and rebound device for testing hardness of materials (Brit. 280,182) 1.

WENDT, R. E.: **Foundry Work.** 2nd ed. revised. New York: McGraw-Hill Book Co. 236 pp. \$2. Reviewed in *Chem. Met. Eng.* 35, 367(1928).

Preliminary treatment and magnetic separation of ores. H. A. MUELLER (to Aktiebolaget Ferriconcentrat). Brit. 279,797, Oct. 28, 1926. Weakly magnetic Fe ores are rendered more strongly magnetic, *e. g.*, by heating with 0.25-0.50% of powd. coal for $1/4$ - $1/2$ hr. at 600° , and are then subjected to magnetic sepn. "Blast furnace mould" contg. Fe oxide and C may be used in mixt. with ore, and carbonate ore is first converted into oxide.

Roasting ores. WILLIAM E. STOKES (to United States Processes, Inc.). U. S. 1,674,806, June 26. Ores such as a V ore, *e. g.*, roscoelite, are roasted at a temp. below their fusion point, with an alkali metal bicarbonate which serves to assist disintegration by action of the CO_2 evolved. NaNO_3 and NaCl also may be added.

Treating ores for sintering, desulfurizing, etc. METALLBANK UND METALLURGISCHE GES. A.-G. Brit. 279,693, Feb. 28, 1927. The air supply to an ignited charge which may be mixed with added fuel is passed through the material on a moving grate so that the main part of the reaction is effected in a limited zone near the ignition point, and air for cooling is supplied in a further zone. Volatile constituents such as water, CO_2 , Zn, Cd, As, Sb, Hg or metallic oxides may be obtained or NaCl or other chlorides may be added for obtaining chlorides of noble metals. An app. is described.

Treating zinc ore. COMPAGNIE DES METAUX OVERPELTLOMMEL. Brit. 279,697, Jan. 26, 1927. The ore is formed into sized grains, which may be dried or baked, and with sulfide ores may be roasted on the grate of a blast app., and charged with reducing agent into retorts for reduction. Calamines may be mixed with pre-roasted sulfide ore before treatment. Oxide ore may be agglomerated with water only and in some cases Zn and NaCl may be added and the drying operation omitted.

Mineral flotation. ELMER K. BOLTON (to E. I. du Pont de Nemours and Co.). Can. 281,647, July 10, 1928. Ores and minerals are concd. by flotation in the presence of a froth-producing agent (pine oil, hardwood creosote or terpinol) and one of the following flotation agents: mercaptothiazole or a sodium or zinc salt thereof, mercaptobenzothiazole, 1-mercapto-3-methylbenzothiazole, mercaptanaphthiazole, 1-mercapto- α -naphthothiazole.

Flotation Agent. F. T. WHITWORTH. Can. 280,916, June 12, 1928. Cresylic acid is mixed with P_2S_5 , heated to 140 - 180° for 1 hr., and the supernatant liquor is drawn off. This is used as a flotation agent.

Recovering zinc compounds in lead refining. JESSE O. BETTERTON. Can. 281,281, June 26, 1928. Zn compds. are recovered from the blue powder residue of Pb refining, by heating ZnCl_2 to fusion, adding the blue powder, agitating the mixt., subjecting the mixt. while heated to negative pressure to draw off the volatilized ZnCl_2 , increasing the heat applied to form slag, heating and rabbling the slag at red heat, and collecting the volatile products.

Cupola furnace. ARCHIBALD H. COPLAN (to Economy Metal Products Corporation). U. S. 1,675,255, June 26. A furnace suitable for melting iron comprises an outer casing and a lining of heat-resisting steel spaced from the outer casing to form a continuous heating chamber between the lining and the casing; the outer surface of the lining is formed with spirally wound fins or corrugations.

Apparatus for pickling tin plates, etc. R. THOMAS & CO., LTD. AND E. A. JONES. Brit. 280,025, Oct. 25, 1926.

Heat-treating metal strip. W. E. WATKINS. Brit. 279,787, Oct. 28, 1926. Metal strip is treated with oil, heated in a furnace (the construction of which is described) to 870–1100°, cooled in a reducing atm., pickled, washed, dried and wound on a spool. Instead of the oil a reducing agent and a compd. of a metal which is to form a coating on the strip may be applied before the heat treatment.

Burner for removing scale from metal surfaces. G. RUTSCHE. Brit. 280,099, April 13, 1927.

Protection of oxidizable metals. GIBBERT MICHEL. Can. 281,069, June 19, 1928. Mg, Al, Ca and other metals are protected against oxidation by cleaning or pickling the surface, applying phenol to produce a solid layer, crust or film which adheres and is united to the metal object, and if desired applying varnish or paint to the phenol crust. Cf. C. A. 22, 1946.

Metal coating baths. EDWIN R. MILLRING (to American Machine & Foundry Co.) U. S. 1,674,694, June 26. Metal coating baths such as those of Pb or Pb contg. Sn 16% or less are protected from oxidation by use of a mixt. of rapeseed oil and a petroleum product having a fire point above 350°.

Coating iron or steel sheets with spelter. HENRY A. ROEMER and DAVID A. WILLIAMS. U. S. 1,675,134, June 26. After coating iron and steel sheets with spelter the coated sheets are subjected to cold rolling to produce a coating which will withstand severe forming and heating without scaling or peeling and which may be spot welded or directly coated with enamel or paint.

Spray-coating of riveted joints, etc., with iron, nickel, copper or other metals. METALLISATION, LTD., AND A. A. ARNOLD. Brit. 279,584, Aug. 25, 1926. The sprayed surfaces may be protected by a thin coating of Al further coated with a reducing substance and subjected to heat treatment as described in Brit. 259,289 (C. A. 21, 3343) or a coating of Al alone may be used for packing the joint.

Lead shot coated with a harder metal such as copper. J. M. OLIN and A. G. SCHURICHT (to Western Cartridge Co.) Brit. 279,781, Oct. 28, 1926. After coating, *e. g.*, by electrodeposition, the shot is smoothed and the plating consolidated by a tumbling operation.

Rust-proofing. MATTHEW GREEN and HOBART H. WILLARD (to Parker Rust-Proofing Co.) Can. 281,317, June 26, 1928. Immerse articles in a bath contg. a dil. soln. of H_3PO_4 and dihydrogen phosphates of Fe and Mn, there being $\frac{1}{3}$ as much Mn as Fe in the soln. and sufficient dihydrogen phosphates in proportion to free acid to rust-proof the articles without reducing their wt. Cf. C. A. 22, 1754.

Cold-rolling band iron or similar metals. KALKER MASCHINENFABRIK A.-G. Brit. 280,159, Nov. 5, 1926. Comparatively thick material (2–10 mm.) is rolled at high speed (30–100 m. per min. or more) with substantial reduction (30–75% of the original thickness), without preliminary treatment or intermediate annealing except for an annealing before the final rolling after which the metal may be further annealed to soften it.

Rolling iron around refractory material to form hollow bars. T. S. WHEELWRIGHT. Brit. 280,382, Dec. 7, 1926. Mech. features.

Apparatus for cooling steel car wheels after forging or casting. JOHN BRUNNER. U. S. 1,674,884, June 26.

Mild steel plates. FRANCIS G. MARTIN. U. S. 1,675,190, June 26. Mild steel plates which by rolling or forging treatment have acquired inequality of longitudinal and lateral elastic limits are heated to 800–900° and then rapidly cooled to equalize the elastic limit in all directions and to increase it without increasing the hardness of the steel.

Porous metals or alloys. KAJ HANSEN. Danish 37,071, Jan. 31, 1927. The melted metal is heated with an indifferent substance, for instance a sulfate, carbonate, oxide, chloride or carbide in suitable disperse form. After solidification the foreign substance is removed by means of suitable solvents which are indifferent to the metal.

Non-ferrous alloys. WILLIAM B. PRICE (to Scovill Mfg. Co.). Can. 281,482, July 3, 1928. An alloy comprises not less than 98% of a mixt. of Cu, Ni and Sn. Cu is not less than 61.6% of total of said three metals, Sn not less than 0.5% of said total and the ratio of Ni to Cu does not exceed 3:7.

Alloys suitable for leading electric conductors. W. S. SMITH and H. J. GARNETT. Brit. 279,549, July 27, 1926. Alloys having high magnetic permeability at low magnetizing forces comprise Fe 14–15, Cu 14–16% and the remainder mainly Ni to which Mn not more than 0.5% and a deoxidizer may be added. The alloys may be heated

to 880° and cooled at 80° per min. and used in tape or wire form. Cf. *C. A.* **21**, 3343, 3597.

Copper alloys. OSCAR VON ROSTHORN. U. S. 1,675,008, June 26. In making Cu alloys contg. components of low m. p. such as Cd and Sn and a high proportion of Cu, by use of intermediate alloys, the intermediate alloys are added to the Cu in 2 portions, the first addn. contg. the component of lowest m. p. and the second those of higher m. p.

Hardened lead alloy. REGINALD S. DEAN and WILLIAM E. HUDSON (to Western Electric Co.). U. S. 1,674,955, June 26. See Can. 265,042 (*C. A.* **21**, 888). U. S. 1,674,954. Pb is alloyed with 2.45% of Sb, and after forming a supersatd. solid the soln. alloy is converted into a more stable condition by heating at 240°, quenching and aging. U. S. 1,674,956 specifies producing cable sheath of Pb by alloying it with not more than 2.5% Sb (but with more Sb than is sol. in solid Pb at room temp.), casting the alloy into ingot form and heating the ingot at a temp. (suitably about 240°) slightly below the fusion temp. to produce a substantially homogeneous solid soln., then extruding, quenching and aging. U. S. 1,674,957 specifies rolling hot ingots of Pb-Sb alloy to form the metal into a sheet, stamping storage battery plates or other articles from the sheet, quenching to a temp. below 100° to produce a supersatd. solid soln. and aging at a temp. below 100°. U. S. 1,674,958 specifies a Pb-Sb alloy in which Pb is the major constituent carrying finely divided particles of Sb substantially uniformly dispersed throughout the Pb.

Alloys of lead and antimony. REGINALD S. DEAN (to Western Electric Co.). U. S. 1,674,959, June 26. A solid alloy such as one contg. Pb 97.5 and Sb 2.5% may be heated at a temp. of about 240° to effect a supersatn. at a controlled rate. The product is then cooled and aged.

Alloy formed from nickel, bronze, copper and zinc. CHRISTINE S. CUSSEN. U. S. 1,674,640, June 26. Charcoal, Ni, bronze and Cu are heated together to a temp. above the m. p. of the metals, while agitated, Zn is added during further agitating and heating and, after discontinuing the application of the heat, As_2O_3 is added to the molten material and agitated with it to promote union of the metals.

Nickel-copper-aluminum alloys. TRUMAN S. FULLER (to General Electric Co.). U. S. 1,675,264, June 26. The phys. properties of an alloy consisting largely of Ni and Cu and contg. a small proportion of Al, e. g., an alloy of Ni 65, Cu 35 and Al 3-5 parts, are improved by deforming the alloy at a temp. of about 1000° and thereafter finishing the deformation of the material at a lower temp. but above 500° (suitably about 600°).

Silver alloys. R. P. JOSEPH and W. F. SCHNORR. Brit. 280,073, Feb. 7, 1927. Alloys (for uses such as those of sterling silver) contain Ag in preponderating proportion together with Sn, Zn, Au and Al. The combined quantity of Sn and Zn is preferably greater than the combined quantity of Au and Al, and Cd may replace the Sn or Zn or both. In casting the alloys, a stream of illuminating gas may be used to protect the molten metal from oxidation.

Removing aluminum from alloys. J. B. M. PEDERSEN. Danish 37,645, June 27, 1927. A mixt. of about 30% Fe_2O_3 , 40% SiO_2 , 10% water glass and 10% paraffin wax is worked into the melted alloy to form an Al-contg. slag.

Electrodes for arc welding. ALLGEMEINE ELEKTRIZITÄTS-GESELLSCHAFT (to International General Electric Co.). Brit. 279,886, Oct. 30, 1926. Structural features of electrodes are specified which may comprise flat, grooved or centrally cored material surrounded by a metal tube with an intervening layer of flux. MeOH or other suitable gas or liquid may be supplied for effecting the arc welding in a protective atm.

Ore flotation. C. H. KELLER. Can. 280,567, May 29, 1928. An ore contg. a mineral value and gang is concd. by agitating an aq. pulp of the ore with a sulphydic aromatic compd. contg. a single phenyl group and also a mineral-frothing agent so as to form a mineral-bearing froth. The froth is being sepd.

Ore flotation. C. H. KELLER. Can. 280,566, May 29, 1928. Fe-bearing ores are concd. by agitating a suitable pulp of the ore with a mineral frothing agent and with Et_3SnNa adapted to cooperate with the mineral frothing agent to produce by the action of both a mineral-bearing froth contg. a large proportion of a value and a diminished proportion of the Fe of the ore.

Action of strong sulfuric acid on olefins and alcohols. W. I. ORMANDY AND F. C. CRAVEN. *J. Inst. Petroleum Tech.* **13**, 844-54(1927).—Both olefins and alcs. (except the lowest members in each series) in the presence of an excess of concd. H_2SO_4 form satd. hydrocarbons and highly unsatd. substances remaining in acid soln. Alcs. and olefins from open-chain paraffins give open-chain paraffins, while alcs. from cyclic paraffins yield cyclic and polycyclic paraffins. When olefins and aromatics are brought together in contact with concd. cold H_2SO_4 , some of the aromatics join with the sepd. paraffins. BRIAN MEAD

The action of zinc on mixtures of polyhalogenated hydrocarbons with ketones and aldehydes. I. CUCULESCU. *Bul. chim. soc. română științe* **30**, 39-41(1928).—Whenever the mixts. of polyhalogenated hydrocarbons and ketones or aldehydes react with Zn, Zn halide is formed, together with an unsatd hydrocarbon, but no organo-metallic compd. is obtained. The mixts. contg. an aldehyde react better than those contg. a ketone. Iodides react more readily than bromides, and bromides better than chlorides. These reactions may be used to prepare cryst. products contg. the ketone or aldehyde and the Zn halide. A. L. HENNE

Synthesis under high pressure. Interaction of carbon monoxide and hydrogen. GILBERT T. MORGAN, RAYMOND TAYLOR AND THOMAS JOHNSON HEDLEY. *J. Soc. Chem. Ind.* **47**, 117-22T(1928).—The Chem. Research Lab. at Teddington, devoted to general investigations of high-pressure synthesis, is described in detail. Numerous illustrations and drawings of high-pressure equipment are reproduced. A "Tantiron" app. for generating CO from HCO_2H and H_2SO_4 is described. MeOH has been synthesized at 400 atm. in relatively large quantities by circulation of CO-H mixts. over any one of several catalysts made by mixing ZnO with other metallic oxides. Other ZnO catalysts contg. alk. substances were used to synthesize mixts. of methanol and higher alcs. These mixts. invariably contained small quantities of aldehydes, acids and esters. It was observed that primary alcs. only were identified; the aldehydes formed corresponded to the alcs.; addn. of Co to the basic Zn chromate catalyst favored the production of higher alcs.; rise in temp. of the catalyst favored MeOH formation. The reactions are assumed to involve primary HCHO synthesis. The results so far obtained on the MeOH equil. are in agreement with Audibert and Raineau's equation: $\log K_p = P_{MeOH}/P_{CO} \cdot (P_{H_2})^2 = 27,000/(4.517T) - 3.5 \log T - 3.6$. R. L. DODGE

Inhibition of esterification by pyridine. KENNETH C. BAILEY. Trinity College, Dublin. *J. Chem. Soc.* **1928**, 1204-6.—Under the exptl. conditions employed an esterification of 3.1% in 6 hrs., in the absence of any negative catalyst, was reduced to about 1.7% by addn. of about 70 parts of C_5H_5N per million; but further addn. (up to 800 parts per million) only reduced esterification to 1.37%. When the effective surface was increased by the insertion of glass tubes, the total surface area of which was approx. the same as that of the vessel, esterification, in the absence of C_5H_5N , reached 4.7%; by the addn. of about 300 parts of C_5H_5N per million, the esterification was again reduced to 1.7, the addn. of further C_5H_5N having comparatively little effect. C. J. WEST

Chelate compounds of thallium dialkyl. ROBERT C. MENZIES, NEVIN V. SMOG-WICK, ERIC F. CUTCLIFFE AND JOHN M. C. FOX. *J. Chem. Soc.* **1928**, 1288-91.—Thallium dimethyl acetylacetonate, m. 214-5° (some decompn.), results in 64% yield from Me_3TlI and TI acetylacetonate in EtOH; it sublimes at 170°; it dissolves slowly in cold and readily in hot H_2O ; it has an alk. reaction and gives a ppt. of Me_3TlI with KI . The benzoylacetone deriv., m. 128-9°, sublimes at 120° at 20 mm., results in 78.7%

from boiling TIOEt and Me_2TlBr in EtOH and then adding BzCH_2Ac ; it is also formed from the carbonate and BzCH_2Ac . The *salicylaldehyde deriv.*, lemon-yellow, decomps. 200° , sublimes at $160-70^\circ$ at 20 mm., results in 63% yield from *o*- $\text{HOC}_6\text{H}_4\text{-CHO}$ and the carbonate in C_6H_6 . *Et Tl dimethyl acetacetate*, m. $128-30^\circ$ (66% yield), by evapg. the filtrate from TIOEt and Me_2TlI and adding $\text{AcCH}_2\text{CO}_2\text{Et}$; the *diethyl deriv.*, m. $88-90^\circ$ (58% yield). *Thallium diethyl acetylacetone*, 81% yield. *Benzoyl-acetone deriv.*, m. $116-8^\circ$ (72% yield); 100 g. petrol. ether, b. $40-60^\circ$, dissolves 3.29 g. at 19° .

C. J. WEST

Refractivity and dispersivity of normal saturated monobasic aliphatic acids. I. H. WATERMAN AND S. H. BERTRAM. *Rec. trav. chim.* 47, 576-7(1928); cf. *C. A.* 22, 1326.—The oscillation phenomenon of properties of substances in the liquid state is real though smaller than in solids. The contradictory assertions of Verkade and Coops are declared invalid. Other authors confirm this phenomenon. R. H. LAMBERT

Oleic, palmitic and stearic acids as mother substances of petroleum. N. D. ZELINSKII AND K. P. LAVROVSKI. Univ. Moscow. *Ber* 61B, 1054-7(1928).—It was shown in an earlier paper (*C. A.* 22, 89) that decompn. of cholesterol with AlCl_3 gives a mixt. of hydrocarbons entirely similar in chem. and phys. properties (even as to optical activity) to natural petroleum. Of course, cholesterol cannot be the sole mother substance of petroleum and Z. and L. undertook to det. whether oleic, palmitic and stearic acids, so widely distributed in nature, would in and of themselves yield petroleum hydrocarbons under the same conditions as cholesterol. Oleic acid begins to react with AlCl_3 at room temp. but heating later becomes necessary and after a time there results a solid mass slightly elastic when broken. As the heating is continued to 150° the reaction becomes very rapid, with formation of CO_2 , combustible gases which decolorize KMnO_4 , and liquid products with a bluish green fluorescence. The yields are: gases about 10%, liquids 60-5%, tar 20-5%. The liquid, treated successively with concd. KOH, H_2O , CaCl_2 and Na, shows d_4^{20} 0.9280, and 600 g. on distn. with steam from alkali yields 155 g. of easily volatile products sepd. by distn. over Na into 68 g. of a fraction b. $35-150^\circ$, n_D^{20} 1.4115, and 75 g., b. $150-250^\circ$, n_D^{20} 1.4432, both of which rapidly decolorize KMnO_4 and of which 30 and 37%, resp., are absorbed by concd. H_2SO_4 , this being the chief difference from the product obtained from cholesterol, which contains less unsatd. compds. The portion non-volatile with steam, after drying with CaCl_2 and Na, yielded 97.5, 103, 67 and 40 g. b. $108-60^\circ$, $160-230^\circ$, $230-70^\circ$ and $270-310^\circ$, resp., n_D^{20} 1.4651, 1.4950, 1.5110, 1.5259; the first 2 fractions reacted with KMnO_4 . The $35-150^\circ$ fraction still reacted with KMnO_4 after treatment with H and Ni-asbestos at 180° and H_2SO_4 absorbed about 30% of the product. The insol. portion, distd. over Na, b. $70-160^\circ$, d_4^{20} 0.7149, n_D^{20} 1.4036, and had the odor and properties of a benzine in which the paraffin hydrocarbons predominate, differing in this respect also from the product obtained from cholesterol. The $119-25^\circ$ fraction, d_4^{20} 0.7193, of this product gave with Br and AlBr_3 a very small quantity of tetrabromo-*o*-xylene. The $150-250^\circ$ fraction, after hydrogenation under 30-5 mm. over Ni-asbestos and treatment with concd. H_2SO_4 , gave products b. $145-90^\circ$ and $190-215^\circ$, with n_D^{19} 1.4255 and 1.4351. The greenish color of the fraction b. $108-60^\circ$ is replaced by a blue fluorescence on hydrogenation *in vacuo* and about 27% now dissolves in concd. H_2SO_4 ; the non-fluorescent insol. portion b. $88-160^\circ$, d_4^{20} 0.8003, n_D^{19} 1.4488. That no hexahydroaromatic derivs. were present in the fractions previously treated with H_2SO_4 was indicated by the fact that no H was evolved and n did not change when they were subjected to dehydrogenation catalysis over Pt-charcoal at 300° . It is worthy of note that oleic acid with AlCl_3 yields liquid paraffins but neither cyclohexanes nor solid paraffins. The decompn. of palmitic and stearic acids with AlCl_3 over a free flame is much more rapid than that of oleic acid. Palmitic acid yielded a very small quantity of a liquid product b. $70-130^\circ$ and 60% of a cryst. product b. $240-360^\circ$, m. 79.5° after treatment with hot concd. KOH, hot H_2O and concd. H_2SO_4 , and recrystn. from alc.; the latter is a mixt. of paraffins with an av. mol. wt. of 412 (Rast). Stearic acid gave very little liquid, b. $130-90^\circ$, a little fluorescent oil, b. $100-40^\circ$, and 60% of a solid, b. $140-300^\circ$, m. 80.5° after treatment as above, mol. wt. 511. It is not unlikely that these 2 acids are the mother substances of the paraffin-rich petroleum.

C. A. R.

The reaction between magnesium derivatives and ethylene oxides. I. A. I. RIBAS. *Anales soc. españ. fis. quim.* 26, 122-32(1928).—The main product of the reaction of BrMgPh and $\text{MeOCH}_2\text{CH}_2\text{CH}_2\text{O}$ or $\text{CH}_3\text{OCH}_2\text{CH}(\text{OH})\text{CH}_2\text{Cl}$ is $\text{PhCH}_2\text{CH}(\text{OH})\text{CH}_2\text{-}$

OMe. Also $\text{PhCH}_2\text{CH}(\text{CH}_2\text{O}) + \text{MeOH} = \text{PhCH}_2\text{CH}(\text{OH})\text{CH}_2\text{OMe} + \text{PhCH}_2\text{CH}(\text{OMe})\text{CH}_2\text{OH}$, and the product so obtained is identical with that obtained with the Mg compd. This gives the constitution and course of the Grignard reaction for this chlorohydrin and ethylene oxide. The reaction with ethylene oxide is parallel to that of $\text{ClCH}_2\text{CH}(\text{CH}_2\text{O}) + \text{BrMgPh}$ and $\text{MeCH}(\text{CH}_2\text{O}) + \text{BrMgMe}$, so that sub-

stitution of the Cl of epichlorohydrin and the H of propylene oxide by the MeO radical has no influence on the opening of the ethylene oxide ring by the Grignard reagents hitherto employed.

Complex salts of β -methyltrimethylenediamine with bivalent platinum. FREDERICK G. MANN. Univ. of Cambridge. *J. Chem. Soc.* 1928, 1261-3.—In an attempt to obtain decisive evidence regarding the uniplanar or tetrahedral configuration of complex salts of bivalent Pt, salts of $\text{MeCH}(\text{CH}_2\text{NH}_2)_2$ were studied; the 6 salts prepd. showed no sign of *cis-trans* isomerism, which they should if they are uniplanar; the salts from active acids could not be resolved into optically active forms, which should be the case if they are tetrahedral. Thus no conclusion can be drawn. *Bis-[\beta*-methyltrimethylenediamine]platinous dichloride, m. $266-7^\circ$ (decompn.); *dibromide*, m. $266-8^\circ$ (decompn.); *diiodide*, m. $263-4^\circ$ (decompn.); *dinitrate*, deflagrates violently on heating; *di-d-camphor- β -sulfonate monohydrate*, m. $279-81^\circ$, $[\alpha] 15^\circ$ (H_2O , c 1.467%); *di-d- α -bromocamphor- π -sulfonate*, decomp. $278-85^\circ$, $[\alpha] 69.2^\circ$ (H_2O , c 0.8453%); *ditartrate*, thick sirup.

Polymerization and condensation. II. Products of inter-reaction of potassium acetate and epichlorohydrin. P. A. LEVENE AND A. WALT. Rockefeller Inst. *J. Biol. Chem.* 77, 685-96(1928); cf. *C. A.* 22, 59, 2741.—When epichlorohydrin is heated with dry AcOK, the following substances may be isolated from the reaction product by fractional distn.: acetylgycidol, diacetin, diacetylglycerylglycidol, triacetylglycerylglycidol and higher condensation products. Thus acetylgycidol has a tendency to condense into di- and polymol. substances in the same manner as free glycidol. *Diacetylglycerylglycidol*, m. 125° .

A. P. LOTHROP

Configurational relationships of 2-hydroxyvaleric acid and lactic acid. P. A. LEVENE AND H. L. HALLER. Rockefeller Inst. *J. Biol. Chem.* 77, 555-62(1928); cf. *C. A.* 21, 3599.—*d*-PrCH(OH)CO₂H yields *l*-MePrCHOH on reduction. In this acid, therefore, the OH group is allocated on the same side of the chain as *d*-4-hydroxyvaleric acid which gives *d*-MePrCHOH on reduction, since it is evident that on reducing the CO₂H groups of these 2 acids to Me groups, 2 carbinols which are enantiomorphous to each other will be obtained. "An important practical significance of this conclusion lies in the fact that it furnishes additional evidence of the validity of the indirect method of correlating the configurations of substituted aliphatic acids. The *d*-PrCH(OH)CO₂H on passing to its anion changed its rotation to the left, and, according to the rule developed in this lab., the acid should belong to the *l*-series, and now it has been shown by the direct method that it does belong to the *l*-series."

A. P. LOTHROP

An x-ray examination of saturated dicarboxylic acid and amides of the fatty acid series. JAMES WALKER. *Proc. Roy. Soc. Edinburgh* 48, 20-7(1928).—The study of x-ray diffraction by normal satd. di-CO₂H acids has been extended to include the following acids: C₃H₄O₄, C₄H₆O₄, C₅H₈O₄, C₆H₁₀O₄, C₇H₁₂O₄, C₈H₁₄O₄ and C₁₀H₁₈O₄. The *d*₁ spacings agree with the data of Trillat. The series of acids shows the difference in properties between odd- and even-numbered acids with respect to x-rays that it does in its other phys. properties, and there is no const. increment of *d*₂ as the length of the C chain increases. With the monoalkylmalonic acids (the C₆, C₈, C₇, C₁₀ and C₁₂ acids are reported) *d*₁ increases fairly regularly (1.0-1.3 A. U. per CH₂) with the no. of CH₂ groups; and this spacing is concluded to be a measure of the length of the mol., with only 1 mol. between successive reflecting planes. This is a different arrangement from that postulated by Stewart and others for the fatty acids, where it is assumed that they are arranged with the terminal polar groups together. This may be because the two terminal CO₂H groups mutually satisfy the residual valences within the mol., leaving insufficient affinity to orient another group. The dialkylmalonic acids resemble the monoalkyl acids. In dioctadecylmalonic acid the *d*₁ spacing is the same as that of the mono-acid, suggesting that the two long CH₂-chains are parallel to one another; whereas, in the lower members of the series, the chains must diverge, since the *d*₁ spacings are smaller for the di-substituted acids than for the corresponding mono-acids. The fatty acid amides give results similar to those of the acids themselves. The cleavage planes are sepd. by the length of 2 mols. which are oriented in

opposite directions. In no homologous series so far investigated are the $\delta d_1/\delta n$ values exactly const. but only approx. so. The chains may have a spiral structure with the angles between adjacent C atoms not necessarily const., but only approx. equal to the tetrahedral angle.

A. W. KENNEY

Imide ring closure in derivatives of diketosuccinic acid phenylosazone. FREDERICK D. CHATTAWAY AND WM. G. HUMPHREY. Queen's College, Oxford. *J. Chem. Soc.* 1928, 1094-8.—Diketosuccinic anhydride phenylosazone (I), fused with $\text{CO}(\text{NH}_2)_2$ for 10 min., gives *diketosuccinimide phenylosazone*, orange-yellow, m. 189° ; it is stable towards HCl but with boiling aq. NaOH gives 4,5-diketo-1-phenylpyrazoline-3-carboxylic acid 4-phenylhydrazine. I and PhCH_2NH_2 in Et_2O give the *benzylamine salt of benzylldiketosuccinamic acid phenylosazone*, light yellow, m. 165° (decompn.); Ac_2O gives I; AcOH or HCl gives *benzylldiketosuccinimide phenylosazone*, orange-yellow, m. 179° . *Dibenzylamine salt*, light yellow, m. $161-2^\circ$ (decompn.), of *dibenzylldiketosuccinamic acid phenylosazone*, orange-yellow, m. 180° . PhNH_2 and I, boiled 10 min., give a mixt. of *diketosuccinanilic acid phenylosazone*, orange-yellow, m. 201° (decompn.), crysts. with 1 AcOH and m. $135-200^\circ$, according to rate of heating, the AcOH is removed by washing with Et_2O or EtOH; and *diketosuccinanil phenylosazone*, orange-red, m. 252° (decompn.). PhNHNH_2 and I in AcOH give *diketosuccinophenylhydrazide phenylosazone*, orange-yellow, m. 270° (decompn.); the *phenylmethylhydrazide deriv.*, bright yellow, m. 243.5° (decompn.). The *p*-tolylhydrazine (corresponding to I) and PhNH_2 , boiled 1 min., give *diketosuccinanil p-tolylhydrazine*, yellow, m. 199° (decompn.); *2,4-dichlorophenylhydrazine*, orange-yellow, m. 308° (decompn.); *2,4-dibromophenylhydrazine*, orange, m. 309° (decompn.). *Diketosuccinophenylhydrazide o-tolylphenylosazone*, orange-yellow, m. 250° (decompn.), *2,4-dibromophenylhydrazide o-tolylphenylosazone*, orange-yellow, m. 295° (decompn.).

C. J. WEST

Steric series. IX. Configurations of the monosubstituted propionic and succinic acids. KARL FREUDENBERG AND ALFRED LUX. Univ. Heidelberg. *Ber.* 61B, 1083-9 (1928); cf. *C. A.* 22, 943.—The configurations of the $\text{MeCHBrCO}_2\text{H}$ having been established by optical comparison with the lactic acids, it was logical to det. in the same way the relationships between the bromosuccinic (I) and malic acids. The (–)-I proved to belong to the *l*-series. The configurations of chloroaliphatic acids can be derived directly from those of the corresponding Br acids. If the $\text{Et}(-)\alpha$ -azidopropionate is also assigned to the *l*-series, its conversion by Forster and Pierz into natural *l*(+)-alanine is another stone in the edifice of the interrelationships between the substances of these groups. In Paper VIII it had already been possible to classify the reactions of the lactic acid group according as they were or were not accompanied by inversion and this can now be done for the succinic acid group also. Comparison of the 2 series of reactions shows that in both groups the most varied reagents have the same effect (rearrangement or non-rearrangement). Kuhn and Wagner-Jauregg have recently (*C. A.* 22, 2145), by an entirely different method, reached the same conclusions as F. and L. as to the configurations of the chlorosuccinic acids, and that the natural (+)-lactic (sarcosuccinic) acid, (–)-halopropionic acids, (+)-alanine, (–)-malic acid, (–)-monohalosuccinic acids and (+)-asparaginic acid all belong to the *l*-series seems to be established with certainty. As the result of these investigations it may be stated that in the liquid state only without a solvent and in the form of derivs. in which all dipolar and associating groups (CO_2H , HO, NH_2) are blocked off, α -hydroxy-, amino- and haloaliphatic acids of the same configuration undergo, almost without exception, a change of rotation in the same direction under the influence of the same substituents. (–)-I, m. 179° , $[\alpha]_D^{20} -70.2^\circ$ (AcOEt). *Dichloride* (10 g. from 10 g. of the acid with PCl_5 in CHCl_3), b_1 56° , $d^{22}_4 1.796$, $[\alpha] -85.3^\circ$, -104.81° -130.5° for the lines 625, 589, 546, $[\alpha]_D^{22} -58.4^\circ$. *Di-Me ester*, b_1 79° , $d^{19}_4 1.513$, $[\alpha] -82.2^\circ$, -98.8° , $-119.4^\circ(?)$ (given as -19.4° in the original.—ABSTR.), $[\alpha]_D^{19} -65.3^\circ$. *Di-Et ester*, $[\alpha]_D^{20} -48.2^\circ$, prepd. from a I contg. 94% active acid, whence $[\text{M}]_D^{20}$ calcd. for the optically pure ester is -130° . *Di-Pr ester*, b_1 108° , $d^{21}_4 1.279$, $[\alpha] -43.8^\circ$, -53.1° , -64.0° , $[\alpha]_D^{21} -41.5^\circ$. *dl-I bisdimethylamide*, from the active or inactive chloride in Et_2O at -15° with Me_2NH , m. 79° . *l*(–)-*Methoxysuccinyl dichloride*, $d^{22}_4 1.341$, $[\alpha] -51.3^\circ$, -59.8° , -69.2° , $[\alpha]_D^{22} -44.6^\circ$, $[\alpha]_D -54.0^\circ$ (6.4% soln. in C_6H_6). *l*(–)-*Acetylmethyl dichloride* (3 g. from 3 g. of the acid), b_{14} 118° , $d^{22}_4 1.377$, $[\alpha] -15.5^\circ$, -18.0° , -20.1° , $[\alpha]_D^{22} -13.1^\circ$.

C. A. R.

History of the isomerism of fumaric and maleic acids. RICHARD ANSCHÜTZ. *Ann.* 461, 155-91(1928); cf. *Ann.* 254, 168(1889).—I. *Action of NH_3 and primary amines upon CO_2 , citraconic, ethylmaleic and dimethylmaleic anhydrides.* (WITH OSWALD

SCHARFENBERG, FERDINAND HAAS AND PAUL TRUMMEL.)— NH_3 and citraconic anhydride in Et_2O give 11–12 g. of the NH_4 salt of citraconamidic acid (I), m. 120–3°; in C_6H_6 , 8–9 g., m. 128–9°; in PhMe , 10–11 g., m. 135–6°; the free I m. 125°; on diln. of an aq. soln. there remains acid NH_4 citraconate, m. 139–40°, of which 2.07 g. dissolves in 100 g. 99% EtOH at 12°. This change was followed by pptn. with AgNO_3 ; the Ag salt of I was analyzed. The equil. is given for 0, 30, 60 and 120 min. at 0°, 50°, 70°, 90° and 100°. The Ag salt and MeI give the Me ester of I, m. 84–5°. The Ag salt of citraconanilidic acid and MeI give the Me ester, m. 126–7°, transformed by boiling H_2O into the anil and by KOH into the anilide. *Et* ester, m. 158°. *Citracono-p-toluidic acid*, m. 170–1°; NH_4 salt, yellow, hygroscopic product; *Ag* salt; *Me* ester, m. 105°; *Et* ester, citron-yellow, m. 168–9°; H_2O gives the anil, m. 114–5°; the anhydride and PhNHNH_2 give the *phenylhydrazide*, m. 108.5°. The action of Br and then of BaCO_3 upon $\text{AcCHETCO}_2\text{Et}$ gives β -mono-*Et* methylmesaconate or ethylfumarate, $\text{EtO}_2\text{CCEt:CHCO}_2\text{H}$, m. 88°; with KOH , there results ethylfumaric acid, m. 194–5°; with EtOH and HCl , the di-*Et* ester, b_{12} 122–3°; partial sapon. of this ester gives the α -mono-*Et* ester, $\text{HO}_2\text{CCEt:CHCO}_2\text{Et}$, m. 53°. The NH_4 salt of ethylmaleamidic acid (II), slightly hygroscopic, m. 123–4° (decompn.). The free acid could not be obtained, since HCl gives ethylmaleic acid. The anhydride and NH_4OH give ethylmaleic imide, m. 141°. Ethylmaleanilidic acid, m. 106–7°, citron-yellow. The *Ag* salt of II and MeI give the *Me* ester, m. 118–9°. Ethylmaleic anil, yellow, m. 129–30°. $\text{AcCHMeCO}_2\text{Et}$ and HCN give the cyanohydrin (III), $\text{MeC(OH)(CN)CHMeCO}_2\text{Et}$, b_{12} 127–8°, d_4^{25} 1.0549; sapon. with HCl and distn. gives dimethylmaleic anhydride, b_{12} 105°, m. 95–6°. The *Ac* deriv. of III, b_{12} 148–9°, does not split off AcOH on distn. at atm. pressure, as was hoped. NH_3 gives the NH_4 salt of dimethylmaleamidic acid, m. 123–4° (decompn.). The *Ag* salt and MeI give the *Me* ester, m. 57–8°. The free acid could not be prepd., since it decomp. into $\text{NH}_3(\text{NH}_4\text{Cl})$ and the anhydride. The anhydride and EtNH_2 in Et_2O give the ethylammonium dimethylmalecthylamide, hygroscopic. NH_4 salt dimethylmaleinanilide; *Ag* salt; *Me* ester, m. 69–70°. Dimethylmale-*p*-toluidic acid, m. 74–7°; NH_4 salt, hygroscopic; the *Me* ester, on crystn., gives diethylmaleic *p*-tolil, m. 110°. II. Action of ammonia and primary amines upon xeronic or dimethylmaleic anhydride, diphenylmaleic anhydride and bromocitraconic anhydride. (WITH ALEXIS VON VOLBORTH.)— NH_4 salt diethylmaleamidate, m. 136–7°; *Ag* salt. The PhNH_2 salt of diethylmaleic anhydride, m. 52–3°; boiling with H_2O gives diethylmaleic anil, m. 62–3°. *p*-Toluidine salt diethylmale-*p*-toluidate is pale yellow, m. 57°; heating with H_2O gives the *p*-tolil, m. 107°. The NH_4 diphenylmaleamidate, m. 147–8°, gradually turns yellow on standing and loses NH_3 over H_2SO_4 . *Ag* salt; warming the NH_4 salt in H_2O gives the anhydride, while AgNO_3 ppts the *Ag* salt of diphenylmaleic acid. *p*-Toluidine diphenylmale-*p*-toluidate, m. 119–20°, heated above 80°, it gradually decomp. into the *p*-tolil, m. 194°. NH_4 bromocitraconamidate, m. 27–9°; warming 0.5 hr. at 100° completely converts it into NH_4 bromocitraconate. Aniline bromocitraconanilide, m. 127–8°; warming the aq. or alc. soln. gives the anil; the NH_4 salt decomp. at 80°; *Ag* salt. *p*-Toluidine salt bromocitracon-*p*-toluidate, m. 123°; NH_4 salt, m. 108–9°; *Ag* salt. Heating the *p*-toluidine salt gives the *p*-tolil, m. 135.9–6°, yellow. III. Aniline, *p*-toluidine and β -naphthylamine derivatives of bromofumaric acid and bromomaleic acid. (WITH OTTO NEUHAUS.)—Bromofumaric acid and PCl_5 give the chloride, b_{14} 93°, the calcd. quantity of PhNH_2 in Et_2O gives the monoanilide (IV), m. 154°, of the chloride, H_2O gives the free acid, m. 147°. *Me* ester, m. 126°; the dianilide, m. 162°. Warming IV with 2 *N* NaOH gives anilinomaleic dianilide, m. 175°; heating a longer time with dil. NaOH gives the fumaric acid isomer, m. 194°. The *p*-toluidide (V), corresponding to IV, intensely yellow, m. 159°; the ditoluidide, yellow, m. 184°. The free acid from V, yellow, m. 169°; *Me* ester, yellow, m. 105–6°. The β -naphthylamide, corresponding to IV, yellow-red, m. 160°; the free acid, m. 176–7°; *Me* ester, yellow, m. 117°; dinaphthylamide, yellow-green, m. 234°. Bromomaleanilidic acid, yellow, m. 141°; *Ag* salt; *Me* ester, pale yellow, m. 122°, *p*-toluidic acid, yellow, m. 162°; *Me* ester, pale yellow, m. 92°; β -naphthylamidic acid, deep yellow, m. 173°; *Me* ester, yellow, m. 112°; β -naphthylimide, dark yellow, m. 208°. Fumaryl bromide, b_{32} 113–5°. (WITH PAUL BAUMGES.)—*Me* fumaryl monochloride, b_{17} 83°; *Et* ester, b_{17} 84°; dibenzyl fumarate, m. 60–1°; benzyl acid ester, m. 98°. Benzyl acid citraconate, m. 86°; benzyl acid itaconate, m. 92°; dibenzyl mesaconate, b_{65} 160–5°; acid ester, m. 71.5°.

C. J. WEST

Actions of Grignard reagents upon α -aminodicarboxylic acids. S. KANAO AND S. INAGAWA. *J. Pharm. Soc. Japan*, **48**, 238–52(1928).—Paal and Weidenkaff (*C. A.* **1**, 718) obtained $\text{Ph}_3(\text{HO})\text{CCH}_2\text{CH}(\text{NH}_2)\text{C(OH)Ph}_3$ from $\text{EtO}_2\text{CCH}_2\text{CH}(\text{NH}_2)\text{CO}_2\text{Et}$

and PhMgBr . But unexpected results were obtained when K. and I. tried the above reaction on homologous aminodicarboxylic esters. Thus, $d\text{-EtO}_2\text{CCH}_2\text{CH}(\text{NH}_2)\text{CO}_2\text{Et}$ and PhMgBr gave, instead of the expected $\text{Ph}_2(\text{HO})\text{CCH}_2\text{CH}(\text{NH}_2)\text{C}(\text{OH})\text{Ph}_2$, α' -[α -pyrrolidonyl]diphenylmethanol, needles, m. 191° , $[\alpha]_D^{20} = -86.38^\circ$ (CHCl_3). *dl-Compd.*, m. $182-3.2^\circ$. The pyrrolidonyldialkylcarbinols prep'd. in this way gave color reactions resembling those of diketopiperazines with $3,5\text{-(O}_2\text{N)}_2\text{C}_6\text{H}_3\text{CO}_2\text{H}$. They undergo ring rupture when sapon'd. with $\text{Ba}(\text{OH})_2$ or alkali hydroxide and give α,α -dialkyl- γ -amino- α -hydroxyvaleric acid. By reduction with Na and AmOH , they give α -pyrrolidylalkylcarbinols. E. g., α' -pyrrolidonyldiethylcarbinol, on reduction, gives α -pyrrolidyl-diethylcarbinol, whose phys. and chem. properties resemble those of Hess's α -pyrrolidylethylcarbinol (C. A. 8, 127) and Putochin's α -pyrrolidylcarbinol (C. A. 18, 983). These reactions give not only the dialkyl or diaryl derivs. of the pyrrolidone series, but also those of the piperidine series. Thus, $\text{Et-}\alpha$ -aminoadipate and PhMgBr gave α' -[α -piperidonyl]diphenylmethanol, needles, m. $225-6^\circ$. Di-Et *l*-aspartate (I) and PhMgBr gave tetraphenylaminobutanol, m. $147-8^\circ$, $[\alpha]_D^{20} = 31.37^\circ$, which differed from the *dl*-compd. (m. $149-50^\circ$) of P. and W. I and PhMgBr gave 2,5-dimethyl-3-aminoheptane-2,5-diol (III), b. $137-9.5^\circ$, m. $87-8^\circ$, $[\alpha]_D^{20} = -17.7^\circ$. *HCl* salt, m. $89-9.5^\circ$. *Bz* deriv., m. $146-7^\circ$. Boiling of III with 33% H_2SO_4 gave $\alpha,\alpha,\alpha',\alpha'$ -tetramethyl- β' -aminotetrahydrofuran, b. $66-7^\circ$, d_4^{20} 0.9021, n_D^{20} 1.4412, mol. refr. 41.91, $[\alpha]_D^{20} = -8.03^\circ$. *HCl* salt, m. 262° . *Bz* deriv., m. 136° . Conclusions: Grignard reagents give aminoglycols, with the esters of aspartic acid, while with the esters of α -aminoglutaric or of α -aminoadipic acid, α' -dialkyl- or diarylcarbinols of heterocyclic α -pyrrolidone or α -piperidone will result. Besides the compds given above, the following new ones are described 3,6-Diethyl-4-amino-octane-3,6-diol, b. $182-3^\circ$. $\alpha,\alpha,\alpha',\alpha'$ -Tetraethyl- β' -aminotetrahydrofuran, b_{15} 113-3.5 (cor.), d_4^{20} 0.9168, n_D^{20} 1.4678, mol. refr. 60.33, $[\alpha]_D^{20} = -9.59^\circ$. *HCl* salt, m. $270-5^\circ$. 4,7-Dipropyl-5-aminodecane-4,7-diol, light yellow, b_{15} 173-4°. 5,8-Dibutyl-6-aminodecane-5,8-diol, light yellow, b_{15} 180-4°. α' -[α -Pyrrolidonyl]-1-methylethanol-1-ol, b_{15} 201-2°. α' -[α -Pyrrolidonyl]-1-ethylpropan-1-ol, m. $91-2^\circ$, b_{11} 209-10°, $[\alpha]_D^{20} = -7.1^\circ$. 1-[α -Pyrrolidyl]-1-ethylpropan-1-ol, b_{15} 214-8°, d_4^{20} 0.95769, n_D^{20} 1.4718, mol. refr. 45.93. *HCl* salt, m. $160-1^\circ$, $[\alpha]_D^{20} = -9.22^\circ$. chloroaurate, m. $103-4^\circ$. picrate, m. $147-8^\circ$. 1, α' -[α -Pyrrolidonyl]-1-butylpentan-1-ol, m. $102-5-3-0^\circ$. 1, α' -[α -Pyrrolidonyl]-1-benzyl-2-phenylethanol-1-ol, m. 202° . Di-Et α -aminoadipate, b_{11} 155-6°. Et α -piperidonecarboxylate, b_{15} 181-2.5°.

NAO UYBI

Influence of the "conversion yield" and of the temperature of condensation on the purity and on the "condensation yield" in the synthesis of phosgene. FRANCESCO GIORDANI. Reale Scuola Ingegneria Napoli. *Ann. chim. applicata* 18, 90-6 (1928).—Mathematical. It is shown that the condensation process, which with the compn. of the gases issuing from the converters, indicates the % and purity of the condensate, can be calcd. The *conversion yield* is the proportion of the equimol. mixt. which reacts. The *condensation yield* is the ratio of the quantity of COCl_2 condensed to that formed. The *integral yield* is the product of the conversion and condensation yields. The following calcd. data give the temp. of condensation, the mol. concn. of COCl_2 in the liquid product, the condensation yield, and the integral yield, resp. (the calcs. being based on an original mixt. contg. 98% of $\text{CO} + \text{Cl}_2$ and a 90% conversion yield): 0° , 0.973, 0.378, 0.340; -10° , 0.942, 0.824, 0.741; -15° , 0.935, 0.888, 0.799; -20° , 0.928, 0.924, 0.831; -25° , 0.924, 0.948, 0.849; -35° , 0.810, 0.994, 0.894. Similar calcs. can be made for other temps., original mixts. and conversion yields. The data show that it is not economical to employ a temp. below -20° , and very low condensation temps. are economical only for the production of gas for use where purity is not essential and free Cl is unobjectionable. The method described is of particular value because of the analytical difficulties involved in detg. COCl_2 , Cl, CO, CO_2 , O and N to obtain the conversion yield (cf. Berthelot, *Bull. soc. chim.* [2], 14, 15 (1870)).

C. C. DAVIS

Reactions of carbonylhydrazide. II. ANDREW M. MUNRO AND FORSYTH J. WILSON. Royal Tech. College, Glasgow. *J. Chem. Soc.* 1928, 1257-61; cf. C. A. 21, 1248.—The view that in the thermal decompn. which carbonylhydrazones (or δ -amino-semicarbazones) undergo at their m. p. the hydrazidicarbonylhydrazide (or hydrazidicarbonylhydrazide itself) is the intermediate product has been confirmed by investigating the thermal decompn. of dibenzaldehydehydrazidicarbonylhydrazide (heating at 250° for 3 hrs. gives benzylideneazine and 4-aminourazole (I)); hydrazidicarbonylhydrazide (N_2H_4 ,

of isolating the native lignin in unchanged form from the plant-cell membrane. The method most used at present is based on the destruction of the saccharifiable constituents of the cell wall with highly concd. HCl. The acid treatment must not be continued too long, to avoid alteration of the lignin, and on the other hand it must not be too short, as the phys. and chem. union between the lignin and carbohydrates may in part not be destroyed and the carbohydrates not be completely converted into H₂O-sol. forms. The object of the present work was the study of the influence of time, temp. and concn. of the HCl on the purity and yield of the lignin. A prerequisite was a more thorough and qual. knowledge of the carbohydrates remaining attached to lignin obtained from wood insufficiently treated with HCl. For the detn. of the carbohydrate content of such preps. the usual indirect hydrolytic method (renewed treatment with concd. acid and detn. of the sugar in the hydrolyzate by the Bertrand method) gives quite consistent results if the hydrolysis is sufficiently long and always carried out under the same conditions, but the abs. values obtained are, for various reasons, not without objection (the formation of the sugars may be accompanied by their decomn. under the influence of the acid, the pentoses always present are calcd. as hexoses, and possibly the lignin itself may yield reducing substances such as HCIO or sugars). Reliable results were to be expected, therefore, only from methods which permit of isolating the carbohydrates in substance. By the Schmidt ClO₂ method the lignin substance in the cell membrane is oxidized and rendered sol. in NaHSO₃, Me₂CO or alc., while the carbohydrates remain unchanged; treatment of the product with NaHSO₃ leaves undissolved the complex of cellulose, galactose-free hemicelluloses (H₈) and polymeric acids designated as "skeletal substance," while with Me₂CO are obtained all the carbohydrates (in addn. to the "skeletal substance," the so-called hemicelluloses of the incrustations (H₇), which contain galactose). These 2 methods, together with a 3rd described below, were applied to the lignin preps. and the carbohydrates thus obtained were characterized by hydrolysis and fermentation. The ClO₂-NaHSO₃ products were about 67% fermentable by both *Saccharomyces cerevisiae* and *Schizosaccharomyces pombe* and were, therefore, free of galactose. Fermentation of the ClO₂-Me₂CO products with *S. cerevisiae* indicated the presence of at least as much pure hexosan as was found of crude polysaccharides in the same preps. by the NaHSO₃ method, showing that the Me₂CO process gives more carbohydrates than the NaHSO₃ method. Whether this is due to the presence of hemicelluloses of the incrustations could not be detd. because no fermentation with *S. pombe* was carried out, but in an earlier investigation (Hannemann, *Diss. Munchen*, 1922) the carbohydrates (about 8%) of a similar lignin prep. had been hydrolyzed off by renewed treatment with concd. HCl and galactose had been qual. identified, along with glucose, fructose, mannose and xylose. The hemicelluloses of the incrustations are possibly not alone responsible for the larger quantity of carbohydrates found by the Me₂CO method; it may be that parts of the skeletal substance, hydrolyzed by the concd. HCl to dextrin-like products, become sol. in NaHSO₃ and therefore are missed in that process; in lignin preps. contg. only very little carbohydrates, the latter can be isolated comparatively less readily than when large quantities are present and it can hardly be assumed that as hydrolysis proceeds the hemicelluloses of the incrustations would accumulate in the last carbohydrate residues remaining attached to the lignin. The compn. of the carbohydrates in lignin preps. and the ability to sep. them in the form of insol. polysaccharides permits of concluding that they consist of residues of the saccharifiable wood constituent, with cellulose predominating, which have escaped the disintegrating action of the concd. HCl. This view was confirmed by isolating the carbohydrates in an entirely different way without destroying the lignin substance, viz., by extn. with CuO-NH₄; from the filtered ext. they are pptd. in most part (contaminated with some lignin) by acids and hydrolysis and selective fermentation shows that they are qual. and approx. quant. the same as those obtained by the ClO₂-NaHSO₃ process. The extn. with CuO-NH₄ affords a practical method for prep. lignin free of carbohydrates. It is improbable that the lignin is hurt by such a treatment. No absorption of N could be detected and there is no decrease in the MeO content (as is usually the case on oxidation of lignin) but an increase; thus, in one prep. the MeO content rose from 12.2 to 15.4% while the carbohydrate content decreased from 19.5 to 0.23%. Furthermore, the extd. lignin, like the normal product, can readily be further methylated until it contains about 30% MeO. This latter fact further indicates that HCl lignin is a definite product closely related to native lignin and not a condensation product of a hypothetical purer lignin with carbohydrates. For the main expts. the ClO₂-NaHSO₃ method was used because, although it does not yield the carbohydrates as completely as the other methods, it does yield them rapidly and

readily in the form of pure, colorless, directly weighable polysaccharides. The values for the carbohydrate content thus obtained are always somewhat lower than those obtained by hydrolyzing 48 hrs. at 15° with 30 parts of HCl (d. 1.21); the values obtained on various preps. by the 2 methods, resp., were as follows: 24.8, 21.9; 24.0, 19.5; 10.0, 9.2; 9.0, 8.5; 3.8, 1.7; 3.5, 1.6; 0.60, 0.46; 0.63, 0.17. Systematic expts. were then carried out on pine wood to det. the mildest conditions of HCl treatment under which a practically carbohydrate-free product can be obtained, the wood being first treated 4 hrs. with concd. HCl to dissolve the cellulose and liberate the lignin ("chief hydrolysis") and then 18 hrs. with more dil. acid to break down the polysaccharides just to the point where smooth filtration becomes possible ("after-hydrolysis"). At room temp. (17–20°) an acid of at least d. 1.205 must be used; at lower temps. products contg. carbohydrates are obtained and at –10° this is true even with an acid of d. 1.21, but such an acid can be used at 1°. The "chief hydrolysis" is complete in 2 hrs. The conditions prescribed by Willstatter and Kalb (C. A. 17, 982) (HCl of d. 1.21 at 15°) therefore give a lignin practically free of carbohydrates. The yield of pure lignin (crude lignin minus carbohydrate content) is in all cases around 26–7% of the wood, *i. e.*, the lignin content does not increase during the treatment with HCl, a fact which speaks against the assumption of a condensation of the lignin with carbohydrates. In another series of expts. the wood was treated for varying lengths of time with HCl of d. 1.22 at 0° and poured into H₂O and the ppt. extd. with CuO-NH₃. Repeated extn. of wood with CuO-NH₃ dissolves out a considerable portion (Ungar's "lignocelluloses") but it is not possible in this way to obtain a carbohydrate-free lignin even when the wood has previously been treated 20 min. or less with HCl; after treatment for at least 2–2.5 hrs. with the d. 1.22 acid at 0°, however, a practically carbohydrate-free lignin can be obtained. Here again the yields of pure lignin, calcd. by subtracting from the yields of crude products their carbohydrate contents as detd. by the ClO₂-NaHSO₃ method, are in the neighborhood of the "normal" values (25–6%). There is, however, a remarkable difference between the carbohydrate-contg. products obtained by the Willstatter-Kalb and the HCl-CuO-NH₃ methods; in those obtained by the 1st method, the carbohydrate can be removed with CuO-NH₃, as mentioned above; possibly the "after-hydrolysis" breaks up the chem. although not the phys. adsorptive union between the lignin and the carbohydrates; in agreement with this is the fact that the HCl compds. of the products prepd. by the W.-K. method, even when they contain much carbohydrate, always have the black-brown color of the HCl compd. of the carbohydrate-free lignin and not the green color which seems to be specific to the HCl compd. of the still phys. and chem. combined lignin-carbohydrate complex.

Chemistry of polycyclic structures in relation to their homocyclic unsaturated isomerides. IX. The effect of the spirocyclopentane grouping on the five-carbon intra-annular tautomeric nucleus. FRANK R. GOSS Univ. of Leeds. *J. Chem. Soc.* 1928, 1306–10; cf. C. A. 21, 3187.—Oxidation of 5-cyclopentanespirodi-cyclopentan-3-one-1-carboxylic acid (I) with K₃Fe(CN)₆ and K₂CO₃ gives principally 5-cyclopentanespirocyclopentan-3-ol-1,4-dione (II), yellow, m. 154° (isolated as the *Me* ether, m. 65°); it gives a cherry-red color with alc. FeCl₃, liberates CO₂ from NaHCO₃ and decolorizes alk. KMnO₄, the 2nd fraction of the esterification product is *Me* 5-cyclopentanespirodi-cyclopentan(or cyclopenten)-4-ol-3-one-1-carboxylate, m. 145°; the free acid, m. 110° (decompn.). Oxidation of 5-cyclopentanespirodi-cyclopentadien-3-ol-1,2-dicarboxylic acid (III) with alk. K₃Fe(CN)₆ gives only II. Oxidation of I with alk. KMnO₄ gives α,α -dihydroxycyclopentane-1,1-diacetic acid (IV), m. 98°. Oxidation of III with alk. KMnO₄ gives IV and α -ketocyclopentane-1,1-diacetic acid, mainly the former.

C. J. WEST

Conversion of hydroaromatic into aromatic compounds. II. Action of bromine on 5-chloro- and 5-bromo-1-phenyl- Δ^4 -cyclohexen-3-one. LEONARD E. HINKEL and DONALD H. HEY. Univ. College, Swansea. *J. Chem. Soc.* 1928, 1200–4; cf. C. A. 19, 267.—Phenyldihydroresorcinol and PBr₃ in CHCl₃, heated 3 hrs. at 70°, give 5-bromo-1-phenyl- Δ^4 -cyclohexen-3-one, m. 81.5°, which has an irritating effect on the skin and gradually splits off HBr in a moist atm. Br in CHCl₃ gives 4,5,5-tribromo-1-phenyl-cyclohexan-3-one, m. 82° (decompn.). Heating on the H₂O bath until evolution of HBr ceases gives a mixt. of 4,5-dibromo-3-hydroxydiphenyl, m. 81° (3 α deriv., m. 104°), and the 5-Br deriv., b₁₁ 208–10° (B α deriv., m. 108°). EtOH-KOH gives 5-bromo-3-ethoxydiphenyl, m. 70–1°, as well as the above 2 Br derivs. 5-Chloro-4,5-dibromo-1-phenylcyclohexan-3-one, m. 98.5°; crystn. from Et₂O gives an unstable form, m. 88.5°; EtOH-KOH gives a mixt. of 5-chloro- and 5-bromo-3-ethoxydiphenyl in mol. proportions, m. 68–9°, in addn. to a mixt. of dihalogen derivs.

C. J. WEST

Aldehydes from acetylenecarbinols. I. Cyclohexylideneacetaldehyde. H. RUPP, W. MESSNER AND E. KAMBLI. *Helv. Chim. Acta* 11, 449-62(1928).—Cyclohexanone with Na or NaNH₂ and C₂H₂ gives 45-55% acetylenecyclohexanol (I), b₁₂ 74-76°. I (15 g) with Ac₂O gives the acetate (14.5 g.), b₁₀ 87°, and some acetylenedicyclohexanol (II) m. 109-10°. II with Ac₂O and AcONa gives the diacetate, m. 46-7°. II with HCO₂H gives 92.3% cyclohexylideneacetaldehyde (III), b₁₂ 84-5°, d₄²⁰ 0.9694, n_D 1.49081, n_{H_α} 1.48743, n_{H_β} 1.50055; semicarbazone, m. 214-5°; oxime, m. 61-2°, phenylhydrazone, stable in H₂ and decomp. in air into a red oil. III with H₂ and Ni catalyst and with AcOH and Zn gives cyclohexylacetaldehyde, b₁₂ 69°, d₄²⁰ 0.9187, n_{H_α} 1.45029, n_D 1.45273, n_{H_β} 1.45856; semicarbazone, m. 171-2°. With O₃, KMnO₄, CrO₃ or H₂O₂ III gives adipic acid, m. 147-8°. With EtMgBr III gives ethylcyclohexylacetaldehyde, b₁₀₋₁₁ 84-5°, and 1-ethyl-2-cyclohexylidenethanol, b₁₂ 97°. The latter with Ac₂O and AcONa gives a hydrocarbon which is probably 1-cyclohexylidene-1-butene, b₁₂ 77-8°. The rearrangement of the acetylenecarbinols into aldehydes is a general reaction whose mechanism is considered to be:

J. S. REICHERT

Carbon rings. X. Monocyclic diketones of 16-, 18- and 30-membered carbon rings. I. RUZICKA, W. BRUGGER, C. F. SEIDEL AND H. SCHINZ. *Helv. Chim. Acta* 11, 496-512(1928).—The decompn. of metallic salts of the ω,ω'-dicarboxypolymethylenes, particularly the salts of the Al and Ti groups, gives cyclic monoketones and diketones. Th salt of azelaic acid decomp. with heat, giving 0.6% cyclohexadecane-1,9-dione (I), b₂ 180°, m. 83-4°, disemicarbazone, m. 240°; dioxime, m. 185-6° and an unidentified diketone, m. 75-6°; semicarbazone, m. 128-30°. The reduction of I with Zn and HCl gives cyclohexadecane, m. 61°. With BzCHO and Na, O₂ and CrO₃, and MeOH, I gives the di-Me ester of 7-keto-1,14-dicarboxytetradecane, m. 45°. The free acid, m. 109-10°, upon reduction with Na-Hg and HCl gives 1,14-dicarboxytetradecane, m. 121°. Azelaic ester with Fe gives the di-Me ester of 8-keto-1,15-dicarboxypentadecane, m. 57-9°; free acid (II) m. 115-6°. Th salt of II upon heating gives I. Th salt of sebacic acid gives cyclooctadecane-1,10-dione (III), m. 96-7°, dioxime, m. 166-8°; disemicarbazone, m. 230° with (decompn.). The reduction of III with Zn-Hg and HCl gives cyclooctadecane, m. 72°; semicarbazone, m. 184°. Cyclopentadecanone with BzH gives benzylidenecyclopentadecanone, b₁ 190°, which with O₃ and CrO₃, and MeOH gives the di-Me ester of 1,13-dicarboxytridecane, m. 43°. Residues from the prepn. of cyclopentadecanone from Th salt of 1,14-dicarboxytetradecane yielded (a) bis[tetradecyl] ketone, m. 65-6°, b₂ 225-30°, d₄⁷⁰ 0.8100 (oxime, m. 41-2°; isoxime, m. 84°), and (b) cyclotriacontane-1,16-dione (IV), m. 74-5° (disemicarbazone, m. 218-9°; dioxime, m. 130-1°). With BzH, IV gives a reaction mixt. which with O₃ and CrO₃ gives 14-keto-1,28-dicarboxyoctacosane (V), m. 101-3°. Upon reduction V gives 1,28-dicarboxyoctacosane, m. 108°. With Zn-Hg and HCl IV gives cyclotriacontane, m. 53-4°, and cyclotriacontanone (semicarbazone, m. 149-50°).

J. S. REICHERT

Nature of the alternating effect in carbon chains. XXV. The mechanism of aromatic side-chain substitution. CHRISTOPHER K. INGOLD AND EUGENE ROTHSTEIN. Univ. of Leeds. *J. Chem. Soc.* 1928, 1217-21; cf. *C. A.* 22, 1963.—The general problem of the influence of nuclear substituents on reactions in the side chains attached to an aromatic nucleus is greatly simplified by the assumption that side-chain reactions fall into 2 main categories, in 1 of which (A) facilitation occurs by the influx of electrons toward, and in the other (B) by a recession of electrons from the side chain concerned. If mechanism B (prior ionization of H) were to operate in the side-chain halogenation of PhMe and similar substances, there are few substituents which would facilitate its action more strongly than an *o*- or *p*-NO₂ group, for *o*- and *p*-Me₂C₆H₃NO₂ are known to undergo reactions indicating that their side-chain H is prone to ionization. In the bromination of 2,1,4-O₂NC₆H₂Me₂, side-chain substitution occurs to the extent of at least 76% in the side chain adjacent to the NO₂ group; thus side-chain halogenation (and probably also nitration) of alkylbenzenes and their nuclear substitution products proceeds by mechanism A; a similar mechanism probably applies to the substitutions of methanes and other aliphatic hydrocarbons. 3-Nitro-*p*-xylyl bromide, m. 76°; 3-nitro-*p*-xylyl-ω-trimethylammonium picrate, m. 138°. XXVI. The nitration of ω-chloro- and ω-bromo-*p*-xylene. *Ibid* 1278-80.—*p*-MeC₆H₄CH₂Cl (16.1 g.) in 30 cc. Ac₂O, gradually added to 9 g. fuming HNO₃ in 20 cc. Ac₂O at 10-12°, gives, after

6 hrs., 14.9 g. of the 3-NO₂ deriv.; about 3 g. of 3-nitro-4-methylbenzyltrimethylammonium picrate was isolated from the liquid portion and also 1.7 g. of a mixt. of 2- and 3-nitro-4-methylbenzyl Et ethers. Thus the predominating substitution occurs in the position ortho to the Me group. XXVII. Nitration of some aromatic phosphonium, arsonium and stibonium salts. C. K. INGOLD, FLORENCE R. SHAW AND IAN S. WILSON. *Ibid* 1280-6.—The proportions of *m*-derivs. formed on nitration are: R=Ph, RNMe₃, 100; RPhMe₃, 100; RAsMe₃, 98.2; RSbMe₃, 86.3%; R=PhCH₃, RNMe₃, 88; RPhMe₃, 10.1; RAsMe₃, 3.4. *Phenyltrimethylphosphonium picrate* (I), yellow, m. 132-3°; *benzyl deriv.* (II), m. 173°; *benzyltrimethylarsonium picrate* (III), yellow, m. 175-6°; *phenyltrimethylstibonium picrate*, m. 153°. Nitration of I at 60° for 7 hrs. gives the *m*-NO₂ deriv., m. 166-7°. Nitration of II at -17° for 2 hrs. gives the *p*-deriv., m. 188-9° (71% yield); the *m*-deriv., m. 171-2°; the *o*-deriv., m. 152-3°. Nitration of phenyltrimethylarsonium picrate was effected by heating with HNO₃ (d. 1.52) at 100° for 5 hrs., the *m*-NO₂ deriv., orange-yellow, m. 180°. The *p*-NO₂ deriv. of III, m. 203°.

C. J. WEST

Action of sulfur monochloride on diphenylamine. E. I. ORLOV. *Z. Furben-Ind.* 20, 121-2 (1928).—*Trithiodiphenylamine* (I) is formed by the action of S₂Cl₂ on Ph₂NH in benzene. Nitration of I gives a dye which from NH₃ soln. gives fast red shades on wool.

FREDERICK C. HAEN

Diphenylamine-*p*-arsonic acid. CHARLES S. GIBSON AND JOHN D. A. JOHNSON. Univ. of London. *J. Chem. Soc.* 1928, 1286-8; cf. Burton and Gibson, *C. A.* 20, 1606.—The m. p. of *p*-PhNHC₆H₄AsO₃H₂ (I) having been questioned by Lieb and Wintersteiner (*C. A.* 22, 1577), the prepn. of I was again repeated. Reduction of *p*-O₂NC₆H₄NACPh with Fe in EtOH and AcOH gives *N*-acetyl-*p*-aminodiphenylamine-*(p*-acetophenylaminoaniline), m. 127-8°; this was converted according to B. and G., into I, which m. 295-7° (decompn.); the *HCl* salt m. 153-5° (decompn.); the Na salt seps. from solns. in warm 25% NaOH.

C. J. WEST

The chemotherapeutic activity of some arsonic acids and its relation to the chemical constitution. W. KOLLE, H. BAUER AND F. LEUPOLD. *Tschirch-Festschrift* 1926, 9 pp.; *Chem. Zentr.* 1927, I, 481-2.—The influence of the CO group in arsonic acids of *o*-aminophenol and *o*-C₆H₄(NH₂)₂ on their biol. activity was studied. The compds. tested included 3,4-H₂N(HO)C₆H₃AsO₃H₂ (I), oxazolone deriv. (II) of I, 4,3-isomer (III) of I, oxazolone deriv. (IV) of III, *N*-Me deriv. of II, *N*-MeAc deriv. of I, 3,4-(H₂N)₂C₆H₃AsO₃H₂ (V), imidazolone (VI) of V, 3-*N*-Me deriv. (VII) of V, 4-*N*-Me deriv. (VIII) of V, imidazolone deriv. of VII, imidazolone deriv. of VIII (1-methyl-benziminoazolone-5-arsonic acid or 1-methyl-2-ketobenzimidazole-2,3-dihydrate-5-arsonic acid), 3-amino-4-ethylaminophenylarsonic acid (IX), imidazolone deriv. of IX, 4,3-Pr(H₂N)C₆H₃AsO₃H₂ (X), imidazolone of X, 4-allyl analog (XI) of X, imidazolone of XI, hydroxyethyl deriv. (XII) of V, imidazolone deriv. of XII, benzyl deriv. (XIII) of V, and imidazolone of XIII. I, II, V and VI were prepd. by the action of COCl₂ on the hydroxyamino- and the diamino phenylarsonic acids. The method of prepn. of IV has been described elsewhere (cf. U. S. patent 1, 539,798, *C. A.* 19, 2210). No simple relation between the biol. activity and the substituents could be established. The imidazolone deriv. of VIII showed a surprisingly good effect, showing itself when administered *per os*, superior to "spirocide" and to "tryparsamide."

C. C. DAVIS

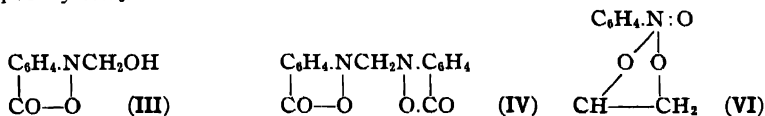

Condensation of formaldehyde with β-hydroxynaphthoic arylides. KURT BRASS AND PAUL SOMMER. Deutsch. Forschungs-Inst. Textil-Ind., Stuttgart-Reutlingen. *Ber.* 61B, 993-1002 (1928).—This work was undertaken to study the mode of action of HCHO in the stabilization of the naphtholate solns. in the so-called "naphthol AS" dyeing. In the belief that this action of HCHO might be similar to that in the long-known condensations of HCHO with β-naphthol and 2,3-C₁₀H₆(OH)CO₂H (I), HCHO was added to an alk. soln. of 2,3-C₁₀H₆(OH)CONHPH ("naphthol AS") (II) in concns. comparable to those used in practice. After a few hrs. the yellow di-Na salt of *methylemed-β-hydroxynaphthoic anilide*, CH₃(C₁₀H₅(OH)CONHPH)₂ (III), could be pptd. quant. with NaCl. The reaction is general for the arylides of I, and I itself also gives CH₃(C₁₀H₅(OH)CO₂H)₂ (IV) in alk. soln., as had already been found by Hosaeus in acid soln. The free III is yellow and difficultly sol. in alkalies and forms a yellow, difficultly sol. mono-Na salt. The dinaphthylmethane constitution of III was confirmed by acetylation, analysis, mol. wt. detns. and reductive cleavage (Fries and Hüner) to 1-methyl-2-hydroxy-3-naphthoic acid (V), characterized by its intense greenish yellow color and tannin-like odor. Although the presence of two HO groups in III and IV has been established it has not been possible to convert them into the corresponding dinaphthopyrans with either POCl₃ or HCl; on the other hand, on heating IV in the air

at 285° there is obtained, with loss of H₂O, a characteristic red-violet melt. **IV** also colors concd. H₂SO₄ a deep red-violet. Earlier investigations indicate that β -naphthol and HCHO yield CH₂(C₁₀H₇OH)₂ in both acid and alk. soln., but the acid condensation becomes somewhat more complex as soon as substituents are introduced into the naphthol. Thus, the **IV** obtained in alk. soln. is not completely identical with the product prepd. in acid soln. (Strohhach); the latter cannot be acetylated or recrystd., resinifying in both cases, apparently by-products are formed in the acid condensation. In AcOH-H₂SO₄ **II** and HCHO gave 20% **III**; the other 80% of the product was an alkali-insol substance with the same compn and mol. wt. as **III** but had no m. p., could not be recrystd. or acetylated and gave no red color with concd. H₂SO₄. Alk. solns. of the arylides of **I** therefore contain the di-Na salts of the arylides of **IV** which are more stable than those of the arylides of **I**, probably because the α -positions to the HO groups are occupied by the CH₂ bridge. **III** couples with 2 mols. PhN₂Cl to *benzenearazo- β -hydroxynaphthoic anilide* (**VI**), also obtained from **II** and PhN₂Cl, *i. e.*, in the coupling of **III** the CH₂ residue is split off. **III** (76.42% from 30 g. **II** in 60 cc. of 30% NaOH and 2 l. H₂O with 20 cc. of 40% HCHO), m. 263.5°, mol. wt. in camphor 539.5, in boiling C₆H₅N 523.28. *Diacetate* of **III**, m. 252°. *Acetate* of **II**, m. 160°. *α -Naphthalide* of **IV** (yield, 65.1%), light yellow, m. 268-9°, mol. wt. in boiling C₆H₅N 607.1, easily sol. in C₆H₅N with brown-red color and green fluorescence, in cold concd. H₂SO₄ with orange color quickly becoming red at 50-60°. *β -Naphthalide* (59.00%), yellow, m. 287-8°, mol. wt. in boiling C₆H₅N 635.83. **V**, sublimes at 205° under 12 mm., mol. wt. in boiling Et₂O 198.95, m. 231°, is strongly irritating to the mucous membranes, gives in H₂O with FeCl₃ a steel-blue color, dissolves easily in alkalis with yellow color, the soln. coupling with diazotized *p*-O₂NC₆H₄NH₂ only after some time, with faint red color, *acetate*, colorless needles with a faint greenish yellow, ivory-like luster, m. 184-4.5°, gives no color with FeCl₃, is odorless and has no antipyretic action or other useful therapeutic properties. C. A. R.

Syntheses with diazomethane. III. *o*-Nitrophenylethylene oxide and the substances obtainable from it. F. ARNDT, B. EISTERT and W. PARTALE. Univ. Breslau. *Ber.* 61B, 1107-18(1928); cf. *C. A.* 21, 2897.—"Nitraldin," the chief product of the action of CH₂N₂ on *o*-O₂NC₆H₄CHO, is *o*-nitrophenylethylene oxide (**I**), O₂NC₆H₄CH₂CH₂O, and the isomer obtained by mild treatment of **I** with acids is *o*-

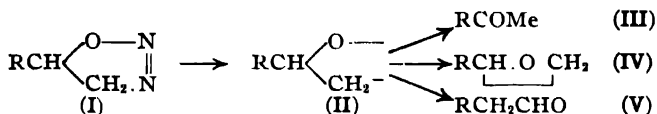

nitrosobenzoylcarbinol, ONC₆H₄COCH₂OH (**II**), which in turn isomerizes into **III**. This last change can be effected smoothly only in the presence of excess of HCHO; the HCHO prevents the disocn. of **III** into HCHO and benzisoxazolone, which would lead to resinification or, in the presence of acids, to the formation of **IV**. These reactions had already been described and the structures of **III** and **IV** had been established but had led to an erroneous conclusion as to the structures of **I** and **II**, *viz.*, that in these compds. also the two C atoms of the side chain were not joined to each other. When, however, **II** is treated with alkali, it gives, although in only small yield, *N*-hydroxyisatin, showing that the two C atoms are still joined to each other, probably as shown in formula **II**. The best way to establish this seemed to be by reduction of **II** to *o*-aminobenzoylcarbinol (**V**), but as **II** undergoes deep-seated change under the influence of the very weakest acids or alkalis, in fact on mere heating alone, a reducing agent acting rapidly and specifically in almost neutral medium had to be used. Dil aq. N₂H₄ H₂CO₃ was found to answer the purpose; on gentle warming it smoothly reduces the NO group in **II** to NH₂ with evolution of the calcd. quantity of N₂. That the product is really **V** is shown by the fact that it can be diazotized, yields mono- and diacyl derivs and a phenylhydrazine and on warming with alkalis smoothly forms indoxyl, with loss of H₂O. For nitraldin there remained possible, in view of the lack of C=O and HO reactions, only the structures **I** and **VI**. **VI** takes into account the apparently peculiar position occupied by *o*-O₂NC₆H₄CHO, representing, as it does, a structural coöperation of the NO₂ group, moreover, the 2 formulas are interchangeable into each other by a simple shifting of bonds and explain in essentially the same way all the reactions of the compd. That **I** is the correct formula was established by the observation that aldehydes other than *o*-O₂NC₆H₄CHO with CH₂N₂ give, instead of Me ketones, isomers which can be considered only as ethylene oxides (see following abstr.). Unfortunately, the formation of ethylene oxides from aldehydes and CH₂N₂ was first discovered with *o*-O₂NC₆H₄CHO, where the ethylene oxide properties of the product are so greatly modified by the *o*-NO₂ group; *e. g.*, HCl, instead of giving the chlorohydrin, O₂NC₆H₄CH(OH)CH₂Cl (**VII**) yields **IV**. Ac₂O as such does not appreciably react with **I**, but in the presence of a little FeCl₃ there is a very vigorous reaction. This is typical of ethylene oxides but, whereas ordinarily the corresponding diacetylglycols are formed,

I gives the acetate of II, and mild treatment with acid gives II instead of the glycol and, under the influence of the NO group, on gentle warming the whole CH_2OH group breaks away from the C and migrates to the N with formation of III, which dissociates into HCHO . The liberation of HCHO from the ethylene oxide I directly probably takes place in the same way. The influence of the NO_2 group on the transformations of the ethylene oxide ring is not manifested in alk. soln. In $\text{C}_6\text{H}_5\text{N}$ I smoothly adds HCl to form VII, whose structure was established by oxidation to $o\text{-O}_2\text{NC}_6\text{H}_4\text{COCH}_2\text{Cl}$. VII is converted back into I by cold dil. alkali but, unlike I, smoothly forms a benzoate by the Schotten-Baumann method (also obtained by addn. of BzCl to I in $\text{C}_6\text{H}_5\text{N}$). The addn. of acid chlorides in $\text{C}_6\text{H}_5\text{N}$ is a general reaction of ethylene oxides. These addn. products, in which the tension of the ethylene oxide ring is released, are no longer explosive and behave like normal NO_2 compds., e. g., dissolve in concd. H_2SO_4 without reaction. Just as the NO_2 group influences the reactions of the ethylene oxide ring, so the latter influences the reduction of the NO_2 group. Under certain conditions is obtained a little anthranil, under others some indole; the main reaction, in all cases, is general resinification. On the other hand VII is smoothly reduced to the NH_2 compd. (VIII), converted by alkalis partly into indole, partly into polymers of indole or of the hypothetical aniuophenylethylene oxide. The rearrangement of ethylene oxides into aldehydes observed by Tiffeneau is prevented in I by the NO_2 group; that a relationship exists between I and $o\text{-O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CHO}$, however, is indicated by the fact that among the by-products in the formation of I are $o\text{-O}_2\text{NC}_6\text{H}_4\text{COPh}$ and *o*-nitrophenylacetone (IX), also synthesized in the usual way from $\text{AcCH}_2\text{CO}_2\text{Et}$, the production of IX is attributed to the intermediate formation of $\text{O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CHO}$, which then reacts normally with the CH_2N_2 . IX was actually obtained from the aldehyde (prepd. according to Weerman) with CH_2N_2 . The aldehyde, however, cannot be formed from the I itself, which does not isomerize into the aldehyde; it is probably produced from the 1st product of the reaction, dihydrofurodiazole (see following abstr.). *o*-Nitrophenylethylene chlorohydrin (VII) (3 g. from 5 g. I), m. $60\text{--}1^\circ$, $b_{17} 170^\circ$ (considerable decompn.); acetate, $b_{18} 186\text{--}8^\circ$, $b_{18} 192\text{--}4^\circ$, m. $69\text{--}70^\circ$, benzoate, m. $87\text{--}8^\circ$. *o*-Amino compd. (VIII) (2–3 g. from 5 g. VII with $\text{SCl}_2\text{--HCl}$), m. $86\text{--}7^\circ$. Acetate of II, m. 104° to a green liquid which turns brownish. V (2.5–3.0 g. from 5 g. II), light yellow, m. 98° , almost odorless when cold, evolves a sweetish odor when heated, especially in soln., immediately reduces Fehling soln., becomes red-violet above its m. p., gives a dark blue dye with concd. HNO_3 or FeCl_3 ; *N*-Ac deriv., obtained by short boiling with a little Ac_2O , m. 141° , easily sol. in 2 *N* NaOH with formation of indoxyl on heating; *di*-Ac deriv., prepd. by short boiling in $\text{C}_6\text{H}_5\text{N}$ with 3 mols. AcCl , easily sol. in a little hot NaOH , forms no indoxyl on heating; *di*-Bz deriv., m. $167\text{--}8^\circ$; phenylhydrazone, faintly yellow, becomes reddish in the air, m. 198° . IX, m. $26\text{--}7^\circ$, gives an intense violet color with alc. KOH ; semicarbazone, m. $213\text{--}4^\circ$ (decompn.). Et α -[*o*-nitrophenylacetyl]acetoacetate (13 g. from 15 g. $\text{AcCH}_2\text{CO}_2\text{Et}$, Na and $\text{O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{COCl}$ in Et_2O) m. $76\text{--}7^\circ$, sol. in 2 *N* NaOH , slowly in Na_2CO_3 , also in dil. alc. KOH , with yellow color, in 20% alc. KOH with dark blue color soon changing to brown, gives in $\text{C}_6\text{H}_5\text{N}$ with a drop of concd. alc. KOH an intense blue color changing to brown, decompd. by concd. H_2SO_4 with brown color; 12 g. refluxed with 2 *N* H_2SO_4 yields 3.5 g. IX, together with 3 g. *o*-nitrophenylacetylacetone, m. $62\text{--}3^\circ$, not further hydrolyzed by boiling 2 *N* H_2SO_4 , sol. in dil. alkali with yellow color, forms with concd. alc. KOH the yellow K enolate, gives with concd. alc. KOH in $\text{C}_6\text{H}_5\text{N}$ a dark green-blue color, yields with aq. $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$ 3-methyl-5-*o*-nitrophenylpyrazole, m. $120\text{--}1^\circ$, sol. in 2 *N* HCl , reprecipitated by NH_3 .

IV. The reaction between aldehydes and diazomethane. F. ARNDT and B. EISTERT. *Ibid* 1118–22.—Schlotterbeck was so convinced that aldehydes give with CH_2N_2 the corresponding Me ketones, that he believed that this synthesis proved the structure of the compd. (I) obtained from CCl_3CHO to be CCl_3COMe , but in view of the work described in the preceding abstr., A. and E. suspected it might well be the isomeric 1,1,1-trichloropropylene 2,3-oxide and such proved to be the case, for in the presence of a little FeCl_3 it adds 1 mol. Ac_2O and it readily combines with HCl to a stable product which can be distd. Work to be reported on later has shown that *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$ with CH_2N_2 gives only $\text{O}_2\text{NC}_6\text{H}_4\text{COMe}$ and the *p*-compd. about equal parts of the ke-

tone and the ethylene oxide, *i. e.*, the disturbing influence of the NO₂ group increases in the order $m \rightarrow p \rightarrow o$. Accumulation of NO₂ groups, on the other hand, seems to destroy this disturbing influence, for according to Sonn 2,4,6-(O₂N)₃C₆H₂CHO gives the ketone (yielding a phenylhydrazone). The tendency of an aldehyde to form an ethylene oxide seems to be related with the introduction into it of substituents which impart a disinclination to the presence of a doubly bound O atom. Thus, CCl₃-CHO readily forms a hydrate, and *o*-O₂NC₆H₄CHO an acetal, and while no hydrate of this aldehyde has been isolated its soly. in concd. alkalis and repptn. by acids may well be due to the presence of such a hydrate in aq. soln. The *p*-aldehyde is likewise sol., although to a lesser extent, in alkalis, while the *m*-compd. is not. A. and E. believe the mechanism of the reaction can be represented by the scheme

In certain cases (V) the O atom combines not singly but doubly with the C atom of CH₂ group while 1 of the H atoms of the latter migrates to the aldehyde C atom (cf. preceding abstr.: formation of O₂NC₆H₄CH₂COMe, presumably through O₂NC₆H₄-CH₂CHO, from *o*-O₂NC₆H₄CHO and CH₂N₂). After repeated distn. *in vacuo*, I b₁₃ 44-5°, b₇₆₀ 149°. 1,1,1,3-Tetrachloro-2-hydroxypropane, from I and HCl, b₁₇ 95-6°, has a faint CHI₃-like odor. 1,1,1-Trichloro-2,3-diacetoxypyrane, b₁₆ 126-8°. V. The reaction of acid chlorides with diazomethane. F. ARNDT AND J. AMENDE. *Ibid* 1122-4.—According to Nierenstein and Staudinger acid chlorides with CH₂N₂ give ClCH₂ ketones while A. and his co-workers had found that *o*-O₂NC₆H₄COCl gives almost exclusively O₂NC₆H₄COCHN₂. This is even less peculiar to the *o*-O₂N compd., as was at first supposed, than in the case of the aldehydes (preceding abstrs.); the expts. hitherto carried out with BzCl, AcCl and ClCH₂COCl indicate that all acid chlorides first give the diazo ketone, the end result depending primarily on the exptl. conditions. If the chloride is gradually added to a soln. of several mols. of the CH₂N₂, so that the latter is always present in excess, the CH₂N₂ takes up the liberated HCl and the diazo ketone is the chief product; conversely, if the CH₂N₂ is added gradually to the chloride so that it is at once used up by the latter, the liberated HCl decomps. the diazo ketone with formation of the Cl ketone. The nature and stability of the diazo ketone also have some influence; *o*-O₂NC₆H₄COCl gives almost only the diazo ketone even by the 2nd of the above methods. *o*-Diazouacetophenone (4.5 g. from 6 g. BzCl in 100 cc. Et₂O slowly dropped into 2.5 mols CH₂N₂ in 300 cc. Et₂O, concd. to 40 cc. after several hrs. and cooled to -15°), m. 49°, smoothly converted into BzCH₂OH by hot dil. H₂SO₄. MeCOCHN₂, faintly yellow, b₁₃ 49°, solidifies in a CO₂ freezing mixt 1-Diazo-3-chloroacetone, light yellow, m. 3°, b₁₃ 75°.

Tautomerism of *o*-nitrobenzaldehyde. F. ARNDT. *Ber.* 61B, 1125-6(1928).—Very brief discussion of the evidence pointing to the incorrectness of Tanasescu's views (C. A. 22, 951) on the tautomerism of *o*-O₂NC₆H₄CHO. C. A. R.

Hydrochalcones and hydrochalcals. P. FRIEGER, E. KALCKBRENNER, W. KUNZE AND K. LEVIN. Univ. Bonn. *J. prakt. Chem.* 119, 109-30(1928).—In general the chalcones were reduced by H and Pt to hydrochalcones, which were then reduced by Na-Hg in EtOH to the hydrochalcals. Hydrochalcals are a light yellow oil, which cannot be purified by distn. *in vacuo* because of the splitting off of H₂O; d₂₀ 1.0614, n_D²⁰ 1.5724; the *p*-nitrobenzoate, m. 89-90°; heated at 130° for 6 hrs. with ZnCl₂, there results 30-47% of PhCH₂CH:CHPh. 3,4-Dimethoxyhydrochalcals, m. 67.5-8.5° (70% yield); oxime, m. 109°, PhMgBr gives the *tert. alc.*, C₁₃H₂₄O₃, m. 102-3°. 3,4-Methylenedioxyhydrochalcals, m. 57-8° (Bargellini and Bini, C. A. 6, 625, give 39-41°); on standing in the sunlight the compd. becomes canary-yellow after 8 days; the color persists in the dark. MeMgI gives the *alc.*, C₁₇H₁₈O₃, m. 50-2°. 3,4,4'-Trimethoxyhydrochalcals, m. 57°; this does not change color in the sunlight. *o*-ClC₆H₄CHO and BzMe give 85-95% of 2-chlorochalcals, pale yellow, m. 51.5°. Reduction gives 66% of 2-chlorohydrochalcals, m. 46.5°; oxime, m. 113°. 2-Chlorohydrochalcals, light orange oil, d₂₀ 1.1636, n_D²⁰ 1.5831; *p*-nitrobenzoate, m. 115°; phenylurethan, m. 100.5°. With dry HCl at 60° there results about 70% of α -chloro- α -phenyl- γ -[*o*-chlorophenyl]-propane, b₁ 151-4°; analysis indicates 10% of the Cl deriv. 2-Chloro-4'-methoxychalcals, m. 91.5-2°; the hydro deriv., m. 48°; oxime, m. 90-1°. 2-Bromo-4'-methoxychalcals, m. 79.5°; the hydro deriv., m. 65°; oxime, m. 99.5-100°. Dihydrobenzal-

2-aceto-1-naphthol, light yellow, m. 98° (75% yield); *Ac deriv.*, m. 89–90°. *Dihydro-piperonal-2-aceto-1-naphthol*, m. 103–4° (90% yield). *o-Chlorobenzal-7-methoxychromanone*, m. 132°; the *hydro deriv.*, m. 75° (*oxime*, m. 162–3°). *o-Bromobenzal-7-methoxychromanone*, m. 164°. *Benzalnaphthochromanone*, yellow, m. 131–2° (50% yield); *piperonal deriv.*, light yellow, m. 170–1° (25% yield); *fural deriv.*, CdS-yellow, m. 145° (50% yield).

C. J. WEST

Use of chromic mixtures for oxidation of *o*-toluenesulfamide into saccharin. V. S. ZAIKOV AND P. I. SOKOLOV. *J. Chem. Ind.* (Moscow) 3, 1304–7 (1926).—The use of chromic mixts. in the oxidation of *o*-MeC₆H₄SO₂NH₂ into saccharin presents the difficulty that acids have a hydrolyzing action on saccharin which results in the formation of *o*-HO₂CC₆H₄SO₂NH₂ and of HO₂CC₆H₄SO₂H. To study the extent of this hydrolyzing action by H₂SO₄ of various concns. at different temps., Z. and S. worked with pure crystd. saccharin, which they submitted to the action of 20, 70 and 90% H₂SO₄ at 50°, 60°, 70°, 90° for 2.5 hrs. at a time. The amt. of pure H₂SO₄ taken was 45 g. (no matter in what diln.) for 4 g. of saccharin. The method used was based on the circumstance that the 2 org. acids formed by hydrolysis, being more sol. in water than saccharin, remain in soln. and can thus be sepd. from residual saccharin. It was found that the extent of hydrolysis depends but little on the concn. of the acid, but depends chiefly on the operating temp. The reaction sets in with marked speed at 60° and further rise of temp. increases the speed of hydrolysis. It is advisable to operate with 70% H₂SO₄ at 50–60° so as to hydrolyze as little saccharin as possible. The next series of expts. were devoted to the study of the course of the reaction of oxidation of pure *o*- and *p*-MeC₆H₄SO₂NH₂ by mixts. of K₂Cr₂O₇ and H₂SO₄ as a function of temp. and of concn. of H₂SO₄ and of K₂Cr₂O₇. It was found that the character of the reaction of oxidation depends chiefly on the concn. of H₂SO₄. Good yields of saccharin are obtained by operating at about 45° with oxidizing mixts. contg. 70% H₂SO₄ and a max. concn. of K₂Cr₂O₇. Elevation of temp. (not above 60°) and increasing concns. of K₂Cr₂O₇, all other conditions being equal, accelerate the reaction. The oxidation of *p*-MeC₆H₄SO₂NH₂ goes on with greater speed than that of the *o*-amide. Chrome alum present in the oxidizing mixt. increases the speed of the reaction. By operating under favorable conditions yields of saccharin above 90% of the theoretical are obtainable. Three diagrams are given.

BERNARD NELSON

2-Bromo-3-nitrobenzoic acid. PAUL J. CULHANE. *Org. Syntheses* 7, 12–4 (1927).—The following should be added to *C. A.* 21, 3898. The use of a soln. of I (255 g. I and 166 g. KI in 250 cc. H₂O) with anhydro-2-hydroxymercuri-3-nitrobenzoic acid gives 61% of 2,3-I(NO₂)C₆H₃CO₂H (based on the 3-nitrophthalic acid used).

C. J. WEST

Oxidation of nitrophenylcyanoacetates. II. ARTHUR FAIRBOURNE AND HAROLD R. FAWSON. King's College, London. *J. Chem. Soc.* 1928, 1077–80; cf. *C. A.* 21, 1257.—Studies of the oxidation of nitrophenylcyanoacetates indicate that the nature of the product depends upon the nitrophenylcyanoacetate rather than upon the agent employed. 2,4-(O₂N)₂C₆H₃CCl(CN)CO₂Et with CrO₃ in glacial AcOH or with concd. H₂SO₄ gives *Et 2,4-dinitrophenylchloromalonate*, m. 121°, which gives a purple color with EtOH-KOH; the corresponding *Br deriv.*, m. 157°, was previously termed *Et 2,4-dinitrobromophenylhydroxycyanoacetate*. 2,4-Dinitrophenylchloroacetamide, m. 134°, results from the cyanoacetate and H₂SO₄ at 120–30° for 0.5 hr.; the *Br deriv.*, m. 160°. The Ag deriv. of (O₂N)₂C₆H₃CH(CN)CO₂Et, boiled with I in EtOH for 0.25 hr., boiled with an equiv. amt. of (O₂N)₂C₆H₃CCl(CN)CO₂Et in EtOH for 4 hrs., or boiled with EtOH alone for 2–3 hrs., gives *Et α,β-bis-2,4-dinitrophenyl-α,β-dicyanosuccinate*, m. 156°. The position of the halogen atom in the side chain of the product of the chlorination or bromination of 2,4-(O₂N)₂C₆H₃CNa(CN)CO₂Et was definitely established by the prepn. of *Et 2,4-dinitrobenzoylformate phenylhydrazone* from both products by warming with 0.5 N NaOH at 40–50°, boiling the product with CrO₃ in AcOH and adding PhNHNH₂. *Et 2,4,6-trinitrophenylchlorocycanoacetate*, m. 118°; oxidation with H₂O₂ in AcOH gives *Et α,β-di-p-nitrophenyl-α,β-cyanosuccinate*, m. 209°; 20% HNO₃ at 100° gives the same product; concd. HNO₃ gives *p*-O₂NC₆H₄CO₂H. 2,4-(O₂N)₂C₆H₃CH(CN)CO₂Et with concd. HNO₃ or with H₂O₂ gives *Et 2,4-dinitrobenzoylformate*, m. 89°.

C. J. WEST

Condensation of α-cyanocinnamic acid by potassium cyanide. M. HENZE. Univ. Innsbruck. *J. prakt. Chem.* 119, 157–72 (1928); cf. *C. A.* 20, 2996.—In the attempt to prep. PhCH:C(CN)CO₂H from BrCH₂CO₂H, BzH and KCN no trace of acid could be obtained; it is now believed that the acid forms as an intermediate step and then reacts with KCN, giving the compd. PhCH(CN)CK(CN)CO₂H, which in neutral or slightly alk. soln. adds a mol. of the acid, giving β,δ-diphenyl-α,γ,δ-tricyanovaleic acid,

$C_{20}H_{15}O_2N_3$, previously reported; this has been obtained from $PhCH_2C(CN)CO_2H$ and KCN in alk. soln. The nitrile groups cannot be sapon. $Ba(OH)_2$ gives a *compd.*, $C_{18}H_{16}O$, m. 112° (*Br deriv.*, m. 119°). Ten percent EtOH-KOH splits off CO_2 , giving 2,4-diphenyl-1,3,4-tricyanobutane, existing in 2 forms, m. 228° and 183° , easily sepd. by crystn. from AcOEt and then from EtOH. Sapon. with 20% $Ba(OH)_2$ for 30 hrs. gives β,δ -diphenyl- γ -carboxyadipic acid, m. 220° (decompn.); *Me ester*, m. 61° ; in the sapon. a small quantity of an isomeric acid, m. $195-6^\circ$, is also formed. Heating the acid, m. 220° , at $220-30^\circ$ gives 3-keto-2,5-diphenylcyclopentamethylene-1-carboxylic acid, $C_{18}H_{16}O_3$, m. 158° ; *oxime*, m. 183° (decompn.); *Me ester*, m. 99° ; oxidation with HNO_3 gives an acid $C_8H_6O_4(?)$, m. 225° ; $KMnO_4$ gives $BzCH_2CHPhCH_2CO_2H$, m. 152° . Zn and HCl gives 2,5-diphenylcyclopentamethylene-1-carboxylic acid, m. $119-20^\circ$; *Ba salt*. In addn. to the *compd.* $C_{20}H_{15}O_2N_3$, there also crysts. the *compd.* $C_{17}H_{13}N_3$, m. 198° ; warming with alkali gives a violet color, or in the presence of EtOH, a deep indigo-blue, changing to red-brown in the air; with $Ba(OH)_2$ there results a *compd.* pale greenish blue, m. $194-7^\circ$; warming with concd. HCl or H_2SO_4 (1 acid: 2 H_2O) gives a *compd.* m. 156° . C. J. WEST

Separation of phthalic and homophthalic acids. HARRY G. POOLE. Univ. of Melbourne. *J. Chem. Soc.* 1928, 1378-9.—The mixt. is neutralized with NaOH, dild. considerably and cold $CuSO_4$ added. After 12 hrs. the insol *Cu homophthalate*, greenish blue, is filtered, washed and treated with concd. HCl and sufficient H_2O to dissolve the mass on boiling; 90% of homophthalic acid may be recovered in this way from mixts. contg. 66% phthalic acid. The *Cu homophthalate* is sol. in 5000 parts H_2O at 25° and less than 0.01% at 100° . *Cu phthalate* is sol. in about 30 parts H_2O at 230° . C. J. WEST

Mellitic acid. EMILIO LURIA. *Quim. ind.* 5, 35-8(1928); abstr. of *Diss. Inst. Chimie Toulouse*.—The following salts were prepd. from the Na salt; $C_6(CO_2)_6(UO_2)_3 \cdot 12H_2O$, yellow, microcryst., insol. in water; $C_6(CO_2)_6Ce_2 \cdot 9H_2O$, white amorph., insol. in water; Cd, white needles, insol.; $C_6(CO_2)_6Li_6 \cdot 9H_2O$, very sol. in water, pptd. by 96% alc. These and 31 other salts already known crystallize with 3 or multiples of 3 mols. H_2O . This phenomenon does not seem to be detd. by the ternary symmetry or the alternating polarities alone, since trimesic acid forms salts with 1, 2 and 5 H_2O . It is apparently not detd. by the 3 maleic and 3 succinic acid groupings in the mol., since there is no simple multiple relation between the H_2O mols. of maleates or succinates on one hand and mellitates of the same metal on the other. *Hexaphenylhydrazine mellitate*, $C_6(CO_2)_6(PhNHNH_2)_6$, prepd. from a 96% alc. soln., is white, very sol. in water, easily decomp. by light. When heated with N_2H_4 to 80° mellitic acid yielded 2 substances: the *tetrahydrazine-monoammonium salt of tetracarboxyphenylglyoxaline* or its tautomer (it combines with 6 KOH), $(H_2N_2HO_2C)_4C_6(CO.NH)_2NNH_4$ or $(H_2N_2HO_2C)_4C_6(CO.NH)_2NNH_4$, yellow needles, very sol. in water, scarcely in alc., insol. in ether, benzene, CCl_4 , very sol. in alkalis, NH_3 and carbonates. The alk. soln. has an intensely red color produced already by 0.005 g./l., which deepens with the alkali content until neutralization is reached. It contains 5.12% H_2 , absorbs 67.56% KOH; the Ag salt contains 40.6% Ag. The *monoammonium-trihydrazine salt of 1,2,3,4-tetracarboxy-phenyl-5,6-glyoxaline-4-hydrazide*, $H_2NNHCO(H_2N_2HO_2C)_4C_6(CO.NH)_2NNH_4$, is red, contains 4.5% H_2 , absorbs 59.3% KOH; the Ag salt contains 59.3% Ag. In order to prepare *mellitic acid* 120 g. wood charcoal was treated with 400 g. HNO_3 (d. 1.3), and, after cooling, with 500 cc. HNO_3 (d. 1.5). The brown mass was heated 40 hrs., the excess HNO_3 distd. off with const. stirring, the residue heated a few min. to 140° , treated with water and stirred with purified C, neutralized with NH_3 and pptd. with $Pb(OAc)_2$. The Pb salt was decompd. with H_2S and the acid recrystd. from water and alc. MARY JACOBSEN

Higher-boiling constituents of the essential oil of hops. A. CHASTON CHAPMAN. *J. Chem. Soc.* 1928, 1303-6; cf. *Ibid* 67, 54(1895).—The higher-boiling fraction of oil of hops was divided into 7 fractions, b_4 87° to 200° . From the fraction b_4 $87-97^\circ$, n_D^{20} 1.4769, d_4^{20} 0.8948, there was obtained a small quantity of *luparone*, $C_{13}H_{22}O$, b_3 $74-6^\circ$, n_D^{20} 0.8861, n_D^{20} 1.485, $[\alpha]_D -0.4^\circ$; *semicarbazone*, m. 98° . The fraction b_4 $97-110^\circ$, n_D^{20} 1.4900, d_4^{20} 0.9091, consisted almost entirely of humulene. The fraction b_4 $110-50^\circ$ was treated with $C_6H_4(CO)_2O$, by which was isolated the alc., *luparenol*, $C_{15}H_{24}O$, b_2 $125-8^\circ$, d_4^{20} 0.9738, n_D^{20} 1.5023, $[\alpha]_D^{20} -3.7^\circ$; *phenylurethan*, m. 157° ; addn. of Br indicates 1 ethylene bond. The remainder of the fraction was treated with EtOH. $AgNO_3$, giving a phenol, *luparol*, $C_{16}H_{26}O_2$, pale yellow, mobile oil, b_2 $122-4^\circ$, d_4^{20} 0.9170, n_D^{20} 1.4942; $FeCl_3$ gives an intense red color; with 50% KOH it yields isovaleric acid

and a phenol; the same products were obtained on oxidation with KMnO_4 ; the *phenol*, $\text{C}_{11}\text{H}_{16}\text{O}_2(?)$, b_4 117°, d_{40}^{20} 0.9448, n_D^{20} 1.4670. No definite products could be isolated from the fractions b_4 above 150°. The greater part of the acid removed from the original oil consists of isovaleric acid.

C. J. WEST

Constitution of isocampholic acid. JULIUS V. BRAUN AND ALBRECHT HEYMONS. Univ. Frankfurt a. M. *Ber.* 61B, 1089–92 (1928).—Recent studies on the behavior of a large no. of *N*-monoalkyl amides of CO_2H acids towards the P halides has shown consistently that when the acid has no H atom adjacent to the CO_2H group the alkylamide is converted only into the imide chloride by even an excess of PCl_5 ; if there is a H atom adjacent to the CO_2H group, it is replaced by Cl in addn. to the imide chloride formation; if there are 2 such atoms they are replaced by 2 atoms of Cl. The methylamide of campholic acid (I) had already been found to give, as expected, only the imide chloride with PCl_5 . For the present comparison with isocampholic acid (II), the ethylamides were used. *Ethylamide* of I, b_{20} 160°, m. 88°; the imide chloride obtained with 3.5 mols. PCl_5 on the H_2O bath regenerates almost quant. the Cl-free amide when decompd. with H_2O . The *ethylamide* of II, m. 41–2°; with PCl_5 and subsequent decompn. with H_2O it gives a *di-Cl deriv.* (III), m. 73–7°, $b_{0.2}$ 125–7°, the intermediate *imide chloride*, $\text{C}_{12}\text{H}_{20}\text{NCl}_4$, strongly unsatd., faintly yellow oil, b_{15} 145–50° practically without decompn. III can apparently be hydrolyzed to the acid only under special, as yet undetd. conditions, when it was heated in the usual way with concd. HCl 5 hrs. at 140° it gave a dark oil not completely sol. in Na_2CO_3 ; the sol. part, b_6 chiefly at 125°, is a faintly yellow, strongly unsatd. oil, $\text{C}_{10}\text{H}_{16}\text{O}_2\text{Cl}$. v. B. and H. conclude that II has the structure, CH_2CHMe

$\begin{array}{c} | \\ \text{CMc}_2 \end{array}$, of α -campholanic acid; the small differences in m. ps. between the $\text{CH}_2\text{CHCH}_2\text{CO}_2\text{H}$

amides and anilides of the 2 acids observed by Lipp can readily be explained by the presence of small quantities of I in his II; this may perhaps also explain the formation of small quantities of camphoric acid in the oxidation of II noted by Rupe and Briellmann.

C. A. R.

The catalytic reduction of hydrocyclic compounds. H. RUPE AND K. SCHÄFER. *Helv. Chim. Acta* 11, 463–77 (1928).—I. Derivs. of pulegone. Pulegone with BzH gives 70% *benzalpulegone* (I), b_{13} 205°, d_4^{20} 1.0245, $[\alpha]$ –24.62°, –28.64°, –32.20°, –39.00°, –46.48°, –53.84° for C, Ca, D, Hg, Cu and I^* at 20°. Reduction of I with H_2 and Ni catalyst gives 90% *benzylmenthone*, $b_{10.5}$ 191°, b_{13} 195°, b_{18} 206°, d_4^{20} 0.9915, n_D^{20} 1.51834, n_B^{20} 1.53604, n_D^{20} 1.52279, $[\alpha]$ 9.25°, 10.90°, 12.37°, 15.42°, 18.97°, 22.26°. Pulegone with Br_2 and Na gives 70% *pulegenic acid* (II), b_{12} 144–50°, d_4^{20} 1.0050, $[\alpha]$ 37.32°, 43.14°, 48.18°, 58.08°, 68.84°, 78.28°. Reduction of II with H_2 and Ni catalyst under 19 atm. at 100–30° gives 91% of *dihydropulegenic acid*, b_{11} 138°, d_4^{20} 0.9642, $[\alpha]$ –0.31°, –0.34°, –0.36°, –0.48°, –0.56°, –0.72°. With PCl_5 100 g. of II gives 76 g. *pulegenyl chloride* (III), $b_{11.5}$ 97–100°. With Me_2Zn 52 g. of III gives 24 g. *Me pulegyl ketone*, b_{135} 98°, d_4^{20} 0.9126, $[\alpha]$ 31.24°, 36.18°, 40.48°, 48.74°, 57.86°, 65.82°; semicarbazone, m. 144°; oxime, $b_{10.5}$ 130°. With Et_2Zn 5 g. of III gives 10 g. *Et pulegyl ketone*, b_{10} 107–12°, m. 136°. *Dihydropulegenic acid* (36 g.) with PCl_5 gives the acid chloride (32.5 g.), b_{11} 80–90°. The acid chloride (33 g.) with Me_2Zn gives 16 g. *dihydropulegyl Me ketone*, b_{10} 86°, d_4^{20} 0.8862, $[\alpha]$ –2.58°, –3.08°, –3.56°, 4.62°, –5.98°, –7.40°; semicarbazone, m. 174°. II. The catalytic reduction of hydroxymethylenetetrahydrocarvone. Tetrahydrocarvone (100 g.) with Na gives 53 g. hydroxymethylenetetrahydrocarvone (I), b_{12} 118–9°. Reduction of I with H_2 and Ni catalyst gives (a) *1-methyl-2-oxido-3-methylene-4-isopropylcyclohexane*, formed by the reduction of both CO and HOCH and elimination of H_2O , b_{12} 112°, d_4^{20} 0.9262, $[\alpha]$ 24.75°, 28.45°, 31.72°, 37.83°, 44.41°, 50.08°; (b) *tetrahydrocarvylcarbinol*, formed by the reduction of only the HOCH, b_{11} 142°, d_4^{20} 0.9947, $[\alpha]$ –29.07°, –34.80°, –40.16°, –51.36°, –64.97°, –78.16°; benzoate, m. 105°; (c) *methylene-tetrahydrocarvone* formed by the elimination of H_2O from the carbinol above, b_{11} 102°, b_{13} 104°, d_4^{20} 0.9152, $[\alpha]$ –4.17°, –5.00°, –5.81°, –7.56°, –9.76°, –12.00°; semicarbazone, m. 177°; (d) *ethylenebis[tetrahydrocarvone]*, b_{11} 219–21°. Oxidation of methylenetetrahydrocarvone with CrO_3 gives a product, b_{12} 105–17°; semicarbazone, m. 182°.

J. S. REICHERT

Artificial musks. II. Notes on the elimination of side chains in the nitration of

complex, quickly assume a yellowish color with H_2SO_4 (d. 1.84) and then dissolve to some extent with a greenish yellow color, while the 92° crystals are not colored by H_2SO_4 and dissolve only slowly to a colorless soln. which becomes golden yellow after some hrs. Dicyclohexylphenylcarbinol with Pt-charcoal gives CO_2 and 9-phenylfluorene, with ordinary charcoal CO_2 and $\text{Ph}(\text{C}_6\text{H}_{11})_2\text{CH}$. From MePh_2COH with Pt-charcoal is obtained 60% of 9-methylfluorene, with ordinary charcoal MePh_2CH . EtPh_2COH behaves in the same way. $\text{Me}_2(\text{PhCH}_2)\text{COH}$ with both catalysts gave $\text{Me}_2\text{CHCH}_2\text{Ph}$. $\text{MePh}(\text{PhCH}_2)\text{COH}$ with Pt-charcoal gave 9-methylphenanthrene, m. 94° , with ordinary charcoal $\text{PhCH}_2\text{CHPhMe}$. $\text{MeEt}(\text{PhCH}_2)\text{COH}$ is reduced by Pt-charcoal to $\text{MeEtCHCH}_2\text{Ph}$. Me_2EtCOH with both charcoals yields a pentane b. $30-0.5^\circ$, d_4^{20} 0.6281, only after several passages through the tubes at 300° . PhOH can also be reduced to C_6H_6 by activated charcoal but only after repeated treatment at 300° . C. A. R.

Acid-basic dyestuffs. G. V. KAGAN. *J. Chem. Ind. (Moscow)* 3, 1307-8(1926).—In order to clear up the effect of replacing the H atoms of two OH groups standing in *o*-position by some bivalent hydrocarbon group, such as $\text{CH}_2=$, on the color of basic dyestuffs, K. operated with piperinol and with protocatechualdehyde, which he condensed with bases such as PhNMe_2 , etc., and obtained 2 groups of dyestuffs, namely (1) those which have 2 hydroxyls replaced by the CH_2O_2 group and consequently possess only basic properties, and (2) those which have 2 free hydroxyls and possess both basic and acid properties. K.'s conclusion is: "whereas the introduction of 2 hydroxyl groups (in *o*-position to each other) in the benzene ring of a dyestuff of the malachite green class communicates to it acid properties, at the same time strongly changing its color from green, through blue, to violet, the closing of these 2 hydroxyls by the CH_2 group forces the dyestuff to conserve the original color of the parent dyestuff of its class." BERNARD NELSON

Relative migration tendencies of acyclic radicals in the semipinacolin rearrangement of phenyldialkylglycols. Their relation to affinitive capacities. M. TIFFENEAU and JEANNE LÉVY. *Compt. rend.* 186, 84-6(1928); cf. *C. A.* 21, 1111, 3609; 22, 585.—In the semipinacolin rearrangement of 1-phenyl-2,2-dialkylglycols 1 alkyl radical migrates alone or in large part. Glycols yielded ketones as follows: 1-phenyl-2,2-ethylmethylglycol, 3-phenyl-4-pentanone; 1-phenyl-2,2-isopropylmethylglycol, 2-methyl-3-phenyl-4-pentanone; 1-phenyl-2,2-butylmethylglycol, 3-phenyl-2-heptanone, 1-phenyl-2,2-isobutylmethylglycol, 5-methyl-2-phenyl-3-hexanone; 1-phenyl-2,2-propylmethylglycol, both 3-phenyl-2-hexanone and 2-phenyl-3-hexanone; 1-phenyl-2,2-ethylmethylglycol, 3-phenyl-4-heptanone; 1-phenyl-2,2-ethylisopropylglycol, 3-phenyl-5-methyl-4-hexanone; 1-phenyl-2,2-ethylisobutylglycol, 2-methyl-5-phenyl-4-heptanone; 1-phenyl-2,2-butylethylglycol, 5-phenyl-6-octanone; 1-phenyl-2,2-butylpropylglycol, 5-phenyl-6-nonanone; 1-phenyl-2,2-benzylethylglycol, 90% of 1,2-diphenyl-3-pentanone and 10% of 1,3-diphenyl-2-pentanone; 1-phenyl-2,2-benzylpropylglycol, 1,2-diphenyl-3-hexanone; 1-phenyl-2,2-benzylisopropylglycol, 4-methyl-1,2-diphenyl-3-pentanone. Since the relative migration tendencies are measures of affinitive capacities, radicals may be arranged in the following order of decreasing affinitive capacities: iso-Bu, Me, Pr, Bu, Et, iso-Pr, Bz. MARGARET W. MCPHERSON

Preparation of 4,4'-dinitrobenzil. FREDERICK D. CHATTAWAY and EDWARD A. COULSON. Queen's College, Oxford. *J. Chem. Soc.* 1928, 1361-4.— $(\text{PhCHOH})_2$ (2.5 g.), gradually added to 15 cc. HNO_3 (d. 1.5) at -10° to -5° , the temp. allowed to rise to 0° , dild. after 2 hrs. with 7 cc. H_2O and boiled 0.5 hr., gives 1 g. 4,4'-dinitrobenzil (I), yellow, m. 213° , identical with the product obtained by Biltz on nitrating 4,5-diphenylglyoxal (II). Oxidation of I with Cr_2O_3 gives $p\text{-O}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$. Equiv. quantities of I and PhNHNH_2 give the *monophenylhydrazone*, deep orange, m. 257° ; an excess of PhNHNH_2 (with P_2O_5) gives the *osazone*, red, m. 293° (decompn.). 2,3-Di-*p*-nitrophenylquinoxaline, m. 201° . II (10 g.) and 20 g. HNO_3 (d. 1.5) at 0° give 4 g. 3,3'-dinitrobenzil, m. 132° . II (27 g.) in 315 g. concd. H_2SO_4 and 90 g. HNO_3 at -5° give 7 g. I; from the AcOH mother liquors 10 g. of the 3,3'-isomer was isolated. C. J. WEST

Deamination of tertiary amino alcohols. S. KANAO and T. YAGUCHI. *J. Pharm. Soc. Japan* 48, 252-8(1928).—The work was completed 2 yrs. ago, but its publication was postponed for fuller study. The appearance of Bettzieche's paper (*C. A.* 21, 567) necessitates the publication of this paper. K. and Y. have succeeded in converting tertiary amino alcs. into ketones of the alkyldeoxybenzoin type by diazotization: $\text{C}_6\text{H}_5\text{CH}(\text{NH}_2)\text{C}(\text{OH})\text{R}_2 \rightarrow \text{C}_6\text{H}_5\text{CHRCOR}$. The rearrangement of groups and the change in the sign of rotation were the notable results of the reaction. *l*-Leucine Et ester (I) and *p*- $\text{MeC}_6\text{H}_4\text{MgBr}$ (II) gave *l*-1,1-ditolyl-4-methyl-2-aminopentan-1-ol, m.

108.5°. *dl*-Isomer (III), m. 121°, from the *dl*-isomer of I and II. III, NaNO₂ and HCl gave *dl*-isobutyldeoxy-*p*-toluoin (IV), b. 205-6°, n_D^{20} 1.5562. IV was also obtained by heating desoxy-*p*-toluoin, iso-BuI and NaOEt. I and PhMgBr gave *l*-1,1-diphenyl-4-methyl-2-aminopentan-1-ol (V), m. 133°, $[\alpha]_D^{20}$ -89.74°. Yield, 56%. The HCl salt of V and NH₄NCO gave 1,1-diphenyl-4-methyl-2-ureidopentan-1-ol, Me₃CHCH₂-CH(NHCONH₂)C(OH)Ph₂·H₂O, m. 106°. The HCl salt of V and NaNO₂ gave *d*-isobutyldeoxybenzoin (VI), b₁₄ 187°, m. 33-6°, $[\alpha]_D^{20}$ 109.18°. Yield, 90%. Semicarbazone, m. 204°. *dl*-Isomer of V, m. 110°, from the *dl*-isomer of I and PhMgBr. *dl*-Isomer of VI, m. 78°, PhCH₂MgBr and I gave *d*-2-benzyl-1-phenyl-5-methyl-8-amino-hexan-2-ol, m. 89°, $[\alpha]_D^{20}$ 7.48. EtMgBr and I gave 3-ethyl-6-methyl-4-aminoheptan-3-ol, b₁₇ 109-16°. HCl salt, m. 178°. Chloroplatinate, m. 204°. *N*-Di-Me deriv., b₁₀ 97-9°. HCl salt, m. 193°. NAO UYER

α -Chloronaphthalene. I. The chlorination of naphthalene in the vapor phase. P. FERRERO AND R. WUNENBURGER. Univ. de Genève. *Helv. Chim. Acta* 11, 416-25 (1928).—An app. is described for the chlorination of C₁₀H₈ (I) in the vapor phase. The optimum temp. is 350. The Cl₂ is introduced at the rate of 15 l. per hr. and in the proportion of 1.5 moles for 1 mole of I. The yield is 59% of the total I introduced and 85% of the I used up. The use of 0.5% I₂ as a catalyst increases these yields to 70 and 94%, resp. FeCl₃ is less effective. REYNOLD C. FUSON

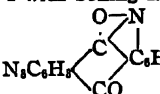

Action of chlorosulfonic acid on naphthalene. A. CORBELLINI. *Giorn. chim. ind. appl.* 9, 118-20 (1927); cf. C. A. 22, 1972.—ClSO₃H behaves towards C₁₀H₈, not only as a sulfonating agent (cf. Armstrong, *J. Chem. Soc.* 24, 173 (1871); *Proc.* 1886, 231; 1887, 42; 1889, 10), but also, as is the case with C₆H₆, as a chlorosulfonating agent. When solid C₁₀H₈ (1 mol.) is treated at 15-45° with ClSO₃H (2 mols.), 1,5-C₁₀H₆(SO₃H)₂ is formed, together with varying proportions of the corresponding disulfonyl chloride. When CCl₄ is used as a diluent and the C₁₀H₈ (1 mol.) is treated with either 2 or 4 mols. of the acid, sulfonyl chlorides are always formed in addn. to the mono- and di-SO₃H acids. In all cases, the C₁₀H₈ is attacked only in the 1- and 5-positions. It is probable that the 1st phase of the reaction consists of the formation of the SO₂H acid, which then passes to the chloride, C₁₀H₇SO₃H + HO-SO₂Cl → C₁₀H₇SO₂Cl + H₂SO₄, these changes being accompanied by the secondary reactions, C₁₀H₈ + H₂SO₄ → C₁₀H₇SO₃H + H₂O and HO-SO₂Cl + H₂O → H₂SO₄ + HCl. The final yields of the various products evidently depend on the velocities of these different reactions, these being governed by the conditions employed. The sulfochlorinating action is favored by low temps. B. C. A.

Synthetic anthraquinone. MAX PHILLIPS. *Z. Farben-Ind.* 20, 122-4 (1928).—A review of the various developments leading to the manuf. of synthetic anthraquinone from C₆H₄(CO)₂O, benzene and AlCl₃. FREDERICK C. HAHN

Migration of the sulfonic acid group in naphthalene compounds. H. H. HODGSON. *Z. Farben-Ind.* 20, 124-6 (1928).—A review of literature on the sulfonation of C₁₀H₈, C₁₀H₇OH and C₁₀H₇NH₂ and a discussion of conditions influencing the migration of the SO₃H groups. FREDERICK C. HAHN

The diazides of anthraquinone. KURT BRASS AND FRIEDRICH ALBRECHT. Deutsch. Forschungs-Inst. Textil-Ind., Stuttgart-Reutlingen. *Ber.* 61B, 983-93 (1928).—The diazides were prepd. by the action of NH₃ on the perbromides of the corresponding bisdiazonium compds. These perbromides show the same instability as those of the simple diazonium salts. In the 1,4-series were obtained products contg. 51.2% Br at most, while the calcd. value for 6 atoms Br is 64.6%; apparently the products were mixts. of the bisdiazonium bromide (37.88% Br) with the perbromide or a Br addn. product of the bromide. The ability of the diazides to exist depends on the position of the 2 azide residues in the anthraquinone nucleus and on whether they are homo- or heteronuclearly distributed. An *o*-C.O group always tends, in the anthraquinone series, to break down the azide residue; the α -diazides (1,4-, 1,5-, 1,8-) are unstable, while a β -diazide (2,6-) is perfectly stable. The instability of the α -compds. diminishes in the order given above; the 1,4-compd. begins to evolve N in abundance as soon as it is formed so that it is impossible to isolate a product with anything like a satisfactory N content. The 1,5-diazide also splits off N very easily but with the proper precautions a product with 19.68% N can be isolated; this seems to be a mixt. of equal parts of the diazide and of the dianthranil (calcd. for such a mixt., 20.3% N); the change into the dianthranil proceeds more rapidly on standing or treating with boiling H₂O, most rapidly on recrystn. from xylene or C₆H₅N. On the other hand, a 1,8-diazide (I) with 26.24% N can be obtained at low temps. On standing the N falls to 24.63% in 24 hrs. and finally to 21.53% (= 4 atoms N); the same product

(II) with a const. N content is obtained by treating the I with boiling H_2O or by

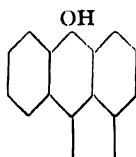

recrystg. it. II is 1-anthraniloanthraquinone 8-azide, . The

presence of an azide group in II is shown by the liberation of exactly 2 atoms N with concd. H_2SO_4 and by the fact that II reacts with Ph_3P . The stability of II, as compared with the α -azides, shows that the N_3 residue can enter the α -position of the anthraquinone nucleus without hindrance provided the residual valences of the adjacent CO group are satd. The 2,6-diazide (III) resembles in general the phenanthrene-quinone diazides; it crystals well and reacts readily with 2 mols. Ph_3P to form the well-crystd. anthraquinone-2,6-di(triphenylphosphinimine) (IV), but it has not as yet been possible to convert it into a 2,6-bisbenzenediazoaminoanthraquinone with $PhMgBr$ in $PhMe$ or into a bistriazoleanthraquinone with $AcCH_2CO_2Et$ or with Na alcoholates. Acid decompn. of the 1,4-dianthranil did not give 1,4-diaminohystazarin and, as by-product, 1,4- $C_6H_4(CO)_2C_6H_2(NH_2)_2$. The anthranil ring is so stable that concd. H_2SO_4 at 200° had to be used to effect complete reaction and under these drastic conditions the reaction does not follow the expected course. Oxidation of the crude decompn. product yields phthalic acid and treatment with 2% KOH showed that it consists of about equal parts of 1,4- $C_6H_4(CO)_2C_6H_2(NH_2)OH$ and of 1,4- $C_6H_4(CO)_2C_6H_2(NH_2)_2$ contaminated with products of high mol. wt. The production of the di- NH_2 compd. is explained as resulting from the intermediate formation of a radical which dehydrogenates other participants in the reaction, but it is not clear how the $C_6H_4(CO)_2C_6H_2(NH_2)OH$ is formed; it cannot be produced by hydrolysis of the di- NH_2 compd. for the latter is unchanged by concd. H_2SO_4 at 200° . Acid hydrolysis of the freshly prepd. product of the 1,5-series (still consisting, therefore, in most part of the 1,5-diazide) gave about 90% 4,8-diaminoanthrarufin (V) but no 1,5- $H_2NC_6H_3(CO)_2C_6H_3NH_2$ could be isolated from the insol. residue. Sepn. of the decompn. product into its components could not be effected with alkali because of the slight soly. of the V but acetylation proved successful. Acid decompn. of I led to the same results, 90% of 4,5-diaminochrysazin (VI) but no $H_2NC_6H_3(CO)_2C_6H_3NH_2$ being obtained. Here again, sepn. of the products could not be effected with alkali because VI loses NH_2 with hot alkalis and, moreover, is not sufficiently sol. The only compd. which it has thus far been possible to isolate from the products of the decompn. of III by acid is 2,6-diaminoanthrarufin (VII). I, brown, dissolves in ice-cold concd. H_2SO_4 with red color, deflagrates with concd. H_2SO_4 at room temp. or on dry heating, gives with Ph_3P in $PhMe$ a red color and fluorescence increased by heating, and on long standing needles, presumably of anthraquinone 1,8-di(triphenylphosphinimine), sep. II, light brown. III (yield, 96%), light brown scales sensitive to light, deflagrates 202° on rapid heating, explosively when heated in a test tube or treated with a drop of concd. H_2SO_4 , dissolves in concd. H_2SO_4 , on cautious addn., with blood-red color before decompn. begins, is unchanged by boiling H_2O or dil acids or by $SnCl_4$ in $PhMe$, even on heating. IV, yellow-red, m. above 280° , sol. in concd. H_2SO_4 with red color. VII, dark red, sol. in concd. H_2SO_4 with yellow color, unchanged by H_3BO_3 , sol. in alkalis with red color, the red-brown alkali salt sepg. on standing or warming; it dissolves slowly in cold Ac_2O with yellow-brown color changing to orange-brown on heating; it colors a cold Ac_2O soln. of pyroboracetate a violet-red, which changes to yellow-red on long boiling, and on cooling the red-brown 2,6-diacetyldiaminoanthrarufin seps. The yellow xylene soln. of VII is colored red-violet by $SnCl_4$ and deposits a brown cryst. Sn complex salt.

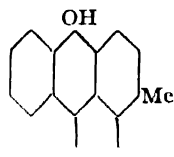

C. A. R.

Free organic radicals. VII. Aryl-*peri*-pyrrolinoanthranolazyls. ROLAND SCHOLL WITH EDMUND STIX, JOACHIM AND WALTER LEONHARDT. Techn. Hochschule Dresden. Ber. 61B, 968-82(1928); cf. C. A. 22, 76.—Further investigation of *m*-xylyl-*peri*-pyrrolinoanthranolazyl (I) has shown that: (1) The elec. cond. of pure alc. and C_6H_5N is not increased by the I, i. e., there is no disproportionation by a shifting of electrons. (2) The solns. changed by the light of a quartz-Hg lamp from blue to red under N or to yellow in air are not restored to blue by darkness nor by cold $PhNHNH_2$ and therefore probably contain no *peri*-pyrrolinoanthrone; on heating with alc. alk. $Na_2S_2O_8$ or long boiling with $PhNHNH_2$ they become an impure blue (red in thick layers), probably as the result of regeneration of the radical from an unknown dehydrogenation or oxidation product. (3) Me_2SO_4 and NaOH convert the I into the *O*-*Me* ether (II), which is considerably more similar to I than is the benzoate; it forms violet needles and the color of its solns. is shifted somewhat towards the red accom-

pared with that of solns. of I. Like I it has a tendency to form solvates; it dissolves in Et_2O , dioxan and xylene with red color and orange fluorescence, in $\text{C}_6\text{H}_5\text{N}$ with violet-red color with vivid red fluorescence, in alc. with violet color and red fluorescence, in AcOH with blue color and faint red fluorescence. Ultra-violet light increases the fluorescence considerably. The solns. are quickly decolorized in the light of the sun or a Hg lamp. The absorption curves of II in alc. (violet) and xylene (red) are very similar to each other and to those of I, the max. being shifted somewhat towards the ultra-violet as compared with those of I. The max. and min. for II in alc. are at 1739–54 and 2439 Å. U., resp., in xylene at 1818 and 2420. II is not sensitive towards NaOH and NH_4OH . Conc'd. acids convert it into radical azylum salts. Its solns. in Et_2O , dioxan or AcOH are turned deep blue by conc'd. H_2SO_4 or HClO_4 and at appropriate concns. deposit the salts which are at once decomp'd. by H_2O . The violet alc. NH_3 soln. is decolorized by Zn dust, presumably with the formation of the *anthranol Me ether*, which, after removal of the Zn dust, at once oxidizes back in the air and could not be isolated. On titration to decolorization in PhNO_2 or AcOH with KMnO_4 , H_2SO_4 , II consumes 5 equivs. of O instead of 3, which, to be sure, is an indication of its radical nature but is remarkably different from the behavior of I and the oxanthronyls. The consumption of the first 3 atoms can be represented by the scheme proposed for I but the resulting tri-HO deriv. apparently decomps. into H_2O_2 , MeOH and the anthrone instead of into H_2O and the anthraquinonyl ketonimide, the H_2O_2 consuming the remaining 2 atoms of O. This view is confirmed by the fact that the soln. decolorized by the absorption of 5 atoms O becomes blue again when allowed to stand (autoreduction of the anthrone) and slowly consumes more KMnO_4 (presence of MeOH). (4) A no. of analogs of I (Ph, *p*- ClC_6H_4 , *p*- MeC_6H_4 , *p*- MeOC_6H_4 instead of $\text{Me}_2\text{C}_6\text{H}_3$) are described. The ketoximes used in prep. them are (with the exception of the brownish yellow MeOC_6H_4 deriv.) yellowish white and the color of their solns. in conc'd. H_2SO_4 (as of those of the azyls in H_2SO_4 and org. solvents) deepens from yellow (Ph, ClC_6H_4) to orange-yellow (MeC_6H_4), dark orange-yellow ($\text{Me}_2\text{C}_6\text{H}_3$) and orange-red (MeOC_6H_4). The color and fluorescence phenomena of the new azyls in org. solvents at room and at high temps. agree as a whole with those of I, apparent deviations being the result of the much less soly. of the ClC_6H_4 and MeOC_6H_4 derivs. (5) Azyls of the type III (R = Ph, *m*- and *p*- $\text{Me}_2\text{C}_6\text{H}_3$) have also been prep'd. The 2-Me group deepens the color of the ketoximes from which they are prep'd to a vivid lemon-yellow, whereas in the azyls themselves the blue to violet-blue of the non-methylated I is shifted strongly towards the violet. All the above azyls (of both types) are very sensitive to light when in soln. The titration with KMnO_4 or Br cannot be carried out in direct daylight. The titration with Br, even in hot $\text{C}_6\text{H}_5\text{N}$, did not always give

...N—CHC₆H₃Me₂ (I)

...N—CHR (III)

a sharp end point. (6) In their properties as a whole, these azyls are reminiscent of ordinary dyestuff mol's. with normal valencies and more closely resemble non-radical compds than any other known kind of radicals. Ph α -anthraquinonyl ketoxime (60% from 1-BzC₆H₄(CO)₂C₆H₄, $\text{NH}_2\text{OH}\cdot\text{HCl}$ and Na_2CO_3 refluxed in alc.), darkens 215–20°, m. 223°, gives in alc. with conc'd. NH_4OH and Zn dust in the dark 50% of *py-1-phenyl-1,9(N)-pyrrolino-10-anthranolazyl*, violet-blue needles with Cu luster, m. 266°. *p*-Tolyl α -anthraquinonyl ketone, from 1-C₆H₄(CO)₂C₆H₃MeCO₂H, PhMe, PCl_5 and a little sublimed FeCl_3 , light yellow, m. 207–8°; oxime, m. 230–1° on rapid heating; azyl (yield, 60%), dark blue, apparently decomps. 310° (benzoate, red). II (yield, 80%), m. 181°, is unchanged in alc. NH_3 by $\text{K}_3\text{Fe}(\text{CN})_6$; perchlorate. *p*-Chlorophenyl α -anthraquinonyl ketoxime (yield, 25–30%), m. 251–2° (decompn.) on rapid heating; azyl (40–50%), violet-blue needles with faint Cu luster, sinters about 310° and seems to m. about 330° (decompn.). Anisyl α -anthraquinonyl ketoxime (30%), m. 235–6° on rapid heating; azyl (about 40%), violet-blue needles with Cu luster, sinters 300°, m. about 310° (decompn.). 1-Cyano-2-methylantraquinone (with Lothar Wanka), obtained in 74% yield from diazotized 2,1-C₆H₄(CO)₂C₆H₃MeNH₂ by the Sandmeyer method, yellow, m. 268°, nearly quant. hydrolyzed by $\text{H}_2\text{SO}_4\text{-H}_2\text{O}$ at 160–70° to the acid (IV), yellow, m. 263–4°, whose chloride (V) (45 g. from 50 g. of the acid with PCl_5

in C_6H_6 or 8.5 g. from 9 g. of the acid in boiling $SOCl_2$ (WITH KURT KLEMM), decomps. about 192° . *1-Benzoyl-2-methylantraquinone* (*Ph 2-methyl-1-anthraquinonyl ketone*) (WITH HEINRICH DEHNERT) (11 g. from 150 g. V refluxed in thiophene-free C_6H_6 with 0.2 mol. sublimed $FeCl_3$), m. $207-8^\circ$; *oxime* (50%), sinters about 234° , m. $239-40^\circ$; *py-1-phenyl-1,9(N)-pyrrolino-2-methyl-10-anthranolazyl* (50%), m. $232-3^\circ$, decomps. about 285° . *p-Xylol ketone* (3.5 g., together with 6.5 g. IV, from 10 g. V and 0.2-0.5 g. $FeCl_3$ in boiling xylene), m. $192-3^\circ$; *oxime* (45-50%), m. $226-6.5^\circ$; *azyl. m-Xylol ketone* (WITH ERICH WEBER), obtained in 10% yield from V in xylene at 80° with $FeCl_3$ or at 0° with $AlCl_3$ (WITH ILSE JULIUS), m. 175° ; *oxime*, m. $232-3^\circ$; *azyl*. The microanalyses were done by MAX BOETIUS.

Rotenone, the active constituent of derris root. SANKICHI TAKEI. Univ. Heidelberg. *Ber.* 61B, 1003-7(1928); cf. C. A. 19, 3483.—The compn. of rotenone (I) was formerly given as $C_{17}H_{16}O_6$, although this could not be reconciled with the MeO content found (15.4%). Further study has shown that this MeO value is correct but mol. wt. detns. in C_6H_6 and camphor gave higher values than before, corresponding to $C_{23}H_{22}O_6$, a formula which also agrees with the analytical results on I and is confirmed through the phenylhydrazone and the oxime. The formula of isorotenone (II), the isomer formed by rearrangement of I in concd. H_2SO_4 , requires the same revision. I and II seem to be *cis-trans* isomers, for I gives with HCl a HCl salt converted by Zn into II, or perhaps a double bond migrates. Rotenic acid (III), the cleavage product obtained by fusion of I with KOH and formerly given as $C_9H_{10}O_3$, must now be assigned the formula $C_{12}H_{12}O_4$; it yields a Tl salt and an acetate and in its *di-Me deriv.* (IV), prep'd. with CH_2N_2 , one Me group is saponifiable and the other in phenol ether combination. III is therefore a phenolcarboxylic acid (probably of the *o*-series, since it gives a deep blue-violet color with $FeCl_3$). On distn., III gives, with loss of CO_2 , a phenol $C_{11}H_{11}O(OH)$ (V), which can likewise be methylated. All attempts to make the 4th O atom, in III, react failed. Neither V nor its Me ether forms an oxime. The Me ether of III reacts with NH_2OH , but the product may be considered as a hydroxamic acid, even though the $FeCl_3$ reaction is not as pronounced as might be expected. With aq. $KMnO_4$, III gives a small quantity of iso- $PrCO_2H$, and the Me ether of V gives $AcOH$. III may therefore with some probability be assigned the structure of an *isopropylhydroxycoumaronecarboxylic acid*, $HO_2C(HO)C_6H_2C(CHMe_2)CH_2O$, in which,

however, the positions of the substituents have not been established. The Me_2CH group is possibly on the C_6H_4 nucleus. Mol. wt. of I in camphor $398-410$, in C_6H_6 $361-402$. *Oxime* of I, m. 239° . Mol. wt. of II in camphor $387-418$. *Oxime*, m. 230° (mixed with the oxime of I, $215-20^\circ$). I, *HCl*, m. 188° . *Tl salt* of III, m. 203° . *Acetate*, m. 155° . IV, oil, sapon'd. by 2% KOH in MeOH to the *Me ether* of III, m. 115° . Nitration of III gives no homogeneous comp'd. but when the reaction product is treated with CH_2N_2 , there is obtained *Me nitromethylrotenate*, $C_{11}H_9O(NO_2)(OMe)CO_2Me$, faintly yellow, m. 120° . *Hydroxamic acid*(?), from the Me ether of III with $NH_2OH \cdot HCl$ and $NaOAc$ in abs. alc. on the H_2O bath, m. 120° , gives a dark red-yellow color with $FeCl_3$ in alc. V, b. 760 271° , m. 42° ; along with it is formed a small quantity of an alkali-insol. substance of approx. the same compn. but double the mol. wt., m. 136° , mol. wt. in camphor $384-423$. *p-Toluenesulfonate* of V, m. $105-6^\circ$. *Me ether* of V, prep'd. with alk. Me_2SO_4 , mobile oil, b. 137° , b. 260° .

Some transformations of 2-methyl-3-carbethoxypyrrole, 2-methylpyrrole and 2,3-dimethylpyrrole. H. FISCHER, H. BELLER AND A. STERN. Techn. Hochschule München. *Ber.* 61B, 1074-83(1928); cf. C. A. 21, 381.—2-Methyl-3-carbethoxypyrrole (I) with 2 mols. Br in AcOH at $15-6^\circ$ gives the *4,5-di-Br deriv.*, m. $138-9^\circ$ (with 1 mol. Br is obtained a blue comp'd., m. $255-6^\circ$, contg. only about 1% Br and becoming colorless without appreciable change in m. p. on recrystn. from C_6H_5N ; it is probably the bis-methylcarbethoxypyrrole holding tenaciously a blue pyrrole dyestuff). With $NCCO_2Et$ and dry HCl in alc. I gives the *imide chloride* $C_{12}H_{11}N_2O_4Cl$, m. $180-1^\circ$ (decompn.), hydrolyzed almost immediately by cold H_2O to the *Et glyoxylate*, $C_{12}H_{11}NO_6$, m. 128° . 2-Methylpyrrole (II), b. 148° , is obtained in 70% yield from I boiled 1 hr. in aq. alc. KOH, evap'd. and dist'd. with superheated steam from KOH at $170-200^\circ$; 35 g. gives with $MeMgBr$ in Et_2O and subsequent treatment with $CICO_2Et$ 24 g. 2-methyl-5-carbethoxypyrrole (III), m. 100° . II is also obtained by reduction by the Wolff-Kishner method of pyrrole- α -aldehyde, which, in turn, is obtained in 6 g. yield from 30 g. pyrrole in $CHCl_3-EtOH-H_2O$ at $50-5^\circ$ slowly treated with concd. KOH, heated 15 hrs. at $50-5^\circ$ and evap'd. as rapidly as possible on a sand bath, the distillate then being treated with $NaHSO_4$, evap'd. to dryness under 12-18 mm. below 60° , heated just to boiling with sat'd. K_2CO_3 and ext'd. with Et_2O . Treated in AcOH at 40° with 3 mols. Br.

III does not yield the corresponding dicarbethoxymethane but the *di-Br deriv.* $C_8H_9O_2NBr_2$ (brominated on the nucleus), m. 176°. With hot 40% HCHO and concd. HCl III gives *bis*-[2-methyl-5-carbethoxypyrrol-4]-methane, m. 195-6°; with Me_2CO the dimethylmethane, m. 217°; with $MeOCH_2CH(CO_2Et)_2$ the compd. $C_{16}H_{23}O_6N$ (presumably $(EtO_2C)CHCH_2C(=CH)_2$), m. 75°, which with Br in $CHCl_3$ gives a β -Br

deriv., m. 105°; with $ClCH_2CN$ in Et_2O the imide chloride $C_{10}H_{12}O_2NCl$, m. 190°. 2-Methyl-5-carbethoxy-3-formylpyrrole (IV) with $NCCH_2CO_2Et$, $MeNH_2.HCl$ and K_2CO_3 in abs. alc. gives the compd. $C_{14}H_{16}O_4N_2$, m. 196° (cor.). The IV, m. 119°, is obtained in 22 g. yield from 24 g. III in cold Et_2O suspension with anhyd. HCN and dry HCl; if the operation is carried out in soln. instead of in suspension the product is the imide chloride, converted by NH_3 into the free aldimide, m. 215-6°. *Semicarbazone* of IV, m. 258°; *phenylhydrazone*, m. 216°. With Na in alc. and $N_2H_4.H_2O$ heated in an autoclave to 160°, 22 g. IV gives 6.5 g. 2,3-dimethylpyrrole (V), b₂ 63°. 2-Ethyl-3-formyl-5-carbethoxypyrrole, prep'd. like IV, m. 89-90° (cor.); *phenylhydrazone*, m. 188° (cor., decompn.), *oxime*, m. 194° (cor.); the aldehyde is reduced by the Wolff-Kishner method to 2-ethyl-3-methylpyrrole and with HCHO and concd. HCl gives *bis*-[2-ethyl-5-carbethoxypyrrol-4]-methane, m. 197°. 2-Methyl-5-formylpyrrole, from the 3- CO_2H acid *in vacuo* at 200°, m. 68°. 2,4-Dimethyl-3-nitropyrrole, from the 4- CO_2H acid, yellow, m. 138°, easily sol. in NaOH, gives with HCN and HCl in Et_2O the 5-formyl deriv. *Br deriv.* of 2,3-dimethyl-5-carbethoxypyrrole, from the pyrrole in CCl_4 with 1 mol. Br at 70°, m. 157° (cor.). V with $EtMgBr$ and $EtCOCl$ yields the *EtCO deriv.*, m. 128° (cor.). C. A. R.

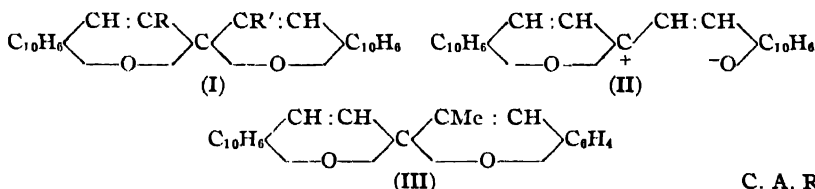

Some observations on pyrroles and complex salts. H. FISCHER and BRUNO PÜTZER. *Techn. Hochschule Munchen. Ber.* 61B, 1068-74 (1928).—Bromocitraconimide having been obtained by the oxidation of bromoporphyrin I (C. A. 22, 75), it became of interest to confirm this reaction, so important in the determination of the constitution of the porphyrin, on synthetic material of indubitable origin. The brominated methene (I) obtained from 2,4-dimethylpyrrole (C. A. 18, 372), the prep'n of which has been improved, was accordingly oxidized with $CrO_3.H_2SO_4$ and found to give bromocitraconimide in good yield. F. and P. also describe a no. of α -ethylpyrroles which were synthesized at a time when the indigoid formulation of the porphyrins still seemed possible and α -ethylpyrroles could be expected as reductive cleavage products of hemin. 3,5-Dicarbethoxy-4-methylpyrrole-2-aldehyde (II) heated with N_2H_4 gives a hydrazone which with II yields the aldazine (III), also obtained directly from II and N_2H_4 in AcOH, and III with $CuO.NH_4OH$ yields a well-crystd. Cu salt contg. one Cu atom to 2 pyrrole nuclei; either two H atoms of the pyrrole nuclei have been replaced by Cu or the substance contains univalent Cu as in the Cu salt of the methene of methylketol (cf. Schmitz-Dumont and Motzkus, C. A. 22, 2164). Attempts to settle this point by detg. the active H led to peculiar results which will be reported on later. Other aldazines were tested with respect to their ability to form such Cu complexes but without success. With $MeMgI$, II reacts smoothly through its CHO group, giving the corresponding sec. alc. (IV) in good yield, a reaction worthy of note. In connection with attempts to decarboxylate mesoporphyrin (V) to etioporphyrin, piperidine was tried. Decarboxylation was not effected but there was obtained a well-crystd. substance (VI) holding piperidine with extraordinary firmness, whose compn. agrees best with that calcd. for a mol. compd. of V with 2 mols. piperidine. It yields a well-crystd. Cu salt, but some further reaction must take place in the formation of the latter, as its compn. can be made to harmonize only with that of the Cu salt of a dipiperide of the V. V and its di-Me ester form well-crystd. Sn salts but no formula can be deduced theoretically to agree with their compn.; only from the di-Me ester and $SnCl_2$ was there obtained a salt having approx. the compn. $C_{24}H_{42}O_4N_4SnCl_2$. I is obtained in 96% yield from 30 g. pyrrole in cold AcOH with 144 g. Br. 2-Ethyl-3-acetyl-4-methyl-5-carbethoxypyrrole (VII) (13 g. from 13 g. 2-ethyl-4-methyl-5-carbethoxypyrrole, $AcCl$ and $AlCl_3$ in CS_2), m. 134°. Free 5-carboxylic acid, m. 204° (decompn.), loses CO_2 on dry distn., giving 2-ethyl-3-acetyl-4-methylpyrrole, m. 112°, b. 285-93°. 2,3-Diethyl-4-methylpyrrole, from VII, $NaOEt$ and $N_2H_4.H_2O$ at 175°, b₂₀ 95-7°, isolated through the Hg salt and picrate, m. 104.5°. 2-Ethyl-3,4-dimethylpyrrole picrate (2.6 g. from 2 g. 2-ethyl-4-methyl-5-carbethoxypyrrole-3-aldehyde by the Wolff-Kishner method), m. 122.5° (cor.). 3,5-Dicarbethoxy-2-bromomethylpyrrol-4-carbinol, from the 2-Me compd. and 1.25 mols. Br in AcOH at 18°, m. 96.5°, gives with $PhNH_2$ in the H_2O bath an antilde, $C_{19}H_{20}O_6N_2$, m. 95°. Nitration of the 2-methylcarbinol gives the di- NO_2 compd., m. 186° obtained from 2,4-dimethyl-3,5-dicarbethoxypyrrole.

2-Bromo-3,5-dicarbethoxy-4-methylpyrrole (0.6 g. from 1 g. II with Br in AcOH), m. 147° (cor.). *Hydrazone* of II, m. 100° (cor.). III, lemon-yellow, m. 196° (cor.), hydrolyzed by excess of hot 10% NaOH and a little alc. to the lemon-yellow *tetra-carboxylic acid*, $C_{16}H_{14}O_8N_4$. *Cu salt* of III, $C_{24}H_{18}O_8N_4Cu$, bronze-colored, m. 203° (cor.). *Aldazine* of 2,4-dimethyl-5-formylpyrrole, yellow, m. 251° (cor.). **3,5-Dicarbethoxy-4-methyl-2-[α -hydroxyethyl]pyrrole (IV)**, m. 95° (cor.). VI, $C_{44}H_{80}O_8N_8$; *Cu salt*, $C_{44}H_{80}O_8N_8Cu$; *Zn salt*, m. 286° (cor.). C. A. R.

Action of aniline on *d*-glutamic acid. WM. H. GRAY. Wellcome Chem. Research Labs., London. *J. Chem. Soc.* 1928, 1264-7.—Abderhalden and Schwab (*C. A.* 20, 3169) state that *d*-glutamic acid(I) and $PhNH_2$ give 2-hydroxypyrroline-5-carboxylic acid; working under the same conditions G. reports a compd. of the same m. p. and giving the same color reactions, which he considers to be *l*,2-pyrrolidone-5-carboxyanilide(II), m. 191°, $[\alpha]_D^{15}$ 17.9° (80% EtOH, c 4.8); this also results from the corresponding acid and $PhNH_2$. Br (2 atoms) gives the *p*-bromoanilide, m. 212°. Boiling II with 11 mols. Ac_2O gives the *l*-Ac deriv., m. 166°. II and $PhCH_2Cl$ give the *l*-di-benzyl deriv., m. 158°. II could not be catalytically reduced. *dl*-2-Pyrrolidone-5-carboxyanilide, m. 204°; it is much less sol. than the *l*-form. Heating I with Ph_2NH also gives II. C. J. WEST

Pyrlyene. JULIUS V. BRAUN AND WILHELM TEUFFERT. Univ. Frankfurt a. M. *Ber.* 61B, 1092-9(1928).—Willstätter found that the I or Br addn. product of the so-called dimethylpiperidine, $CH_2:CHCH_2CH_2CH_2NMe_2$ (the product of the Hofmann cleavage of piperidine), undergoes intramol. alkylation with formation of the pyrrolidine deriv. I, which then with alkalis or Ag_2O gives the unsatd. cyclic quaternary base II and this on distn. yields the so-called dimethylpiperideine (III) whose methiodide with alkali forms NMe_3 and pyrlyene (IV). W. assumed that the ring opening in II occurs between the N and CH_2 groups and that III has the structure $Me_2NC(CH_2)CH_2CH(CH_2)CH_2$ without considering the possibility of the structure $CH_3 \cdot C \cdot CHCH_2CH_2NMe_2$ (V) (resulting from opening of the ring between the N and the $C(CH_2)$ group). A repetition of W.'s work on II and its salts confirmed all his observations except that his conversion of the iodide into an isomer with Sn and HCl could not be reproduced. Catalytic hydrogenation of III, however, gave homogeneous $AmNMe_2$, showing that it has the structure V. But IV has not the structure $CH_2 \cdot C \cdot CHCH \cdot CH_3$, as might be expected, for it contains only 2 double bonds; it has therefore undergone a secondary change, with ring formation. Of the 5 possible structures for IV, that of cyclopentadiene is excluded by the fact that the latter compd. is known and is entirely different from IV. That IV is a methyleyclobutadiene is improbable because cyclobutadiene itself is unstable and decomps. into C_2H_2 at high temps., and moreover the mol. refraction of IV is somewhat higher than that calcd. for such a compd. It is also higher than that calcd. for a compd. VI. It agrees well, however, with the calcd. values for the compds. VII and VIII and v. B. and T. give the preference to VII, as the change $CH_2 \cdot C \cdot CHCH \cdot CH_2 \rightarrow VII$ seems the simpler one; this point could not be established by degradation, as the only oxidation products of IV which could be isolated were $AcOH$ and $(CO_2H)_2$ and these could be produced equally well from VII or VIII. The influence of the blocking of the β - and γ -C atoms to the N on the change piperidine $\rightarrow III \rightarrow IV$ was studied with tetrahydroisoquinoline. The 1st stages of the transformations are the same as in the piperidine series; there is obtained through *o*- $CH_2 \cdot CHC_6H_4CH_2NMe_2$ (IX) the quaternary compd. X which is smoothly converted into XI, whose structure is established by hydrogenation to the satd. salt (XII) but which, when treated with alkalis like I above, gives a diamine, probably $[Me_2NC(CH_2)C_6H_4]_2O$ (XIII). Characteristic of both series of reactions is the disinclination to the formation of an end $-C:CH$ group. α -Methylene-*N*-dimethylpyrrolinium chloride (chloride of II), very hygroscopic, m. 217° (chloroaurate, m. 265° (W. gives 226°)); α -methyl compd., readily obtained by catalytic hydrogenation with colloidal Pd or Rupe's Ni, does not m. 280°. III, b. 136-8°, d_4^{19} 0.7979, n_D^{19} 1.4635; chloroaurate, yellow flocks, gradually softening and liquefying on heating (W. describes it as an oil). The base is hardly altered by short warming with dil. H_2SO_4 . IV, b. 60°, shows no indication of polymerization on long standing, d_4^{19} 0.7443, n_D^{19} 1.4505, absorbs 4 atoms Br in CS_2 and 4 atoms H in MeOH with Pd. α -Bromomethyl-*N*-dimethyldihydroisoindolium bromide (X), m. 181-2° (decompn.); chloroplatinate, yellow, decomps. 198°. α -Methylene-*N*-dimethyldihydroisoindolium chloride (XI), hygroscopic, m. 159° (chloroaurate, m. 184°, decomps. 190°; chloroplatinate, m. 218-9°), easily reduced with Pd or Ni to the α -methyl salt (XII), m. 229°, also obtained from the bromide (*C. A.* 11, 2785). XI heated in concd. aq. soln. with 2 mols. KOH forms a

tion is accompanied by a hypsochromic effect. (2) 3,3'-Trimethylenespirodinaphthopyran (IV) forms salts which are not deep blue but only violet and are less stable than those of the I which are not substituted in the 3,3'-position. In agreement with the observations of Dickinson and Heilbron IV shows no color phenomenon in either alc., C_6H_5N , xylene or $PhCl$ but in higher boiling solvents (e. g., Ph_2O) there appears a distinct violet color which fades out on cooling and reappears on heating. The influence of 3,3'-disubstitution is therefore only quant., not specific. A further argument in favor of ionoid dissoen. is that in the 3-Am deriv. (V) of I ($R = Am$, $R' = H$) the appearance of the color is favored and bathochromically influenced by a little H_2O ; boiled in abs. dry C_6H_5N it gives only a dirty violet color which is changed to a deep blue by a couple drops of H_2O ; as more H_2O ppts. the unchanged colorless IV there can be no chem. action of the H_2O . The decrease in basicity with substitution in the 3- and 3'-positions can be seen quite distinctly in the 3,3'-di-Ph deriv. (VI) of I; the VI forms colored solns in concd. H_2SO_4 and CCl_3CO_2H , to be sure, but the salts are exceedingly unstable and cannot be obtained from dil. solns. The perchlorate obtained from 2,1- $C_{10}H_6(OH)CHO$ (VII) and $(PhCH_2)_2CO$ is a 2-benzyl-3-phenylnaphthopyrylium salt (VIII), which, however, loses its acid quite easily and changes into the anhydro base, 2-benzyl-3-phenyl-5,6-benzo-2-chroman (IX). V, from VII and $MeCOCH_2Am$ in alc. satd. with HCl and subsequent decompn. of the deep blue HCl salt in alc. suspension with NH_3 , m. 182° ; perchlorate, deep blue needles with brass luster, m. 256° , converted by boiling Ac_2O into the Ac deriv., $C_{22}H_{23}O_7Cl$, brown, m. 204° (decompn.). IV-HCl, from cyclohexanone and 2 mols. VII in alc. with HCl , dark brown needles with a violet streak, m. about 172° , loses its acid on attempted recrystn.; perchlorate, violet, begins to decomp. about 160° , decompn. being complete only at 190° . Free IV can be obtained from C_6H_6 or dil. C_6H_5N in colorless crystals, m. 238° ; the orange-red soln. (acid salt) in concd. H_2SO_4 is changed by diln. with alc. to violet (neutral salt); it dissolves in glacial $AcOH$ without color or salt formation; the non-fluorescent C_6H_6 soln. is turned brown-red by picric acid and petroleum ether ppts a brown-violet picrate but on heating the soln. becomes decidedly lighter. 3,3'-Di-Me deriv. of I, from VII and Et_2CO , m. $237-8^\circ$; the orange soln. in concd. H_2SO_4 is changed to orange-red by alc.; it dissolves in CCl_3CO_2H with brown-red color, it shows no color phenomenon in hot solvents, the picrate is very unstable toward heat. VI, from $(PhCH_2)_2CO$ and a large excess of VII, m. $247-8^\circ$, forms in concd. H_2SO_4 a brown-red soln. gradually becoming lighter and fluorescent, in CCl_3CO_2H a dichroitic green-red soln.; the C_6H_6 soln. is turned orange by picric acid but no picrate could be isolated, it shows no color phenomenon on heating. VIII, from 1.7 g. VII, 4.2 g. $(PhCH_2)_2CO$ and 70% $HClO_4$ in $AcOH$ satd. with HCl , dark brown crystals with garnet luster and a yellow streak, m. about $212-4^\circ$, loses its $HClO_4$ on short boiling in alc., giving IX, vivid red-orange, m. 146° , regenerates VIII with $HClO_4$, sol. in concd. H_2SO_4 with red-orange color and green fluorescence.

C. A. R.

Isomerization of an isoxazole into a triazole derivative. G. WITTIG, F. BANGERT and H. KLEINER. Univ. Marburg. *Ber.* 61B, 1140-3 (1928).—An attempt to prep. 3-methyl-4,5-diphenylisoxazole from NH_2OH and $PhCHBzCOME$ was unsuccessful; the diketone is not attacked by NH_2OH or, under more energetic treatment, decomps. 3-Methyl-4-benzeneazo-5-phenylisoxazole (I) was accordingly made from $PhN_2CH-BzCOME$ and NH_2OH in the hope of being able to remove the PhN_2 group directly or indirectly. When I is heated above its m. p. there occurs an explosive reaction which can be moderated by the addn. of Cu powder or sand but the product, which has the same compn. and mol. wt. as the original I and forms an oxime and nitrophenylhydrazones, is 2-phenyl-4-methyl-5-benzoyl-1,2,3-triazole (II). The isomerization takes place only far above (at about 180°) the m. p. of the I. All attempts to synthesize II from the phenylhydrazones (III) of $BzC:(NOH)COME$ gave only 3-methyl-4-nitroso-1,5-diphenylpyrazole, but the methylphenylhydrazones (IV) on short boiling with Ac_2O yielded II, with loss of $MeOH$. In the prepn. of IV 3 of the 4 possible isomers were obtained: these m. 126° , $150-1^\circ$ and $164-5^\circ$, resp., but after the most

stable form (164-5°) had once been prepd. it was no longer possible to isolate the 150-1° isomer originally prepd. by heating the 126° compd. above its m. p. The isomerism is not due to differences in intermol. arrangement in the crystal lattice (polymorphism), since the Na salts of the isomers have different solubilities and II is formed with different velocities from the 3 forms; the 126° compd. gives II on merely bringing to a boil in Ac_2O , whereas the other 2 yield an acetate (V) which changes into II only after boiling 15 min. As the Beckmann oxime rearrangement gave no conclusive results no suggestion as to the configuration of the isomers is ventured. PhCHBzCOMe (12 g. from 20 g. PhCH_2Bz boiled in Et_2O under H with NaNH_2 and then treated with cold AcCl), m. 99-9.5°, gives no color with FeCl_3 . I (yield, 95%), red-yellow, m. 99-9.5°. II, m. 74°, *p*-nitrophenylhydrazone, yellow, m. 231-1.5°. (C. A. R.)

The action of formic ester on dibenzyl ketone. FRICH BENARY AND GUSTAV A. BITTER. *Ber.* 61B, 1057-60 (1928).—In attempts to condense $(\text{PhCH}_2)_2\text{CO}$ with HCO_2Et in the presence of NaOEt it was found that, contrary to the usual course of such reactions, the resulting Na salt on decomn. with mineral acids yielded only in part a hydroxymethylene deriv.; along with the latter was obtained a cryst. compd. of faintly basic instead of acid properties, sol. without change in concd. HCl . In part one CH_2 group of the ketone reacts with formation of the mono- CHOH compd. but the 2nd also partly reacts, especially when a large excess of ester and NaOEt is used. The resulting di-Na salt, however, does not give the free bis- CHOH deriv. with acids but the anhydride, β,β' -diphenylpyrone (I). The actual presence of the di-Na salt in the reaction product is shown by the formation of the dianilide, $(\text{PhC}(\text{CHNHPh}))_2\text{CO}$ (II), with $\text{PhNH}_2 \cdot \text{HCl}$. The ring in I is much more stable than in pyrone; to convert I into the γ -pyrnone (III), it must be heated to boiling with AcONH_4 . III on distn. with Zn dust in H gives β,β' -diphenylpyridine (IV). The mono- CHOH compd. obtained along with I, an oil which cannot be distd., is the chief product when 1 mol. each of $(\text{PhCH}_2)_2\text{CO}$, HCO_2Et and NaOEt are used. With PhNHNH_2 it yields 1,4-diphenyl-5(or 3)-benzylpyrazole (V). Et_2CO with HCO_2Et gives no pyrone but only $\text{MeC}(\text{CHOH})\text{COEt}$ I, m. 186-7°. III (β,β' -diphenyl- γ -hydroxypyridine), m. 376° sol. in concd. mineral acids, reprecip. partially by H_2O , completely by alkalis, reduced, by Na in boiling alc. to the piperidine (yield, very small), turns brown 290°, m. about 310°. IV, m. 193-4°, picrate, yellow, m. 276°. Bishydroxymethylenedibenzyl ketone dianilide (II), orange-yellow, m. 165.6°. V, m. 128°. (C. A. R.)

Condensation of chloral with substituted phenols. FREDERICK D CHATTAWAY AND FERNANDO CALVET. Queen's College, Oxford. *J. Chem. Soc.* 1928, 1088-94; cf. C. A. 21, 1965.—Condensation of $p\text{-H}_2\text{NC}_6\text{H}_4\text{OH} \cdot \text{HCl}$ and $\text{Cl}_3\text{CCHO} \cdot \text{H}_2\text{O}$ in concd. H_2SO_4 gives 6-amino-2,4-bis(trichloromethyl)-1,3-benzodioxin(I), m. 174.5°, identical with the reduction product of the corresponding NO_2 deriv. (C. A. 21, 233); the alk. soln. contains 2,4- $\text{HO}_2\text{S}(\text{H}_2\text{N})\text{C}_6\text{H}_3\text{OH} \cdot 7 \text{ Br deriv. of I}$, m. 171-3° (Ac deriv., m. 231-32.5°). Boiling I with KOH in EtOH gives 6-amino-2,4-bis(dichloromethylene)-1,3-benzodioxin, m. 113.7° (Ac deriv., m. 191-4°). $p\text{-MeC}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4\text{OH}$ gives 6-*p*-tolueneazo-2,4-bis(trichloromethyl)-1,3-benzodioxin(II), reddish yellow, m. 152-3°. Reduction of II with SnCl_2 in EtOH gives I and $p\text{-MeC}_6\text{H}_4\text{NH}_2$. *m*- $\text{HOC}_6\text{H}_4\text{CO}_2\text{H}$ and chloral give 5-hydroxytrichloromethylphthalide, m. 199-200°. 3,4- $\text{Me}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{OH}$ and chloral give 6-nitro-7-methyl-2,4-bis(trichloromethyl)-1,3-benzodioxin, pale yellow, m. 148-50°; alc. KOH gives 5-nitro-2-ethoxy-4-methylmandelic acid, m. 155°, which on oxidation yields a mixt. of 5-nitro-2-ethoxy-*p*-tolylglyoxylic acid, m. 194° (*p*-phenylhydrazone, m. 199°) and 6-nitro-3-ethoxy-*p*-toluic acid, m. 166°. *o*- $\text{HOC}_6\text{H}_4\text{CO}_2\text{H}$ and *o*- and *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{OH}$ also condense with chloral but in each case a viscid and resin-like product has been obtained (C. J. WEST)

Flavanone glucosides. Y. ASAHINO, J. SHINODA, AND M. INUBUSE. *J. Pharm. Soc. Japan* 48, 207-14 (1928).—During the study of the constitution of sakuranin, the authors found that methylation of sakuranetin (I) (5,4'-dihydroxy-7-methoxyflavanone) resulted in the rupture of the flavanone ring to form a chalcone deriv. Perkin and Hummel (*J. Chem. Soc.* 85, 1459) also found that the methylation of butin resulted in the rupture of the flavanone ring to give butein, a methylated chalcone deriv. It was therefore suspected that acetylation might also cause the opening of the flavanone ring. As suspected, boiling of I with Ac_2O and AcONa gave triacetylsakuranetin, a chalcone deriv., m. 146°. These facts necessitate the reexamination of the constitution of some of the compds. to which a chalcone structure has been ascribed. The proof for the chalcone structure of hesperetin(II), according to Tutin (C. A. 5, 1078) is based upon the identity of the completely methylated product with the synthetic 2',4',6',3,4-pentamethoxychalcone and the formation of a tetra-Ac compd. Since II gives a violet color reaction by reduction (Tiemann and Will, *Ber.* 14, 951) a characteristic

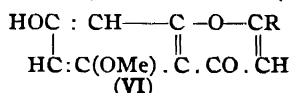

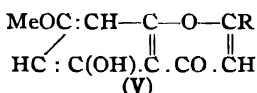

reaction for hydroxy- and methoxyflavanones, not possessed by chalcone derivs., T.'s formula for II is open to criticism. The acetylation of II with Ac_2O and a drop of H_2SO_4 gives a tri-Ac deriv. of II, m. $80-2^\circ$, colored red by reduction. Boiling of II with Ac_2O and AcONa gives a tetra-Ac deriv., m. 127° , not colored by reduction. These facts indicate that II has a flavanone structure easily convertible into a chalcone deriv. Moreover the absorption spectrum of II speaks in favor of the flavanone structure. Oesterle and Kueny's argument in favor of the chalcone nature of hesperetin (C. A. 10, 2472) is based upon the conversion of a Br deriv. of II into luteolin mono-Me ether by an alkali, but this reaction can also be considered as a conversion of 3-bromo-flavanone into a flavone. The chalcone formulas of T. for eriodictyol and homoeryodictyol are also open to the similar criticism. The four products of nature, butin, naringenin, sakuranetin and hesperetin, are all flavanone derivs. and occur in plants as glucosides.

NAO UYEI

Color reactions of flavone and flavanol derivatives and the like. J. SHINODA. *J. Pharm. Soc. Japan* 48, 214-20(1928).—K. had reduced 22 synthetic and natural flavone and flavanol derivs. in alc. with Mg and HCl in the presence or absence of Hg in order to study the color reactions of these compds. The results showed that the compds. having HO or MeO groups on the side Ph group give red to reddish violet color reaction, while compds. with Ph or other groups such as Me, $\text{PhCH}:\text{CH}$ or $\text{Ph}(\text{CH}_3)_2$ showed only a yellow coloration. Among the natural coloring matters, fukugetin and garcinin gave a reddish violet color. Of 7 synthetic flavanone derivs. tested, including sakuranetin and hesperetin Me ether, all except the non-substituted flavanone and 5,7-dimethoxyflavanone gave more or less strong reddish, or bluish violet colors. Of 18 synthetic chalcone derivs., none gave a color. Among 8 xanthone derivs., 1,3-dihydroxyxanthone, gentisin, isogentisin and gentisein gave a reddish violet color, while 1,3-dihydroxy-5-nitroxanthone gave a dark yellow color. Among Ph_2CO derivs., only maclurin gave a red color, while 2,4,6- $\text{Me}_3\text{C}_6\text{H}_2\text{COPh}$ and hydrocotoin gave no color. The following new compds. were prepd.: 2',4'-Dihydroxy-4-methoxychalcone, orange-yellow, m. 186° , from resacetophenone, anisaldehyde and alkali. 2-Methyl-3-acetyl-5,7-dihydroxychromone, m. 252° , from phloracetophenone, Ac_2O and AcONa . 7-Methoxyflavanone, m. 89° , from 2'-hydroxy-4'-methoxychalcone and $\text{EtOH}-\text{H}_2\text{SO}_4$. 7,8-Dihydroxyflavanone, m. 184° , from 2',3',4'-trihydroxychalcone and $\text{EtOH}-\text{H}_2\text{SO}_4$. 5,7-Dimethoxyflavanone, m. 140° , from 2'-hydroxy-4',6'-dimethoxychalcone and $\text{EtOH}-\text{H}_2\text{SO}_4$.

NAO UYEI

Phloracetophenone monomethyl ether. J. SHINODA AND S. SATO. *J. Pharm. Soc. Japan* 48, 220-2(1928).—Sonn (C. A. 20, 375) described 2 forms of phloracetophenone mono-Me ether, one m. $205-7^\circ$ (I) and the other m. $136-7^\circ$ (II). S. and S. obtained I and phloracetophenone di-Me ether from phloracetophenone tri-Me ether and AlCl_3 . Asahina, Shinoda and Inubuse (C. A. 22, 1592) obtained a mono-Me ether, m. $139-40^\circ$ (III), as a decompn. product of sakuranin (IV). III is probably identical with II. A., S. and I. could not arrive at the final constitution of IV because of the doubtful nature of the positions of the MeO group in I and II as assigned by Sonn. To make this point clear, I was converted into luteorin tri-Me ether by veratric anhydride and Na veratrate according to Robinson and Venkataraman's method for acacetin (C. A. 21, 93). The reaction should give either compd. V or VI ($\text{R} = 3,4-(\text{MeO})_2\text{C}_6\text{H}_3$). V, already been obtained by Perkins and Horsfall (*J. Chem. Soc.* 77, 1319), m.

$161-3^\circ$; acetate, m. $156-8^\circ$. S. and S. obtained VI, m. $285-6^\circ$, which gave a characteristic color reaction for flavones, yielded Herzig's luteorin tetraacetate, m. $225-7^\circ$, was converted into luteorin by HI, and into luteorin tri-Me ether by Me_2SO and KOH. These reactions show I has the MeO group ortho to the Ac group and III should have the MeO group para to the Ac group. Therefore the MeO group of sakuranetin should be at position 7.

NAO UYEI

Synthesis of 1,3-dihydroxy-7-nitroxanthone. H. YUMOTO. *J. Pharm. Soc. Japan* 48, 258-60(1928).—2,5- $\text{HO}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{CO}_2\text{H}$ and 1,3,5- $(\text{HO})_3\text{C}_6\text{H}_2$ by Hoesch's reaction gave 1,3-dihydroxy-7-nitroxanthone, m. $281-2^\circ$. Diacetate, m. 162° . N. U.

Nitration of 3-ethoxypyridine. ERNST KOENIGS, HANS C. GERDES AND ALFRED SIROT. Univ. Breslau. *Ber.* 61B, 1022-30(1928).—3-Methoxypyridine (12 g. from 20 g. 3- $\text{C}_6\text{H}_4\text{NBr}$ with Na in MeOH), b. 179° (chloroplatinate, reddish yellow, m. 269°), gives no pure mono- NO_2 deriv. but when cautiously dissolved in concd. H_2SO_4 and

Constitution of lycorine. H. KONDO AND K. TOMIMURA. *J. Pharm. Soc. Japan* **48**, 223-37 (1928); cf. *C. A.* **21**, 3622.—After repeated recrystn. from hot alc. lycorine (I), $C_{18}H_{17}NO_4$, m. 280° . Two of the four O atoms are in a CH_2O_2 group, while the other 2 belong to alc. OH groups. I and Ac_2O give *diacetyllycorine* (II), m. $215-6^\circ$, $[\alpha]_D^{20}$ 31.5° . *HCl salt*, contains 1.5 mols. H_2O , decomps. 258° , $[\alpha]_D^{19}$ $96-8^\circ$. I and $ClCO_2Et$ give *tricarbethoxylycorine*, m. 68° . Heating of I with MeI in a closed tube gives *lycorine-MeI*, decomps. 247° , which with AgOH gives the *methohydroxide* (III). When III is heated with concd. KOH, *methyllycorinemethine*, $C_{18}H_{16}NO_4Me$ and *methyllycorine-isomethine* (IV) are obtained. By heating with 20% KOH, III gives *lycorine ψ -methohydroxide* (V) $C_{18}H_{17}NO_4Me(OH) \cdot 4H_2O$, decomps. 219° , which on drying in vacuum at 60° or below loses 4 mols. H_2O and at $65-100^\circ$, it loses another mol. of H_2O to give a neutral *isomethine* (VI) $C_{18}H_{16}NO_4Me$, m. 234° , and a small quantity of a *methine* sol. in HCl. When V is heated with MeI in a closed tube, it loses 1 mol. H_2O and gives

methylanhydrolycorine-MeI (VII), $C_{16}H_{13}NO_2Me$. MeI, decomps. 235° , whose methoxyhydroxide and 20% KOH give VI having 4 mols. of H_2O of crystn. VI and MeI also give VII. Dihydrolycorine (VIII) and MeI give its *methiodide* (IX), m. 282° , $[\alpha]_D^{17} -7.65^\circ$. VIII and Ac_2O give the *di-Ac deriv.*, m. 224° , $[\alpha]_D^{16} -8.61$. *HCl salt*, m. 211° , liberates VIII when treated with EtOH-KOH. II, H_2 and Pt oxide also give VIII. IX, after conversion into the methoxyhydroxide does not undergo Hofmann's exhaustive methylation. I and PCl_5 or $POCl_3$ give *isolycorine* (XI), $C_{16}H_{17}NO_4$, m. $201-2^\circ$. *HCl salt*, m. 266° . XI, H_2 and Pt oxide give *dihydroisolycorine*, decomps. 103° . *HCl salt*, decomps. 118° . VIII and $POCl_3$ give *anhydrosdihydrolycorine*, $C_{16}H_{13}NO_2$, m. 102° . The above reactions indicate that I has the structure $C_{16}H_{13}(OH)_2(:N)(:O_2CH_2)$. On heating or with a dehydrating agent, two OH groups are eliminated as H_2O by taking H from neighboring C atoms to give the anhydro base. I can be conceived of as 2 cyclic compds. jointed by the N atom. The compd. V and the methoxyhydroxide of IX do not undergo Hofmann's exhaustive methylation, probably because their N is the quinoline type or tetrahydroquinoline type. Therefore, Gorter's assumption (C. A. 15, 1711) of a tetrahydroisoquinoline ring in I and the production of hydraetic acid as an oxidation product is open to question. NAO UYEI

Synthetical experiments on the aporphine group. II. Synthesis of bulbocapnine methyl ether. JOHN M. GULLAND AND ROBERT D. HAWORTH. Univ. of Durham. *J. Chem. Soc.* 1928, 1132-7; cf. C. A. 22, 1978.—2,3,4- $O_3N(MeO)_2C_6H_2CH_2COCl$ (from 6 g. of the acid) and 5 g. $CH_2(O)_2C_6H_3CH_2CH_2NH_2$ in C_6H_6 give 8 g. of 2'-nitro-3',4'-dimethoxyphenylacetate- β -3,4-methylenedioxyphenylethylamide, m. 158° ; with PCl_5 in $CHCl_3$ (36 hrs.), 5 g. of the amide give 3.8 g. of 2'-nitro-3',4'-dimethoxy-6,7-methylenedioxy-1-benzyl-3,4-dihydroisoquinoline, pale yellow, m. 230° (decompn.); the *HCl salt*, very pale yellow, m. 230° (decompn.); *methiodide* (I), bright yellow, m. 215° (decompn.); with dil. alkali I yields oxyhydrastinine and 2-nitrohomoveratrole. Reduction of I with Zn and HCl gives 2'-amino-3',4'-dimethoxy-6,7-methylenedioxy-1-benzyl-2-methyltetrahydroisoquinoline, oily, analyzed as the *di-HCl salt*, m. 231° (decompn.); the diazo soln. gives a crimson azo dye with β - $C_{10}H_7OH$. Diazotizing in $MeOH-H_2SO_4$ gives *dl*-bulbocapnine Me ether, isolated as the *III salt*, m. 250° (decompn.); *methiodide*, m. 243° . C. J. WEST

Membranes of spores and pollen. I. Lycopodium clavatum L. FRITZ ZETZSCHE AND KARL HUGGLER. *Ann.* 461, 89-108(1928).—Extn. of *Lycopodium clavatum* spores with AcOH does not remove hydrocaffeic acid or albumins; these are removed, however, by a subsequent extn. with HCl or alkali. Alternatively, they may be removed in 1 stage by extn. with alkali. The membrane remaining (25% of the original spores) contains no lignin, and when treated with diacetylorthonic acid gives pure cellulose (about 2% of the crude spores). By boiling the crude spores with 5% alkali and extg. with alc. and H_2O (both boiling) a residue corresponding with 23-5% of the spores is obtained. This, after prolonged digestion with HCl, followed by boiling with 5% alkali, affords a new brownish yellow substance, *sporonin*, $(C_{16}H_{16}O_3)_x$. This appears to be a chem. individual, since the reactions which can be effected with it are reproducible with great exactness. Sporonin contains 1.26% OMe and forms about 21% of the crude spores. It is insol. in all common solvents, contains neither CO nor CO_2H groups, and is very stable towards mineral acids, alkalis and heat, beginning to decomp. first at 300° . When heated in $C_2H_5(OH)_1$ with KOH it affords *anhydrospononin*, $C_{16}H_{12}O_{21}$. Br converts sporonin in cold CCl_4 into *bromospononin I*, while free Br gives *bromospononin II*. These are not readily attacked by HNO_3 . Bromospononin I is converted by cold alkali into *bromospononin III*, the latter being brominated in CCl_4 to *bromospononin IV*. H_2O_2 oxidizes sporonin in AcOH to *oxidospononin*, $C_{16}H_{14}O_{31}$ or $C_{16}H_{14}O_{31}$. Boiling Ac_2O converts sporonin into a compd. contg. 13% Ac, which, however, on hydrolysis gives a substance other than sporonin. Me_2SO_4 and alkali transform sporonin into a substance contg. 2.2% OMe. C. J. WEST

3,4,5,6-Tetrahydro-4-carboline. JULIUS N. ASHLEY AND ROBERT ROBINSON. Univ. of Manchester. *J. Chem. Soc.* 1928, 1376.—3,4,5,6-Tetrahydro-4-carboline (tetrahydronorharman) (Asahina, Irie and Ohta, C. A. 21, 3622) is readily prep'd. by the reduction of 3-keto-3,4,5,6-tetrahydro-4-carboline (Manske and Robinson, C. A. 21, 1263) with Na and BuOH. Oxidation with CrO_3 gives a poor yield of norharman. C. J. WEST

Coloring matters of saffron. II. P. KARRER AND HARRY SALOMON. Helv. Chim. Acta 11, 513-25(1928); cf. C. A. 21, 2474.—The 3 substances isolated from saffron are identified as follows: α -crocetin (I) is a di- C_6H_3 acid, $C_{22}H_{24}O(CO_2H)_2$; β -crocetin (II) is its mono-Me ester; and γ -crocetin is its di-Me ester. The 5th O

atom is probably present in an ether or an inactive C:O linkage. OH and CO could not be detected. I is present in saffron as a sugar ester, α -crocin (IV), m. 186°. Hydrolysis of IV gives 4 mols. of glucose, which are present in IV as 2 disaccharide groups II also appears to be present in saffron as a sugar deriv., while III, being a di-Me ester, is not. III adds on 8 mols. of H to form $C_{22}H_{40}O(CO_2Me)_2$, b_p 198–200°. Crocetin is therefore an open-chain aliphatic di-CO₂H acid. The 8 double bonds are conjugated since decompn. with O₃ gives glyoxal bis- $\{p$ -nitrophenylosazone $\}$, m. 302–4°. Both I and II are converted into III with CH₂N₂, and II and III give I by sapon. I takes up over 40 atoms of O but no definite compds. were isolated from the reaction.

J. S. REICHERT

Conjugated double bonds. V. Constitution of carotin and bixin. RICHARD KUHN AND ALFRED WINTERSTEIN. *Helv. Chim. Acta* 11, 427–31 (1928); cf. C. A. 22, 1767.—To explain its color the 11 double bonds in carotin must be largely conjugated. The following formula for bixin is suggested: $MeO_2CCH=CH(CMe=CHCH=CH)_4CO_2H$. The 2 CO₂H groups are dissimilar since 2 Me Et esters are known. It adds on 18 H but only 10 halogen atoms. With O₃ Me bixin gives methylglyoxal and Me β -acetylacrylate indicating the presence of the $MeOCC=CHCMe=$ group. The formation

of *m*-xylene by dry heating suggests the presence of the $=CHCMe=CHCH CMe=$ group.

J. S. REICHERT

Chromoproteins of red algae. I. RUDOLF LEMBERG. *Ann.* 461, 46–89 (1928). Phycoerythrin (I) and phycocyan (II) have been extd. from *Ceramium rubrum* and from *nori* (Japan). The former in winter contains about 1.9% of total pigment, of which 15–25% is I. In the spring, the total pigment is only about 0.9%, of which about 35% is I. *Nori* contains 1.7–2.2% of total pigment, of which 32–50% is I. Incomplete investigations of the similar pigments in *Phyllophora nervosa* and *Rhodomela subfusca* are recorded. I is very strongly fluorescent. The effects of alkali, NH₃, ZnCl₂, CuSO₄·NH₄OH, concd. H₂SO₄, Br-H₂O, H₂O₂, (NH₄)₂S, H₂SO₃ and Molisch's reagent are mentioned. II is less fluorescent than I. That from *Ceramium* forms large, rhombic leaflets, showing dichroism in polarized light. That from *nori* has a different cryst. form. The effect of different H-ion concns. on aq. solns. of both pigments has been investigated. I has an appreciable Ca content but no other metal could be detected. Scission of I with pepsin in acid soln. produces "phycobitin". Solns. of I and II obey Beer's law.

C. J. WEST

Carotin. RUDOLF PUMMERER AND LUDWIG REBMANN. Univ. of Erlangen. *Ber.* 61B, 1099–102 (1928).—Because of the appearance of the paper of Zechmeister, v. Cholnoky and Vrabély (C. A. 22, 2169) P. and R. report now the results of some expts. in connection with rubber (I) carried out partly to test analytical methods for measuring double bonds and partly to det. why the still more unsatd., colored carotin (II) shows so little similarity to I in respect to viscosity, associating power, etc. Quant. measurements (by G. SCHEIBE AND A. ROSENBERG) of the spectrum of II showed a quant. unusually strong absorption ($\log K > 5$, K being the extinction coeff.) in the visible regions; there is a double max. at 451 ($\log K$ 5.3) and 482 $m\mu$ ($\log K$ 5.2). The most interesting fact is that the chief band is drawn together into one and is of such a height that this plant hydrocarbon can well be compared as to absorption with many very powerful dyestuffs and is approx. equiv. to eosin ($K > 5$). Besides the chief band there is a much weaker secondary band at 273 $m\mu$. I with the Pileshaeiev reagent in CHCl₃ at 0° gives rapidly a normal oxide (C₄₀H₅₈O)₂, 1 double bond reacting for every C₈H₈ group. Of II, C₄₀H₅₆, each mol. consumes 8 atoms O, indicating the presence of 8 double bonds if the reaction proceeds normally. II adds only 1 mol. Br₂. According to Escher (*Diss. Zürich*, 1909) it uses up 22 atoms of Br but at the same time 20 mols. HBr are split off. Cl, on the other hand, gives a product very rich in Cl with liberation of only very little HCl. Titration with ClI (by FRANZJOSEF MANN) showed that at room temp. II absorbs 11–11.5 mols., while Z., v. C. and V.'s crude perhydrocarotin, C₄₀H₇₈, corresponds to the absorption of 11 mols. H₂. But in the reaction with ClI about 3 mols. halogen acid are liberated. Apparently, then, 8 double bonds react like normal aliphatic double bonds with BzO₂H and ClI, while 3 do not react with BzO₂H and react abnormally with ClI. Possibly these 3 "sluggish" double bonds are present in a C₈H₆ (cymene) nucleus. Xanthophyll unexpectedly showed the presence of 8 double bonds with BzO₂H.

C. A. R.

Cortex of Byrsonima crassifolia. G. HEYL AND H. HEIL. *Festschr. A. Tschirch* 1926, 62–71.—The cortex of *Byrsonima crassifolia* contains byrsonimol, C₂₃H₄₀O, m. 197.5°, $[\alpha]$ 96.94° (Ac deriv., m. 242°; Bz deriv., m. 232°), giving in concd. H₂SO₄ a yellow soln. becoming brown on addn. of Ac₂O or reddish yellow to dull red when

warmed. The substance, when treated with Ac_2O and (dropwise) with concd. H_2SO_4 , gives a deep violet-red soln. These and other color reactions are given by naturally occurring higher alcs. of the character of phytosterols. B. C. A.

Organic catalysts with H-ion optimum (LJUNGGREN) 2.

CHAMBERLAIN, JOSEPH SCUDDER: **A Textbook of Organic Chemistry**. 2nd ed. revised. Philadelphia: P. Blakiston's Son & Co. 901 pp. \$4. Reviewed in *Chemicals* 29, No. 25, 22(1928).

Richter-Anschütz **Chemie der Kohlenstoff-verbindungen oder Organische Chemie**. Band I. Die Chemie der Fettkörper. 12th ed. Revised and rewritten by Dr. Reindel. Akademischen Verlagsgesellschaft m. b. H. 850 pp. Price about M. 55.

Oxidation products from gaseous hydrocarbons. JOSEPH H. JAMES (to Clarence P. Byrnes, trustee). U. S. 1,675,029, June 26. A gaseous stream contg. O and a proportion of gaseous hydrocarbons such as CH_4 or higher hydrocarbons which is greater than comes within the explosive range is passed through a catalytic layer such as Mo oxide or a similar compd. at a temp. (suitably about 550° with CH_4 and Mo oxide) below the volatilizing point of the catalyst and at such velocity as to produce partial oxidation products, e. g., CH_2O from CH_4 . An app. is described.

Oxidizing alcohols. A. I. MAKOVEZKII and V. V. YANOVSKII. Russian (Soviet) No. 1420, July 31, 1926. Air is blown through a container with alc. and a catalyst at a rate sufficient to form aldehyde. The water is condensed and the aldehyde mixed with fresh air is blown again over another catalyst and oxidized to acid.

Pyrogenous treatment of organic acids. G. L. STADNIKOV, N. N. GAVRILOV and A. A. VINOGRADOV. Russian (Soviet) No. 1245, Sept. 15, 1924. Org. acids are led in vapor form at $250\text{--}400^\circ$ over iron reduced from iron oxide pptd. on pumice stone, asbestos or similar material. *Lubricating oils* are obtained by this treatment of fatty acids from vegetable or animal fats.

Column apparatus for hydrolysis of alkylsulfuric acids. MAURICE DUCHANGE (to Compagnie de Bethune). U. S. 1,674,891, June 26. Alkylsulfuric acid to be hydrolyzed is introduced into filling material in the lower portion of a column after passing in heat-exchange relation with vapors arising from contact plates in the upper part of the column; steam and a neutralizing agent may also be admitted into the lower part of the column; residue is withdrawn at the bottom and vapors are led off from the top.

Aromatic acid anhydrides. BRITISH DYESTUFFS CORPORATION, LTD., J. B. PAYMAN and N. HALL. Brit. 280,373, Nov. 29, 1926. Benzoic anhydride is obtained by treating benzotrichloride at $100\text{--}105^\circ$ with water in the presence of pumice contg. ZnCl_2 , or by heating benzotrichloride to $110\text{--}115^\circ$ with dry FeSO_4 or FeCl_3 and benzoic acid, or by heating benzotrichloride at $100\text{--}105^\circ$ with FeSO_4 crystals. Similarly, other aromatic acid anhydrides may be produced by use of catalysts such as chloride, sulfate, oxide, benzoate or sulfonate of Zn, Cu, Fe, Al or Sn.

Acetic anhydride, etc. H. DREYFUS. Brit. 279,916, June 1, 1926. Ac_2O or other aliphatic acid anhydrides are made by heating the corresponding acid in vapor form and condensing or extg. the anhydride from the reaction products without condensing or extg. the water. Dil. or concd. HOAc may be used and a temp. of $200\text{--}1200^\circ$ may be used in reaction tubes of Cu, Fe, earthenware or other materials in the presence of a catalyst and under either reduced or increased pressure. Among the solvents which may be used for the selective extn. of the anhydride are: PhCl , *p*-dichlorobenzene, benzyl ether, $\text{C}_6\text{H}_5\text{Cl}$, paraffin oil, triacetin or other acetyl glycerols, phenetole, anisole, cresols and *p*-cresol acetate.

Alkylguanidines. CHEMISCHE FABRIK AUF AKTIEN, VORM. I. SCHERING. Brit. 279,884, Oct. 28, 1926; Can. 281,121, June 19, 1928. Isoamyl-, hexyl-, heptyl- and phenylethylguanidines are prepd. by heating a salt of the corresponding alkylamine with cyanamide in aq. or alc. soln. Pentamethylene-, hexamethylene- and deca-

methylene-diguanidines are made from the corresponding diamines and cyanamide. *N*-methyl-*N'*-hexylguanidine is made by heating hexylamine with methylcyanamide in alc. Propyl-, amyl-, isoamyl- and hexylguanidines are made by allowing a salt of the corresponding amine to stand with a soln. of cyanamide in NaOH.

Thiuram disulfides. SILESIA VEREIN CHEMISCHER FABRIKEN. Brit. 279,790, Oct. 30, 1926. Alkyl-aryl-substituted dithiocarbamic acids are oxidized in alk. soln. by a mixt. of NO and air; e. g., dimethyldiphenylthiuram disulfide is made from the NH_4 or alkali metal salt of methylphenyldithiocarbamic acid.

Acyl naphthalenes and acenaphthenes. I. G. FARBEIND. A.-G. Brit. 279,506, Oct. 23, 1926. Monoacyl derivs. such as α -benzoylnaphthalene or 5-benzoylacenaphthene are treated with an aromatic or aliphatic acid chloride such as benzoyl chloride in the presence of AlCl_3 to obtain diacyl derivs.

Acetone. HOLZVERKOHLLUNGS-INDUSTRIE A.-G. Brit. 280,184, Nov. 4, 1926. In the catalytic manuf. of acetone from C_2H_2 and steam, a suitable catalyst such as Fe oxide is rendered more active by the addn. of a "promoter" such as Fe, Mn oxide, Al_2O_3 , BaCO_3 , ZnCO_3 , lime or MgO and the catalyst and promoter are preferably used on a metallic carrier. The partial pressure of O in the reaction mixt. should be adjusted in accord with the reaction temp. employed. Several examples are given.

Menthol. HANS JORDAN, WALTER SCHOELLER and REINHARD CLERC (to Chemische Fabrik auf Aktien, vorm. E. Schering). Can. 281,116, June 19, 1928. Menthol is produced by action of H under pressure in presence of catalyst and menthane on a product of condensation of *m*-cresol and acetone at about 280° until 16 atoms H have entered into the combination.

Thymol. HANS JORDAN (to Chemische Fabrik auf Aktien, vorm. E. Schering). Can. 281,117, June 19, 1928. Thymol and its isomers and homologs are produced by treating the condensation product of *m*-cresol and acetone at about 180 – 190° in the presence of about 0.1% Al 3-methyl-6-isopropylphenolate and about 1% of a Ni catalyst with H until 4 H atoms have entered into the combination, and sepg out the thymol.

Products from cresols and ketones. HANS JORDAN (to Chemische Fabrik auf Aktien, vorm. E. Schering). Can. 281,118, June 19, 1928. The product of condensation from *m*-cresol and acetone is distd. and the vapors are slowly conducted over a layer of frankonite heated to about 320°C . The product of decompn. is mixt. of dimethylcoumaran and 3-methyl-6-isopropylphenol. If *m*-cresol is replaced by *p*-cresol there are obtained dimethylcoumaran and 4-methyl-6-isopropylmethylphenol. Cf. C. A. 22, 2756.

Phenols. HANS JORDAN, WALTER SCHOELLER and REINHARD CLERC (to Chemische Fabrik auf Aktien, vorm. E. Schering). Can. 281,114, June 19, 1928. The products of condensation of phenols with ketones are treated under pressure with H in the presence of a catalyst. E. g., hydrogenation of the product of α -naphthol and AcMe gives as a new compd. 4-isopropyl-1-naphthol.

Phenols and coumarans. CHEMISCHE FABRIK AUF AKTIEN, vorm. E. SCHERING. Brit. 279,857, Oct. 26, 1926. Alkylisopropylphenols and alkylcoumarans are made by bringing the etheric condensation products of *m*- and *p*-cresol with ketones (such as acetone) into contact with a surface catalyst, preferably at a temp. of about the b. p. Bleaching earths, silica gel and charcoal may be used and their activity may be increased by depositing on them Ni or Ni oxide or other metals or metal compds. of catalytic properties. The products may be hydrogenated to produce thymol and menthol.

Hydrogenating phenols. CHEMISCHE FABRIK AUF AKTIEN, vorm. E. SCHERING. Brit. 279,855, Oct. 26, 1926. Alkylisopropylphenols and the corresponding cyclohexanols are made by hydrogenating the mixt. of alkylisopropylphenols and alkylcoumarans, described in Brit. 273,686 (C. A. 22, 1982), without previous fractionation. After hydrogenation (which may be effected in the presence of a Ni catalyst), the mixt. is fractionated, preferably *in vacuo*. Thymol, menthol and their isomers may be obtained.

Alkylisoalkylphenols. WALTER SCHOELLER and HANS JORDAN (to Chemische Fabrik auf Aktien, vorm. E. Schering). Can. 281,120, June 19, 1928. Alkylisoalkylphenols are manufd. by first decompg. by heating the condensation products obtainable from alkylated phenols and acetone, thereafter hydrogenating the mixt. of the products of decompn. until 2 H atoms have entered into combination, and finally sepg. from the mixt. the alkylisoalkylphenols.

Hydrogenated alkylisoalkylphenols. WALTER SCHOELLER and HANS JORDAN (to Chemische Fabrik auf Aktien, vorm. E. Schering). Can. 281,119, June 19, 1928.

Alkylisoalkylphenols hydrogenated in the nucleus are produced by heating the condensation products obtainable from *m*-cresol and acetone, hydrogenating the mixt. of the products of decompn. until 8 H atoms have entered into combination, and finally sepg. from the mixt. the hydrogenated alkylisoalkylphenols.

Phenolic compounds. HANS JORDAN, WALTER SCHÖELLER and REINHARD CLERC (to Chemische Fabrik auf Aktien, vorm. E. Schering). Can. 281,115, June 19, 1928. Thymol or its isomers and homologs are produced by acting with H under pressure in the presence of a catalyst and a diluent (menthane) on the product of condensation of a cresol and a ketone at about 280° until 4 H atoms have entered into the combination.

11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

A—GENERAL

FRANK P. UNDERHILL

Studies on the influence of benzoic acid and of the three isomeric hydroxybenzoic acids on succinodehydrogenase. SVEN MÅHLÉN. *Skand. Arch. Physiol.* 53, 152-75 (1928).—The K salts of benzoic and hydroxybenzoic acids have been used in expts. with succinodehydrogenase extd. from horse flesh. The methylene blue method was employed. The discoloration, *i. e.*, the oxidation, was inhibited by all these substances, the order of their action being: salicylic acid > *m*-hydroxybenzoic > *p*-hydroxybenzoic > benzoic acid, and a 10% reduction in enzyme activity was attained with 0.5, 5, 12 and 24 millimol. concns. of the 4 acids. S. M.

Heparin. W. H. HOWELL. *XII Int. Cong. Physiol.* 1926, 80; cf. *C. A.* 17, 3349.—Heparin, an anticoagulant prepd. from liver, contains Ca and sulfate, but no protein, amino acid or P. It may be a conjugated glucuronic acid of glucosidic structure. B. C. A.

Influence of x-rays on certain blood constituents. A. GIGON and M. LÜDIN. *Schweiz. med. Wochschr.* 56, 814-6(1926). B. C. A.

The free-energy decrease of alcoholic fermentation. E. I. FULMER and EINAR LEIFSON. *Iowa State Coll. J. Sci.* 2, 159-77(1928).—The method of applying the concept of free energy decrease to microbiological processes is explained and illustrated. The difference between heat evolved, ΔH and free energy ΔF is emphasized. A comparison of symbols used by Gibbs, Plank, W. McC. Lewis, MacDougal, G. N. Lewis, Eucken and Jette & LaMer's translation of Eucken, for equiv. thermodynamic functions and a summary of the relation involving A , the available energy, at const. volume and F , the free energy, at const. pressure are given. The formation of alc. from sucrose is assumed to be quant. $C_{12}H_{22}O_{11} + H_2O \rightarrow 4C_2H_5OH + 4CO_2$. Tables give: the fugacity of CO_2 from 1 to 800 atms.; $-\Delta F$ for CO_2 from 10^{-10} to 800 atms.; $-\Delta F$ for EtOH solns. from 0.21×10^{-10} to 4.94 *M*; ΔF for the effect of the presence of 0%, of 20%, and of 50% EtOH on the diln. of solns. of $C_{12}H_{22}O_{11}$ from 5.35 to 0.001 *M*; and $(\Delta F - K)$ for initial concns. of sugar from 1.00 to 0.30 *M* in each of 3 initial concns. of EtOH, 0.21×10^{-10} , 0.21×10^{-1} and 0.21. In the last table ΔF is the free energy decrease under the initial conditions indicated, and K the free energy decrease for standard states. The average value of $(\Delta F - K)$ is 27 Cal., or $-\Delta F$ at ordinary conditions for fermenting sugar is 23% greater than $-\Delta F$ for standard states. For standard states, $-\Delta F^\circ_{-298} = 116.6$ and $-\Delta H = 51.2$ Cal. The paper is written primarily for biological, and not for physical, chemists. F. E. BROWN

Hemoglobin. J. BARCROFT. *Chemistry and Industry* 47, 609-17(1928).—A review of the chemistry and properties of hemoglobin and its decompn. products protoporphyrin, hemochromogen, cytochrome; the differences in the hemoglobin of various species, especially in their affinities for O_2 ; the mol. wt. of hemoglobin and its equilibria with O_2 . F. A. CAJORI

The question of the electrodialysis of serum. G. ETTISH, R. BRADFELD and W. EWIG. Kaiser Wilhelm Inst. Physik. Chem., Berlin. *Kolloid-Z.* 45, 141-5(1928).—When a d. c. of 120 v. and about 96 ohms resistance is passed through a dil. soln. of serum with a collodion and hemoglobin membrane at the anode and a parchment membrane at the cathode, serum globulin is pptd. The p_H of the soln. shows a remarkable shift, becoming at first more alk. and later, if the dialysis is continued, more acid, a change which is explained by the character of the membranes at the anode and cathode. F. A. CAJORI

Considerations concerning the "protein sugar" in blood. G. QUAGLIARIELLO. *Arch. sci. biol. (Italy)* 11, 106-38(1928).—A review of recent work. The exact amt. of protein sugar formed cannot be definitely detd. as it varies according to conditions under which the hydrolysis takes place, and sugar is never sepd. from the mol. without also affecting the protein radical. A. W. CONTIERI

Formation of lactic acid in the oxidation of glucose in the presence of animal carbon. V. BOLCATO. *Boll. soc. ital. biol. sper.* 2, 884-7(1927).—Many org. acids and salts are oxidized in the presence of bone black activated by H_3PO_4 , but there have been conflicting results obtained in the oxidation of glucose. Ten cc. of glucose soln. (2-3%) (sterile) was added to 0.3 g. of bone black (not activated) and kept 75-100 hrs. at 40° with occasional stirring. The remaining glucose was detd. iodometrically according to Lehmann. In about 20 detns. amts. of glucose varying from 1 to 5% were consumed. Traces of lactic acid were found in residual liquid. Lactic acid is itself oxidized by bone black; therefore, only traces are found. A. W. CONTIERI

The effect of gradual removal of oxygen from inspired air. R. ROMANESE. *Boll. soc. ital. biol. sper.* 2, 887-9(1927).—Two methods were used; in the first a rabbit was placed in a closed space and tubes were so connected that aspirated air passed through NaOH, thus removing CO_2 . The air became rarified from loss of O_2 by fixation, this was neglected. The rate of breathing gradually decreased from 55 to 33 per min and the heart beat slowed down till breathing and heart-beat stopped practically at the same time. In the second expt., N_2 was added to replace the O_2 removed by CO_2 fixation. The vol. of air breathed increases although the rate decreases, as above. Blood pressure remains fairly const. until O_2 is down to 10% when several rapid drops occur. Breathing stopped about 2 min. before heart-beats stopped. A. W. CONTIERI

Chemical composition of follicular liquor. G. B. TAFURI AND M. TESTA. *Boll. soc. ital. biol. sper.* 2, 893-4(1927).—The physicochem. compn. of the liquid from the follicles of the cow's ovary has been studied. It is a yellow, somewhat viscous, turbid liquid with d. 1.027 at 11°, 1.022 at 29°, surface tension 0.958; mol. lowering of f p 0.589-0.63°; viscosity (H_2O at 37° = 1.50") = 3.39"; cond. at 12° = 175.8×10^{-4} , p_H 7.40; N 1.34612, loss at 105° (moisture) = 92.49%; total N_2 = 11.083%, residual N_2 (pptd. with $COOH\ CCl_3$) = 0.443%; residual N_2 (pptd. with phosphotungstic acid) 0.3187%; proteins pptd. by $(NH_4)_2SO_4$ = 22.85%; protein coagulable 34.1. 35.08 = av. 34.59%; reducing power (glucose) 0.987%. The figures given, except water, are % of the dry residue. Protein N_2 (total N_2 minus N_2 pptd. by $CCl_3\ COOH$) = 10.64%, so that there are 66.5% proteins; of these 22.85% = % pptd. by $(NH_4)_2SO_4$, and 34.59% coagulable, leaving 9.07% which is not coagulable by heat, and which is pptd. by EtOH, probably ovomucoids. Traces of fat and lipoids in the liquid have not been identified. A. W. CONTIERI

The biological-chemical trend in research in dermatology. ERICH URBACH. *Wiener klin. Wochschr.* 41, 581-4, 634-6(1928).—A review with bibliography. D. B. DILL

The chemistry of sputum. II. HELMUT MÜLLER AND HELMUTH REINWEIN. *Z. physiol. Chem.* 176, 200-6(1928); cf. *C. A.* 20, 3700.—From 2.5 l. of sputum collected over a period of 2 months from a bronchiectatic and preserved with PhMe and $CHCl_3$, arginine and choline were isolated and identified. The presence of urea could not be demonstrated. The choline may possibly account for the contraction of cat intestine observed by Harkaw (C. A. 20, 232) with the alc. ext. of a similar sputum and attributed by him to histamine. A. W. DOX

Composition of intraocular fluids. 1. Ox and horse. F. TRON. *Arch. Ophthalm.* 117, 677-92(1926). H. C.

The inactivation of urease. E. G. SCHMIDT. Mercy Hospital, Baltimore. *J. Biol. Chem.* 78, 53-61(1928).—The inactivating action of $HgCl_2$ on urease is suggested as a means of standardizing the latter. Hg , however, could not be detected in the blood of patients poisoned with $HgCl_2$ when this method was employed. The inactivating power of Ag^+ , Hg^{++} , Cu^{++} , Zn^{++} , Cd^{++} , U^{++++} , Au^{+++} , Pb^{++} , CO^{+++} , Ni^{+++} , Ce^{+++} and Mn^{++} are in the order named. ARTHUR GROLLMAN

Review of recent developments in histochemistry. MAURICE PARAT. *Biol. Rev. Biol. Proc. Cambridge Phil. Soc.* 2, 285-97(1927). E. H.

Biochemical experiments practical for elementary biology classes. HENRY J. FRY. Washington Square College. *Science* 68, 16-8(1928). E. H.

Effect of ultra-violet radiation on the blood alkali reserve of children. E. LEEN-

HARDT AND J. CHAPTAL. *Bull. sci. med. biol. Montpellier* **8**, 425-8(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 494.—Irradiation with a Hg-quartz lamp causes in rachitic and dystrophic children a rapid increase of the alkali reserve, in normal children an increase to the adult level.

MARY JACOBSEN
Scleroproteins. R. O. HERZOG. *Helv. chim. Acta* **11**, 529-33(1928).—X-ray investigation of natural albumin-like fibers shows that they consist to a large extent of submicroscopic crystals. These crystd. portions H. calls scleroproteins. Measurement of the x-ray diagram shows that the crystallographic elementary cell of the scleroproteins is relatively small. The structure of the scleroproteins is probably different from that of the true proteins (albumins). The study of collagen and fibroin indicates that each substance is a mixt. of probably 1 crystd. and several amorphous compds., the nature of the mixt. varying with the source. The material obtained by treating fibroin with resorcinol dissolves in *m*-cresol to give a polydisperse soln. of av. mol. wt. of about 320

LOUISE KELLEY

The inhibition of acid irritation by sugars. WALTER R. PENDLETON. Univ. of Chicago. *Am. J. Physiol.* **82**, 358-69(1927).—The irritating effects of lemon juice, citric, tartaric, lactic, nitric and sulfuric acids on frogs' skin were reduced by the presence of sucrose, levulose, glucose and lactose in the acid soln., the degree of reduction being related to the sweetness of the sugar rather than to mol. wt. HCl and AcOH were only slightly inhibited. The addn. of sugar did not change the p_H of the acid solns. It is suggested that the sugar mols. are adsorbed at the cell surfaces. J. F. LYMAN

The effect of carbon monoxide and oxygen at high pressure on the power of animal tissue to cause the oxidation of guaiacum. ARTHUR L. MEYER. Johns Hopkins. *Am. J. Physiol.* **82**, 370-5(1927).—When hemoglobin combined with CO its behavior toward guaiacum in the presence of H_2O_2 was altered; more H_2O_2 was needed to produce the guaiacum reaction than was needed with blood free from CO. CO in a concn. of 10% seemed to have no effect on the power of muscle tissue to give the guaiacum reaction. When brain tissue in water suspension was exposed to O_2 at 4 atm. the guaiacum reaction was much reduced, indicating a definite retarding influence on the metabolic activity of the brain tissue. J. F. LYMAN

The oxidation of sodium lactate by red blood cells. GEORGE B. RAY. Western Reserve Univ. *Am. J. Physiol.* **82**, 405-14(1927).— CO_2 production by red blood cells, measured by the method of Osterhout, shows that such cells in a proper substrate have an appreciable metabolism. In the absence of air (O_2) acetaldehyde (recognized by its odor) is the end-product of sodium lactate oxidation by red blood cells. In the presence of O_2 the acetaldehyde probably forms acetyl peroxide, which in turn oxidizes the hemoglobin to methemoglobin. J. F. LYMAN

Colloid properties of the surface of the living cell. III. Electric impedance and reactance of blood and muscle to alternating currents of 0 to 1,500,000 cycles per second. J. F. McCLENDON, WITH F. A. COLLATZ, J. BARTON AND R. M. JOHNSON. Univ. of Minn. *Am. J. Physiol.* **82**, 525-32(1927).—A new high-frequency Wheatstone bridge with heterodyne detection and 2-stage amplification and all parts, including the A and B batteries, shielded in Cu is described. The sp. impedance of erythrocytes at 1,500,000 cycles per sec. seems to be about the same as that of erythrocyte interiors and to be about 400 ohms or roughly that of a 0.02 *N* NaCl soln. The elec. resistance of the erythrocyte surface is very high, but probably much less than that of *Valonia*. It seems improbable that Osterhout's conclusions as to the impermeability of *Valonia* to ions can be applied to ox erythrocytes. J. F. LYMAN

Simultaneous study of the constituents of the sweat, urine and blood; also gastric acidity and other manifestations resulting from sweating. IV. Ammonia nitrogen. G. A. TALBERT, R. FINKLE AND D. KATSUKI. Univ. of N. Dak. *Am. J. Physiol.* **82**, 639-43(1927); cf. *C. A.* **21**, 3917.—Sweat contained from 0.05 to 0.35 mg. NH_3 N per cc. An increase in NH_3 of the urine as a result of sweating is indicated. There was a correlation of 41% between NH_3 N and urea N of the sweat; but no correlation between NH_3 of the sweat and NH_3 of the urine. J. F. LYMAN

Capillary permeability. III. The effect of lack of oxygen on the permeability of the capillary wall to fluid and to plasma proteins. EUGENE M. LANDIS. Univ. of Penn. and Woods Hole. *Am. J. Physiol.* **83**, 528-42(1928).—Lack of O_2 increased capillary permeability in frog mesentery. The movement of fluid through the asphyxiated capillary wall was directly proportional to the difference between capillary pressure and the effective osmotic pressure of the plasma proteins. Exposure of the mesentery to Ringer soln. 0.5 satd. with CO_2 produced no change in permeability. Complete satn. with CO_2 increased the rate of fluid movement slightly but the wall remained impermeable to protein. Increase in acidity produced almost no change in fluid movement

within physiol. limits, though at p_H 4.0 the characteristic effects of injury appeared.

J. F. LYMAN

The response of smooth muscle in different ionic environments. H. B. VAN DYKE and A. BAIRD HASTINGS. Univ. of Chicago. *Am. J. Physiol.* **83**, 563-77(1928).—

The response of the isolated virgin guinea-pig uterus to pituitary ext. was obtained in various ionic environments. Variations in all physiologically essential ions singly or together altered the response. Changes in Ca ions produced the greatest relative change in response. The uterus was sensitive to changes in the carbonate ion. J. F. L.

Oxidation processes occurring in the system plasma (serum)-potassium ferri-cyanide. G. LITARCZEK. Cambridge. *J. Physiol.* **65**, 1-14(1928).—A mixt. of plasma (or serum) and $K_3Fe(CN)_6$ absorbs O_2 when exposed to the air. K_4FeCN_6 or $FeCl_3$ cannot replace $K_3Fe(CN)_6$ in the system; but hemoglobin can do so. The ether-sol. lipoids seem to be an important factor in the part played by the plasma since (1) in lipemia the plasma was most highly active; (2) the removal of the lipoids by ether extn. greatly reduced the O_2 adsorptions; (3) serum filtrates after removal of lipoids and proteins were quite inactive; (4) the extd. lipoids when redissolved had some power of absorbing O_2 in contact with $K_3Fe(CN)_6$, though not so great as did the original plasma from which they were extd. The estn. of O_2 in blood by the use of $K_3Fe(CN)_6$ is subject to error. The Van Slyke method is the only one suitable for lipemic blood. Other methods in which $K_3Fe(CN)_6$ is used are accurate in proportion as they can be manipulated rapidly. The absorption of O_2 by the system plasma-hemoglobin is thought to have physiol. importance.

J. F. LYMAN

Autoxidation and reduction. E. AUBEL and I. GENEVOIS. *Rev. gén. botan.* **40**, 53-62, 120-7, 184-9, 244-50(1928).—A review, with bibliography, of oxidation-reduction reactions as applied to biology.

LAWRENCE P. MILLER

The physiological action of radiant energy. HENRY LAURENS. Tulane Univ. *Sci. Monthly* **26**, 353-62(1928).—A general article on the various aspects of the use of radiation in the treatment of disease.

Studies on iodine metabolism. I. The iodine excretion in the urine of inhabitants of Norwegian goiter regions. GULBRAND LUNDE. *Biochem. Z.* **193**, 94-104(1928).—See C. A. **22**, 1785.

S. MORGULIS

The rate of reaction between enzyme and substrate. J. BERKSON and L. B. FLEXNER. *J. Gen. Physiol.* **11**, 433-57(1928).—The course of change of viscosity in a mixt. of gelatin and pancreatin is accurately described by an equation of the form, $v_t - v_\infty = (v_f - v_\infty) / [1 - \{(v_0 - v_f) / (v_0 - v_\infty)\} e^{-rt}]$, in which v_t = time of flow of the mixt., v_∞ the time of flow for water, v_f the time of flow of the mixt. when proteolysis is complete, v_0 the time of flow at the beginning of the expt., t time of observation, r a const. An equation of the same general form has also been found to apply to the reaction between urease and urea, diastase and starch, and yeast juice and a polypeptide. The equation can be derived theoretically by assuming a bimol. autocatalytic reaction between enzyme and substrate. Preliminary expts. show that the correlation between r and the concn. of enzyme used is linear. Further expts. are in progress. C. H. R.

Combination of salts and proteins. III. The combination of $CuCl_2$, $MgCl_2$, $CaCl_2$, $AlCl_3$, $LaCl_3$, KCl , $AgNO_3$, and Na_2SO_4 with gelatin. J. H. NORTHROP and M. KUNITZ. Rockefeller Inst. *J. Gen. Physiol.* **11**, 481-93(1928).—The equiv. combining value of Cu is about 0.9 millimols. per g. gelatin, the same as that for H; the value for deaminized gelatin is approx. 0.4-0.5 millimols. per g., again the same as that for H. The sum of the H and Cu ions combined with gelatin in the presence of an excess of either ion is 0.9 millimols., indicating that there is an equil. between Cu, H and gelatin and that Cu and H are attached to the same group in the gelatin mol. The equiv. combining value of La and Al ions is approx. 0.5 millimols. per g. gelatin, the value for deaminized gelatin being about the same. This suggests that these salts combine only with gelatin groups which are not affected by deamination. Ca is not combined on the acid side of p_H 3; the no. of millimols. combined rises rapidly from p_H 3 to 4.7 and then remains const. K, Li, Na, NO_3 and SO_4 apparently do not combine with gelatin. Cl combines less than bivalent and trivalent metals, gelatin therefore being positive in $CaCl_2$ and negative in KCl. Methods are described. C. H. RICHARDSON

The vapor pressure of dog blood at body temperature. A. GROLLMAN. Johns Hopkins Univ. *J. Gen. Physiol.* **11**, 495-506(1928).—The vapor pressure of dog blood and blood plasma was detd. at 37.5° by the dynamic method of Washburn and House (C. A. **9**, 1143) and the osmotic pressure calcd. from the exptl. data. The observed vapor pressures ranged from 48.08 to 48.12 mm. Hg., the calcd. osmotic pressures from 7.6 to 8.8 atm. The vapor pressures calcd. from f. p. values agreed closely with those

obtained by the dynamic method. The vapor-pressure lowering produced by the blood colloids was minimal compared with that of the other blood constituents. C. H. R.

Microirrigal studies in cell physiology. VI. Calcium ions in living protoplasm. H. POLLACK. Cornell Univ. *J. Gen. Physiol.* 11, 539-45(1928).—Alizarinsulfonate will ppt. Ca ions quant. as purplish red crystals of Ca alizarinate. When it is injected into the living ameba an appreciable amt. of free Ca ion can be demonstrated. The toxicity of phosphate, sulfate, tartrate and oxalate anions to the ameba is in some degree related to the soly. product of the Ca salt. The carbonate does not follow in the same order. It is suggested that toxicity depends upon the ability of the salt to remove Ca ions from the protoplasm. The apparent deviation of carbonate from the rule is explained by the specific toxic effect of CO_2 resulting from hydrolysis of the carbonate. The ameba has a Ca reserve which enables it to recover from sublethal doses of these anions and from alizarinsulfonate. Ca appears to be present in large crystals in the ameba. The behavior of the ameba is nearly the same when either the intracellular Ca ion concn. is diminished or the Na or K ion concn. is increased. C. H. RICHARDSON

Intracellular oxidation-reduction studies. I. Reduction potentials of Ameba dubia by micro injection of indicators. B. COHEN, R. CHAMBERS AND P. REZNIKOFF. Hygienic Lab., Washington, D. C., and Cornell Univ. *J. Gen. Physiol.* 11, 585-612 (1928).—Under anaerobic conditions, the ameba was able to reduce completely all the reversible oxidation-reduction indicators injected into the cell down to and including indigodisulfonate in a group of 25 of these indicators. Under the same conditions only 6 of the most easily oxidizable indicators were reoxidized by the ameba. In the presence of oxygen, the ameba reduced completely all indicators down to and including 1-naphthol-2-sulfonate indo-2,6-dichlorophenol. Toluylene blue, methylene blue and indigotetrasulfonate may be completely or only partly reduced according to the quantity injected and the duration of the observation. Time of reduction varied approx. with the amt. of indicator injected. It was more rapid under anaerobiosis than under aerobiosis, in active than in sluggish cells and was retarded by toxic compds. Sulfonated compds. were generally somewhat toxic. The results show that the ameba has a high reducing potential lying on the r_H scale (Clark and Cohen, *C. A.* 17, 2667). Reducing capacity is relatively great in the region of the simple indophenols and progressively diminishes as the zone of the indigos is approached. Substance of high reduction potential seems to be generated within the ameba at a measurable rate. These results parallel closely those obtained in reduction electrode studies on bacterial cultures. C. H. RICHARDSON

The idea of relativity and biologic problems. First study. L. TIXIER. *Bull. sci. pharmacol.* 35, 293-5(1928). L. W. RIGGS

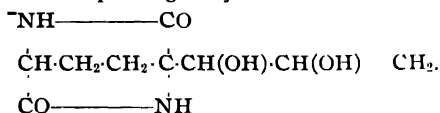

Microincineration and the content of fixed inorganic matter in the different parts of the cell. A. POLICARD. *Compt. rend.* 186, 1066-7(1928); cf. *C. A.* 18, 698; 19, 1297.—Cultures of the spleen of the white rat were sectioned and fixed in alc., then dried and incinerated by the method already described. The resulting films of ash were studied by reflected light with a stereoscopic microscope with the greatest magnification possible. A pair of 12 Zeiss objectives and a pair of orthoscopic periplanetic 28 oculars giving a magnification of 336 diams. were used. Intense illumination is indispensable. The cell nucleus contains a notable quantity of inorg. matter and is shown in its characteristic form and dimensions. The nucleolus was indistinguishable. The cytoplasm contains but little ash, but enough to indicate the outline of the cell. L. W. RIGGS

Analogies between physiological rhythms and the rhythmical reactions in inorganic systems. RALPH S. LILLIE. *Science* 67, 593-8(1928).—The arrangements of Fe wire and HNO_3 for producing rhythmical reactions are described. In general increase in active area accelerates the rate of rhythm. Within the limits of 60 to 80 vol. % of acid the rate increases with the concn. in a manner approx. linear. Within the limits of 10 to 30° and a concn. of 65 vol. % the rate of rhythm increased with the temp. but not directly; thus from 10° to 15° the rate was increased 100% while from 25° to 30° the rate increased 45%. Other factors such as elec. polarization and length of wire are considered. The biologic analogies of ciliary beats and heart beats are indicated. L. W. R.

Adsorption of the active principle of the posterior lobe of the hypophysis by animal charcoal. GINICHI SATO. Pharm. Inst. Freiburg. *Arch. exptl. Path. Pharmacol.* 130, 323-5(1928).—Both the uterus-stimulating agent and the melanophore-expanding principle are adsorbed by animal charcoal. G. H. S.

A new product of the catalytic decomposition of the collagen of tendons. V. S. SADIKOV. *J. Russ. Phys.-Chem. Soc.* 58, 775-8(1926).—Collagen was hydrolyzed by 1% HCl in an autoclave (*C. A.* 19, 1869). The water-sol. portion of the AmOH ext.

gave on evapn. an amorphous sirup. When treated with CuCO_3 a green sirupy mass was obtained sol. in EtOH and MeOH. It was pptd. from EtOH by the addn. of 3 vols. Me_2CO , decompd. by H_2S , again converted into the Cu compd. and analyzed for Cu (20.55, 20.48%), C (33.15%), H (4.87%) and N (9.30%). This corresponded to the compn. $\text{C}_{17}\text{H}_{28}\text{N}_4\text{O}_{12}\text{Cu}_2$, *i. e.*, the Cu salt of tetraaminotetrahydroxytridecanetetra-carboxylic acid, and the corresponding anhydride would be

It contains two bipeptide rings analogous to the two bipyrrrole rings of bilirubin.

BASIL C. SOYENKOFF

Thermophile bacteria and the radiation pressure of the sun (ARRHENIUS) 2. The permeability of gelatin membranes (COLLANDER) 2. Ionization and adsorption iso-electric points (HARVEY) 2. Composition of the fatty acids present as glycerides in elasmobranch oils (HILDITCH, HOULBROOKE) 27.

HARVEY, H. W.: *Biological Chemistry and Physics of Sea Water*. New York: The Macmillan Co.; London: Cambridge University Press. 191 pp. \$4.25.

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Serum lipase, its determination by the stalagmometric method, significance and clinical value. S. KATZENELBOGEN AND H. WOHLERS. *Ann. med.* 20, 373-91 (1926). The Rona and Michaelis' method was employed. Blood serum gives velocity coeffs. of 0.006-0.008; turbid serum gives higher values, but hemolysis produces no change. The lipase titer falls in general cachexia. B. C. A.

The reaction of bromine upon histidine and tyrosine. OTOMATSU FUJII. *Bul. Sci. Fakultato Terkultura, Kjusu Imp. Univ.* 1, 127-36 (1926).—The method of Plummer and Phillips (*C. A.* 18, 2015) cannot be used in the presence of cystine. Moreover, tyrosine and histidine react with more than 2 atoms Br, depending on the temp. and time of bromination. This method is not satisfactory. A. L. HENNE

Experiments on the determination of phenylalanine by oxidation. G. KOLLMANN. *Biochem. Z.* 194, 1-14 (1928).—A method for detg. phenylalanine in protein is proposed depending upon the formation of benzoic acid on oxidation with $\text{K}_2\text{Cr}_2\text{O}_7$ in an acid medium. The benzoic acid is extd. with ether in Linot's rotating extn. app. and after washing free from impurities is weighed as the pure acid. It is absolutely necessary carefully to remove any fat adhering to the protein which can only be accomplished by extg. the hydrolyzate with ether. The results give only min. values inasmuch as the yield in expts. with phenylalanine or the recovery of added material is 95% on the av. The method has the addnl. advantage that relatively small quantities of protein (15-20 g.) are required for the analysis. The results for various proteins were on the av. as follows: casein 3.10, fibrin 2.11, edestin 3.47, hemoglobin 3.57, zem 6.57, legumin 5.10, gelatin 0.24%. S. MORGULIS

Studies on the solubility of cystine under various conditions and a new method of cystine preparation. LEN OKABE. *J. Biochem. (Japan)* 8, 441-57 (1928). In salt solns. of definite concn. the soly. of cystine varies with the H-ion concn. Its min. soly. coincides with its isoelec. point. The soly. of the cystine also varies with the concn. of the salt and the nature of the salt of the medium. NaCl , $(\text{NH}_4)_2\text{SO}_4$, and Na_2SO_4 increase while NH_4Cl or $\text{NH}_4\text{C}_2\text{H}_3\text{O}_2$ has no effect on the cystine soly. EtOH decreases its soly. Temp. below 20° has no influence on the soly. The soly. of cystine in a hydrolyzate from hair is quite different from that of a pure cystine soln. Method for prepn.: washed and dried hair, or completely defatted wool can be used. To 100 g. is added 300-500 cc. 20% HCl and the mixt. is boiled 7-10 hrs. under a reflux. After adding 10-20 g. of animal charcoal and stirring heating is continued for $\frac{1}{2}$ hr. until completely decolorized. The soln. is filtered, evapd. *in vacuo* to a thick sirup. This is dissolved in 100 cc. H_2O and 50 cc. 90% alc. is added and enough 10% NH_4OH until the soln. turns bluish. The p_{H} will then be about 4.8, or this may be more carefully controlled colorimetrically with dil. NH_4OH and AcOH . The hydrolyzate is cooled for 2 hrs. at 0° , and the crystd. cystine filtered off by suction. This crude cystine can be purified by dissolving in 10% NH_4OH , completely decolorizing with charcoal and again adjusting the reaction to p_{H} 4.8 with 36% AcOH . S. M.

The cystine content of several kinds of protein determined by a modification of Okuda's method. YUTAKA TERUUCHI AND LEN OKABE. *J. Biochem. (Japan)* **8**, 459-67(1928).—Folin and Looney's colorimetric method gives somewhat high results for the cystine content of protein. By a modification of the Okuda method the authors found the following cystine content: serum albumin 1.58, egg white 2.01, serum globulin 1.64, fibrin 1.48, beef 0.66, chicken 0.64, salmon 0.58, edestin 1.13, legumin 0.90, gliadin 2.19, zein 0.58, globin 0.61, gelatin 0.04, human hair 14.26, horse hair 11.07, wool 9.12 and casein 0.33.

S. MORGULIS

Nickel sulfate as a test for alkalies. (A useful reagent in urine analysis.) CLIFFORD MITCHELL. *Clin. Med.* **35**, 167(1928).—Several cc. of a 20% soln. of NiSO_4 are placed in a test tube and the urine is poured carefully down the side of the test tube. If a white ring, band or cloudiness is seen above the Ni soln. the urine contains excess of OH compds. such as $(\text{NH}_4)_2\text{CO}_3$ or Na_2CO_3 . Albumin and sugar do not interfere.

M. H. SOULE

Modifications of Katayama's formulas for computing the fecal nitrogen and fecal organic matter in samples of chicken's excrement. HARRY W. TITUS. *Poultry Sci.* **7**, 145-50(1928).—K.'s monograph is briefly reviewed and in place of his formulas, fecal N = {excrement N - (uric acid N + excrement NH_3 N) 1.146} 1.023, and % urinary org. matter in the excrement = $3.23 \times \% \text{ urinary N}$, the following formulas are suggested: fecal N = 0.9784 excrement N - 1.0253 uric acid N - 1.2641 excrement NH_3 N - 0.0554, and % urinary org. matter in the excrement = $2.16 \times \% \text{ urinary N} + 27.53\%$. (K.'s formula for fecal N is given incorrectly in *C. A.* **22**, 803; it is as given above.)

HARRY W. TITUS

C—BACTERIOLOGY

CHARLES B. MORREY

Adaptation of the bactericidal action of chloroform to the preparation of bacterins. HUBERT BUNYEA. *J. Agr. Res.* **34**, 623-30(1927).— CHCl_3 kills many nonspore-bearing bacteria with no important modification of their biochemical characteristics. It therefore serves to conserve potency in the prepn. of bacterins. It is not applicable, however, to the prepn. of killed cultures of spore-bearing organisms. The passage of 4.5% CHCl_3 in streaming vapor through a broth culture of *Staphylococcus aureus* is sufficient to produce sterilization.

M. S. ANDERSON

Chemical constitution and germicidal action. G. W. BACHMAN. *Proc. Soc. Exptl. Biol. Med.* **25**, 249-50(1928).—Computation of the germicidal action for *Bacterium coli A* was made for CH_3OH , aniline, *o*-toluidine, *p*-toluidine and malachite green, as compared with the germicidal action of the compds. produced by addn. of methyl and ethyl groups to these compds. The computed germicidal action was found to vary in a const. ratio with the addn. of alkyl groups.

C. V. B.

Inactivation of staphylococcus bacteriophage by trypsin. E. W. SCHULTZ. *Proc. Soc. Exptl. Biol. Med.* **25**, 280-2(1928).—Two "races" of staphylococcus bacteriophage were made inactive by trypsin within 48 hrs. A description of technique used is given. Various colon, typhoid and dysentery bacteriophages were not shown to be susceptible to trypsin action. A single expt. on plague bacteriophage showed this sample inactive after 5 days exposure to trypsin. Later this plague bacteriophage spontaneously became inactive, suggesting a lower resistance than is usual.

C. V. B.

Availability of carbon compounds for the streptococcus. F. KRASNOW AND M. L. ROSENBERG. *Proc. Soc. Exptl. Biol. Med.* **25**, 295-6(1928).—When added to synthetic media, dextrose shortens the period of the viability of streptococci markedly. A comparison of dextrose with other sugars in reference to their availability for growth gives a series such as sucrose > lactose, maltose > raffinose > mannitol, dextrose. Of the several sugars tested, sucrose seems to be the most easily utilized, though in some cases it was without effect. Similar results were obtained from glycerol, lactic, malic, tartaric and citric acids. These compds. are more often beneficial than the carbohydrates.

C. V. B.

A differential plating medium for lipase-producing bacteria. R. H. TURNER. *Proc. Soc. Exptl. Biol. Med.* **25**, 318-20(1928).—A differential plating medium for lipase-producing bacteria is described and its use in studying intestinal bacteria is discussed.

C. V. B.

Differentiation of acid-fast bacteria by means of complement deviation. L. HANDEL, L. LANGE AND G. HEUER. *Arbeit. Reichsgesundheitsamte* **77**, 716-24(1926); *Rev. Hyg.* **50**, 315-6(1928).—Agglutination and pptn. methods gave inconclusive results. Complement deviation though not entirely satisfactory served to differentiate

certain types of acid-fast organisms. By using certain sera it may be possible to differentiate the bovine from the human type of the tubercle bacillus. C. R. FELLERS

A time and labor saving method for the preparation of legume cultures. DONALD B. SHUTT. *Sci. Agr.* **8**, 665-7(1928).—A modification of Ashby's agar consisting of agar 20, sucrose 10, $\text{Ca}_3(\text{PO}_4)_2$ 1, $\text{Mg}_3(\text{PO}_4)_2$ 1, K_2SO_4 1, NaCl 0.1 g and tap H_2O 1000 cc. This medium gave an excellent growth of *B. radicicola* in 5-6 days at 25°. An atomizer greatly facilitates the seeding of slopes. C. R. FELLERS

Chemical action of quinones on proteins and amino acids. E. A. COOPER AND R. B. HAINES. *Biochem. J.* **22**, 317-25(1928).—The germicidal power of the quinones is not necessarily due to their chemical interaction with the cell proteins, but is associated with their reactivity towards the simpler cell constituents, such as some of the amino acids. BENJAMIN HARROW

Relation of the growth of certain microorganisms to the composition of the medium. III. The effect of the addition of growth-promoting substances to the synthetic medium on the growth of *Streptothrix corallinus*. VERA READER. *Biochem. J.* **22**, 434-9(1928); cf. C. A. **22**, 609.—The substance in tryptic beef broth that exerts a stimulating action on the growth of *S. corallinus* is org., water-sol. and dialyzable, and is not pptd. by neutral or basic lead acetate. It is present in yeast preps., rabbit muscle, serum and wheat embryo. The bacterial growth-promoting factor is present in Peters' yeast concentrates (see C. A. **20**, 436). BENJAMIN HARROW

Note on the Meningococcus as a source of growth factor for Streptothrix corallinus. JEAN ORR-EWING AND VERA READER. *Biochem. J.* **22**, 43-44(1928).—A strain of *Meningococcus* type 1 (National collection of type cultures, Strain Littleale, No. 668) grows readily upon a meat-ext. medium which had been completely freed from the *S. corallinus* growth factor by repeated charcoal extractions. Since the *S. corallinus* has been found to react to a vitamin B concn. of 2×10^{-6} pigeon dose (cf. preceding abstr.), the authors are convinced that the vitamin B factor, if present at all, was reduced below this value. On retesting the meat-ext. (vitamin-B-free) medium after the growth of the *Meningococcus*, it was found to be capable of supporting good growth of *S. corallinus*. BENJAMIN HARROW

Deamination and synthesis of L-aspartic acid in the presence of bacteria. R. P. COOK AND BARNET WOOLF. *Biochem. J.* **22**, 474-81(1928).—At 37° and p_{H} 7.4 the eleven species of bacteria examd. deaminate aspartic acid anaerobically to succinic acid. 2-4% PrOH , 0.1 *N* NaNO_2 , or toluene inhibits this reaction. The facultative anaerobes can effect a reversible equil. $\text{aspartic acid} \rightleftharpoons \text{fumaric acid} + \text{ammonia}$. BENJAMIN HARROW

The splitting products and the dissemination of the fermentation sarcines (Sarc. ventriculi Goodsir, and Sarc. maxima Lindner). JAN SMIT. *Verslag Akad. Wetenschappen Amsterdam* **37**, 278-88(1928); cf. C. A. **21**, 934.—With pure cultures of the sarcines an acidification with HCl can be tolerated to a p_{H} of 0.8, HNO_3 1.5 and lactic acid 2.9. The resistance against H_3PO_4 is considerable. On the alk. side the limit lies near p_{H} 9.8. The cellulose reaction with Cl-Zn-I is positive for *S. ventriculi* and negative for *S. maxima*; the former can split up only 1.5-2% sugar but the latter splits up even less, namely 0.5-1%. Among the splitting products of *S. maxima* there is no alc. but there are large amts. of butyric acid. Sarcines were found in all surface layers of the earth, but different kinds of soil often require entirely different acidification for propagation. Samples taken from greater depth in the ground were free from sarcines. Wind and dust play an important role in their dissemination, especially of *S. maxima* on grains. *S. ventriculi* is not present in healthy stomachs, and *S. maxima* has never been found even in abnormal stomachs. S. thinks it probable that the *S. pulidosa* is identical with the fermentation sarcine. The sarcines obtained from natural sources are much more resistant than those from pure cultures, and the latent form is much more so than the sarcine form. Efforts to obtain a large increase in latent sarcines did not succeed. J. C. JURRIENS

The production of bacteriophage by killed bacteria. WALDEMAR GOHS AND IRENE JACOBSON. Staatlichen Serotherapeutischen Inst., Wien. *Z. Immunitäts.* **53**, 12-9(1927).—Substances that kill bacteria but which destroy their enzymes permit the continuance of the formation of bacteriophage from bacteria killed in this way. The addn. of a trace of bacteriophage to a suspension of chemically killed bacteria increased the lysin titer 10 to 100,000 times after incubation for 24 to 48 hrs. Nevertheless formation of bacteriophage from killed bacteria is not const. When killed by heat bacteria do not form lysin. Bacteriophage is apparently not a secretion of diseased bacteria but is the result of autolysis. This postmortem lysin-forming autolysis is never as marked as in the living culture. JULIAN H. LEWIS

Potentially unlimited multiplication of yeast with constant environment, and the limiting of growth by changing environment. O. W. RICHARDS. Harvard Univ. *J. Gen. Physiol.* 11, 525-38(1928).—The decrease in rate of growth of a population of yeast cells which results in the maintenance of an equil. level of population is due to substances excreted by the cells. These toxic substances tend to destroy the young buds. EtOH is the primary compd. causing decline in growth rate, a concn. of approx. 1 mg. per cc. being associated with the beginning of decrease of growth rate in these expts. Increasing acidity of the medium, due to CO₂, pyruvic and other org. acids, has a retarding influence on the growth rate but is considered to be a secondary factor. When the accumulation of these toxic products is prevented, yeast grows at a const. rate and the growth is potentially unlimited. In these expts. growth was limited only by the size of the test tubes and the efficiency of the method used to remove toxic products. Methods are described.

C. H. RICHARDSON

Oxidation-reduction potential of media in which strict anaerobes and facultative anaerobes are growing. R. AUBEL AND E. AUBERTIN. *Compt. rend. soc. biol.* 97, 1729-30(1927).—The life of the organisms is possible only between certain limits characteristic of the organism. The limits are between $rH = 0$ and $rH = 20$ for the facultative anaerobes, and between $rH = 0$ and $rH = 12$ for the strict anaerobes. L. W. R.

Four new bacteria isolated from the monosulfide thermal waters of Bârges. RENÉ ROBINNE AND PAUL HAUDUROY. *Compt. rend. soc. biol.* 98, 24-6(1928).—A bacteriologic description of each organism is given and the following names are proposed: *Micrococcus baregensis purpureus*, *Bacterium baregensis oosporogenes*, *Bacillus fluorescens baregensis* and *Microbacillus citreus baregensis*.

L. W. RIGGS

Course of proteolysis in the cultures of dysenteric bacilli. A. BERDNIKOV. *Compt. rend. soc. biol.* 98, 210-1(1928); cf. *C. A.* 21, 2007; 22, 252.—A N partition was made of a bouillon when sterile, and when contg. cultures of Shiga bacilli, toxic and atoxic, Flexner bacilli and Y bacilli, the N being detd. in the following six fractions: (1) bacillary bodies, (2) substances precipitable by tannin, (3) precipitable by colloidal Fe after pptn. by tannin, (4) precipitable by phosphotungstic acid after pptn. by tannin and colloidal Fe, (5) non-precipitable N and (6) volatile N. The bacilli are named above in the order of decreasing virulence. The detns. show that the N of the "biuretic proteins" (pytd. by tannin and colloidal Fe) diminished with the virulence of the organism, while N under the forms of polypeptide, amino acid and volatile N compds. increased as the virulence increased.

L. W. RIGGS

Conditions of the pigment in cultures of *Bacillus prodigiosus*. M. BÉGUET. *Compt. rend. soc. biol.* 98, 937-9(1928).—The conditions of the medium are discussed under 6 topics: variations in pH , NaCl, surface tension, temp., oxygenation and exposure to light. In addn. to factors already well known with reference to the bacillus, certain physiof. factors, particularly hypertonicity and osmotic pressure, under which the bacillus is grown must be considered.

L. W. RIGGS

Culture of strict anaerobes in aerobic media. E. AUBERTIN, E. AUBEL AND L. GÉNEVOIS. *Compt. rend. soc. biol.* 98, 957-9(1928).

L. W. RIGGS

Vital coloration of the Koch bacillus by Nile blue. A. CH. HOLLANDE AND (Mlle.) G. CRÉMIEUX. *Compt. rend. soc. biol.* 98, 1379-81(1928).—The substance colored is of lipoidic nature, partly sol. in alc.-ether, xylene and acetone. Its reaction is acid.

L. W. RIGGS

The effect of ultra-violet radiation upon yeast culture media. J. W. WOODROW, A. C. BAILY AND E. I. FULMER. *Plant Physiology* 2, 171-5(1927); one figure.—Yeast culture media (*C. A.* 15, 694) contained in quartz "Vitrosil" Erlenmeyer flasks and Pyrex flasks developed a toxicity upon exposure to ultra-violet light which increased with duration of irradiation. The toxic factor is non-volatile and results from the action of the short rays (300-425 $m\mu$) on the sucrose in the culture medium. For the study of the effect of the direct action upon *Saccharomyces cerevisiae*, a medium must be used whose growth-promoting properties are not changed by the ultra-violet ray treatment.

WALTER THOMAS

Thermophile bacteria and the radiation pressure of the sun (ARRHENIUS) 2.

D—BOTANY

THOMAS G. PHILLIPS

The role of plastin of myxomycetes and its albuminoid nature. ALEXANDER KIRSEL. *Zhurnal ekspl. Biol. Med.* 5, 279-88(1927).—The supporting substance found in the plasmodia of myxomycetes, namely, the plastin, is an albuminoid, which, like the albuminoids of animal origin, shows changes with aging and cannot be brought into soln.

without alteration of its properties. The plastin was prepd. from *Lycogala epidendron* at 3 different phases of development by dissolving and pptg. the substance, which of course no longer corresponded to the original plastin. Apparently the guanidine group of arginine suffers the greatest changes in the prepn. of plastin by soln. in alkali, resulting in a splitting off of urea. This manifests itself in a diminution of the N content.

S. MORGULIS

South African flowers. J. MOIR. *J. S. African Chem. Inst.* **10**, 36-47 (1927) — The absorption spectra of dil. exts. of the coloring matter of various flowers were studied, with a modified direct-vision spectroscope. In order to find the pigment causing color, the spectra of the oxonium salts of the following substances were examd.: pelargonidin, cyanidin, delphinidin, myricetin, apigeninidin and luteolinidin. Glucosides of pelargonidin were detected in Barlberton daisy, brown nasturtium, scarlet salvia, and *Chelone barbata*. Other red flowers in which glucosides of other members of the class are regarded as contaminating the pelargonin or which are possibly glucosides of a methyl ether of pelargonidin are scarlet protea, bramble, eendagsbloem lily and the red canna lily. Glucosides of cyanidin were found in scarlet zinna, pink convolvulus, purple convolvulus, deep red Ards rose, pink hydrangea, blue hydrangea, crimson verbenia, *Lychnis coronaria*, scarlet geum, puce-colored hollyhock and the anthers of the agapanthus lily. Glucosides of delphinidin are present in nearly all bright blue flowers. Delphinin was detected in blue agapanthus lily, azure plumbago, blue jacaranda, scarlet pomsetta, royal-blue convolvulus and common larkspur. Petunin was found in the petunia, bramble, and habrothamnus. The yellow sunflower is colored with a mixt. of xanthophyll and quercitrin. The alkali-sol. pigment of sunflower is probably a quercetin glucoside. The common orange marigold probably contains glucosides of kempferol and myricetin. The brown Japanese sunflower probably contains lycopin and kempferol glucoside. Flowers yielding indefinite results were: the sulfur-yellow chrysanthemum, the yellow coreopsis and the *Montbretia* lily. Every stage in the origin of flower colors can be followed by examg. all the intermediate substances in concd. sulfuric acid soln.

B. C. A.

Chemical composition of the seeds of the wild hemp (*Cannabis ruderalis* Janisch). V. FOFONOV. *Ber. Saratower Naturforscherges.* (Russ.) **1**, No. 4, 33-6 (1925). (*Chem. Zentr.* **1927**, **1**, 466-7) — The air-dried seeds contained in %: water 6.62, ash 5.85, fat 29, total N 3.57, protein N 3.33 (corresponding to 20.8 protein) and crude cellulose 18.52. The oil was brownish green, with $d_{20}^{20} = 0.9233$, sapon no. 195.5, I no. 158.9.

C. C. DAVIS

Effect of certain alkaloids on germinating seeds of plants forming the same alkaloids. TH. SABALITSCHKA and M. W. ZÄHER. Univ. de Berlin. *Tschirch Festschrift* **1926**, 24 pp.; *Chem. Zentr.* **1927**, **1**, 113-4. — Germinating seeds of plants were treated with solns. of morphine, trigonelline, nicotine, atropine, strychnine and lupinine, the alkaloid solns. being added to the seeds of the plants producing the particular alkaloids. In no case were the seeds of the alkaloid-producing plants which contained alkaloid more resistant to the particular alkaloid than seeds of alkaloid-free plants. In agreement with the earlier conclusion of S. and Jungermann (*C. A.* **19**, 3286) that seeds contg. alkaloids do not when germinating under normal conditions liberate alkaloids, the results controvert the hypothesis that such germinating seeds create a protective zone of alkaloid. Moreover, alkaloids are probably not nutrients or stimulants during normal germination.

C. C. DAVIS

The development of mutase action in germinating barley. ZOLTÁN I. KERTÉSZ. *Z. physiol. Chem.* **176**, 144-50 (1928). — The aldehyde-mutase activity of germinating barley was detd. at intervals up to the 18th day. For each detn. a suspension of ground grains corresponding to 2 g. dry material was treated with 25-30 mg. AcH, phosphate buffer of p_H 6.4 and yeast cozymase, and the residual AcH detd. at intervals of 1, 2, 4 and 20 hrs. by the Ripper method with $KHSO_5$ and I soln. During this period of germination the mutase showed a regular increase of considerable extent. From the 15th to the 18th day the roots and leaves examd. separately showed a decrease of mutase in the roots and an increase in the leaves.

A. W. DOX

Effects of chemical treatments on dormant potato tubers. J. T. ROSA. *Hilgardia* **44**, 125-42 (1928). — Ethylene in concns. of from 1:400 to 1:2200 of air exerted a mild effect upon the hastening of sprouting of dormant, nearly matured, moderately suberized tubers placed in a gas chamber at harvest time and held for 4 weeks. Ethylene hastened the sprouting of fully matured White Rose tubers after treatment for only 6 days while the Idaho Rural variety showed max. stimulation after treatment for 15 days. Ethylene chlorohydrin proved to be very effective in reducing dormancy. Treatment for 14 to 21 days in a gas chamber or by soaking in a 0.5% soln. for 1 hr. showed

marked stimulation to sprouting without toxic effects. The momentary dipping of the cut sets in 3% or stronger solns., then storing in a closed container for 12 hrs. resulted in a great increase in decay of the sets after planting. The optimum concn. of ethylene chlorohydrin to use by the gas chamber method was 0.75 cc. per l. of space at 20–25° and with a fan to hasten volatilization and uniform distribution. NaCNS and NH_4CNS were toxic to cut sets in 2 and 3% solns. A concn. of 1% proved non-toxic but was also non-stimulative and hence of no value. Ethyl bromide hastened sprouting but the optimum concn. varied so widely according to tuber maturity, and degree of suberization that it was considered unsatisfactory. A 0.5 M soln. of NaNO_3 was a moderately effective stimulant but caused excessive decay of tubers in hot weather. Ethylene dichloride at concns. between 0.2 and 0.4 cc. per l. of space and exposure continued for 24 hrs. proved effective in reducing dormancy. R. concludes that from the practical viewpoint of elimination of seed piece decay and of stimulating prompt sprouting of potatoes planted during mid-summer, there is a considerable promise for combinations of storage periods known to hasten sprouting with the use of chem. stimulants

C. R. FELLERS

Nutritional studies with *Fragaria*. MALCOLM B. DAVIS AND H. HILL. *Sci. Agr.* 8, 681–92(1928).—A study was made of the effect of nutrient solns. of different ratios of N and minerals upon strawberry plants in both pure sand and soil. The quant. data showed danger of excess of N over minerals, indicating that a ratio of 1 N to 1 mineral was about as close as the ratio could be brought with safety. Excess of minerals over N, up to 1 N to $3\frac{1}{2}$ minerals, did not cause distress. The optimum was 1 N to 0.85 mineral. Total salt concns. varied from 0.009 to 0.070 without materially affecting the results. None of the solns. showed any interpretive effect upon the set of the blossoms

C. R. FELLERS

The reaction of wheat plants at two stages of growth, to stem rust. J. B. HARRINGTON AND W. K. SMITH. *Sci. Agr.* 8, 712–25(1928).—A two-yr. greenhouse study on Marquis, Marquillo, Lumillo and Vernal varieties of wheat showed a distinct correlation between seedling reaction and infection after heading.

C. R. FELLERS

Evolution of substances in the plant world and the fundamental laws of biochemistry. SERGIUS IVANOV. *Ber. deut. botan. Ges.* 44, 31–9(1926); *Biol. Abstracts* 1, 1026.—In biochemistry, development of knowledge has proceeded in 2 directions, chem. and physiol. Biochem. knowledge is now developing in a 3rd direction, "evolutionary." Each plant and its pure line has a const. chem. compn. which experimenters cannot alter, neither can they cause the plant to produce products which are not characteristic of the plant. Plants artificially fed in the dark utilize to form starch only such substances as can be used in the natural condition. In graft expts., the scion and stock each always produces characteristic products, as evidenced by *Helianthus tuberosus* and *H. annuus*. In pathol. cases there is only a quant. alteration in the products and never are products formed which are not characteristic of the plant. Each species preserves, in the constancy of its outer form, the ability to produce its characteristic substances. Each species shares its physiol. chem. characteristics with the species which are genetically related to it; species closely related have more characteristics in common. New physiol. chem. characteristics appear in species distantly related, i. e., the characteristics undergo an evolution

H. G.

Solution of calcium oxalate crystals in plants. W. G. ALEXANDROW AND A. S. TIMOFEEV. *Bot. Archiv.* 15, 279–93(1926); *Biol. Abstracts* 1, 1021.—This investigation was to det. the fate and role of Ca oxalate crystals in certain higher plants. In *Sterculia plataniifolia* it was found that at certain times of the year, especially at blossoming time, the crystals dissolve. No special enzyme is responsible for this disappearance. They dissolve in water, especially in water acidified with oxalic acid. After soln. in the onion scale, druses previously masked by crystals may be seen. Starch formation occurs in those cells from which the crystals have disappeared and it is assumed that disintegration products of the crystals furnish material for this, oxalic acid being an intermediate product in the assimilation of C. The various stages in the soln. of crystals are described and their similarity to the corrosion figures of starch grains is pointed out. Crystals formed artificially in elder pith did not dissolve under the conditions which caused soln. of natural crystals, which suggests that the latter are not pure Ca oxalate.

H. G.

Influence of stimulative chemicals upon seed germination. ANNELESE NIETHAMMER. *Jahrb. Wiss. Bot.* 66, 285–300(1927); *Biol. Abstracts* 1, 810; cf. *C. A.* 21, 2289; 22, 294, 613.—N. finds that the germination of wheat seed, dry stored for some time, is not stimulated in darkness by concns. of Mn salts that Popoff claimed effective, i. e., 1–2%. MnSO_4 showed little stimulation in these or other concns. in dark or light.

The germination of light-favored seed (*Verbascum thapsiforme* and *Apium graveolens*) was much stimulated by these salts in light but not in darkness. The author speaks of the salts as acting as light catalyzers. *Apium graveolens* seeds planted in soil were greatly stimulated by watering with solns. of MnSO_4 instead of water. Germination of light-inhibited seed (*Amaranthus caudatus*) was not favored by Mn salts either in dark or light. Immediately after harvest, seeds (wheat and *Chelidonium majus*) were much more favored in germination by Mn salts than they were after a considerable period of dry storage. Wheat was also favored by higher concns. of the salt immediately after harvest. H. G.

Microchemical detection and change of the organic phosphorus in plants. G. KLEIN. *Planta* 2, 497-506(1926); *Biol. Abstracts* 1, 1022.—The macrochem. method of Mandel and Neuberg for detg. organically bound P and S has been adapted for microchem. use. By carrying out the reactions on sections on hollow-ground slides, good localization of org. P in tissues (though not in cells) is possible. Seeds of *Phaseolus multiflorus* and *Zea mays* were germinated and the seedlings grown in P free nutrient solns. with controls in normal nutrient solns. In seedlings that were limited to the P reserve, chiefly org. of the seed, there was an unbroken change from organically bound P to inorg. and again to org. P. There was always inorg. P in the growing regions, little in the conductive tissues of the stem, and less in the older leaves. In the P-free cultures, 3-week seedlings of *Zea* showed marked P-chlorosis and the leaf veins of both *Zea* and *Phaseolus* were red, due to increased anthocyanin. Phosphate was added in concn. about $1/100$ of the control. In 48 hrs the distribution of P within these plants was similar to that in the controls. The inorg. P always moves to the growing regions, where it is assimilated. H. G.

Lipoids in plants. C. COLA. *Biochim. therap. spec.* 15, 65-76(1928).—Review with especial reference to *cytolipoids*. The chloroplasts contain a lipid which is probably derived from the chlorophyll phytol. Its quantity increases with the progressing inactivation of the chlorophyll, by either dry heat, excessive insolation or excess CO_2 . Cytolipoids have no doubt a part in C assimilation as evidenced by their higher content in the surface strata of the green leaves. On the other hand their greater abundance in fatigued chloroplasts and in non-assimilating plastids, the faculty of the latter to synthesize starch from lower carbohydrates, the presence of cytolipoids in latex and resins, their migration to and conversion into cuticular strata, the important part probably played by the chromolipoids in O_2 transportation and ultra-violet absorption suggests that all plants have a kind of *internal secretion* consisting mainly of cytolipoids or their isoprene precursors. These compds. are not further metabolized but are important for the metabolism and the protection of the plant. MARY JACOBSEN

Researches on the limiting factors of carbon dioxide assimilation. T. H. VAN DEN HONERT. *Verslag Akad. Wetenschappen Amsterdam* 37, 295-307(1928).—A review and discussion in detail of work done by other investigators is given, as well as a description of methods and app. used by H. Assimilation means the consumption of CO_2 in exposure to light, plus the CO_2 production in the dark. In order to get comparative values for the assimilation under different conditions, the values found must be calcd. to a certain unit of cell material. H. has taken as unit that quantity, which, under certain definite conditions, assimilates $100 \text{ mm}^3 \text{ CO}_2$ per hr. It was found that a CO_2 concn. over 0.040% was too high. With a high light intensity (6.18), and an excess of CO_2 , a Q_{10} of 1.87 was found between 12° and 20° . With a low intensity (1) a Q_{10} of 0.90 was found at the same temp. range. At 12° and a light intensity of 6.18 the same amt. of material assimilates $61 \text{ mm}^3 \text{ CO}_2$ per hr., if CO_2 is present in excess. It is possible to reduce the assimilation to a chain process, considering it to exist of: (1) a diffusion process of the CO_2 from the outside to within the chloroplast; (2) a photochem. process; (3) a dark chem. process, each in its turn detg. the velocity of the assimilation, when (1) the CO_2 concn., (2) the light intensity or (3) the temp. is the limiting factor. The cell wall and the protoplasm through which the CO_2 must diffuse can be regarded as an aq. medium. In order to penetrate to the inside of the cell, the CO_2 must begin by dissolving in the outer layer of the cell wall. In the extreme outer layer of the cell wall the CO_2 concn. is in equil. with that of the adjacent air. The soly. of CO_2 in water decreasing at increase in temp. means that one can deduce from an apparent $Q_{10} = 1$ a real $Q_{10} = 1.3$ for the diffusion process, as was found by H. The assimilating agent, be it chlorophyll or an enzyme, apparently possesses an immense affinity for CO_2 . The photochem. process is independent of the CO_2 concn. J. C. JURRYENS

The plant cell-membrane. II. MAX LÜDTKE. Kaiser-Wilhelm Inst. *Ber.* 61B, 465-70(1928); cf. C. A. 21, 3932.—Material from 15 species of plants was tested with ZnCl_2 -I and I- H_2SO_4 reagents before and after thorough grinding in a ball mill. Typical

cellulose tests were obtained only after grinding. Oak and mahogany did not give positive tests probably because of the interference of accompanying tannin and pigment. Cellulose acetates, nitrates and xanthate, and various Me and Et derivs. did not give positive reactions. Plant material often fails to give typical cellulose tests because of the structures surrounding the cell walls and not because the cellulose occurs in chem. combination with accompanying materials. LAWRENCE P. MILLER

The form of the iodine in certain Florideae. F. CHEMIN. *Rev. gén. botan.* 40, 129-45(1928); cf. *C. A.* 21, 943.—The formation of crystals with cresyl blue is not a characteristic test for free I. From studies with *Falkenbergia doubletti*, *Bonnemaïsonia asparagoides* and *Asparagopsis hamifera*, C. concludes, contrary to Sauvageau (*Bull. de la Slat. biol. d'Arachon* 24, 1927), that the I occurs not free but in very unstable combination, from which it is readily set free by very weak acids, even the cell sap itself in the case of the first two species, while with *A.* stronger acids are required. L. P. M.

The chemical elements indispensable to plants. CHAS. B. LIPMAN. Univ. of Calif. *Sci. Monthly* 26, 289-94(1928).—In addition to the ten elements acknowledged to be essential to the higher green plants, Mn, B, Zn and probably Si, Al and Cu are to be regarded as essential in small amounts, and it is not unlikely that further research will show others to be also essential. The function of these elements in plants is not understood. LAWRENCE P. MILLER

Do plants show anaphylaxis? R. OTTO AND HERRIG. *Inst. "Robert Koch," Berlin. Z. Immunitäts.* 53, 487-92.—The findings of Lumière and Couturier (*C. A.* 15, 2903) that plants could be anaphylactically sensitized with serum were not confirmed. J. H. LEWIS

Substances regulating the passage of material into and out of plant cells: the lipoids. D. T. MACDOUGAL. Carnegie Inst., Washington. *Proc. Am. Phil. Soc.* 67, No. 1, 33-45(1928).—A survey on the present knowledge of the role of the lipoids regulating the activity of the plant cell. M. showed that artificial cells represented by layers of protein pentosan jellies, when including lipoids as a lecithin-cholesterol combination, resemble living cells very much in regard to the ability of stabilizing the H-ion concn. and of controlling osmosis and permeability to ions. G. SCHWOCH

Carbohydrate transformations in carrots during storage (HASSELBRANG) 12. Cortex of *Byrsonima crassifolia* (HEYL, HEIL) 10. Membranes of spores and pollen. 1. *Lycopodium clavatum* L. (ZETTSCHKE, HUGGLER) 10.

II—NUTRITION

PHILIP B. HAWK

The so-called specific dynamic action of foodstuffs. G. MANSFIELD AND Z. HORN. Univ. of Pecs. *Deut. med. Wochschr.* 54, 646-8(1928).—The O consumption of typhus bacilli as measured by Warburg's micro-respirometer was found to be proportional to the concn. of the nutrient materials present in the culture medium. The specific dynamic action of food in the higher animals is considered as a process analogous to that found for the unicellular organisms. ARTHUR GROLLMAN

Human milk studies. V. A quantitative comparison of the antirachitic factor in human milk and cow milk. J. OUTHOUSE, I. G. MACY AND V. BREKKE. Merrill-Palmer School, Detroit. *J. Biol. Chem.* 78, 129-44(1928); cf. *C. A.* 21, 2724.—Human milk fed to rats in amts. of 40 cc. daily contains no antirachitic factor. Thirty cc. of cow milk under the same conditions induces healing of rickets in 7 days. A. G.

Effect of various substances on rickets of rats with especial reference to irradiated water. R. BARBACCI. *Pediatria Rivista* 35, 1113(1927).—Rat rickets produced by standard diet 84 was prevented or cured by irradiated olive oil and alleviated by well water or irradiated distd. water. A moderate case of rickets produced by an avitaminous diet was slightly aggravated by irradiated water. MARY JACOBSEN

Glutathione and reducing power of muscle in vitamin B deficiency. HIDEYAKE YAOI. Govt. Inst. for Infectious Diseases, Tokyo. *Japan Med. World* 8, 85-6(1928).—The muscle of pigeons fed on a vitamin-B deficient diet has a weaker reducing action on methylene blue than that of normal pigeon muscle, but no corresponding difference between the two is detectable in the glutathione content, according to the Tunnicliff methods. N. KOPELOFF

The effect of diet on the concentration of non-protein sulfur of blood. W. DENIS AND LUCILLE REED. Tulane Univ. *Am. J. Physiol.* 83, 47-51(1927).—The concn. of inorg. ethereal and neutral (unoxidized but non-protein) S of the blood of dogs seemed to be unrelated to the relative rate of excretion, to the concn. of these S fractions in the urine and to the level of S or N in the food. J. F. LYMAN

Studies in liquid exchange. VII. Intermediary liquid exchange in beriberi and in experimental human avitaminosis B (contribution to the question of the origin of beriberi edema). TOMOTAKA YAMAGUCHI. *Tôhoku J. Exptl. Med.* 10, 435-65(1928); cf. C. A. 22, 2605. L. W. RIGGS

The assay of a so-called cod-liver oil extract for vitamin-A content and calcifying properties compared to cod-liver oil (MUNSELL, BLACK) 17.

EDDY, WALTER H. **Nutrition.** Baltimore: The Williams & Wilkins Co. Reviewed in *Home Economist* 6, 155(1928).

F—PHYSIOLOGY

R. K. MARSHALL, JR.

The absorption of water and chlorides from the intestine. JACOB RABINOVITCH. Washington Univ., St. Louis. *Am. J. Physiol.* 82, 279-89(1927) -- When solns. of NaCl were placed in a loop of the intestine, equil. was established at a concn. of between 0.6 and 0.7%. Water absorption, i. e., H_2O absorbed $\div H_2O$ introduced, was at a max. with concns. of 0.2 to 0.8% NaCl. The amt. of NaCl absorbed increased with increasing concns. of the solns. introduced into the intestine up to 0.6 to 0.8%. With strongly hypertonic solns. salt absorption may be at a still higher rate but this was not invariably true. The absorption of both H_2O and Cl is somewhat increased by the presence of an excess of K ions and greatly increased by an excess of Ca ions. Acacia had no effect on the rates of absorption of H_2O or NaCl. Atropine increased absorption. J. F. L.

Differential metabolism in brain tissue as indicated by lactic acid determinations. J. A. HALDI, H. P. WARD AND LEO WOO. Catholic Univ. of America. *Am. J. Physiol.* 83, 250-3(1927) -- The amt. of lactic acid in the parts of the brain of the rabbit under anaerobic conditions increased in the following order: cerebral hemispheres, cerebellum, mid brain, medulla. More than twice as much lactic acid was formed in a unit wt. of medulla tissue as in the tissue of the cerebral hemisphere. J. F. LYMAN

Cardiac inhibition. I. The effect of vagal inhibition on the lactic acid content of the terrapins heart. C. L. GEMMILL. Johns Hopkins. *Am. J. Physiol.* 83, 415-9(1928) -- The av. resting concn. of lactic acid in the terrapins heart is: auricle 0.036% and ventricle 0.026%. The max. fatigue concn. is: auricle 0.137% and ventricle 0.141%. Stimulation of the vagus nerve had no effect on the lactic acid content of the heart. J. F. LYMAN

The response of the isolated segment of small intestine (rabbit) to extracts of yeast and other substances during their passage through the lumen. JOHN B. POLANSKY. Univ. of Rochester. *Am. J. Physiol.* 83, 488-98(1928). -- An app. is described by which the fluid being tested is passed through the lumen of the intestinal segment while longitudinal contractions and vol. changes due to contraction of the circular fibers and to peristaltic waves are simultaneously recorded. Yeast (52% alc. ext. or the Osborne and Wakeman yeast vitamin prepn.) had a definite stimulating effect on tonus. Vitamin B is probably the active stimulant. J. F. LYMAN

The determination of the amount of hemoglobin present in rat fetuses during development. J. S. NICHOLAS WITH E. B. BOSWORTH. Yale Univ. *Am. J. Physiol.* 83, 499-501(1928). -- The % of hemoglobin present in rat fetuses rose from 30% at 12 days of gestation to 65% at birth. J. F. LYMAN

The effect of carbon dioxide on the action current of nerve. H. DAVIS, W. PASCUAL AND L. H. RICE. Proc. Am. Physiol. Soc., *Am. J. Physiol.* 81, 471(1927) -- Increase in O_2 tension caused an increase in elec. response up to about 40% at 27 mm. Further increase was less favorable. At physiol. tensions the increase in response was negligible and from 60 to 100 mm. tension, the final effect was a depression of 5 to 8%. J. F. L.

The effect of varying amounts of oxygen, anoxemia and anesthetics on the sugar metabolism of animal cells. A. M. ESTES AND W. E. BURGE. Proc. Am. Physiol. Soc., *Am. J. Physiol.* 81, 474(1927). Paramecia cultures, through which small quantities of air and O_2 were bubbled as well as large amts. of air and O_2 , metabolized less sugar than did those through which a medium amt. of air and O_2 was bubbled. Organisms tightly stoppered in bottles and hence deprived of air and O_2 metabolized practically no sugar. N_2O and ethylene produced no anesthesia of the paramecia and no effect on sugar metabolism when administered with a liberal O_2 supply, but when administered with a small O_2 supply a decreased sugar metabolism was noted. The decreased sugar metabolism following excessive O_2 is thought due to injury of the organisms by the O_2 . J. F. LYMAN

The effect of temperature on the acidity of the skin. H. C. BAZZETT AND B. Mc-

GLONE. Univ. of Penn. *J. Physiol.* **64**, 393-404(1928).—The intravenous injection of a neutral soln. of phenolsulfonephthalein into white decerebrate cats resulted in colored skin areas whose shade of color indicated their acidity. Subdermal or subcuticle injections into spots on the human arm were also used to est. skin acidity. Acidity varied with temp., a leg immersed in a warm bath being more acid than one immersed in a cold bath. Acid production during arrested circulation was considerable, and after a long arrest the acidity did not disappear for 5 or 20 min. following release of the circulation. Hyperemia produced by immersion in water at 40° to 42° and persisting when the leg was subsequently immersed in water at a lower temp. was not assocd. with acidity.

J. F. LYMAN

A study of the basal metabolism, weight and blood chemistry following bilateral oophorectomy. S. H. GEIST AND M. A. GOLDBERGER. *Am. J. Obstet. Gyn.* **12**, 206-17 (1926); *Biol. Abstracts* **1**, 642.—In 48 cases the basal metabolism, urea, non-protein N, creatinine and cholesterol of the blood and blood plasma were detd. Observations were made 2 weeks preoperative, and at various intervals to 3 months postoperative. No consistent variation in basal metabolism or body wt. was observed, and there was no definite relationship between these variations. The blood chemistry and blood pressure were not influenced by the double ovariectomy.

H. G.

Origin of B bile. M. R. FEISSLY. *Arch. Malad. App. Digest. et Malad. Nutrition* **16**, 328-45(1926); *Biol. Abstracts* **1**, 835.—F. injected tetrabromophenolphthalein and demonstrated its presence in the gall bladder by x-rays. Then by a duodenal drainage with instilled $MgSO_4$, he secured B bile. With x-rays he observed emptying of the gall bladder and showed that the B bile was more opaque than the A or C fractions. He considers this conclusive evidence that $MgSO_4$ produces contractions of the gall bladder and that the B bile obtained in duodenal drainage is vesicular in origin.

H. G.

Origin of the hippuric acid excreted in the urine of ruminants. F. ROGOZINSKI AND M. STARZEWSKA. *Bull. intern. acad. Polonaise* **B1926**, (1/2): 157-75(1926); *Biol. Abstracts* **1**, 820.—Urine of ruminants is rich in hippuric acid although there is no obvious source for it, i. e., no benzoic acid, in the food. It is not derived from the lignin of straw and protein substances play little, if any, part in its production. The authors reduced hippuric acid in urine by treating food (oat straw, prairie grass and clover hay) with dil. alkali in the cold and feeding the washed and dried residue. They, therefore, believe the substance antecedent to hippuric acid to be a non-nitrogenous substance sol. in the cold in dil. alkali and relatively insol. in boiling water.

H. G.

Cycle of hydrochloric acid secretion determined by fractional analysis of gastric juice in dogs with a Pavlov pouch, after feeding with Ewald or Riegel-Leube test meals. ANTONIO FRAGOMELE. *Morgagni Rivista* **68**, 129-35(1926); *Biol. Abstracts* **1**, 1050.—With the Ewald meal, the peak of acid secretion is reached at 30 min.; this is followed by an abrupt drop. With the Riegel-Leube meal, secretion reaches its height at 50 min.; the acidity is greater. Thus, secretory reaction varies with different stimuli.

H. G.

The behavior of the circulatory proteins of human plasma under normal and pathological conditions. W. STARLINGER. *Medical Clinic, Freiburg. Deut. med. Wochschr.* **54**, 731-3(1928).—A summary of 1800 analyses of the blood proteins in 280 normal and pathological individuals. The variations which the concns. of these proteins undergo normally and in disease are indicated.

ARTHUR GROLLMAN

The distribution of sugar between blood corpuscles and blood plasma for several animal species. R. E. SHOPK. Rockefeller Inst. *J. Biol. Chem.* **78**, 107-10(1928).—The distribution of sugar between the corpuscles and plasma varies with different animal species.

ARTHUR GROLLMAN

The effect of posture upon the composition and volume of the blood in man. W. O. THOMPSON, P. K. THOMPSON AND M. E. DAILEY. *Mass. General Hospital. J. Clin. Investigation* **5**, 573-604(1928).

ARTHUR GROLLMAN

The quantitative changes in cystine, tryptophan and tyrosine in the proteins of hen egg during incubation. BAEKHYEN CHO. Kjusu Imp. Univ. *Bul. Sci. Fakultato Terkultura* **2**, No. 1, 6 pp.(1926).—The cystine content increases during the later part of the incubation. The tryptophan content increases during the middle period, then decreases. Tyrosine decreases gradually. No conclusions would be justified, because of the difficulty of accurate sampling.

A. L. HENNE

The cystine content of keratins. TEIZO TAKEDA. Kjusu Imp. Univ. *Bul. Sci. Fakultato Terkultura* **2**, 262-72(1926).—The detn. of the cystine content of keratins has been performed by Okuda's I methods (macro and micro) and Folin-Looney's colorimetric method. The results are generally the same; with certain proteins larger results are given by the color method. The cystine content of human hair is larger for

men than women; it is especially poor in rapidly growing youths. The same tendency is observed with other mammals. Monkey hair has a larger cystine content than human hair. Coarser wools contain less cystine than softer ones. Feathers contain less cystine than mammal hair. In feathers the barbs contain more cystine than the shafts.

A. L. HENNE

Seasonal periodicity in man. I. Basal metabolism and respiratory vascular changes. F. R. GRIFFITH, G. W. PUCHER, K. A. BROWNELL, M. E. CARMER and J. D. KLEIN. *Am. J. Physiol.* **81**, 483 (1927).—See C. A. **22**, 616.

E. H.

The effect of emotion on basal metabolism. HARRY L. SEGAL, HERBERT F. BINSWANGER and SOLOMON STROUSE. *Arch. Internal Med.* **41**, 834-42 (1928).—In emotionally stable patients with normal basal metabolism and in hyperthyroid patients who had received I treatment, the basal metabolism was not affected by the thought of impending operation, while it was markedly increased in patients, who had not received I. The basal metabolism detd. before the operation may serve as an index of sufficient or insufficient I treatment.

MARY JACOBSEN

Pancreatic function and upper intestinal digestion. A new method of study. SANFORD M. ROSENTHAL. *Arch. Internal Med.* **41**, 867-74 (1928).—Ten rabbits received by stomach tube 10 g. uncooked sol. starch and 0.2-0.3 cc. 1 N HCl in 50 cc. water. The blood sugar rose by 62 mg./100 cc. in 30 min. After ligation of the pancreatic duct there was no rise or one of 5-10 mg. The increase did not exceed 21-25 mg. when 1-4 cc. HCl was added to the starch. The inhibition of intestinal digestion was not caused by delayed emptying of the stomach contents, since similar expts. with glucose gave essentially the same results with and without HCl. From 1 to 2 g. dextrose produces the same glucemia as 10 g. starch. The rabbit secretes about 1-4 cc. HCl during a meal (calcd. from dog expts.). The inhibition of amylase by HCl probably also applies to trypsin and lipase and explains some of the disturbances of hyperchlorhydria. Bile plays an important role in the neutralization of gastric acids. A study of intestinal digestion in obstructive jaundice would therefore be of interest.

MARY JACOBSEN

The combined sugar and water tests for liver function. ANTONIO GUALDI. *Riv. patol. sper.* **2**, 197-213 (1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 66, cf. Klein and Lang, *Münch. med. Wochschr.* **73**, 187-90 (1926).—G concludes from 5 expts. with water-honey that the water only tends to introduce complications and that the sugar test alone is preferable.

MARY JACOBSEN

A few experiments on the respiratory quotient during muscle work of short duration. J. LINDHARD. *Biol. Mededel. danske videnskab. Selskab* **6**, 1 28 (1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 70-1; cf. C. A. **14**, 3099; Hill, C. A. **19**, 320.—The respiratory quotient for the entire period was consistently below 1 (12 subjects) in contrast to the results of Hill who found it equal to 1. Hill's results are probably caused by nervous disturbances of metabolism. Conclusion: The energy for work of short duration is supplied by both fat and carbohydrates in equal measure and not by carbohydrates alone.

MARY JACOBSEN

The expansion of frog melanophores as a biological test for hypophyseal extracts, and the influence of chloretone on it. P. DI MATTEI. *Bull. acad. med. Roma* **63**, 133-55 (1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 565.—Hypophyseal exts. share the above property with practically all organ exts.: liver, brain, thymus, thyroid and a no. of other substances. The effect is very pronounced for chloretone, the usual preservative of com. hypophyseal exts. The results of Hogben, Winton, etc., are therefore not convincing.

MARY JACOBSEN

The mineral constituents of woman's milk. OTAKAR LAXA. *Časopis lékařu českých* **66**, 1792-4 (1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 512.—The results obtained by direct evapn. and ignition are not correct. Milk is dialyzed through parchment and dialyzate and the residue charred, extd. with water, evapd. and ignited separately. The dialyzable portion contains 81.5% of the total mineral content, $\frac{1}{3}$ of which is water sol. The relations between woman's and cow's milk (the latter according to Soldner) are: NaCl 2:1, K citrate 3:1, K phosphate 1:3, Mg phosphate 1:2, Ca citrate combined with casein < 2:3, Ca citrate free < 1.

MARY JACOBSEN

Relation of blood coagulation time and fibrinogen content to the thyroid. K. ICHIKAWA and T. SASAKI. *Folia endocrinol. japon.* **3**, 825-62 (1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 85-6.—Blood clotting time and fibrinogen content are increased in hyperthyroidism, thyroidectomy and thyroid feeding, slightly increased or unaltered in hypothyroidism. There is no parallelism between coagulability and fibrinogen content.

MARY JACOBSEN

Thyroid and tissue respiration. M. MAEDA. *Folia pharmacol. japon.* **3**, 796-

824(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 102.—The changes produced in the O_2 consumption and respiratory quotient of the thyroid and other organs by thyroid feeding and thyroidectomy indicate that the thyroid hormone promotes tissue respiration of almost all organs with the exception of the thyroid. MARY JACOBSEN

Supplementary report on the transportation of coloring substances into the amniotic fluid. H. SAKUMA. *Japan. J. Obstetr. Gynecol.* **10**, 34-6(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 117.—Ten cc. 1-2% dyestuff soln. was injected into the ear vein of pregnant rabbits 24 hrs. before laparotomy. Trypan blue (I), trypan Congo and bengal reds appeared in the amniotic fluid 1-5 hrs. after the injection. The concn. of I was 0.04%, that of the other dyes 0.001%. The amniotic epithelium was stained by these dyes, the placenta also by aniline black. I is also adsorbed by the embryo and the stomach mucosa. The dye passes directly from the mother into the amniotic water. MARY JACOBSEN

Spleen and carbohydrate metabolism. VII. Lactic acid level in blood. ARATA NOMA. *Okayama Igakkai Zasshi* **39**, 1041-8(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 90.—The blood lactic acid of normal rabbits as detd. at various intervals after glucose and glucose-electrargol injection is 0.0151-0.0298%. It is not materially affected by splenectomy. MARY JACOBSEN

Effect of gastric juice on lactic enzymes. C. SERONO AND R. DI MONTEZEMOLO. *Rass. clin. terap. sci. affini.* **26**, 1-7(1927).—When artificial gastric juice is added to an aq. emulsion of com. lactic enzymes or to a lactose broth culture all lactic cocci are destroyed in 45-60 min. at 37° and a HCl concn. of 0.8%. Only sporulating organisms survive such as *B. subtilis* and *mesentericus*, with which the preps. are frequently contaminated. Expts. with well-buffered HCl solns. on pure cultures of lactic cocci isolated from com. enzyme preps. showed that sterilization requires 1, 2 and 3 hrs., resp., for pH 2.05, 2.15 and 2.35. Loewenbergh has also shown that even HCl-free gastric juice has a definite germicidal effect. The administration of lactic enzymes is therefore not only useless but mostly dangerous because of the contamination. On the other hand acid milk has a high nutritive and therapeutic value because of its protein and lactic acid content and the abundance of lactic acid bacteria, some of which may escape the action of gastric juice and improve the intestinal flora. MARY JACOBSEN

Role of adrenals and thyroid in basal metabolism. C. DEMARIA MASSEY. *Rev. soc. argentina biol.* **3**, 5-19(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 423.—The basal metabolism is lowered by either adrenal- (I) or thyroidectomy (II). A further decrease occurs when I is followed by II or II by I. Conclusion: The effects on basal metabolism are independent of each other. MARY JACOBSEN

The part of renal medulla in the regulation of arterial tension. A. BIASOTTI. *Rev. soc. argentina biol.* **3**, 279-302(1927); *Ber. ges. Physiol. exptl. Pharmacol.* **44**, 105.—Removal of the abdominal branch of the sympathetic and the large and small splanchnic nerves on the left and on both sides had no effect on arterial pressure. Single adrenalectomy detcs. only slight variations if any. Double adrenalectomy causes progressive hypotension. Removal of 1 adrenal and of the medulla of the other causes a transient hypotension of 3-4 cm. Dogs deprived of the adrenal medulla and with a blood pressure brought up to normal suffered a more pronounced hypotension than normal dogs from a loss of blood amounting to 1.5% of the body wt. Simultaneous adrenal- and sympathectomy was followed by transient hypotension. Bleeding stimulates adrenaline secretion; blood transfusion inhibits it. The quantity of adrenaline normally produced in 1 adrenal of the dog has a definite pressor effect and is sufficient to increase the beat rate of the enervated heart and to suppress glycoma in a dog with normal adrenals. MARY JACOBSEN

Experimental study of prostatic function in relation to basal metabolism. Experimental hyperprostatism. GIAN C. PERACCHIA. *Rev. sud-americana endocrinol. immunol. quimioterap.* **11**, 311-53(1928).—Grafts or injections of prostatic exts. (from young dogs) extended over a period of several months caused in young dogs pronounced symptoms of old age with loss of general and sexual activity, dull, rough hair with alopecia, and moderate loss of wt. toward the end in spite of good appetite and digestion. After the 5th transplant or the 40th injection the basal metabolism (I) was reduced by 15-30%, the rate of excretion of phenolsulfonephthalein and the quantity excreted in 4 hrs. (II) by 35%. The prostate was enlarged and showed the characteristic increase in connective tissue and muscle fibers, and enlargement or obliteration of the acini. All these phenomena were more pronounced when grafts or exts. of prostate from old dogs were used. Prostatectomy caused in young only a slight increase in I and II. Transplants or exts. of young prostates rejuvenated old dogs, increased I by 10-25% and improved II. Conclusion: The testicle is responsible for the general systemic and

prostate changes. The prostate has an important part in the control of the gonadal condition.

MARY JACOBSEN

Protein regeneration in the blood. N. ROZANSKII. *Russkij fiziol. zhurnal* 9, 582-4(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 86.—Bleeding causes a decrease of the fibrin content followed by an 60-80% increase and return to normal within 2-3 weeks. A more transient and less pronounced decrease is produced by a NaCl transfusion. Conclusion: The formation of fibrin and its supply into the blood stream are detd. by its concn. in the blood.

MARY JACOBSEN

Adrenal secretion in angiotomized dogs. P. POPOV. *Russkij fiziol. zhurnal* 10, 227-37(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 104, cf. *C. A.* 21, 3669.--Blood drawn from the point of entrance of the *vena lumbalis* into the *vena cava inferior* (London's technic) inhibits the contractions and lowers the tonus of the isolated small intestine of the rabbit. This stage is followed by an increased tonus and finally return to normal. Blood from the femoral artery increases the tonus slightly and has no effect on the height of the contractions.

MARY JACOBSEN

Liver and pregnancy. OTAKAR SAITZ. *Sbornik lékarsky* 29, 15-42(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 123.—During the last month of normal pregnancy (25 women) the urea excretion was lowered in 88% cases and the levulose assimilation retarded. An increase of bilirubin in the blood was found in 8% and in the duodenal juice in 83% cases. The urine urobilin rose in 67%, the duodenal in 66 7%, the blood cholesterol in 56% cases. The changes can be explained by the effect of pregnancy on the thyroid, pancreas and adrenals. The conception of pregnancy liver is unfounded.

MARY JACOBSEN

Disappearance of adrenaline from circulating blood. C. G. SUNDBERG. *Uppsala lakareforenings forhandl.* 33, 301-25(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 469-70.—Adrenaline was infused continuously into the jugular and mesenteric inferior veins and into the femoral artery of cats whose spinal cord was severed between the 6th and 7th vertebra. About 70-80% adrenaline was destroyed by the liver, 50% by the femoral capillary territory. Expts. with ligated hepatic vessels confirmed the important but not exclusive part of the liver in adrenaline destruction. Expts. *in vivo* did not confirm Tatum's statement that arterial tissue destroys adrenaline. M. J.

Partial ligation of renal arteries in the dog. R. E. MARK. *Verh. deut. Ges. inn. Med.* 1927, 177-81; *Ber. ges. Physiol. exptl. Pharmacol.* 44, 561.—Partial ligation of the arteries of one kidney with subsequent removal of the other results in inhibited excretion. When urea is fed, the rate of decrease of blood urea is lowered. Meat feeding leads to compensatory polyuria, urea retention, rise of blood pressure, increased albuminuria and toxic symptoms. The latter are pptd. when water is withheld. Milk protein or cheese does not cause intoxication.

MARY JACOBSEN

The formation of methylglyoxal from hexose phosphate in the presence of tissues. NOBORU ARIYAMA. Wash. Univ. Med. School. *J. Biol. Chem.* 77, 395-404(1928).—See *C. A.* 22, 1784.

A. P. LOTHROP

The similarity of glucormont and synthalin. FRITZ BISCHOFF, N. R. BLATHERWICK and MELVILLE SAHYUN. Potter Metabolic Clinic. *J. Biol. Chem.* 77, 467-71 (1928).—Evidence is presented which indicates that the glucormont of von Noorden (*C. A.* 21, 3941) is either synthalin or a near homolog of it.

A. P. LOTHROP

Some chemical investigations of embryonic metabolism. I. The isolation of four pentose nucleotides from chicken embryos. H. O. CALVERY. Johns Hopkins and Univ. Mich. Med. Schools. *J. Biol. Chem.* 77, 489-96(1928).—Chicken embryos contain a β -nucleoprotein which yields all 4 of the pentose nucleotides of yeast on hydrolysis. The suggestion is made to substitute the term, "hexose nucleic acid," for thymus or animal nucleic acid and "pentose nucleic acid" for yeast or plant nucleic acid since the older terms no longer possess their original significance. The nomenclature for nucleic acid, nucleotide and nucleoside would then be uniform. The β -nucleoprotein is similar in many of its properties to the compd. obtained originally by Hammarsten from pancreas. The evidence shows that developing chicken embryos synthesize the pentose nucleotides. II. The isolation of a hexose nucleic acid from chicken embryos. *Ibid.* 497-503.—Chicken embryos also contain a compd. having several of the properties of a hexose tetranucleotide which is probably identical with the hexosenucleic acid of other animal tissues. Adenine and guanine were obtained on hydrolysis with 7% H_2SO_4 in amts. bearing quant. relationships to the original substance and to each other.

A. P. LOTHROP

Quantitative studies of β -oxidation. I. The conjugation of benzoic acid and phenylacetic acid formed as the end-products from the oxidation of phenyl-substituted aliphatic acids. ARMAND J. QUICK. Cornell Univ. Med. Coll. *J. Biol. Chem.* 77,

581-93(1928).—BzOH is conjugated in the dog with glucuronic acid and glycine in the ratio of approx. 3:1 and this conjugation also occurs in that ratio when the BzOH is derived from the oxidation of $\text{PhCH:CHCO}_2\text{H}$ or $\text{Ph}(\text{CH}_2)_2\text{CO}_2\text{H}$. $\text{PhCH}_2\text{CO}_2\text{H}$ is the end-product of the oxidation of $\text{PhCH:CHCH}_2\text{CO}_2\text{H}$ and of $\text{Ph}(\text{CH}_2)_3\text{CO}_2\text{H}$ and is combined with glucuronic acid and glycine in the ratio of 2:1 when fed or when derived from these 2 acids. The sum of the 2 conjugated forms of either BzOH or $\text{PhCH}_2\text{CO}_2\text{H}$ excreted during 24 hrs. accounts for more than 80% of the ingested acid, thus giving the expts. quant. significance. These results furnish addnl. evidence for the theory that the fatty acids are broken down in the body exclusively by β -oxidation. The idea is no longer tenable that these conjugations are more or less unimportant mechanisms concerned solely with detoxication powers of the organism. They are normal and common chem. reactions made manifest because the body is applying them to a foreign substance and a study of the conjugation of BzOH may help to solve various problems of metabolism quite unrelated to hippuric and glucuronic acids.

A. P. LOTHROP

The effect of insulin on protein metabolism. ADOLPH T. MILHORAT AND WILLIAM H. CHAMBERS. Cornell Univ. Med. Coll. *J. Biol. Chem.* 77, 595-602(1928); cf. *C. A.* 21, 2299.

A. P. LOTHROP

Muscular exercise and nitrogen metabolism of dogs. WM. H. CHAMBERS AND ADOLPH T. MILHORAT. Cornell Univ. Med. Coll. and Yale Univ. *J. Biol. Chem.* 77, 603-18(1928), cf. preceding abstract.—Dogs were exercised moderately on a horizontal treadmill and the total urinary N excretion was detd. An increase of as much as 50 to 100% in N metabolism is produced by work on the 3rd or 4th day of fasting and this is prolonged into the postwork period. This extra N can be completely spared by carbohydrate so that muscular work in the dog can be accomplished without any increase in protein metabolism in so far as it is possible to det. from the excretion of urinary N. It gradually disappears on continued fasting. These data and those obtained with insulin indicate the derivation of the extra N from an exhaustible reserve rather than from tissue protein.

A. P. LOTHROP

The influence of ingested methylxanthines on the excretion of uric acid. VICTOR C. MYERS AND EMMA L. WARDELL. Univ. of Iowa. *J. Biol. Chem.* 77, 697-722(1928).—The ingestion of caffeine by man is followed by an unmistakable increase in the excretion of uric acid and there is usually an increase following administration of theophylline. There is no increase after ingestion of theobromine. The origin of these increases has not been definitely established but it is suggested that it may be due at least in part to the transformation of caffeine and theophylline to uric acid or methyluric acid. Stimulation of metabolism alone seems insufficient to account for all the extra uric acid. "It is an interesting fact of circumstantial character that whereas 3,7-dimethylxanthine (theobromine) does not cause an increase in the excretion of uric acid as detd. colorimetrically and 3,7 dimethyluric acid does not give the color reaction, on the other hand 1,3-dimethylxanthine (theophylline) does increase the output of uric acid and 1,3-dimethyluric acid does give the color reaction. It is further significant that 1,3-dimethylxanthine (theophylline) causes a greater increase in uric acid excretion when estd. by the Benedict-Franke procedure than when estd. by the Benedict-Hitchcock method and that 1,3 dimethyluric acid does respond to the Benedict-Franke procedure but not to the Benedict-Hitchcock method." The accuracy of the Benedict-Franke colorimetric method was checked by gravimetric estns. of uric acid.

A. P. LOTHROP

The relation of smooth-muscle tone to biological oxidation-reduction. J. M. JOHNSON, W. T. MCCLOSKEY AND CARL VOEGTLIN. Hygienic Lab., U. S. Pub. Health Service, *Am. J. Physiol.* 83, 15-27(1927).—See *C. A.* 21, 3668.

J. F. LYMAN

Butterfat tests on first and later lactations. C. F. MONROE. Ohio Agr. Expt. Sta., *Bimo. Bull.* 12, 34 8(1927).—The av. fat content of the milk of 32 Holstein and 30 Jersey cows during the first lactation was 3.4 and 5.4%, resp.; 19 of the Holstein and 14 of the Jersey cows gave milk during their entire life, the av. fat content of which was within 0.1% of the av. for the first lactation. Butterfat percentages for individual lactations show differences as high as 0.9% for Holsteins and 1.1% for Jerseys. The av. difference between the highest and lowest av. for the individual lactations was 0.36% for the Holsteins and 0.57% for the Jerseys. The butterfat test in the first lactation is a very good indication of what to expect as an av. test of the cow during her entire lifetime.

A. L. MEHRING

Influence of pinching the hepatic veins on glucemia and chloesterolemia. J. J. ROUZAUD AND L. C. SOULA. *Compt. rend.* 186, 1378-80(1928).—In expts. with chloralosed dogs the glucose and cholesterol were detd. in the blood of the hepatic veins before, during and after the pinching. During the pinching of the veins the glucemia

increased progressively and was doubled in 1 hr., due probably in part or entirely to the suppression of the insulin output. The cholesterolemia diminished immediately but the diminution was transitory, lasting about 30 min. This may be caused by the sudden suppression of splenic venous blood in the general circulation. L. W. RIGGS

Female sexual hormones. CHAMPY C. BENCAN AND T. KELLER. *Compt. rend. soc. biol.* **97**, 229-32(1927).—The placenta contains the hormone of the follicles and the hormone of the corpus luteum; thus the secretion of sexual hormones is not confined to a definite class of histological elements. B. C. A.

Excretion of uric acid and diuresis. R. GOIFFON. *Compt. rend. soc. biol.* **98**, 941-3(1928).—The findings indicate that the concn. of uric acid in the urine tends to be fixed whatever the output of water or the concn. of urea. This shows the importance of aq. diuresis and renal permeability in the elimination of urea. L. W. RIGGS

Gastric juice from different levels of the stomach. FELIX RAMOND, PREVEDOURAKIS AND ZIZINE. *Compt. rend. soc. biol.* **98**, 945-6(1928).—The secretion of HCl occurs in the elevated parts of the stomach, and the max. of this secretion takes place in the vicinity of the lesser curvature. L. W. RIGGS

Velocity of oxido-reduction processes in cells of normal adult mammalian tissues. P. MAURIAC, E. AUBERTIN AND E. AUBEL. *Compt. rend. soc. biol.* **98**, 959-60(1928).—The results of tests with the guinea pig, rabbit and dog were comparable to those obtained by Voegtlin, Johnson and Dyer with the rat. cf. C. A. **19**, 2854. L. W. RIGGS

Ammoniacal and real acidity of the urine. MICHEL POLONOVSKI AND PAUL BOULANGER. *Compt. rend. soc. biol.* **98**, 961-2(1928); cf. C. A. **22**, 2000.—The formula of Raffin, $k = p_H/4 + \log(\text{ammonia N}/\text{total N})$, is discussed. L. W. RIGGS

A study of phosphagen. W. DULIERE. *Compt. rend. soc. biol.* **98**, 1252-4(1928); cf. Eggleton, C. A. **21**, 1485, 2278.—The relations of muscular contractility to the presence of phosphagen were studied. L. W. RIGGS

Histochemical study of the distribution of fixed mineral substances in the human placenta. R. NOEL AND H. PIGEAUD. *Compt. rend. soc. biol.* **98**, 1317-8(1928).—No trace of mineral substances was found in the sanguinous space (lac sanguin). The contour of the chorial villi and of the intercotyledonary partitions was always marked by an abundant deposit of ash. L. W. RIGGS

Calcium compounds in the cell nucleus. A. POLICARD AND D. PILLET. *Compt. rend. soc. biol.* **98**, 1350(1928).—A further application of the micro-incineration method in which Ca was recognized as CaSO_4 proved that the nucleus of animal cells contained a large quantity of this element. L. W. RIGGS

Action of peroxidase on the blood plasma. JAKOB MOELLERSTROM. *Compt. rend. soc. biol.* **98**, 1361-4(1928).—Reciprocal relations appear between the action of peroxidase on the blood plasma, velocity of sedimentation of the red corpuscles, temp., I index and no. of white cells per cu. mm. L. W. RIGGS

Intestinal secretin as an excitant of the secretion of the gastric juice. Preparation and effects. JULIAN WALAWSKI. *Compt. rend. soc. biol.* **98**, 1371-2(1928).—Expts. with dogs proved that the gastric secretion is stimulated not only by exts. of the pyloric mucosa, but also by exts. of any segment of the intestine. The intensity of stimulation diminishes as the samples are taken from the pylorus toward the rectum. **Mode of action.** *Ibid.* 1373-4.—The secretin formed under the influence of HCl acts on the gastric glands by the humoral route. **A study in man with a gastric fistula.** *Ibid.* 1374-5.—Intestinal secretin stimulates the secretion of the gastric juice in man as well as in dogs. L. W. RIGGS

Existence of a difference of variable potential between the mouth and stomach during gastric secretion. JEAN SWYNGEDAUW. *Compt. rend. soc. biol.* **98**, 1431-2(1928).—Variations of potential developed in the gastric mucous during secretion. *Ibid.* 1433-4. L. W. RIGGS

Relation between the external and internal secretions of glands. I. G. MANSFELD AND L. SZIRTES. *Univ. Pecs. Arch. expil. Path. Pharmacol.* **130**, 1-27(1928).—Partial ligation of the pancreas in normal dogs is followed by a persisting increased production of insulin. II. G. MANSFELD. *Ibid.* 28-36.—From the results of blood sugar detns. in dogs whose parotid glands have been extirpated or ligated it appears that secreting glands may undergo functional changes indicative of glands of internal secretion. G. H. S.

Place of formation of bilirubin. K. TANIGUCHI. Kiushu Univ. of Fukuoka. *Arch. expil. Path. Pharmacol.* **130**, 37-48(1928).—Within 6 to 8 hrs. after a total extirpation of the liver in dogs or after an operative procedure which leaves the circulation of the liver intact, bilirubin appears in the blood, and the amt. present increases with time. This bilirubin is of extrahepatic origin, although in normal animals the liver

functions as the principal site of its formation. After complete removal of the liver the injection of hemoglobin results in an increase in the extrahepatic formation, but the response is less than in the normal animal. Tolylenediamine and phenylhydrazine act only on the liver, since injections of these compds fail to lead to icterus after extirpation of this organ. G. H. S.

Influence of moderate altitudes on artificial hyperthyroidization in dogs. II. Effect of different diets. ROBERT E. MARK. Univ. Wien. *Arch. expl. Path. Pharmacol.* 130, 257-79(1928); cf. C. A. 21, 766.—Dogs being fed upon a diet consisting solely of meat and kept at a moderate altitude (1040 m.) react to thyroid feeding with an increased diuresis, increased excretion of N, an accelerated pulse rate and a gain in wt., while if upon a carbohydrate diet these effects are lacking. If the same dogs are fed thyroid at sea-level the diet (protein or carbohydrate) is without influence upon the results. G. H. S.

Origin of bile acids. I. Methods for the determination of bile acids, of cholesterol and of the unsaponifiable residue in the bile of dogs. M. JENKE. *Arch. expl. Path. Pharmacol.* 130, 280-91(1928).—By means of two newly devised methods for the direct detn. of bile acids it is shown that in dogs not only are combined bile acids excreted but also cholic acid. Bile acids given by mouth are excreted quant. in the bile. Decompn. of cholic acid in the body is improbable. The new methods permit simultaneous detns. of the cholesterol and unsaponifiable residue. Polarimetric detn. is the basis of the procedure for detg. the bile acids. **II. Cholesterol-bile acids balance in dogs with a complete biliary fistula.** E. ENDERLEN, S. J. THANNHAUSER AND M. JENKE. *Ibid* 292-307.—The formation of bile acids in the body with oral or intravenous administration of cholesterol proceeds independently of the exogenous or endogenous supply of sterols. As basic material for the synthesis of bile acids the fatty acids are of chief importance. **III. Spatial configuration of the sterols and its influence on the formation of bile acids.** *Ibid* 308-18.—Coprosterol and allocholesterol, both of which possess the same spatial configuration, cause, when given intravenously to dogs with a biliary fistula, a definitely increased excretion of bile acids. This in no way shows that these compds. are transformed directly into cholic acid, since they may simply exert a stimulus for the formation and excretion of the bile acids. G. H. S.

G—PATHOLOGY

H. GIDRON WELLS

The fasting gastric secretion in man. W. MORRELL ROBERTS. *Quart. J. Med.* 21, 7-19(1927).—The gastric secretion is depressed by $\frac{1}{100}$ grain of atropine sulfate. Doses of $\frac{1}{32}$ to $\frac{1}{16}$ grain inhibit secretion by paralyzing vagus endings. Gruel then fails to stimulate secretion but caffeine can stimulate it. Decrease of secretion follows doses too small to affect the pulse. Atropine will inhibit the "after secretion" following emptying the stomach after a test meal. There is evidence of incomplete mixing in the stomach consisting of a usual difference of 0.07% acidity between the cardiac and pyloric ends, and it may be much greater. The most copious fasting secretions occur in reflex dyspepsia assocd. with duodenal or appendiceal lesions. This is probably identical with the "psychic secretion" of Pavlov. JOHN T. MYERS

Studies in pernicious anemia. IV. The relationship between corpuscular hemoglobin and chloride contents in the anemias. A. T. CAMERON AND MARIAN E. FOSTER. *Can. Med. Assoc. J.* 18, 673-7(1928); cf. C. A. 21, 2729.—In pernicious anemia the hemoglobin content of a given vol. of red blood corpuscles is invariably above the av. normal and usually much above this value. The Cl content is almost always below the av. normal value, suggesting that a causal relationship may exist between these 2. In secondary anemias the Cl content is usually above the av. normal value, but all variations of hemoglobin values are found. In a single case of anemia from *Diphyllobothrium latum* high Cl and very low hemoglobin values were found. A. T. CAMERON

The occurrence of a raised basal metabolic rate in new growth without hyperthyroidism. E. H. MASON. *Can. Med. Assoc. J.* 18, 681-2(1928).—A case of melanoma-sarcoma with extensive involvement of the liver showed rates of + 40% and over for several weeks. There was no evidence of thyroid disorder. A. T. CAMERON

The production of sugar by animal tissues. Favoring influence of asphyxia and of traumatism. F. MAIGNON. *J. physiol. path. gén.* 25, 626-37, 644-53(1927).—Total ligature of a limb, and traumatism (crushing of muscles below the skin) both cause appearance of sugar (chiefly glucose) of the order of 0.1% in the urine. Asphyxia and traumatism both augment the production of sugar in muscle, whether this has

been perfused with saline to remove blood, or not. Both factors accelerate the decompn. of glycogen. Myocardial muscle produced more sugar than striated muscle, and the latter than smooth muscle. Other tissues also produce glucose. The sugar formed following traumatism of muscle is initially maltose, which prolonged autolysis transforms completely to glucose. A. T. CAMERON

A consideration of the results of albuminuria occurring during pregnancy, with special reference to the relationship between pregnancy kidney and chronic nephritis. G. F. GIBBERD. *Proc. Roy. Soc. Med.* **21**, 831-43(1928).—The paper is mainly clinical. It is considered that the term "functional albuminuria of pregnancy" should be abolished. The condition recurs in the majority of subsequent pregnancies, and points to permanent renal damage. A. T. CAMERON

New Zealand views on goiter. D. W. C. JONES. *Proc. Roy. Soc. Med.* **21**, 1217-30 (1928).—Endemic goiter is of great antiquity among the Maoris and has been described among Europeans in New Zealand for 50 years. It occurs in both men and animals. Its incidence varies greatly in different districts. The only cause consistent with the variation in distribution is lack of I in the soil. An inverse ratio has been demonstrated between the I content of the soil and the incidence of goiter in school children in 33 districts. The I content of the soil is reflected in the food raised upon it. The daily I intake is estd. as 35 micrograms in a non-goitrous and 20 in a goitrous district. The intake of the necessary amt of I is ensured by use of NaCl for ordinary consumption contg. 4 parts of KI per million. If starved of I the thyroid adapts itself either by increasing its colloid or by a diffuse hyperplasia, both may occur in different parts of the same gland. Adenomatous areas may occur and degenerations. If such goiters are treated with I, in children readjustment is readily made, but in adults long accustomed to a low intake excess often causes too great production of the endocrine secretion with toxic symptoms, so that a minimally iodized salt is alone permissible. A. T. CAMERON

Cholesterol examinations in the blood in pulmonary diseases. MARIE V. BABARCY. *Beitr. klin. Tuberk.* **66**, 568-72(1927).—In pulmonary tuberculosis there can occur a normal, hyper- and hypo-cholesterolemia. With increased tuberculin hypersensitivity there usually occurs a hypocholesterolemia. In addn. to the immunobiologic condition in pulmonary tuberculosis the exudative or productive focal character appears of significance for the cholesterol content of the blood. H. J. CORPER

The possibility of differentiating human and bovine tubercle bacilli by means of complement fixation. O. KIRCHNER. *Beitr. klin. Tuberk.* **66**, 581-7(1927). By utilizing bacillary suspensions as antigen, and varying the amts. of both antigen and serum, no differences were found which would permit a differentiation of human and bovine tubercle bacilli by means of the complement-fixation technic. H. J. C.

Experimental demonstration of complement-binding antibodies towards fatty substances of simple constitution. J. E. WOLF. *Beitr. klin. Tuberk.* **66**, 710-8 (1927); cf. *C. A.* **21**, 2730.—The energetic investigations of Much on fats and lipoids and their antigenic property have been taken up by various authors. W. has in addnl. expts. verified these earlier observations experimentally on rabbits, geese and goats and demonstrated that human fat, a relatively simple fatty body, possesses antigenic properties and that under suitable conditions (in the presence of high mol. protein bodies) can form serum antibodies. These expts. are believed to clarify certain biological reactions and to be a valuable index for the therapy. H. J. CORPER

Lipase in tissues, especially in the granulation tissues in surgical tuberculosis. H. TAKEBAYASHI. *Beitr. klin. Tuberk.* **67**, 748-55(1927).—Tuberculous granulation tissues were found to be richer (0.0019) in lipase than non tuberculous (0.00071). Tuberculous pus was also richer in lipase but not to so great an extent. Higher than normal lipase values were found for non-tuberculous granulation tissues from open wounds. The lipase values were not dependent upon lymphocytic content. H. J. CORPER

Therapy of pulmonary tuberculosis by diminished metabolism. G. JACOBSON. *Z. Tuberk.* **48**, 299-300(1927).—The low oxidative conditions in gout, opposite to those of diabetes and Basedow's disease, explain the antagonistic influence of the former tuberculosis. The blood uric acid mirror indicates the oxidation possibility as it occurs in the tissues. Therefore, nuclein-rich materials (Acurogen) cause an unfavorable medium by increase of the uric acid mirror for the development of the tubercle bacillus, and a diminution of metabolism results in a slowing of respiration with rest to the lung, so that there occurs a diminution of the bacilli in the sputum as well as an inhibition of the liberation of toxins. H. J. CORPER

Microchemical gold reactions in the organs of tuberculous sanocrysin-treated individuals. JOSE A. GALLINAL. *Z. Tuberk.* **48**, 433-42(1927).—Au was found in sections of organs of 6 cases of phthisis treated with sanocrysin and examd. microchemi-

cally by means of the Kurosu $ZnCl_2$ reaction. The main depot in man was the liver, thus differing from the exptl. animal. A pos. reaction was also obtained in the blood and though slight in the intestine (in the Lieberkuhn cryptus and submucosal connective tissue). In one of the cases the muscles proved free from Au. There was no definite relation between the tuberculous disease process and the type of deposit. A measure of the deposit in the lungs was difficult since the Au deposit could not be distinguished from coal pigment.

H. J. CORPER

The lipolytic enzyme of the blood, the lymphocytes and the Pirquet reaction in tuberculosis. N. GRGETCHKORI. *Z. Tuberk.* **48**, 460-2(1927).—There exists a relation between the Pirquet skin reaction, the lymphocyte percentage and the amt. of lipolytic enzyme in the blood in tuberculosis, dependent upon the pathologic-anatomic character of the disease. A high grade of allergy with marked pos. Pirquet reaction, lymphocytosis and high lipase content of the blood were assoc. with favorable cirrhotic-productive forms of pulmonary tuberculosis, while anergy, lymphopenia and low lipolytic enzyme content occurred in prognostically unfavorable exudative forms of the disease.

H. J. CORPER

Mineral salts and phosphorus in tuberculosis. RÜCKLE. *Z. Tuberk.* **48**, 462-6 (1927).

H. J. CORPER

Complement fixation in tuberculosis with a simplified antigen. ALFRED SALOMON. *Z. Tuberk.* **48**, 467-9(1927).—A simplified antigen equal in value to Besredka's antigen in comparative tests was prepd. by extg. 0.3 g. of dried and ground up tubercle bacilli in a Soxhlet app. with 300 cc. of ether and dissolving the dried ether ext. in 200 cc. of 96% alc. by several hrs. agitation in a shaking machine.

H. J. CORPER

Studies on the adenoid state. IV. Sedimentation velocity of the red cells. GIOVANNI DONADEI. *Arch. Ital. Otol. Rinol. e Laringol.* **37**, 70-8(1926); *Biol. Abstracts* **1**, 490.—The velocity of red-cell sedimentation was studied in 21 babies with adenoidism, and in 4 normal controls. In 15 cases examd. before operation, there was retardation, in 2 a normal rate, and in 4 acceleration. Operation was usually followed by a return towards normal. D. discusses the theoretical significance of the sedimentation rate in this and other conditions, in particular the correlation between sedimentation, viscosity of blood and protein content of the blood serum.

H. G.

Functional examination of the stomach by physical-chemical methods. SEWERYN CYTRONBERG. *Arch. Malad. App. Digest. et Malad. Nutrition* **16**, 653-79(1926); *Biol. Abstracts* **1**, 1049.—Observations have been made on 134 gastrointestinal cases and 51 normal subjects, including color, n , surface tension, pH , HCl, total acidity and biuret reaction, on: (1) fasting contents; and (2) 45 min., (3) 90 min. and (4) 4 hrs. after ingestion of an albumin test meal. A discussion of the comprehensive data includes functional as well as org. conditions. The n appears to be of considerable significance.

H. G.

A contribution to the study of the deposits containing calcium and iron in the brain. ELIZABETH COWPER FAVES. *Brain* **49**, 307-32(1926); *Biol. Abstracts* **1**, 1075.—A quant. chem. analysis of calcified areas in human brains demonstrates that no other method is conclusive as regards increase in Ca. The staining reaction of calcified tissue with fresh hematoxylin so frequently used is not specific; neither is the microchem. formation of $CaSO_4$ crystals by treatment with H_2SO_4 satisfactory in all cases. Two cases with angionata were investigated by chem. analysis; quant. figures are given for Ca and Fe, phosphates and carbonates. Only traces of Mg were present. In epidemic encephalitis considerable Fe was found localized in various parts of the brain. In the midbrain of 1 case deposits similar to so-called psammoma bodies were present; some gave an Fe reaction, while others did not. A dense neuroglial overgrowth was present and appeared related to the deposits. In 5 of 6 cases of general paralysis of the insane, Fe-contg. pigment was found in the walls of the blood vessels, particularly of the cerebral cortex.

H. G.

Neoplasms and blood potassium. PIETRO OTTONELLO. *Policlinico Sez. Med.* **33**, 511-6(1926); *Biol. Abstracts* **1**, 257.—Using the method of Kramer and Tisdall (cf. C. A. **15**, 1912) O. found the normal variations in K content of blood to be 20-34 mg. per 100 cc. of blood. He cites other observations showing a variation of 18-70 mg. per 100 cc. In cases of carcinoma the K content of the blood was somewhat higher (40-85 mg. per 100 cc.). The differences between these figures and those obtained in cases of cirrhosis of the liver, Malta fever, mitral insufficiency, etc., were not sufficiently pronounced to make the detn. of blood K diagnostically valuable.

H. G.

Physicochemical investigation on the blood of cancerous patients. ED. PEYRE AND C. SANNIE. *Progrès med.* **1926**, 515-23; *Biol. Abstracts* **1**, 258.—This gives the pH and osmotic pressure of plasma, total hemoglobin concn. and vol. of red blood cells

of the blood of patients with cancer of uterus, rectum, face and mouth before and after x-ray or Ra treatment. Venous blood is defibrinated by shaking with glass beads. The plasma p_H is measured electrometrically at 38°. Hemoglobin is detd. by the Sahli-Gowers method. Cell vol. is detd. by 24-hr. sedimentation. Osmotic pressure is calcd. from the f. p. of the plasma. Conclusions are that there is no definite change in p_H ; no apparent variations in f. ps. beyond the normal; but there is a slight diminution of the total hemoglobin and the cell vol. H. G.

The distribution of sugar between corpuscles and plasma in blood from normal human beings, and from diabetics with and without insulin therapy. R. E. SHOPE. Rockefeller Institute. *J. Biol. Chem.* **78**, 111-5(1928).—No abnormality in the distribution of sugar between red blood corpuscles and plasma was found in diabetics. Insulin caused no change in this distribution. ARTHUR GROLLMAN

Studies in blood composition of animals under pathological conditions. I. Broncho-pneumonia in cows. A. A. HORVATH AND R. B. LITTLE. Rockefeller Institute. *J. Clin. Investigation* **5**, 541-6(1928).—Pneumonia in cows caused a drop in the blood-plasma Cl and a rise in the globulin and fibrin fractions. The chemical analysis of blood in pneumonia is of great diagnostic and prognostic value. A. G.

Immune processes associated with syphilis. I. Spirochete specific antibodies in man. H. KRÓO AND F. O. SCHULZE. *Klin. Wochschr.* **7**, 246-8(1928).—A vaccine was made of killed spirochetes in liquid cultures and was injected into normal persons in various concns. some of them receiving as much as 240 cc., containing 3000 million spirochetes per cc. over a period of 6 weeks. Serum obtained from these persons fixes complement with an alc. ext. of *Sp. pallida*. The complement fixation is specific for *Sp. pallida*. Complete fixation was obtained at a dilution of 1:80 in some cases. Of the vaccine, 0.1 cc. was injected intracutaneously before the immunization was begun. A wheal appeared at the site of injection at definite intervals during the period of immunization. A wheal is obtained only when the serum contains complement-fixing antibodies. MILTON HANKE

The amino acid content of blood in tuberculosis. LEO HANTSCHMANN AND MAGDALENE. *Klin. Wochschr.* **7**, 637-8(1928).—The amino acid content of the blood is elevated in tuberculosis, in cases with fresh lesions or with exacerbation, and it is low in cachectic patients or those that are persistently lean. MILTON HANKE

Basal metabolism. II. The basal metabolic rate in relation to symptoms and signs of hyperthyroidism. JAMES H. SMITH. *Arch. Internal Med.* **41**, 830-3(1928); cf. *C. A.* 2599.—An arbitrary numerical index of symptoms was chosen: nervousness 1, tremor 2, loss of wt. 3, tachycardia 4, exophthalmos 5, goiter 6, total 21. In 102 patients an index below 10 was assocd. with a basal metabolism below 20 and absence of hyperthyroidism, although many had nontoxic goiter. Of 44 patients 41 had an index > 10, a basal metabolism over 20 and presented hyperthyroidism. The index is of no value in toxic adenoma because of the absence of exophthalmos. M. J.

Acromegaly and diabetes. Report of six cases. WALLACE M. VATER. *Arch. Internal Med.* **41**, 883-912(1928).—The assumption that acromegaly and diabetes are of the same origin is supported by the following facts: Acromegaly is frequently, hypopituitarism very rarely, associated with diabetes or lowered glucose tolerance. The sugar tolerance in diabetics and normal persons is increased by hypophysectomy. Injections of pituitary ext. produce transient hyperglucemia and glucosuria in normal persons and prevent or relieve insulin hypoglucemia and convulsions. Unlike diabetes alone diabetes associated with acromegaly sometimes shows spontaneous recovery. The common cause of acromegaly and diabetes is perhaps an insufficient production of insulin or its partial neutralization. MARY JACOBSEN

Serum and urine diastase in pregnancy and puerperium. CATELLO DEL PIANO. *Arch. ostetr. ginecol.* **14**, 423-8(1927); *Ber. ges. Physiol. expil. Pharmacol.* **44**, 572-3.—In normal women the blood-urine diastase index is 0.25-0.04. The blood diastase is never > 7. A min. in the blood corresponds to a max. in the urine and *vice versa*. The index is almost regularly increased toward the end of pregnancy and returns to normal during the puerperium. The diastase content is a reliable index of kidney function. In pathol. conditions the index may rise above 1. MARY JACOBSEN

Creatinuria and creatininuria in normal and pathological conditions. Importance of determination of the concentration of the creatine substances in the urine. GAETANO SALVIOLI. *Arch. patol. clin. med.* **6**, 429-47(1927); *Ber. ges. Physiol. expil. Pharmacol.* **44**, 561; cf. *C. A.* 22, 2202.—In normal children the total and % excretion run parallel, so the detn. of the former may be dispensed with. The urine output increases with the age at a much lower rate than the creatinine output. The latter is 0.6 g. daily for 6 months, 1.2225 g. for 14 years of age. In tuberculous children the creatine out-

put, total as well as in % and in g./kg. body wt., is increased. A further increase is caused by fever. The exhaustion in protracted cases may be assocd. with a decline, but the no. g./kg. is still above normal. Non-tuberculous pulmonary diseases with fever cause a transient increase in the abs. and relative values. The curves for the different ages show in pathol. cases the same relation to each other as the normal ones.

MARY JACOBSEN

Biochemistry of thyroid diseases. U. G. BIJLSMA. *Ber. staatl. Gesundheitsfuersorge Nederland.* 6, 1086-111(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 103.—The metabolism of the non-thyroxine I of the thyroid is still little known. The convincing proof of I deficiency as a cause of thyroid enlargement has not been furnished yet. However, the prophylactic administration of minute I doses to school children or the admixt. of I to salt and water seems to have beneficial effects. The I content of Dutch foodstuffs is only slightly below the min. requirements. The I content of the water alone would not suffice to prevent goiter if combined with an I-deficient diet. M. J.

Lipoids and their relation to proteins and immunity. S. BELFANTI. *Biochim. terap. sper.* 15, 33-40(1928).—In order to elucidate the role of the protein "vehicle" in lipid immunization the compd. of ovolecithin (I) with ovovitellin (II) was studied. On treating egg yolk directly or in a physiol. saline emulsion with ether-acetone 4:1 until all fats and most of the lecithin are dissolved a white residue is obtained consisting of alc.-sol. I proper, a water-insol. and a water-sol. protein. The latter is pptd. by alc. and acetone, is not coagulated by heat or AcOH, redissolves after pptn., and gives a very intense Millon, $K_4Fe(CN)_6$ and tannic acid reactions. The chem. constitution has not been detd. In contact with an animal poison the soln. or emulsion of either protein with the I which it carries forms lysocithin (III) rapidly. III can be detached from II by alc. and especially by acetone, but not by physiol. saline in spite of its high soly. in it. It may, therefore, be concluded that II, a complex of 2 proteins, serves as a vehicle for I and that the hemolytic protein consists of II + III. From the immunological point of view the following is of importance: II has also a detoxifying function, since the insignificant hemolytic effect of II + III is most conspicuously raised by the addn. of alc. which is a protein coagulant and lipid solvent. On the other hand it has been found previously by B. that III is inactivated by the energetic action of wasp poison, but may be reactivated by any fat solvent, e. g., ether. The inactivation is here apparently the result of a sudden liberation of fatty acids which envelop the active groups of III. In these 2 cases hemolysis is counteracted without the intervention of an antibody. When just enough III is added to red cells to effect hemolysis III cannot be liberated from the heat-coagulated cell albumins by washing with hot water; but it may be extd. with alc. Similar adsorption of antigen was reported by Calmette for cobra poison-antiserum and by Morgenroth for toxin-antitoxin. The question whether I and III are antigens or only haptens which require a vehicle for their antigenic action is not solved yet. II immune serum (only the sol. protein was used) gave a sp. zone reaction. III gives turbidity with and is detoxified by III immune sera, normal and syphilitic sera. A III soln. of the hemolytic titer 1:10,000 is completely ad-orbed and neutralized by the sol. II. Complement deviation with the Wassermann antigen could not be obtained. It is, however, to be borne in mind that antigenic properties are not always assocd. with the ability to react with the antibody. MARY JACOBSEN

A urinary calculus of unusual composition. FRANCESCO NICOLA. *Giorn. farm. chim.* 6, 163-7(1928).—The stone weighed 0.23 g. and consisted almost exclusively of cystine: 5.30% moisture, 25.82% S. Tests for ash, fibrin, uric acid, xanthine and tyrosine were negative.

MARY JACOBSEN

Experimental calculosis. F. C. VAN LEERSUM. *Handl.* 21 *Nederland. Natuur-Geneeskund. Congr. Amsterdam* 1927, 228-31; *Ber. ges. Physiol. exptl. Pharmacol.* 44, 528.—Of 645 rats fed on a diet free from vitamin A, 197 had calculosis (males twice as frequently as females), some xerophthalmia. The stones consisted mostly of Ca phosphate alone or in combination with CaC_2O_4 , in a few cases of $Ca_3(PO_4)_2$. The urine was clear and acid. Occasional hematuria was not always coincident with calculosis. The latter is apparently not of inflammatory origin. About 88% of these rats and 12% rats fed on a rachitic diet had concrements in the renal tubules, attributable to keratinization of the renal epithelium.

MARY JACOBSEN

Eosinophilia and fibrinogenesis. PAULO ALFONSO VERGNE DE ABREU. *Rev. chim. farm. militar* 3, 87-94(1927).—Eosinophilia is a result of hypercoagulability of the blood caused by toxic agents, which upset the humoral equil. (dermatoses, intestinal parasites, other diseases). The protective mechanism of the body opposes fibrinogenesis. The excess substance set free by the leucocytes crystallizes inside the white cells causing general eosinophilia. Or it is deposited in the skin, intestinal walls, pleura,

lungs and bronchi and crystallizes in the leucocytes, endothelial or connective cells encountered there, thus giving rise to local eosinophilia. Outside of the cell elements the substance forms the Charcot-Leyden crystals.

MARY JACOBSEN

Studies of anaphylaxis. VI. Anaphylaxis and mineral waters. ENRICO SERENI. *Riv. patol. sper.* 2, 171-84(1927); *Ber. ges. Physiol. explil. Pharmacol.* 44, 143; cf. *C. A.* 22, 2203.—An intraperitoneal injection of 3 cc of the water of Fiuggi before or after sensitization reduces shock or abolishes an existing sensitization, but does not prevent passive anaphylactic shock. Conclusion: The water modifies the process of sensitization and not the susceptibility to the anaphylactic "poison." Distd. water has no effect.

MARY JACOBSEN

Behavior of serum lipase in hemolytic icterus. L. AVELLONE. *Riv. patol. sper.* 2, 353-8(1927). *Ber. ges. Physiol. explil. Pharmacol.* 44, 128-9; cf. *C. A.* 21, 2324; 22, 1803.—The content in total and quinine-resistant lipase of dog serum is not altered in icterus produced by tolylenediamine. Since this icterus is characterized by the presence of bile pigment and absence of bile salts in the blood it may be assumed that the former have no effect on serum lipase.

MARY JACOBSEN

Blood nitrogen in pregnancy. JAROSLAV JUNG. *Sbornik lekárský* 29, 87-98 (1927). *Ber. ges. Physiol. explil. Pharmacol.* 44, 123.—Toward the end of normal pregnancy or in mild cases of albuminuria and nephropathies the nonprotein and urinary N reach the lowest physiol. values or are even below normal. The highest physiol. values are reached or exceeded in eclampsia and during labor. The normal condition is restored after labor.

MARY JACOBSEN

The diagnosis of rabies by the precipitin reaction. PUIS LASSER. Bundesanstalt f. Tierseuchenbekämpfung, Modling. *Z. Immunitäts.* 53, 1-11(1927).—Antirabic rabbit sera give precipitin reactions not only with brains contg. the rabies virus but also with those contg. other neurotropic viruses and sometimes with normal brains.

JULIAN H. LEWIS

The titration of the derivatives of diphtheria toxin by means of the ring test. E. HOEN, L. CHERTKOV AND V. ZIPP. Staatlichen Bakteriolog. Inst., Odessa. *Z. Immunitäts.* 53, 20-38(1927).—Increasing heat decreases the antigenic properties of diphtheria toxin and at the same time decreases its pptg. action on diphtheria antiserum, the ring test of Bacher, Kraus and Lowenstein (cf. *C. A.* 20, 1268) being used. The antigenic property of anatoxin is influenced much less than that of toxin by heat. As long as the p_H is within 8.4 and 6.0 the titration of toxin by the ring method is not changed as the result of reaction. Toxin pptd. with CH_3COOH and dissolved again at its original reaction also remains unaffected. Changes in the antigenic value of toxin and anatoxin were followed by *in vivo* expts. and were found to correspond to changes in the ring test.

JULIAN H. LEWIS

The latent period of passive anaphylaxis with homologous serum. F. FRIEDBERGER AND S. SEIDENBERG. Forschungs-Inst. f. Hyg. und Immunitätslehre, Berlin-Dahlem. *Z. Immunitäts.* 53, 39-48(1927).—In answer to reports of unsuccessful attempts to confer passive anaphylaxis from guinea pigs to guinea pigs with a negligible latent period, F. repeated his former expts (cf. *C. A.* 20, 235). To produce precipitins in the guinea pig, which is a difficult procedure at best, 2 methods were used. In 1 series 1 cc. of sheep serum was injected intraperitoneally every other day until 13 injections were given. Only 15% lived 3 weeks after the last injection at which time they were bled. In the 2nd series 0.5 cc. of serum was injected intraperitoneally 3 times a day for 7 days. After an interval of 7 days they were bled, there being only 5 of 30 surviving. The sera from these 2 groups injected intravenously sensitized guinea pigs to fatal anaphylaxis after an incubation period of 1 to 5 min. There is some indication that the serum of guinea pigs immunized in winter do not passively sensitize either after a short latent period or the usual one of 24 hrs. This might explain the negative results of Doerr and Bleyer (*Z. Hyg.* 106, 119(1926)) and Schwarzmann (*ibid.* 371).

J. H. L.

The antigenic properties of the distillate of certain bacterial cultures. Z. YERMOLEYEVA. Biochem. Inst. Kommissariats Volksgesundheit, Moskau. *Z. Immunitäts.* 53, 101-12(1927).—The distillate from bouillon cultures of cholera vibrio and diphtheria bacilli contg. neither proteins, fats nor carbohydrates show distinct antigenic properties.

JULIAN H. LEWIS

The preservation of hemolytic sera. V. S. KALININ AND S. I. GINSBURG. Inst. f. Infektionskrankheiten "Elias Metschnikoff," Moskau. *Z. Immunitäts.* 53, 112-7(1927).—Boric acid in concns. of 1% preserves hemolytic sera without affecting its properties in any way.

JULIAN H. LEWIS

The role of complement. G. D. BELONOVSKII. Staatlichen Inst. f. ärztliche Fortbildung, Leningrad. *Z. Immunitäts.* 53, 118-32(1927).—Larger doses than the

mineral hemolytic amt. of complement increase the activity of amboceptor and the amt. of amboceptor which combines with the red cells. Immune bodies which do not ordinarily require complement (precipitins, agglutinins, antienzymes) are increased in their action in the presence of complement.

JULIAN H. LEWIS

Production of artificial immune sera by the method of Mez and Ziegenspeck. M. EISLER. Staatlichen serotherapeutischen Inst., Wien. *Z. Immunitäts.* 53, 136-50(1927).—Artificial immune sera prepd. by the method of Mez and Ziegenspeck react entirely unsp. Their reaction depends on unsp. colloidal reactions between certain constituents of the serum and the exts. A seemingly sp. reaction is sometimes obtained due to the absence or presence of the essential constituents in certain exts. J. H. L.

Preservation of complement. S. I. GINSBURG AND V. S. KALININ. Staatlichen serotherapeutischen Inst., Wien. *Z. Immunitäts.* 53, 219-26(1927).—Complement is preserved, sterile and active, by the addn. of 4% boric acid and one of several electrolytes, the best being 5% SrCl₂ and 10% NaCl.

JULIAN H. LEWIS

Diagnosis of filterable viruses by complement fixation. Third report. J. MICHALKA. Bundeanstalt f. Tierseuchenbekämpfung, Mödling. *Z. Immunitäts.* 53, 227-32(1927).—The antigen was prepd by extg the infected brain with NaCl soln. There was little or no specificity among the various viruses and normal brain gave about the same results.

JULIAN H. LEWIS

The nature of antibodies. L. A. SILBER AND E. P. SHAECHTER. Mikrobiol. Inst. d. Kommissariats f. Volksgesundheit, Moskau. *Z. Immunitäts.* 53, 263-9(1927).—The loss of agglutination properties of immune serum as the result of heat depends not on the destruction of the antibodies but on changes in their phys. state coincident with coagulation. If coagulation is inhibited by mixing the serum with fermentoid, a high mol. deriv. of the polymethane series, antiserum can be heated 1 hr. at 70° without affecting its titer. Likewise, by increasing the reaction of antiserum to Ph 8.3-10.14, which inhibits coagulation, it can be heated 1 hr. at 70-96° without losing its antibody action.

JULIAN H. LEWIS

The pathogenesis of hemoglobinuria in malaria (blackwater fever). M. K. EBERT. Mikrobiologischen Inst. des Volkunterrichtskommissariats, Moskau. *Z. Immunitäts.* 53, 297-314(1927).—This article is partly polemic over the theory of Krichevskii (cf. *C. A.* 18, 552) that hemoglobinuria in malarial fever is the result of the activation of lecithin with quinine to produce hemolysis. Expts. are also given to show the quant. relations of quinine and lecithin in the *in vitro* production of hemolysis of washed human red blood cells. Attention is called to the similarity of lecithin-quinine hemolysis to cobra toxin-lecithin hemolysis and that other medicaments, as caffeine, can be activated to hemolysis with lecithin.

JULIAN H. LEWIS

The production of precipitating serum of high titer for protein differentiation. E. G. DRESSEL AND G. MEISSNER. Univ. Greifswald. *Z. Immunitäts.* 53, 332-8(1927).—Immuneization of rabbits with mixts. of serum with lipid-containing alc. exts. of meat, homologous or heterologous, or pure fatty acids or lecithin has no practical advantage in the production of antisera of high titer.

JULIAN H. LEWIS

The distribution of isohemagglutinins in the protein fractions of serum. L. BLEYER. Hygienischen Institut, Basel. *Z. Immunitäts.* 53, 386-90(1927).—Human sera fractionated either with (NH₄)₂SO₄ or electro-ultrafiltration showed that α - and β -agglutinins were for the most part in the euglobulin and only in traces in the pseudoglobulin. Contradictory to the results of Rona and Krebs (*C. A.* 20, 3504) both types of agglutinins are divided in the same way among the serum fractions.

JULIAN H. LEWIS

The formation of antibodies in children with relation to age. Second report. W. HALBER, H. HIRSZFELD AND M. MAYZNER. Staatlichen Inst. f. Hyg., Warschau. *Z. Immunitäts.* 53, 391-418(1927).—Children in the first yr. of life form little or no natural antibodies. Immune antibodies are developed in small quantities and quickly disappear. Immunization acts unspecifically and heterologous antibodies are formed.

JULIAN H. LEWIS

Isohemagglutinogens in human serum. IDSURU OUCHI. Hokkaido Univ., Sapporo, Japan. *Z. Immunitäts.* 53, 462-7(1927).—Human serum, as well as the red blood cells, may contain group sp. isohemagglutinogens. They are pptd. undestroyed by alc.

JULIAN H. LEWIS

Double-ring formation in toxin-antitoxin mixtures. E. HOEN AND T. CHERTKOV. Staatlichen Bakteriolog. Inst., Odessa. *Z. Immunitäts.* 53, 468-77(1927).—A layer of toxin superimposed on antidiphtheria serum forms 2 rings, one sp. and the other unsp. The unsp. ring is formed at exactly the plane of contact and is also produced by stratifying toxin on normal horse serum or Martin bouillon and other antigens on antidiph-

theria or normal serum. The sp. ring is more or less removed from the plane of contact.

JULIAN H. LEWIS

Peroral immunization of mice against paratyphoid B. ERNST FRÄNKEL AND ERNST SCHULTZ. Inst. f. Krebsforschung, Berlin. *Z. Immunitäts.* 53, 478-86(1927).—Peroral administration of killed paratyphoid B bacilli to mice along with Na benzoate gave better results than the subcutaneous injection of the vaccine. Bacterial filtrates and exts. were just as effective as the whole bacilli.

JULIAN H. LEWIS

The importance of the Meinicke turbidity reaction in the diagnosis of syphilis. B. ELBERT AND V. GERKESS. Weissrussischen Staatlichen Bakteriolog. Inst., Minsk. *Z. Immunitäts.* 53, 493-505(1927).—The Wassermann and the Meinicke turbidity reactions were compared. The Wassermann is preferred in the primary stage, and the Meinicke in the secondary and tertiary stages, while in hereditary syphilis there is no choice. The 2 methods agreed in 90% of the tests. The Meinicke turbidity test is much better than the 3rd modified Meinicke test and the Sachs-Georgi reaction.

JULIAN H. LEWIS

The relation of chemotherapy and chemoprophylaxis to the reticulo-endothelial system. I. KRICHIVSKII. Mikrobiol. Inst. d. Volksunterrichtskommisariats, Moskau. *Z. Immunitäts.* 53, 506-31(1927).—The functional elimination of the spleen by any method leads to a marked reduction of the prophylactic and therapeutic action of chem. substances. This phenomenon is not due to the anti-infectious action of the spleen but to the absence of some action on the therapeutic substance, such as storing it in the reticulo-endothelial cells preventing its quick elimination.

JULIAN H. LEWIS

The influence of active and inactive serum on the formation of nitrites by bacteria. OSKAR WELTMANN, OTTO BSTEH AND KARL NEUMAYER. *Z. Hyg. Infektionskrankh.* 107, 126-9(1927).—Active serum, unlike inactive serum, causes a definite inhibition of the nitrite-forming power of certain bacteria, particularly with typhoid and proteus bacilli, and in regulated dosage with *B. coli* and paratyphoid A and B bacilli. No effect was noted with *B. fecalis alkaligenes* and the *Staphylococcus albus*. As shown by plate cultures the inhibiting action on nitrite production parallels the bactericidal property of the serum. The principle responsible for inhibiting the nitrite production is of complex structure, consisting of thermostable and thermolabile components. The latter may be replaced by fresh guinea pig or human serum.

E. R. LONG

The relations between the reticulo-endothelial system and chemotherapeutic action. CLAUD W. JUNGERLUT. Georg-Speyer Haus, Frankfurt a. M. *Z. Hyg. Infektionskrankh.* 107, 357-79(1927).—Doses of silver neoarsphenamine which invariably effected a sterilization of recurrent spirochetal infection in otherwise normal mice are of much less effect in splenectomized mice and mice with the reticulo-endothelial system blocked. Primary trypanosome infections are likewise much less susceptible to treatment with Bayer 205 and other chemotherapeutic agents after these operations than in controls. These results indicate the necessity of an intact reticulo-endothelial system for chemotherapeutic action, and suggest that a conversion of chemotherapeutic agents from a non-bactericidal to a bactericidal form takes place in the cells of this system.

E. R. LONG

The role of the reticulo-endothelial system in chemotherapy. ADOLF FELDITZ AND ALIX SCHOTT. Robert Koch Institute, Berlin. *Z. Hyg. Infektionskrankh.* 107, 453-71(1927).—The curative action of chemotherapeutic agents was greatly weakened in white mice with the reticulo-endothelial system largely thrown out of action by splenectomy and injection of Fe saccharate. This held for arsphenamine, neoarsphenamine, their corresponding oxides, solganol, trypaflavin, Bayer 205 and antimosan, when used as curative agents in the infections for which they are ordinarily sp. The reticulo-endothelial system plays an important part in chemotherapeutic action.

E. R. LONG

The varying behavior of the toxins and the protein antigens toward the sodium salts of the alkylresorcinolcarboxylic acids; the hydrotropic properties of these salts. H. L. BLEYER. Univ. Basel. *Z. Hyg. Infektionskrankh.* 107, 702-15(1927); cf. *C. A.* 21, 2327. —Toxins are detoxicated by treatment with the Na salts of alkyl compds. (tetanus toxin and ricin by amyl compds.) *in vitro*, the inactivation depending not on the abs. amt., but on the concn. of the alkyl compd. The detoxication takes place within 1 min. Subsequent diln. with water does not bring about a disoccn. with restoration of toxicity. Toxins and proteins behave differently toward the alkyl combination: the former lose their toxicity and antigenic action at the same time, whereas the proteins do not lose their antigenic activity, as measured by their capacity to engender anaphylactic sensitiveness. The alkyl compds. acquire "hydrotropic" properties (cf. C. Neuberg, *C. A.* 11, 256). In relatively low concn. they inhibit the heat coagulation of sera and under certain conditions convert water-insol. substances into sol. The length of

the C chain in the alc. radical is important in this connection. III. *Ibid* 108, 302-7(1928).—The anaphylactogenic and lysinogenic capacity of proteins is not weakened by concg. the alkyl linkages. No loss of antigenic action occurs in the heated mixts. of protein and alkylresorcinolcarboxylic acids, in cases where the presence of the alkyl compd. prevented the heat coagulation of the protein. The agglutinating, hemolyzing and antitoxic antibodies of immune sera are not harmed by toxin-destroying concns. of alkyl linkages at room temp. At 100° the antibodies are completely destroyed, although the proteins of the immune sera suffer no change. This difference supports the view that the antibodies and proteins of immune sera are not identical. E. R. L.

The nature of the material in liver effective in pernicious anemia. II. EDWIN J. COHN, GEORGE R. MINOT, GORDON A. ALLES AND WILLIAM T. SALTER. Harvard Med. School. *J. Biol. Chem.* 77, 325-58(1928).—The material in liver effective in pernicious anemia is sol. in H₂O, insol. in Et₂O and pptd. by EtOH. It is found in the filtrate from basic Pb acetate and is pptd. by phosphotungstic acid. A fraction of the phosphotungstates contg. about 19% N contains the active principle which must therefore be considered either a nitrogenous base or a polypeptide. As little as 0.6 g. daily has sufficed to produce a marked response of reticulated red blood corpuscles in a patient with pernicious anemia. The growth of immature red blood corpuscles has also been stimulated by the purest fractions thus far prepd. A. P. LOTHROP

The state of plasma calcium in parathyroidectomized dogs. C. I. REED. Baylor Univ. *J. Biol. Chem.* 77, 547-54(1928); cf. *C. A.* 22, 2203.—"Detns. of diffusible Ca in parathyroidectomized dogs show that certain individuals undergo a pronounced diminution of 1 fraction or the other, but there is no constancy of response among different animals, tetany occurring both at high and low concns. and proportions. There is less stability between the 2 fractions than in the normal animal. The incidence of tetany in the early postoperative period is associated with a change in the proportions of Ca and inorg. P sufficient to lower the Ca:P ratio to 1 or less. But in latent tetany there is an adaptation that enables the animal to survive a low ratio without tetany for long periods (as much as 10 days or longer with a ratio continuously as low as 0.6)." A. P. LOTHROP

The chemical reaction of the crystalline lens and the acidosis theory of cortical cataract. NOE SCALINCI. *Arch. sci. biol.* 8, 465-9(1926).—Principally an argumentative paper in answer to Lo Cascio (*Ann. di Oftalmol. e Clin. Oculistica* 1918-1919). The *p_H* of lens extract is 7.38, showing that the protein is slightly alkaline and is present as alkali proteinate. S. advances these facts to explain his theory that the opalescence of the crystalline lens in cataract is due to acidosis. PETER MASUCCI

Liver and thyroid; hepatic hyperfunction in Basedow's disease. N. PENDE. *Boll. soc. ital. biol. sper.* 3, 192-6(1928).—A clinical study of liver hyperfunction in Basedow's disease and hyperthyroidism. PETER MASUCCI

Studies on the hydrogen-ion concentration of the feces in health, in achylia gastrica, colitis simplex and gastrogenous diarrhea. N. C. LUNDING. *Acta med. Scand.* 68, 97-107(1928).—The H-ion concn. of the feces of normal individuals varies from *p_H* 6 to 8, but for the same person the daily variations are not more than 1.1 *p_H*. The solid content in well-formed or slightly soft but still formed feces of normal persons is 31 to 14%, and with a solid content below 14% the feces become fluid. The *p_H* increases parallel to the increase in solids so that in hard fecal masses a *p_H* of 8.5 is found. The *p_H* is also detd. by the length of time the feces are retained. The *p_H* of feces of achylia gastrica patients does not vary from the normal, and the administration of HCl does not influence the *p_H* value. In colitis the *p_H* variations extend more to the alk. side, reaching values of 9 and more; this is probably due to admixt. of the alk. intestinal juice. In a case of gastrogenous diarrhea the *p_H* values of the feces were normal. S. MORGULIS

Disturbance of sugar metabolism in trypanosomiasis and spirochetosis. KURT SCHERN. *Biochem. Z.* 193, 264-8(1928).—Infection with trypanosomes leads to a hypoglucemic condition preceded by a hyperglucemia. S. MORGULIS

The mechanism of complement action in hemolysis. KEIZO NAKAMURA. *J. Biochem. (Japan)* 8, 409-39(1928).—The amt. of the combination of complement with sensitized red blood cells is generally more or less proportional to the concns. of these substances. The product of hemolysis inhibits the combination of complement with sensitized red cells according to its concn. S. MORGULIS

Biochemical study on the urine of carcinomatous rats. YOSHIO KIMURA. *J. Biochem. (Japan)* 8, 469-94(1928).—The av. daily urine output of rats is about 1.0 cc. The fresh urine is acid. In carcinomatous rats the quantity of urine is more or less parallel to the amt. of Cl excreted. The compn. of the urine is influenced by the soften-

ing of the tumor. With the development of the tumor the total N increases. The NH_3 N is also increased but the % of NH_3 N is actually diminished. Uric acid N increases with the total N but the % is again lowered. The NH_3 N diminishes during the period of active growth but increases later. The allantoin N increases. The total H_2SO_4 varies with the NH_3 N. The neutral S is greatly increased. K, Na, Ca and Mg increase in direct relationship to the condition of the tumor. Ca increases with the increase in H_2SO_4 . It is concluded that the tumor causes an increased splitting of body protein, especially of the nucleated cells. The increased protein cleavage is accompanied by insufficient oxidation. The increased elimination of allantoin indicates an increased destruction of the nuclei. The softening of the tumor leads to a great increase in the salt content of the urine. The diminished excretion of NH_3 N in spite of the increased protein destruction is interpreted to mean that there is simultaneously also a new formation of protein.

S. MORGULIS

Antigenic function of lipids. Z. YERMOLYEVA. *Zhurnal expl. Biol. Med.* **8**, 180-6(1928).—Ether exts of egg yolk possess antigenic properties. Cholesterol and lecithin have no immunizing effect, but pig serum changes these from lipid haptens into typical antigens. Separate injection of serum and lipid gives only neg. results. Immunization with 2 or more non-antigens (cholesterol and lecithin) produces immunity reactions in the serum against one of these haptens.

S. MORGULIS

Experimental immunization with carbohydrates. V. A. CHERNOKHIVOSTOV. *Zhurnal expl. Biol. Med.* **8**, 260-4(1928).—Intravenous injection of starch soln. into rabbits causes the appearance of properties for binding alexin, which is not observed either with agar gels or agar sols. The curve of rise in immunity obtained with starch is entirely analogous to that obtained with protein.

S. MORGULIS

The specific and non-specific reaction of alexin fixation. V. A. CHERNOKHIVOSTOV. *Zhurnal expl. Biol. Med.* **8**, 265-9(1928).—Both the specific and non-specific alexin fixation reactions depend upon the same mechanism; this consists of certain physico-chem. changes.

S. MORGULIS

Experimental immunization with iodine preparations. I. KATZ. *Zhurnal expl. Biol. Med.* **8**, 398-403(1928).—Preliminary expts. indicate that colloidal I_2 prepns. can produce an immunizing effect.

S. MORGULIS

Sugar content of the blood in diphtheria. P. LEREBoullet and P. PIERROT. *Arch. med. enfants, Paris* **31**, 148(1928); *J. Am. Med. Assoc.* **90**, 1593.—In the cases observed the malignant type of diphtheria was usually accompanied by hypoglycemia, whereas in ordinary diphtheria hypoglycemia was rare. The hypoglycemia is attributed to suprarenal insufficiency caused by diphtheria intoxication. When suprarenal ext. was given a patient with malignant diphtheria and hypoglycemia, the sugar content of the blood usually returned to normal and the condition of the patient improved.

L. W. RIGGS

Hydrogen concentration and the flocculation of normal and syphilitic serums by acetic acid. R. DOURIS, CH. MONDAIN and J. BECK. *Compt. rend. soc. biol.* **98**, 901-3(1928).—Under identical conditions syphilitic serum gives a more abundant ppt. than normal serum. The addn of AcOH increases the slight difference in the concn. of H ions in the normal and syphilitic serums.

L. W. RIGGS

The p_{H} and the alkaline reserve of the blood in the anxious. M. LAIGNEL-LAVASTINE, R. CORNELIUS and M. VINCENT. *Compt. rend. soc. biol.* **98**, 941(1928).—In a study of 7 cases, the 3 with the highest p_{H} of the blood, 7.43 to 7.47, also had a p_{H} of the urine of 7.0 to 7.4. A lower p_{H} of the blood was accompanied by a lower p_{H} of the urine. In 6 of the cases the alk. reserve was above 64 and in 4 of the 6 it was above 70.

L. W. RIGGS

Improvement of the functional efficiency of the pathologic kidney by the ingestion of lacto-serum. MAURICE RENAUD, J. MULLER and A. MIGET. *Compt. rend. soc. biol.* **98**, 945-7(1928); cf. *C. A.* **22**, 2604.—In a series of 20 nephritic patients the renal output during 90 min. following the ingestion of 200 cc. of water was: urine 210 cc., urea 0.85 g., Cl 0.65 g., Ambard const. 130. The figures for the same patients after the ingestion of 200 cc. of lacto-serum were 240 cc., 2.70 g., 1.90 g. and 78. L. W. R.

Application of the histo-chemical technic of micro-incineration to the study of anthracic pulmonary pigments. A. POLICARD, S. DOUBROW and D. PILLET. *Compt. rend. soc. biol.* **98**, 985-6(1928).

L. W. RIGGS

Variations in the glucemia in depancreated dogs carrying a pancreatic graft, after the operation and following the ingestion of glucose. L. KÉPINOR and S. PETIT DUTAILLIS. *Compt. rend. soc. biol.* **98**, 1193-5(1928).—In depancreated dogs carrying a pancreatic graft under the skin of the abdomen, the glucemia was about double the normal figure on the 3rd, 4th and 5th days following the operation. By the 7th day the glu-

cemia had fallen to about the normal figure. With a dog carrying a large graft there was only a slight rise in the glucemia. After the administration of glucose the dogs carrying large pancreas grafts showed little or no rise above normal in their blood sugar content.

L. W. RIGGS

The curve of weight and the amount of diuresis in diabetes insipidus. MARCEL LABBÉ, P. L. VIOLÉ AND GILBERT DREYFUS. *Compt. rend. soc. biol.* **98**, 1293-5(1928).—Report of a case. The modifications of body wt. coincident with modifications of diuresis have a relation to the absorption of water by the tissues. Medication by hypophysis ext. increases this absorption.

L. W. RIGGS

Acid-base equilibrium of urines in pulmonary tuberculosis. R. GOIFFON AND R. BLASKO. *Compt. rend. soc. biol.* **98**, 1308-10(1928).—Analyses of the urine of 70 patients with pulmonary tuberculosis were made, and in some cases the urine of the same patient was analyzed for many days in succession. The factors detd. were p_H , titration acidity, formol acidity, org. acids, phosphates and the usual N constituents. The numerical results of this study are not given, but the variations and ratios of one constituent to another are discussed at length.

L. W. RIGGS

Reaction of takata-ara in the cerebrospinal liquid. A. PRUNELL. *Compt. rend. soc. biol.* **98**, 1315-6(1928).—The method consists in treating 1 cc. of the spinal fluid with 1 drop of 10% Na_2CO_3 soln. and 0.3 cc. of a soln. made by mixing equal parts of a 0.5% soln. of $HgCl_2$ and a 0.02% soln. of diamond fuchsin in H_2O . From the time necessary for flocculation and the colors observed a sp. diagnostic for metasyphilis is claimed. On repeating the test P. found that while it indicated pathol. spinal fluid, it was not sp. for metasyphilis, and that its clinical value depended on the concn. of albumin in the spinal fluid.

L. W. RIGGS

Distribution of organic and inorganic phosphorus in human blood in the course of pulmonary tuberculosis. A. MOREL AND F. K. AALAM. *Compt. rend. soc. biol.* **98**, 1345-6(1928).—The org. P in comparison with the inorg. P is increased in human blood during pulmonary tuberculosis.

L. W. RIGGS

The physical factors involved in phagocytosis. ERIC PONDER. New York Univ. *Protoplasma* **4**, 611-26(1928).—A review.

M. H. SOULE

Blood uric acid in nephritis. WILLIAM P. HOLBROOK AND HOWARD D. HASKINS. *J. Lab. Clin. Med.* **12**, 10-5(1926).—Uric acid detn. cannot be used clinically as a reliable indication of kidney impairment. It is not retained in the blood at an earlier stage of nephritis than is urea. Creatinine estn. is much more valuable, agreeing approx. with the urea results and serving as a check on the latter. High estns. are very significant for prognosis. Urea estns. are the most reliable and significant of the blood chemistry findings in nephritis. Estn. of urea in blood filtrate by Folin's method using titration instead of nesslerization is very advantageous. NaCl estn. yields such variable results that its value in nephritis is very doubtful.

ETHEL W. WICKWIRE

The influence of magnesium salts on amboceptor and complement titrations. WILFRED H. KELLOGG AND L. AMY WELLS. *J. Lab. Clin. Med.* **12**, 153-6(1926).—Mg salts in proper amt. added to physiol. saline soln. aid in the specific lysis of red blood cells, thus increasing the titer of amboceptor and of complement. The optimum amt. for this purpose is 0.1 g. of the Cl or sulfate to the l. of N NaCl.

ETHEL W. WICKWIRE

A contribution to the nature of diabetes. A mathematical derivation of the blood-glucose curve. DWIGHT M. ERVIN. *J. Lab. Clin. Med.* **12**, 318-25(1926).—A mathematical equation for the blood-glucose curve of the blood is derived from the 3 factors, absorption from the intestinal tract, formation of glycogen and oxidation. The consts. of the curve detg. the rate at which absorption, glycogen formation and oxidation take place are detd. From these consts. the effect on each function on the curve can be investigated. The curve derived from failure to burn glucose differs only insignificantly from the normal and in no way approaches the curve found in diabetes. By investigating mathematically the condition of diabetes from the blood-glucose curve no evidence of the failure to burn glucose can be obtained. It is found that the curve depends only upon a decreased rate of glycogen formation.

ETHEL W. WICKWIRE

Hypoglycemia. With and without insulin: with and without symptoms. BENJAMIN I. ASHE, HERMAN O. MOSENTHAL AND GEORGE GINSBERG. *J. Lab. Clin. Med.* **13**, 109-16(1927).—Cases are reported which demonstrate that hypoglycemia may develop with marked suddenness both in diabetics and non-diabetics, in patients receiving comparatively small doses of insulin and those who have never had insulin. Symptoms vary greatly and may lead to incorrect diagnosis. Especial attention is called to the serious situations created when hypoglycemia, brought on by insulin administration, results in loss of voluntary control with resultant irresponsible actions. Inanition and dehydration are discussed in their relation to the production of hypoglycemia;

these factors may have been responsible for the low blood sugar found in one case.

ETHEL W. WICKWIRE

Occurrence of lipoids in urine and their diagnostic importance. EDWARD L. MILOSLAVICH. *J. Lab. Clin. Med.* 13, 542-6(1928).—A study of urinary sediments by means of Reichert's polariscopic attachments, which can be applied to any microscope, revealed lipiduria in the following pathologic conditions: (1) lipid nephrosis of unknown origin (genuine lipid nephrosis); (2) lipid nephrosis of luetic etiology (secondary stage of syphilis); (3) subacute and chronic glomerulonephritis (combination forms of nephritis and nephrosis); (4) amyloid nephrosis with edema; (5) Grawitz tumor (so-called hypernephroma) of the kidney; (6) lipid carcinoma of the prostate. Further observations and studies are suggested.

ETHEL W. WICKWIRE

An antigen for use in serum tests for syphilis. B. S. KLINE. *J. Lab. Clin. Med.* 13, 586-96(1928).—A method of obtaining an acetone-insol. lipid wax, thoroughly satisfactory in serum tests for syphilis, within a few days, is described. Antigen emulsions from this lipid base gave better results in the microscopic slide pptn. test for syphilis than the Kahn antigen diln. and also good results in the Wassermann test.

RIEBERT, H.: *Lehrbuch der allgemeinen Pathologie und der pathologischen Anatomie*. Revised by Carl Sternberg. Leipzig: F. C. W. Vogel. 727 pp. M. 45.

H—PHARMACOLOGY

A. N. RICHARDS

The effect of the internal secretions and temperature on the metabolism of amino acids and simple sugars by animal cells. W. E. BURGE, A. M. ESTES, G. C. WICKWIRE and MAUDE WILLIAMS. *Proc. Am. Physiol. Soc., Am. J. Physiol.* 81, 408(1927).—Cultures of paramecia utilized the 3 sugars, glucose, levulose and galactose; glucose and levulose were used more rapidly than galactose. The addn. of insulin to the medium increased the rate of utilization of all 3 sugars. Pituitrin also increased sugar consumption by paramecia, while thyroxine decreased it. Insulin and pituitrin had no effect on the utilization of amino acids by paramecia while adrenaline and thyroxine increased amino acid utilization slightly.

J. F. LYMAN

Experience with dilaudid, the morphine derivative. GRACE. *Deut. med. Wochschr.* 53, 1979-81(1927).—Dilaudid (cf. *C. A.* 21, 2934) is recommended as an analgesic, particularly against tabetic pain and the pain arising from the use of febrifuges. It is much less habit-forming than other morphine derivs.

ARTHUR GROLLMAN

Danger of intravenous calcium therapy. W. D. M. LLOYD. *Brit. Med. J.* 1928, I, 662-4.—The intravenous use of 4 cc. 10% CaCl_2 soln. is dangerous. In one case the electro-cardiogram indicated a sino-auricular heart-block.

A. T. CAMERON

A fatal case of poisoning by a non-arsenical weed-killer. A. H. D. SMITH. *Brit. Med. J.* 1928, I, 714-5.—A patient who drank less than 56 g. of com. cresylic acid died within 2 hrs.; the corrosive action was negligible, but there were profound toxic effects on the nervous system.

A. T. CAMERON

The treatment of malignant disease by colloidal lead. STANLEY WYARD. *Brit. Med. J.* 1928, I, 838-40.—Of 40 patients who had received 0.2 g. or more of colloidal Pb only 1 showed any improvement. The results afforded no evidence in support of the view that colloidal Pb exerts a beneficial influence upon the progress of a malignant growth.

A. T. CAMERON

Two cases of hematuria caused by insulin treatment. R. D. LAWRENCE and A. S. HOLLINS. *Brit. Med. J.* 1928, I, 977-8.—Only 7 previous cases had been reported in the literature. There seems to be no common underlying explicatory factor. But no cases have been reported on small dosage. The condition seems transient, and to cause no inconvenience, and does not seem to need even the temporary discontinuance of insulin treatment.

A. T. CAMERON

The insulin-glucose treatment of traumatic shock. E. C. PADGETT and T. G. ORR. *Surgery Gynecol. Obstet.* 46, 783-8(1928).—This is considered to be probably no more beneficial than intravenous hypertonic glucose or NaCl soln.

A. T. CAMERON

The biological effects of atmospheres containing excess of oxygen. C. ACHARD, L. BINET and A. LEBLANC. *J. physiol. path. gén.* 25, 489-94(1927). See *C. A.* 21, 2033.

A. T. CAMERON

Pharmacological investigations on various derivatives of pyrrole. I. Preliminary studies on the action of α -acetylpyrrole on frogs. ANGELO RABBENO. *Boll. soc. ital. biol. sper.* 2, 830-4(1927).—Injected into a lymph sac, 0.000092 g. mol./100 g. causes loss of voluntary movement: 0.000275 g. mol./100 g. causes complete paralysis of all

muscles except those of eyes. Min. lethal dose (0.000735 g. mol.) kills by cardiac depression; 0.002062 g. mol. causes strychnine-like convulsions followed by complete paralysis and death. Recovery from sub-lethal doses is complete. Skeletal muscles after death are still electrically excitable, but fail to react if the substance is applied directly. The action on the heart is much less powerful than on reflexes. Pyrrole itself is 2-5 times less toxic than α -acetylpyrrole.

A. W. CONTIERI

Influence of insulin on the amylolytic power of the saliva and blood. TULLIO GAYDA. *Boll. soc. ital. biol. sper.* 2, 849-53(1927).—The amylolytic power of the saliva of the rabbit shows marked increase during insulin action: that of serum is unchanged.

A. W. CONTIERI

Atropine, emetine, strychnine and nicotine may all favor experimental pancreatic amylolytic action. G. M. PICCININI. *Boll. soc. ital. biol. sper.* 2, 860-3(1927).—These alkaloids in doses above 1:50,000 decrease the amylolytic power of the pancreas; lower concn. increase it (max., 10%).

A. W. CONTIERI

Action of caffeine on the resistance of erythrocytes outside of the organism. G. B. ZANDA. *Univ. Sassari. Studi sassaresi* 3, 587-8(1926); *Chem. Zentr.* 1927, I, 1177; cf. C. A. 22, 459.—Caffeine increases the resistance of erythrocytes. When 0.5-1.0% caffeine is added, defibrinated blood is laked only after 1 week instead of a few hrs. Hypertonic hemolysis is retarded.

C. C. DAVIS

Glucolysis in blood rendered incoagulable by morphine. GIOVANNI LO MONACO. *Arch. farmacol. sper.* 45, 1-6(1928).—Injection of 1 cc. of 1% morphine-HCl per kg. of body wt. into the mesenteric veins of the dog renders the blood incoagulable. When injected elsewhere into the general circulation the morphine has no such effect. Blood thus rendered incoagulable has a higher sugar content than normal blood from the same animal. If the blood is then treated with oxalate and kept in the thermostat 24 hrs. at 37° with thymol as antiseptic, the sugar sinks to a lower value than that of normal blood similarly treated, the total glucolysis being about twice that of normal blood. This phenomenon contrasts with that observed by Doyon, where blood rendered incoagulable by injection of peptone did not show glucolysis.

A. W. DOX

The significance of the hypoglucemic action of some alcoholic extracts of plants and the nature thereof. UBALDO SAMMARTINO. *Arch. farmacol. sper.* 45, 7-32(1928).—Exts. of *Poa pratensis*, *Spinacia oleracea*, *Cichorium endivia* and *Beta vulgaris* were prepd. by steaming the fresh plant 3-5 min., reducing to a pulp, adding EtOH to 60-70%, macerating several days, evapg. the filtrate *in vacuo* at 35-40°, filtering off the chlorophyll, shaking with Et₂O and pptg. the aq. soln. with 6 vols. of EtOH. Other active exts. were obtained by the use of a press without steaming the plants, the maceration and subsequent treatment being performed as above except that the EtOH was removed by Et₂O instead of evapg. The final product was sol. in dil. EtOH, very sol. in H₂O, insol. in 95% EtOH, Et₂O and MeAc. The Millon, Adamkiewicz and biuret reactions were negative, and no ppts. were obtained with picric and picrolonic acids. When administered subcutaneously to normal fasting rabbits these exts. brought about a lowering of blood sugar, the max. effect being obtained about 3 hrs. after injection. The effect was only moderate, however, and no relationship appeared to exist between the amt. of ext. administered and the extent of hypoglycemia. Only in one instance was the syndrome characteristic of insulin observed. A diabetic patient on the Noorden diet, after being given a no. of daily injections of ext. of *Poa pratensis* each corresponding to 40 g. of the plant, developed an increased tolerance to carbohydrates, from 40 g. to 100 g. This effect persisted a no. of days after suspension of the treatment. In more severe cases where ketonuria was also present, the treatment diminished the glucosuria but had no apparent effect on the ketonuria. The effect of these exts. in promoting glucolysis was shown also by a marked acceleration of sugar fermentation by beer yeast. The factor or factors in the plant exts. which bring about these phenomena are believed to be of a vitamin character and not related to insulin.

A. W. DOX

The influence of alcohol upon the urinary secretion. JUJI OKUTO. *Folia Japonica Pharmacol.* 2, 70-83(1926); (In Japanese; English résumé, p. 4); *Biol. Abstracts* 1, 66.—Intravenous injection in rabbits of a small quantity of EtOH, especially with a large amt. of Ringer-Locke's soln., exerts a diuretic action, while larger amts. diminish the quantity. With per oral administration alc. diuresis occurs only when abundant water has been given. When injected into the vein alc. in small doses causes a slight increase of the arterial pressure together with a scant augmentation of the vol. of the kidneys, but in large doses these effects are reversed. From these facts O. believes that an ample supply of water with the alc. is the most important factor for alc. diuresis. H. G.

Influence of acids, especially lactic acid, and their sodium salts on the vessels. HYŌJIRŌ TANAKA. *Folia Japonica Pharmacol.* 2, 94-119(1926); (In Japanese;

German résumé, 6); *Biol. Abstracts* 1, 298.—When lactic, acetic and HCl acids course through the vessels of frog's leg, contraction always takes place, irrespective of concn. of the soln. The vessels of rabbit's ear contract only with concd. solns.; dil. solns. produce only dilation. The transition point from vessel contraction to vessel dilation occurs at higher concns. with strong acids, like HCl, than with weak acids, like lactic and acetic acids. This is ascribed to differences in dissociation and the attendant different degrees of neutralization attained in the process of coursing through the vessels. The nature of the effects of acids on the vessels appears in the main to be due to H-ion action. Na salts of the above acids always caused vaso-dilation in the frog; only with relatively concd soln. of Na acetate (at the beginning of the expt.) was the no. of drops reduced, accompanied at times by peristaltic movement of the vessels. In general, Na salts likewise cause vaso-dilation in the rabbit's ear, Na lactate, however, only in concd. soln. (in dil. soln. it causes contraction). H. G.

The paradoxical action of insulin. Endocrine dysfunction. G. P. SACHAROV AND J. S. DANENKOV. *Rev. franç. Endocrinol.* 4, 416 28(1926); *Biol. Abstracts* 1, 1059.—Rabbits received different salts (CaCl₂, MgCl₂, KCl, NaCl, Na citrate, Na₂HPO₄) together with insulin injections, and the blood sugar was detd. before and 2-3 hrs. after the injections. In 1 series CaCl₂, NaCl, KCl in small, MgCl₂ in both small and large doses (20 and 200-300 mg., resp.) augmented the insulin effect. Large doses of CaCl₂, NaCl, KCl, Na citrate and Na₂HPO₄ inhibited or reduced insulin action. Glycocoll in large doses (400 mg.) and distd. H₂O (3-5 cc.) augmented the insulin effect. In a 2nd series of expts. results were contradictory. CaCl₂ in all doses and large doses of MgCl₂ decreased the insulin effect. H. G.

The effect of insulin and of pancreatectomy on the distribution of phosphorus and potassium in the blood. S. E. KERR. American Univ. of Beirut. *J. Biol. Chem.* 78, 35-52(1928).—The org., acid-sol. P content of corpuscles was not significantly altered by insulin overdosage. Pancreatectomy increased it slightly. Lipoid P was also not affected by insulin. The K which disappears from serum after insulin did not enter the corpuscles. ARTHUR GROLLMAN

Electrical changes in tissue as the cause of the toxic action of poisons. R. BRUNER. *Klin. Wochschr.* 7, 648-9(1928); cf. *C. A.* 21, 3979; 22, 991-2.—A detailed report will appear in *J. Pharmacol.* MILTON HANKE

The antagonism between insulin and pituitary extract. Its demonstration in a patient with acromegaly. HELMUTH ULRICH. *Arch. Internal Med.* 41, 874 82(1928).—The hyperglucemia of a patient with pituitary neoplasm did not respond to insulin. MARY JACOBSEN

Effect of narcotics on oxygen consumption in rats. U. G. BIJLSMA. *Ber. staatl. Gesundheitsfuersorge Nederland* 8, 1112-20(1927); *Ber. ges. Physiol. explil. Pharmakol.* 44, 151.—Unlike the majority of authors B. finds that chloralose, somniphene and urethane anesthesia sometimes reduce the O₂ consumption of the rat, apparently by lowering the irritability of the respiratory centers. This may account for the injurious effect of anesthesia on rats. MARY JACOBSEN

Resuscitation after carbon monoxide poisoning with air, oxygen and five percent carbon dioxide. D. G. COHEN TERSAERT AND U. G. BIJLSMA. *Ber. staatl. Gesundheitsfuersorge Nederland* 8, 1141-8(1927); *Ber. ges. Physiol. explil. Pharmakol.* 44, 82.—Henderson's expts. were repeated on normal and decerebrated cats and dogs with 375 l. air contg. 1.4-2% CO. Resuscitation was started with onset of unconsciousness or convulsions. O₂ is incomparably more effective than air. Addn. of CO₂ to the O₂ hastened recovery with the exception of 1 case. MARY JACOBSEN

Does insulin increase the glucolytic power of liver, muscle and blood in vivo? GIUSEPPE ROSSI. *Biochim. terap. sper.* 15, 41-53(1928).—Insulin "Bellanti" was given to rabbits subcutaneously and intravenously in 3-4 units/kg. after a 48 hrs.' fast. A 24 hrs.' fast is not always sufficient for a full hypoglycemic effect. Even after a 48 hrs.' fast and with a blood sugar content of 0.03-0.025%, a temp. drop of 4° and general atony convulsions were frequently absent. The diastatic power of liver and blood was not increased by insulin. The liver and muscles contained no glycogen, while definite quantities were found in the controls. The glucolytic power of liver, muscle and serum was somewhat increased when 20% of the Tyrode soln. in which the glycolysis took place was replaced by Na₂HPO₄ of pH 8.3. MARY JACOBSEN

The alkaline reserve of rabbits injected with massive doses of glucose. BRUNO BORGHI. *Biochim. terap. sper.* 15, 99-107(1928); cf. *C. A.* 22, 615, 1399.—Rabbits received every 2nd day 10 cc. 30% glucose intravenously. The animals remained in a perfect nutritional and general condition. The alk. reserve showed a perceptible though slight

decrease after the 1st injection. The effect was attenuated on repeated injections, perhaps as a result of adaptation. The hypothesis of a compensated acidosis must therefore be abandoned and another explanation sought for the glycogen losses.

MARY JACOBSEN

The mechanism of action of sodium hyposulfite in hydrocyanic acid poisoning. TUPI CALDAS. *Boll. assoc. Brasil pharm.* 8, 25-32(1927).— $\text{Na}_2\text{S}_2\text{O}_3 + \text{HCN} = \text{HCNS} + \text{Na}_2\text{SO}_3$. The reaction is promoted by nascent S which in the organism is set free by CO_2 or HCl .

MARY JACOBSEN

Effect of adrenaline on the endocrines. S. IGURA. *Folia endocrinol. japon.* 3, 863-928(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 104.—The histological changes in the endocrine organs of adult rats were studied 1-3 weeks after an injection of 0.05-0.1 cc. 1% adrenaline-HCl. The thyroid showed parenchymatous hyperthyroidism and increase in wt. The cwt. and no. of the Hassal bodies of the thymus were reduced and the borderline between cortex and medulla was blurred. The pancreas showed loss in wt. and atrophied cells. The eosinophilic cells of the anterior pituitary were reduced in size and no., while the no. of main cells was increased. Adrenals and gonads were not essentially changed.

MARY JACOBSEN

Changes produced in endocrine organs by injections of choline, with special reference to the choline-adrenaline relation. S. IGURA. *Folia endocrinol. japon.* 3, 929-45(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 54, 152.—Injections of choline (I) and adrenaline (II) produced in rats colloid struma of the thyroid. The thymus was hyperplastic after I, atrophic after I + II. The anterior lobe of the pituitary showed an increase of the no. of eosinophiles and hypertrophy after I. Pancreas, adrenals and gonads were not altered. An antagonism between I and II seems to exist.

M. J.

Effect of tannic acid on vessels in normal and inflamed tissue. AKIRA OCHIAI. *Folia pharmacol. japon.* 6, 37-45(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 149.—Tannin in concns. of 0.01-1% has no effect on the frog's femoral vessels or the rabbit's ear vein. From 1 to 5% causes vasodilatation. A whitish opacity is produced in the skin and mesentery of the frog, especially when it is inflamed (mustard oil). Only high concns. cause a reduction of the caliber of the vessels in the normal mesentery and grave circulatory disturbances, while the inflamed tissue is not affected.

MARY JACOBSEN

Pharmacological study of the intestine of the chicken with special reference to age. HAYASHI SUGANO. *Folia pharmacol. japon.* 6, 66-82(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 157-8.—The intestine of the chicken is stimulated by pilocarpine, acetylcholine, strophanthin and Ba, inhibited or paralyzed by quinine, papaverine, adrenaline and Mg. Veratrine stimulates in small and inhibits in large doses. The reverse obtains for nicotine, morphine and atropine. The adult intestine is more susceptible to stimulation, the young one to inhibition.

MARY JACOBSEN

Effect of chlorine on the surviving rabbit intestine. SAKAYE ODA. *Folia pharmacol. japon.* 6, 157-64(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 148.—Low concns. always cause stimulation, higher ones depression and death after a transient stimulation. The effect is attributable chiefly to Cl_2 , partly to nascent O_2 and HCl .

M. J.

Experimental studies of the photodynamic action of sensitizing dyes. II. Conditions under which photodynamic effects take place in the heart. HAYASHI SUGANO. *Folia pharmacol. japon.* 6, 165-73(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 337.—Eosin and erythrosin have a noticeable photodynamic effect on the heart only when the heart itself has been impregnated with the dye *in vivo* or immediately after excision and provided it is directly illuminated.

MARY JACOBSEN

Effect of certain drugs on the healing of wounds. EKIZO KOBAYASHI. *Folia pharmacol. japon.* 6, 183-92(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 149.—Drugs were applied in salve form to an aseptic wound produced on the rabbit's ear by complete removal of the skin. Healing was promoted by HgCl_2 , AgNO_3 , thymol, resorcinol, protargol, KMnO_4 , CHI_3 , PhOH , lysol, cresol, naphthol, salicylic acid, balsam of Peru, orthoform and cocaine in small, and H_2O_2 and ichthyol in moderate, doses and inhibited by large doses. Tissue was frequently destroyed by large doses. Chloral hydrate inhibits healing even in 0.1% soln.

MARY JACOBSEN

Pharmacology of rutamine (β -indolethylamine). I. Experiments on the surviving uterus. RYO KANSHI. *Folia pharmacol. japon.* 6, 232-46(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 150.—Rutamine (I) in any concn. increases the tonus and stimulates the contractions of the isolated guinea pig and rabbit uterus regardless of its physiol. condition. Atropine has no effect; adrenaline causes an immediate fall of tonus which lasts several min. The stimulation caused by adrenaline may be completely suppressed by I. Its effect seems to consist mainly in muscle stimulation, per-

haps also in a paralysis of the sympathetic fibers. II. Experiments on the intestine, vessels, pupil and blood pressure of rabbits, frogs and chickens. *Ibid* 247-62.—The rabbit intestine is stimulated by small, paralyzed by large, doses. The peripheral vessels of the frog are constricted by I in any concn., the ear vein of the rabbit only by low and very high concns., while moderate concns. have a varying effect. I produces intense mydriasis in the frog pupil, even after dilatation with atropine. Adrenaline is an antagonist with regard to the mydriatic and vascular actions, while atropine has no effect. Repeated intravenous injections of I cause in chickens paralysis of the femur and cyanosis of the comb, but no definite gangrene.

MARY JACOBSEN

Experiences with plasmochin. F. R. A. LUYKE ROSKOTT AND R. SÉNO. *Geneeskund. Tijdschr. Nederland. Indie* 68, 80-98(1928).—Plasmochin destroys the malaria parasites energetically. The remarkably rapid degeneration of the gametes of tropical malaria may be observed under the microscope. It definitely counteracts splenic enlargement. The side effects are mostly slight, but sudden, mostly fatal blood destruction with methemoglobin formation may occur. The cyanosis is chiefly of enteric origin.

MARY JACOBSEN

Occurrence and treatment of pulmonary plague and pulmonary septicemia in Tenger, Java. J. SCHUT. *Geneeskund. Tijdschr. Nederland. Indie* 68, 99-111(1928).—The best results were obtained with a combination of prophylactic *omnadin* (I) treatment given to all suspected persons before the temp. rose above 37° and of *quinine* (II) -*arsitochine* (III) as soon as fever and a high pulse rate set in. II (with urethan) was given in 1-2 g doses subcutaneously for 2-3 days; then 0.4 g. III was given *per os* 3 times a day. Out of 18 patients treated 10 developed a grave condition and 5 died. I given in the fever period aggravates the disease, probably because of the sudden liberation of toxins through the death of bacteria. It has a certain bactericidal, but no antitoxic, effect. Of 9 patients treated with I-III 8 died. *Neosphenamine-digalen* treatment was of no avail.

MARY JACOBSEN

Sterilization of sodium bicarbonate solutions. ANNA PIRONETTI. *Gior. farm. chim* 6, 167-70(1928); cf. Guerbert (C. A. 18, 1178) and Chambon (C. A. 20, 2686).—Isotonic NaHCO₃ is used in large quantities for intravenous injections in diabetes. Sterilization in streaming steam at 100° (0.5 hrs.) is preferable to 56 days' tyndallization at 55-60°. Besides being more rapid and reliable it causes less loss in NaHCO₃: 0.0924 g. instead of 0.2518 g. per l. isotonic soln.

MARY JACOBSEN

Experimental study of insulin. KUNITAKO KITAMURA. *Kyoto Ikadai-gaku Zasshi* 1, 861-9(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 154.- Insulin, 0.2 cc. (?), is sufficient to produce in a fasting rabbit hypoglycemia (of a varying degree) and to abolish the hyperglycemia and glucosuria caused by 0.5 cc adrenaline. It has no effect on normal or raised (adrenaline) blood pressure. Its action is balanced by 1 cc. pituitrin.

MARY JACOBSEN

The effect of inhaled chloroform on blood and blood serum. S. TAKIYAMA. *Japan. J. Obstet. Gynecol.* 10, 28-30(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 467.- One hrs.' CHCl₃ anesthesia (8-10 cc.) caused no change of hemoglobin, red cell count and cholesterol content in the blood of rabbits. The decrease of the white count was followed by an increase and return to normal within 48-72 hrs. The corpuscular resistance to hypotonic NaCl and saponin was not altered; that to K soap was lowered after 1-4 days. The hemolytic complement was lowered and returned to normal after 3-5 days. The anticomplement was unaltered, the antitrypsin content rose to a max. in 24 hrs. and gradually returned to normal within 10-14 days. The sedimentation velocity rose; the plasma stability decreased. The inhibition of antibody and immune body formation which lasted several days could be obviated by an adrenaline injection before or after anesthesia.

MARY JACOBSEN

Indirect paravertebral alcohol injections. LA CHAPPELLER. *Ned. Maandschr. Geneeskunde* 15, 180-8(1928).—Severe abdominal pain with a history of gallstone, appendix and pylorus operations, Röntgen irradiation for postpartum hemorrhage and morphine habit was abolished for the period of 8 months by injections of 80% alc. into the intercostal space below the 9th rib. The treatment is indicated in the abdominal crises of tabes, pains in inoperable cases and some cases of angina pectoris. It is not without danger.

MARY JACOBSEN

Intravenous injections of lecithin. ALFONSO CRUTO. *Rass. clin. terap. sci. affini* 26, 8-15(1927); cf. C. A. 20, 2874.—Highly dispersed emulsions of 10-15% lecithin and 1-3% cholesterol and its ethers were injected into the marginal ear vein of the rabbit. It disappeared from circulation in 5-6 hrs. The urine was examd. for degradation products of choline (Hoesslin). Traces of N(Me)₂ (10-15 mg. per 3 days) were found. The increase in HCO₂H excretion was more pronounced but HCO₂H is not necessarily

derived from choline. Conclusion: the rate of decompn. of intravenously injected and of ingested lecithin is about the same.

Antihypoglycemic effect of adrenaline and pituitary-adrenal extracts. E. TROCELLO AND A. CRUTO. *Rass. clin. terap. sci. affini* 26, 23-6(1927).—One cc. Ipovagol (a pituitary-adrenal ext.) corresponding to 1 mg. adrenaline was sufficient to suppress the convulsions caused in a rabbit by 1 insulin unit and to restore the normal blood sugar level, while 1 mg. synthetic adrenaline was either insufficient to produce this effect or produced it very slowly.

Insulin in fattening cures. E. TROCELLO. *Rass. clin. terap. sci. affini* 26, 63-77 (1927); cf. *C. A.* 21, 2738.—The treatment is started with 10 units a day given 0.5 hrs. before the meals and followed by 50 g. sugar soln. orally. The dose is gradually raised to 50 units daily, the treatment extending over 4-6 weeks. It is very useful in under-nutrition with no evidence of other diseases except endocrine-sympathetic disturbances. It is contraindicated by the presence of any inflammatory processes and must be discontinued as soon as the patient shows swelling of joints, signs of latent disease or fails to gain wt. It has a beneficial effect in neurasthenic syndromes. MARY JACOBSEN

Effect of glucose-insulin therapy on liver function. A. FORTUNATO AND F. MACCATIONE. *Rass. clin. terap. sci. affini* 26, 99-104(1926); cf. *Gazz. internat. med. chir.* Sept. 18, 1926.—Rabbits received 1 mg. P and were treated with 3 units insulin and 10 g. glucose daily. As soon as the control died (2-5 days) the insulin rabbit was killed and the liver glycogen compared. It was higher in the treated animals. Conclusion: Liver function is related to the glycogen content and is improved by insulin. M. J.

Pharmacotherapy of pulmonary tuberculosis. GUIDO M. PICCININI. *Rass. clin. terap. sci. affini* 27, 26-33(1927); cf. *Riforma medica* 43, No. 40(1927). M. J.

A new cure for trachoma. Preliminary note. ANTONIO D'ANGELO. *Rass. clin. terap. sci. affini* 27, 77-8(1928).—Three patients were cured by the injection of Sero's Rame Coleolo, a double oleate of Cu and cholesterol. MARY JACOBSEN

Hyperglucemic effect of injections of Bayliss-Starling secretion. H. HERMANN. *Rev. franç. d'endocrinol.* 4, 381-415(1926); *Ber. ges. Physiol. expll. Pharmacol.* 44, 89.—A rapid injection of secretin causes a hyperglucemia of max. 0.03% and 10 min. duration, followed by hypoglycemia. Expts. prepd. according to Bayliss-Starling also lower the blood pressure by vasodilatation. Secretin prepd. from a mucosa extd. with alc. has neither a hypotensive nor a hyperglucemic effect, while the alc. ext. has both, but does not influence pancreatic secretion. The hyperglucemia must be attributed to some effect on the adrenals rather than to inhibited insulin secretion since it occurs in depancreatized, but not in adrenalectomized dogs and since it promotes the adrenaline secretion of the normal dog. MARY JACOBSEN

Experimental histological and clinical observation on the chemical sympathectomy of the spermatic cord. AUGUSTO CASSUTO. *Rev. sud-americana endocrinol. immunol. quimioterap.* 11, 221-42(1928).—Brief review of physiopathology and therapy of gonadal diseases and senescence. In 4 young men, 3 of whom presented slight testicular hypoplasia impotence was cured by painting the internal and deferential spermatic arteries with 5% phenol. The sympathetic fibers investing the adventitia are paralyzed. Injury to the sensory and motor nerves must be avoided. MARY JACOBSEN

Effect of guanidine on the degeneration of tissues. MARIO D'ALISE. *Riv. patol. sper.* 2, 204-7(1927); *Ber. ges. Physiol. expll. Pharmacol.* 44, 38.—When kept in guanidine soln. the brain, kidney and liver of guinea pigs reduce PhNO, more energetically than when kept in Ringer soln. Conclusion. Guanidine promotes the vital activity of tissues similarly as it increases the irritability of muscle tissue. M. J.

Effect of glycocholate and taurocholate on serum lipase. G. DI MACCO. *Riv. patol. sper.* 2, 359-63(1927); *Ber. ges. Physiol. expll. Pharmacol.* 44, 129.—The content in quinine-resistant lipase of dogs serum is increased by 0.8 percent Na taurocholate and by 2.5% Na glycocholate. MARY JACOBSEN

Effect of atropine on gastric secretion and evacuation of the stomach. V. JOFFE. *Russkaja Klinika* 8, 236-44(1927); *Ber. ges. Physiol. expll. Pharmacol.* 44, 540.—In 50 patients atropine caused the following decreases: total acid 76.5%, free HCl 89%, juice vol. 76.5%, evacuation rate 58%. This effect permits the study of the functioning of the pylorus. MARY JACOBSEN

Effect of hydrogen sulfide water on the vasodilators. N. USINSKIJ. *Zhurnal expll. Biol. Med.* 8, 314-7(1928); *Ber. ges. Physiol. expll. Pharmacol.* 44, 418-9.—Plethysmographic and elastometric detns. demonstrate a direct effect of H₂S baths on the tonus of the peripheral vessels through dilatation. MARY JACOBSEN

The value of iron salts in counteracting the toxic effects of gossypol. WILLIS D. GALLUP. *Okla. Expt. Sta., J. Biol. Chem.* 77, 437-49(1928).—Ferric citrate and Fe-

$(\text{NH}_4)_2(\text{SO}_4)_3$ in sufficient amts. to furnish 3 g. of Fe per g. of gossypol counteract the poisonous effect of diets contg. cotton seeds and allow rats to make nearly normal growth for some time. Fe_2O_3 is without effect probably because of its insol. A change in diet is more effective than the addn. of Fe for promoting recovery from gossypol poisoning. The Fe apparently delays the effects of the gossypol by combining with it to form an insol. compd. as test tube expts. show that the reaction is of a quant. nature. Food consumption was increased by the addn. of the Fe salt. A. P. LOTHROP

Effect of intraperitoneal injections of insulin upon the blood sugar of well-fed rabbits. MELVILLE SAHYUN AND N. R. BLATHERWICK. Potter Metabolic Clinic. *J. Biol. Chem.* 77, 459-66(1928).—The 1st intraperitoneal injection of insulin into well-fed rabbits not accustomed to insulin sometimes fails to produce hypoglycemia and it is impossible to offer any explanation for this puzzling observation. Subsequent injections, however, produce results similar to those following subcutaneous injections. When "educated" rabbits are used, they respond to the first injection and smaller doses are required. Intraperitoneal injections are more effective than intravenous in standard fasted animals. These results do not accord with the findings of Hoskins and Snyder (C. A. 22, 267). A. P. LOTHROP

The effect of anesthesia on the recovery process in mammalian skeletal muscles. C. N. H. LONG. McGill Univ. *J. Biol. Chem.* 77, 563-79(1928).—The recovery processes in mammalian skeletal muscle (cat) are profoundly affected by anesthesia. The initial breakdown of glycogen and the initiation of contraction are not affected but there is a blockage of the resynthesis of the formed lactic acid; that is, of the oxidative phase. Cats were used as the exptl. animals and studies were made of the effect of anesthesia (generally amytal) with and without stimulation on the glycogen content and on glycogen restoration. Lactic acid production in the muscles was also estd.; this disappears from the muscles and probably comes into diffusion equil. with the body fluids. Lack of knowledge of the fundamental oxidative mechanism of the cell prevents any attempt to state the exact reason why anesthetics should act in this manner on the carbohydrate cycle in muscles. The av. glycogen content of the cat gastrocnemius muscle was found to be about 0.9% but is subject to considerable variation (mean difference in 10 cats 3.2% with individual variations of from 0.0 to 7.3%). A. P. LOTHROP

The influence of certain camphors on the viscosity of the blood. P. TESTONI. *Arch. sci. biol.* 8, 310-22(1926).—*In vitro* tests show that Laurus, Borneo and mint camphor have the property of lowering the viscosity (η) of distd. H_2O , aq. solns. of gum arabic, egg albumin, blood serum and defibrinated blood. The decrease in η of the various liquids increases with the time of contact with the camphor. Various concns. of the 3 camphors dissolved in olive oil were injected into dogs fasted for 12 hrs. The dogs were bled 30 min. later and the η of the defibrinated blood was detd. Japanese camphor, borneol and menthol diminished the η of defibrinated blood. P. M.

Variations in the viscosity of blood after the injection of olive oil. PIRRO TESTONI. *Arch. sci. biol.* 8, 323-37(1926).—Thirty min. after the subcutaneous injection of olive oil in dogs fasted 12 to 14 hrs., there is an increase in the viscosity (η) of defibrinated blood. The increase is proportional to the quantity of oil injected until it reaches a max. with 2 cc. of oil per kg.; then it diminishes and tends to return to normal when 4 cc. are administered. For the same dose η increases with the time elapsing between injection of oil and bleeding till a max. is reached after which it gradually returns to normal. PETER MASUCCI

Does insulin exert any action on the blood pressure? S. VISCO AND S. CASTAGNA. *Boll. soc. ital. biol. sper.* 3, 355-7(1928).—Some brands of insulin lower blood pressure; others have no effect. The lowering of blood pressure attributed to insulin is not caused by this substance, but by impurities which are present in many com. preps. P. M.

The effect of a constant electric current on nerves treated with cyanide and arsenite salts. P. MAKAROV. *Zhurnal ekspl. Biol. Med.* 6, 144-54(1927).—KCN or Na_3AsO_3 in concns. of 0.01 to 0.001 M act on the nerve in the same way as does KCl. Na_3AsO_3 in 1.04-4.15% solns. has a slow and weak effect. Complete inhibition of the cond. of impulses appears only after 30-70 hrs. S. MORGULIS

The chemistry of vegetative stimulation. Further studies on the supposed role of ions. L. JENDRASSIK AND A. CZIKE. *Biochem. Z.* 193, 285-99(1928).—In a K-poor soln. the effect of pilocarpine and of K is antagonistic in the large intestine, stomach, uterus, esophagus and urinary bladder. Ca and adrenaline produce different effects on the rabbit uterus, the former paralyzing and the latter stimulating it, the stimulating effect occurring even in the absence of Ca. The antagonistic action of the Ca and adrenaline manifests itself also in most frog stomachs. Likewise, on the intestine of the cat it is

demonstrable that the 2 do not always act in a parallel manner. In a Ca-free medium the adrenaline paralyzes, while the addn. of Ca induces the stimulation. S. M.

Studies on the effect of insulin. III. Effect on the gaseous metabolism of the turtle. B. V. ISSEKUTZ AND F. V. VÉGH. *Biochem. Z.* 192, 383-9(1928).—See C. A. 22, 1405.

S. MORGULIS

The effect of insulin on the carbohydrate oxidation in the fasting animal. BÉLA FÖRSTNER. *Biochem. Z.* 194, 422-40(1928).—Expts. on fasting, curarized and artificially respiring dogs show that injection of insulin (without carbohydrate) increases the O_2 consumption which is perhaps to be attributed to the action of insulin. However, since the respiratory quotient is not altered it is concluded that the increased O_2 consumption is not indicative of a greater carbohydrate oxidation. S. MORGULIS

The influence of intravenous injections of magnesium chloride and calcium chloride on the gastric secretion in dogs produced by means of morphine injections. N. PYATNITSKII AND P. OLEFIRENKO. *Zhurnal expil. Biol. Med.* 8, 382-96(1928).—Intravenous injection of 30-75 mg. $CaCl_2$ per kg. of body wt. increases the gastric secretion stimulated by morphine. $MgCl_2$, when the vagus nerve is excluded, causes inhibition of secretion. The $MgCl_2$ and $CaCl_2$ produce the same effect on the gastric glands as on the heart.

S. MORGULIS

The influence of carbon dioxide on the respiratory center of the frog. N. A. POPOV AND L. B. WAGNER. *Zhurnal expil. Biol. Med.* 9, 150-60(1928).—Perfusion expts. on the isolated frog head lead to the conclusion that CO_2 affects the amphibian respiratory center.

S. MORGULIS

New principles in chemotherapy. MYER COPLANS AND A. G. GREEN. *J. Soc. Dyers Colourists* 44, 5-10(1928); cf. C. A. 21, 460.—The object of this study was to learn if a controlled and selective action could be exerted upon invading organisms or their toxins by the administration of compds. (derivs of dyestuffs in particular) which are themselves innocuous, but are converted in the body into active agents. To this end 2 classes of compds. were studied: leuco compds. which could give rise to dyestuffs by oxidation within the system, and derivs. of dyestuffs or their leuco compds. containing labile acidic groups such as the sulfato group or the omega sulfonic group. These compds. were tested for their actions on the animal organism, bacteria and toxins. The results support the belief in a rational system of chemotherapy based upon the slow generation of the curative agent in the blood or tissues.

L. W. RIGGS

Effects of subcutaneous injection of acetylcholine on the retinal artery of man. MAURICE VILLARET (MMR.) SCHIFF-WERTHEIMER AND L. JUSTI BESANÇON. *Compt. rend. soc. biol.* 98, 909-11(1928).—In 11 out of 25 subjects the injection of acetylcholine caused a dilation of the central artery of the retina, easily observed with the ophthalmoscope. Five subjects gave a doubtful reaction and 9 no reaction.

L. W. R.

Effect of saponin and of strophanthin on the excitability of the cerebral cortex. A. RIZZOLO. *Compt. rend. soc. biol.* 98, 939-41(1928).—Five or 6 local applications of a 2% soln. of saponin to the cerebral cortex (method of Baglioni and Amantea) of dogs did not affect the chronaxie or rheobase. Similar applications at 3 min intervals of 2% soln. of strophanthin at first diminished and afterwards increased the chronaxie, that is, after the 2nd application the chronaxie was at a min., by the 3rd or 4th application the figures had returned to normal and by the 6th application the chronaxie was several times the normal figure.

L. W. RIGGS

Action of ephedrine on the gastric chemism. FERNANDO FONSECA AND CARLOS TRINCAO. *Compt. rend. soc. biol.* 98, 1016-7(1928).—Ephedrine is a synthetic isomer of ephedrine with a very similar physiol. action. When administered by mouth ephedrine diminishes the gastric acidity. Administered by injection, in a few cases at least, it increases the gastric acidity. This discordance of results following administration by different routes may be explained by the vaso-constrictor action exercised directly upon the gastric mucous by ephedrine when administered by mouth.

L. W. RIGGS

Action of glukhormont on the glucemia and the glucosuria. A. MORAIS DAVID AND CARLOS TRINCAO. *Compt. rend. soc. biol.* 98, 1019-21(1928).—"Glukhormont" is a powder resulting from the fermentation of the pancreas, and is prepd by Hormont of Berlin. This prepn. is able to lower the glucemia of diabetes and consequently cause the glucosuria to disappear. It allows an increase of carbohydrate in the diet and it may be substituted in part at least for insulin. It is not recommended for the treatment of grave cases of diabetes or for combating a pronounced acidosis. No intolerance was observed attributable to a secondary action of glukhormont.

L. W. R.

Influence of intravenously injected neurotoxic serums on the blood pressure. M. GORDOYC AND P. KUBIKOWSKI. *Compt. rend. soc. biol.* 98, 1070-2(1928).—The in-

jection of neurotoxic serum of cerebral origin has slight effect on the blood pressure, while that of sympathetic origin always leads to a marked and prolonged lowering of the blood pressure. In many cases the neurotoxic serum of sympathetic origin causes glomerular hemorrhage, hemolysis, spasms of the extremities and often death.

L. W. RIGGS

Action of the lacrymal extract on the blood. D. MICHAÏL AND P. VANCEA. *Compt. rend. soc. biol.* **98**, 1083-4 (1928).—Intravenous injections of lacrymal ext. in dogs caused in 2 min. a sharp increase in the no. of red and white corpuscles followed by a progressive decrease, so that after 30 min. the no. of corpuscles was generally less than before injection.

L. W. RIGGS

Mechanism of the action of scopolamine in post-encephalitic Parkinson disease. G. MARINESCO, O. SAGER AND A. KREINDLER. *Compt. rend. soc. biol.* **98**, 1322-5 (1928); cf. *C. A.* **22**, 822.—Scopolamine diminishes all of the increased muscular chronaxies and to a less extent the nerve chronaxies. The muscles of which the chronaxies are diminished return to their normal values after the injection of scopolamine.

L. W. RIGGS

Pharmacodynamic properties of a glucoside of Adonis vernalis: adonidosisin. L. JUNG AND P. FONTENAILLE. *Compt. rend. soc. biol.* **98**, 1338-40 (1928); cf. Mercier, *Rev. pharmacol. exptl. therap.* **1**, 87 (1927).—Injections of 0.25 to 0.5 mg. of adonidosisin per kg. in dogs caused periods of violent vomiting alternating with quiet periods. The action on the heart varied between accelerations, retardations and changes in the amplitude according to the dose.

L. W. RIGGS

Do biliary salts cause bradycardia? HENRI BÉNARD AND M. BARIÉTY. *Compt. rend. soc. biol.* **98**, 1397-8 (1928).—Bradycardia is not caused in rabbits and dogs.

L. W. RIGGS

Hyperinsulinemia following the injection of a non-hypotensive solution of secretin. EDGARD ZUNZ AND JEAN L'ABARRE. *Compt. rend. soc. biol.* **98**, 1436-8 (1928). The results indicate a relation between the endocrine and exocrine activities of the pancreas.

L. W. RIGGS

Influence of the variation of calcium on the length-tension diagram of the muscle. J. COLLE. *Compt. rend. soc. biol.* **98**, 1439-41 (1928). By plotting the length of the muscle in mm as abscissas and the tension in g. as ordinates, the curve of a muscle in normal Ringer soln. was compared with the curve of a muscle in Ringer soln. deprived of CaCl_2 . The absence of Ca causes a diminution of contraction as well as diminution of tension.

L. W. RIGGS

Action of ergotamine on the basal metabolism and glucemia in ocular affections. D. MICHAÏL, T. BENDESCU AND P. VANCEA. *Compt. rend. soc. biol.* **98**, 1468-9 (1928).

In the course of ocular diseases, ergotamine causes a nearly const. lowering of the basal metabolism, and a lowering of the glucemia only when there exists a mild sympathetic hyperglucemia.

L. W. RIGGS

Action of lacrymal extract on respiratory movements. D. MICHAÏL AND P. VANCEA. *Compt. rend. soc. biol.* **98**, 1472-4 (1928).—The lacrymal ext. increases the amplitude of the respiratory movements and retards their rhythm by a direct action on the bulbar center of respiration.

L. W. RIGGS

Ergotamine and post-hypophyseal hyperglucemia. I. I. NITZESCU. *Compt. rend. soc. biol.* **98**, 1479-82 (1928).—Ergotamine, which has a definite inhibitory action on adrenaline hyperglucemia, had no influence in rabbits and an insignificant influence in dogs on hyperglucemia caused by injection of pituitary ext.

L. W. RIGGS

Yohimbine, glucemia and adrenaline hyperglucemia. I. I. NITZESCU. *Compt. rend. soc. biol.* **98**, 1482-5 (1928).—Intravenous injections of yohimbine in medium or large doses cause a pronounced hyperglucemia in the rabbit and a less marked hyperglucemia in the dog. Yohimbine, like ergotamine, had an inhibitory action on the sympathetic hyperglucemia caused by injections of adrenaline.

L. W. RIGGS

Action of insulin on hyperglucemia following hemorrhage. HIROSHI TACHI. *Tôhoku J. Exptl. Med.* **10**, 420-5 (1928).—If at the time of profuse bleeding (say 21 g. per kg. of an animal) 0.95 units of insulin per kg. is injected, a moderate hyperglucemia follows though less intense than without insulin. The administration of insulin in doses of 1.83 units per kg. completely masks the hyperglucemia action of bleeding.

L. W. R.

Excretion of barbituric acid derivatives by way of the urine in dogs. MARC REINERT. Pharm. Lab. Hoffmann-LaRoche & Co. *Arch. exptl. Path. Pharmacol.* **130**, 49-60 (1928).—With the diethyl, phenylethyl and allylisopropyl compds. of barbituric acid the posthypnotic effect is intimately assocd. with excretion in the urine. In the case of both the allylisopropyl and phenylethyl compds. about 80% of the amt. administered is destroyed in the body, while the balance is excreted in the urine in 48 hrs.

(allylisopropyl) or in 9 to 10 days (phenylethyl). Only some 25 to 30% of the diethyl compd. is broken down in the body, the remaining 70% being slowly excreted throughout a period of some 7 to 8 days. G. H. S.

Effect of some diuretics on the Starling heart-lung-kidney preparation. H. GREMELS. Univ. Hamburg. *Arch. expil. Path. Pharmacol.* 130, 61-88(1928).—Acting upon the surviving kidney of the dogs, caffeine, theobromine, theophylline, ephylline, novasurol, salyrgan, strophanthin and digitoxin cause diuresis. In addn. they exert a dilating effect upon the kidney vessels, the latter action being distinct from the sp. action on the kidney. G. H. S.

Relation of the absorption, fixation and decomposition of digitalis compounds to their action on the heart. HANS FISCHER. Univ. Zurich. *Arch. expil. Path. Pharmacol.* 130, 111-93(1928).—Prior to the fixation of digitoxin in an irreversible fashion to the heart there is a period of a few secs. when the action is reversible and which probably represents a phys.-chem. surface phenomenon involving an adsorption by the surface layers of the muscle fiber or a diffusion through the limiting membrane. Expt. shows that a diffusion of digitoxin takes place, both through artificial membranes and surviving tissue membranes, just as with crystalloid bodies although far more slowly. The toxic action of digitoxin becomes manifest only when the fixation is irreversible, and toxic action can only appear when a definite, abs. limiting dosage becomes bound to the heart. For the isolated frog heart this dosage is between 0.0016 and 0.0037 (av. 0.0026) mg. of digitoxin. The time required for fixation and for the toxic effect to become evident is related to the concn. To a slight extent unaltered digitoxin is excreted through the urine, but the greater portion is fixed to the muscle tissues. Whether other organs, such as the liver, fix the compd. and play a role in detoxication is uncertain. Detoxication by means of fixation seems to be but a transitory mechanism, for with continued administrations a breakdown to digitoxigenin occurs. Only in cases of repeated administration is digitoxin broken down in the heart and under these circumstances digitoxigenin is derived through a hydrolytic cleavage, just as strophanthin is derived from strophanthin. Both of these derived compds. exert a very strong irreversible action on the heart. Decompn. processes of digitoxin or strophanthin parallel the cumulative effect. Unlike digitoxin, genin is not in detectable amts. irreversibly fixed in the frog heart intoxicated with bigitaligenin. Obviously with such a compd. a cumulative effect cannot be obtained. Bigitaligenin is not broken down to any appreciable extent in either the heart or skeletal muscle and it is apparently excreted unchanged. No definite proof could be obtained of a hydrolytic splitting of gitalin. G. H. S.

Synergism between digitalis and calcium. HANS FISCHER. Univ. Zurich. *Arch. expil. Path. Pharmacol.* 130, 194-241(1928).—When present in the concn. found in Ringer soln. Ca has no influence upon the course of digitoxin intoxication of the isolated frog heart; the degree of increased tonus due to digitoxin and the velocity of the action are the same whether Ca is present or absent. Although Ca does not intensify the action of digitoxin, a heart exposed to the influence of digitoxin becomes sensitized to Ca, and will exhibit an increased tonus to unusually low concns. of Ca. This sensitizing effect of the digitoxin also renders the heart responsive to other agents, such as K and alc., in concns. inert upon normal hearts. Thus, although the effect is non-sp., it is particularly outspoken with Ca and Sr. While with digitoxin and Ca the synergistic action operates in only one direction, with bigitaligenin and Ca (or Sr) the synergism is more or less mutual, in that Ca favors the increase in tonus by bigitaligenin, and the latter likewise sensitizes to Ca. Just as digitoxin and Ca are not identical in the mechanisms underlying their action on the heart, so does the action of bigitaligenin differ from that of Ca. The sensitizing action of bigitaligenin lacks specificity just as does that due to digitoxin. G. H. SMITH

Effect of strychnine on the respiratory function of the blood. GÜNTHER ANTON. Univ. Heidelberg. *Arch. expil. Path. Pharmacol.* 130, 242-9(1928).—The effect of strychnine upon the gas relationships of blood is due solely to its action in limiting bacterial growth, for with sterile blood strychnine has no effect. Nor does strychnine inhibit *in vitro* the power of rabbit blood to fix O_2 and CO_2 , as is suggested by v. Miko and Pala. G. H. S.

Chemical constitution and activity. Aromatic fluorine compounds. FRITZ LEHMANN. Univ. Greifswald. *Arch. expil. Path. Pharmacol.* 130, 250-5(1928).—When F or Cl is introduced into the side-chain of such aromatic compds. as toluene and *m*-toluidine the toxicity for frogs is increased. F is somewhat more effective than Cl. The lethal dose (millimols. per 100 g. of frog) of toluene is 1.0-2.5, that of $C_6H_5CCl_3$ 1.1-1.2, of $C_6H_5CF_3$ 0.7-1.0 and of $C_6H_5CF_2$ 0.6-0.7. The introduction of an NH_2 group increases the toxicity to 0.4-0.5, while the introduction of NO_2 and of $COOH$

groups gives toxicity values of 0.3-0.6 and 0.4, resp. All of the compds. act upon the central nervous system, while that with the NH_2 group introduced causes cardiac paralysis. When the H of the side chain is replaced by a halogen any stimulating action the original compd. may have possessed is changed to a paralyzing action, and if the compd. originally was inhibitory this action is intensified. Unlike the NH_2 group, the NO_2 and COOH groups introduced into the *m*-position exhibit strong exciting properties. The water-sol. HCl salt of *m*-trifluorotoluidine can well be used as a narcotic for frogs, since the narcotizing effect becomes operative quickly and persists for a long time. G. H. S.

Magnesium narcosis through oral administration of magnesium sulfate and saponin. L. KOFLER AND R. FISCHER. Univ. Innsbruck. *Arch. expl. Path. Pharmacol.* 130, 319-22 (1928).—Narcosis is induced in mice and frogs by the oral administration of relatively small quantities of MgSO_4 if given in conjunction with saponin. Narcosis does not appear if an interval greater than 3 hrs. is allowed to elapse between the administration of the saponin and the Mg . G. H. S.

Mode of action of some analeptics. II. Coramine. WILHELM STROSS. Univ. Prag. *Arch. expl. Path. Pharmacol.* 130, 326-48 (1928); cf. *C. A.* 21, 276.—The most significant action of coramine is a diminution in conduction, assoc. with a retardation of pulse. With high concns. arrest of the heart takes place, the heart remaining susceptible to mech. stimulation. **III. Hexatone.** *Ibid.* 349-64.—Hexatone paralyzes the frog vagus as does camphor, and with the isolated frog heart it increases conduction and frequency, the last 2 effects not necessarily being related. Of the various toxic and mech. agencies leading to impairment of heart function only that due to alc. is influenced to any considerable degree and with any uniformity by hexatone. G. H. S.

Effect of repeated administrations of sodium bromide upon artificially produced convulsions. KARL MEYER-NOBEL. Univ. Heidelberg. *Arch. expl. Path. Pharmacol.* 130, 365-73 (1928).—The daily administration of 0.4 g. of NaBr per kg. to pigeons leads after about 3 weeks to a characteristic intoxication picture which quickly and completely disappears upon the administration of NaCl . If smaller quantities of Br are fed over a longer period the susceptibility to convulsion phenomena, as, e. g., those induced by picrotoxin, is diminished materially, the relation between susceptibility and the amt. of Br in the body being approx. linear. G. H. S.

Venom of the ringed adder (*Tropidonotus natrix*). I. Effect of the blood of the ringed adder upon the isolated heart of cold-blooded animals. OTTO GESSNER. Univ. Marburg. *Arch. expl. Path. Pharmacol.* 130, 374-83 (1928).—The plasma, serum or defibrinated blood of the ringed adder causes arrest of the isolated frog or toad heart. It is active both undil. and in dilns. (in Ringer soln.) of 1:5. The arrest is usually systolic and is always followed by an intense contraction of the heart muscle. The active principle resembles a saponin-like substance more closely than a digitalis-like substance. It does not sensitize to Ca , and in many pharmacol. actions resembles saponin. The amt. present in the blood of the adder is not const. G. H. S.

The aims and methods of modern pharmacology. DAVID I. MACHT. *J. Am. Pharm. Assoc.* 17, 7-17, 111-21 (1928).—The search for active principles, the study of pharmacodynamics, toxicology, conditions modifying drug action (including dosage and penetrating properties of the drug) and therapeutic data are cardinal lines of inquiry. The highest goal of the pharmacologist is the study of chemopharmacodynamic relations. The study of endocrines has increased, also the newer lines of phytopharmacology and photopharmacology. The training of a pharmacologist is discussed.

L. E. WARREN

The poison in illicit liquor. H. V. ATKINSON. *J. Am. Pharm. Assoc.* 17, 28-35 (1928).—Discussion. Many substances foreign to liquors are found in illicit beverages of the market. The evidence indicates that most of the cases of acute poisoning have been due to excessive doses of EtOH . The second in importance is MeOH . A few cases of poisoning have been traced to Pb derived from the solder. L. E. WARREN

Notes on the spectrum and pharmacology of chlorophyll. FREDERICK GRILL. North. Pac. Coll. Ore. *J. Am. Pharm. Assoc.* 17, 422-7 (1928).—The spectrum of chlorophyll varies with the solvent and concn. Heat does not affect the spectrum but age causes a darkening and widening of the bands and a reduction in the intensity; the green color changes to brownish. Exts. of chlorophyll have a stimulating action on all of the tissues and organs of animals. Earthworms are very susceptible to the action of chlorophyll exs. In the frog heart exs. increase the force of contraction and slow the beat, suggesting a similarity to digitalis. L. E. WARREN

Isopropyl alcohol—an investigation of its physiologic properties. HENRY C. FULLER. *J. Lab. Clin. Med.* 12, 326-49 (1928).—A series of studies on rabbits, guinea pigs, dogs, cats, chickens, monkeys and humans is presented in detail. When taken

into the system in strength to be ingested without apparent local discomfort, the animal economy is capable of absorbing $\begin{array}{c} \text{CH}_3 \\ \diagup \\ \text{CHOH} \\ \diagdown \\ \text{CH}_3 \end{array}$ in reasonable amt. without toxic re-

sults. A form of intoxication is apparent especially in the early part of the test, the violence and duration of it depending on the species. Barring perhaps cats, a tolerance is quickly established, and thereafter the outward appearance of the intoxication differs in no respect from that produced by $\text{C}_2\text{H}_5\text{OH}$.

ETHEL W. WICKWIRE

The action of adrenaline upon the cardiac rhythms. HAROLD L. OTTO. *J. Lab. Clin. Med.* 13, 70-4(1927).—Exptl. and clinical studies show that adrenaline can cause the appearance of cardiac arrhythmia, in many instances of a dangerous or unpleasant nature. It is therefore advisable to administer it with caution particularly to cardiac patients or those individuals presenting a history of having had one of the cardiac arrhythmias.

ETHEL W. WICKWIRE

The relation between cardiac reactions to drugs and the p_{H} of the blood. Experiments with mercury. WM. SALANT AND J. ERNEST NADLER. *J. Lab. Clin. Med.* 13, 117-23(1927); cf. *C. A.* 21, 776; 22, 811.—A small quantity of Hg, in the form of succinate, administered intravenously into anesthetized cats produces cardiac irregularity, depression and arrest of heart action, which occur after a latent period of about 3 min. and last several min. The latent period decreases and the duration of the attack increases with successive injections of Hg. Complete recovery may occur even after prolonged cessation of contraction. Acid given in sufficient quantity before Hg greatly increases its toxicity. The amt. of Hg necessary to produce the characteristic changes in heart action may be only half to a third of the dose required to cause the same effect without acid. Very small quantities of acid are toxic even after a moderate amt. of Hg. Alkali confers protection against Hg, provided a moderate amt. only is given. If sufficient alkali is introduced to increase the p_{H} of the blood by about 0.2 above normal, Hg becomes more toxic. Increased pulmonary ventilation increased the resistance to Hg. It was suggested that the effect was due to a decrease of the p_{H} of the blood as well as greater amt. of O.

ETHEL W. WICKWIRE

Barbital in parathyroid tetany. L. B. BRANNAN AND C. A. DRAGSTEDT. *J. Lab. Clin. Med.* 13, 732-3(1928).—Parathyroid tetany may be relieved by the adequate administration of barbital without any material change in the level of the blood Ca. The life of the parathyroidectomized dog can be slightly prolonged when tetany is controlled in this way.

ETHEL W. WICKWIRE

Morphine tolerance. III. The effect of cocaine upon dogs before, during and after habituation to morphine. ARDREY W. DOWNS, NATHAN B. EDDY AND J. P. QUIGLEY. *J. Lab. Clin. Med.* 13, 839-42(1928).—Cocaine produced convulsions that were less intense and of shorter duration in dogs habituated to the daily subcutaneous injection of morphine, 150 mg. per kg., than in normal dogs.

ETHEL W. WICKWIRE

The stability of mercurochrome solutions. G. F. REDDISH. *J. Lab. Clin. Med.* 13, 850-61(1928).—The bactericidal power and the toxicity of aq. mercurochrome soln. were not affected by holding at room temp. in a glass-stoppered bottle for at least 5 years.

ETHEL W. WICKWIRE

Morphine tolerance. I. The acquirement, existence and loss of tolerance in dogs. ARDREY W. DOWNS AND NATHAN B. EDDY. *J. Lab. Clin. Med.* 13, 738-44(1928).—Dogs habituated to the daily subcutaneous injection of morphine sulfate, 150 mg. per kg., showed a high degree of tolerance to the depressant action of the drug on the cerebrum and on the vomiting center. Tolerance to its action on the heart rate and size of the pupil was also shown. Body temp. was always lowered by morphine. II. The susceptibility of morphine-tolerant dogs to codeine, heroine and scopolamine. *Ibid* 745-9.—Dogs habituated to the daily injection of morphine, 150 mg. per kg., showed tolerance to codeine and heroine, but not to scopolamine.

ETHEL W. WICKWIRE

Digitalis (Focke) 17.

I—ZOOLOGY

R. A. GORTNER

Sensitization to quinine of quinine-resistant protozoa by means of arsenic. K. SEMELÉW. *Zhurnal ekspl. Biol. Med.* 8, 460-6(1928).—As reduces the natural quinine resistance of certain protozoa.

S. MOROGLIS

Some chemical investigations on Bombyx mori. I. The effect of hydrogen-ion concentration upon the coagulation of liquid silk. SINGERU NAKAJIMA. *Bull. Sci. Fakultato Terakultura, Kjusu Imp. Univ.* 2, 20-32(1926).—So-called "liquid silk" which

is a colloidal silk soln. in the silk glands of *Bombyx mori* has a negative elec. charge and is readily coagulated by the addn. of some acids. HCl, AcOH, MeCH(OH)CO₂H, PO₄H₃ and HO₂CCO₂H were used to det. the effect of the H-ion concn. The optimum coagulation points are at p_H 1.3 and 3.9. The latter point is very near the isoelec. point of sericin. II. Quantitative changes of cystine, tryptophan and tyrosine in proteins of silkworms. *Ibid.*—The cystine content has been detd. by the I method in the proteins of silk worms and the pupa. It decreases gradually during the development of the worms or silk formation, as silk contains very little cystine. After spinning the cocoon, or after the excretion of silk, most of the cystine remains in the pupa. The quant. changes of the tryptophan are somewhat similar. The tyrosine content increases during the silk formation, as silk is rich in tyrosine. A. L. HENNE

Researches on the osmotic pressure of the blood and urine of certain fishes in the Gulf of Naples. L. CONDORELLI. *Boll. soc. ital. biol. sper.* 3, 197-203(1928).—The Δ of 7 detns. made on the blood and urine of *Lophius piscatorius* is given. In every case the urine was hypotonic with respect to the blood. PETER MASUCCI

The antagonism between acetic acid and the chlorides of sodium, potassium and calcium as manifested in developing *Fundulus* embryos. P. B. ARMSTRONG. Woods Hole and Cornell Med. Coll. *J. Gen. Physiol.* 11, 515-23(1928).—Developing embryos of *F. heteroclitus* react similarly to AcOH in salt solns. whether or not their membranes have been removed. No specific function of the chorionic membrane therefore need be assumed. AcOH kills the surface of the embryo and heart stoppage results from the penetration of the acid after the surface has been killed. Salts (NaCl, KCl and CaCl₂) antagonize the action of AcOH by slowing or preventing the killing of the embryo surface. In certain KCl-AcOH mixts., the surface killing effect of the acid on the embryo is antagonized but the KCl penetrates and stops the heart in a manner characteristic of KCl alone. C. H. RICHARDSON

State of the protoplasmic proteins in the egg of the living sea urchin. F. VLÈS AND M. GEX. *Compt. rend. soc. biol.* 98, 853-6(1928).—An ultra-violet spectroscopic study. L. W. RIGGS

Pulmonary lipodieresis in inferior vertebrates. H. ROGER, LÉON BINET AND J. VERNE. *Compt. rend. soc. biol.* 98, 931-2(1928); cf. *C. A.* 18, 852, 3639.—The frog lung and fish gill are able to attack droplets of oil which are arrested in the capillaries of these organs. L. W. RIGGS

Action of certain anthelmintics on cestodes, ascaris and ankylostome. SILVIO REBELLO, S. F. GOMES DA COSTA AND J. TOSCANO RICO. *Compt. rend. soc. biol.* 98, 995-7(1928).—Essence of chenopodium, thymol, β -naphthol and CCl₄ had a strong toxic action on all 3 organisms. A dozen other preps. were toxic to 1 or 2 but not to all 3 of the organisms. Differences of reaction of the earth worm and of intestinal helminths toward certain anthelmintics. *Ibid.* 1021-2.—The differences are tabulated. Conclusions with reference to the toxicity of an agent to earth worms are not always applicable to intestinal worms. L. W. RIGGS

Utilization by aquatic animals of organic materials dissolved in water. J. POMIRADSKY. *Compt. rend. soc. biol.* 98, 1033-5(1928).—Tadpoles in media contg. peptone and sugars had their growth increased in the presence of KCl which increased the permeability of the skin, and their growth decreased in the presence of CaCl₂ which lessened the permeability of the skin. These changes were not dependent on the no. of bacteria in the medium. Tadpoles do not feed on bacteria, neither do bacteria appear to play any intermediate role in the utilization of the dissolved nutrients. L. W. RIGGS

Purinolytic diastases of the invertebrates. R. TRUSZKOWSKI. *Compt. rend. soc. biol.* 98, 1048(1928).—The purine N was detd. in leeches and mussels before and after autolysis. These animals excrete no uric acid and their ground tissues do not destroy uric acid. Guanase and adenase were present but not xanthinioxidase. L. W. RIGGS

Effect of inorganic salts on photic orientation in *Allobophora foetida* (sav.). II. Sulfates—MgSO₄, FeSO₄, Na₂SO₄ and K₂SO₄. IKITARO NOMURA AND SHINRYO OHFUCHI. *Sci. Repts. Tôhoku Imp. Univ.* [4], 3, 223-48(1928); cf. *C. A.* 22, 1830.—The object of this study was to det. what kind of sulfates would affect the + orienting function of the ventral nerve cord or the — orienting function of the brain of *A. foetida*. The expts. were made by submerging the worm in solns. of the single or mixed sulfates, with the following results: (1) In the ventral nerve cord, K₂SO₄ causes a weakening of the + orienting functioning, while MgSO₄, FeSO₄ and Na₂SO₄ cause a strengthening at first and then a weakening. (2) In the brain, FeSO₄ and K₂SO₄ cause a weakening of the — orienting functioning, Na₂SO₄ causes a strengthening at first and then a weakening, and MgSO₄ a weakening at first and then a strengthening which is followed by a

weakening. (3) When FeSO_4 is mixed with MgSO_4 , Na_2SO_4 or K_2SO_4 , the general change in orientation is much influenced by FeSO_4 . (4) When MgSO_4 is mixed with Na_2SO_4 or K_2SO_4 , the tendency of change in orientation in the ventral nerve cord follows that of the worms placed in MgSO_4 , while in the brain it follows that in Na_2SO_4 or K_2SO_4 , resp. (5) In $\text{Na}_2\text{SO}_4 + \text{K}_2\text{SO}_4$, the general tendency of change in orientation in the 5 cm. angles follows that in K_2SO_4 , while in the 10 cm. angles it follows that in Na_2SO_4 . (6) In MgSO_4 , Na_2SO_4 , $\text{MgSO}_4 + \text{Na}_2\text{SO}_4$ and $\text{MgSO}_4 + \text{K}_2\text{SO}_4$, the backward crawling is caused mainly by a weakening of forward crawling functioning in the ventral nerve cord. (7) In FeSO_4 , K_2SO_4 , $\text{MgSO}_4 + \text{FeSO}_4$, $\text{FeSO}_4 + \text{Na}_2\text{SO}_4$, $\text{FeSO}_4 + \text{K}_2\text{SO}_4$ and $\text{Na}_2\text{SO}_4 + \text{K}_2\text{SO}_4$, the backward crawling is caused by a relative weakening of forward crawling functioning in both the brain and the ventral nerve cord. (8) The returning movement is caused by a functioning in the brain, and it tends in general to weaken in relation to the prolongation of the duration of submergence. (9) In the mixts. contg. K_2SO_4 , the no. of winding individuals tend to increase with the prolongation of the duration of submergence. The expts. were made at a temp. of 22.8° to 25.6° . III. Nitrates $\text{Mg}(\text{NO}_3)_2$, $\text{Ca}(\text{NO}_3)_2$, NaNO_3 and KNO_3 . *Ibid* 379-403.—The exptl. procedure was the same as described above. In the ventral nerve cord, NaNO_3 causes a weakening of the positively (+) orienting functioning, while $\text{Mg}(\text{NO}_3)_2$, $\text{Ca}(\text{NO}_3)_2$ and KNO_3 cause a strengthening at first, then a weakening. In the brain, $\text{Mg}(\text{NO}_3)_2$ causes a weakening of negatively (−) orienting functioning, while the Ca, Na and K nitrates cause a strengthening at first and then a weakening. When $\text{Ca}(\text{NO}_3)_2$ is mixed with $\text{Mg}(\text{NO}_3)_2$ or NaNO_3 , the general tendency of change in orientation appears to follow mainly that of worms placed in $\text{Ca}(\text{NO}_3)_2$. When KNO_3 is mixed with Mg or Ca nitrates, the tendency of change in orientation is to follow that in KNO_3 . In mixed Mg and Na nitrates the tendency of change in orientation follows mainly that in $\text{Mg}(\text{NO}_3)_2$. In $\text{NaNO}_3 + \text{KNO}_3$, the change in + orientation appears to follow that in NaNO_3 , while the change in − orientation follows neither that in NaNO_3 nor KNO_3 . In NaNO_3 and KNO_3 , the backward crawling is caused mainly by a relative weakening of forward crawling functioning in the ventral nerve cord. In the nitrates of Mg, Ca, Mg + Na, Ca + Na, Mg + K and even in Na + K, the backward crawling is caused by a relative weakening of forward crawling functioning in both the brain and the ventral nerve cord. In the nitrates of Ca + K and Ca + Mg, however, backward crawling is caused mainly by a weakening of forward crawling functioning in the brain, and in Mg + Ca the forward crawling functioning in the ventral nerve cord appears to be strengthened. The returning movement is caused by a functioning of the brain. In nitrates of Mg, Ca, Mg + Ca, Ca + Na, Mg + K and Ca + K, the movement becomes frequent after submergence, while in Na, K, Mg + Na and Na + K it becomes less frequent. KNO_3 causes in worms a notable frequency of winding movement.

L. W. RIGGS

Chemical effects upon the lengthening of Caudina muscle. LIEH TAO. *Sci. Repts. Tôhoku Imp. Univ.* [4], 3, 417-20(1928).—*Caudina* muscle under loading shows an initial contracture, when it is transferred from sea water to hypertonic sea water, distd. water, isotonic solns. of NaCl, KCl, CaCl_2 and sucrose or nicotine in sea water. Hypotonic sea water, hypotonic NaCl soln. and alkalinized sea water (p_H 11) cause a gradual contracture. Acid in sea water (p_H 3) causes a progressive shortening. Isotonic MgSO_4 and MgCl_2 solns., strychnine, pilocarpine and atropine in sea water accelerate the lengthening; the Mg salts in elastic form and the alkaloïds in plastic form. *Caudina* muscle shows a contracture when it has been immersed in the isotonic solns. of KCl, MgCl_2 and sucrose, and is returned to sea water. The initial contracture may be considered as an excitatory process or a membrane effect, while the gradual contracture may be regarded as a swelling effect due to osmotic relation; and the progressive shortening is a chem. phenomenon of the muscle substance itself. These results suggest an existence of an osmotic and excitatory active membrane in *Caudina* muscle, contrary to Meigs's opinion; and it seems to be more sensitive to the effect of salts than are striated muscles or the smooth muscles of vertebrates.

L. W. RIGGS

12—FOODS

F. C. BLANCE AND H. A. LEPPER

Scientific control in the food industry. J. VALENTINE BACKES. *Food Manuf.* 1, 7-8(1927).

Food and future. ROBERT WHYMPER. *Food Manuf.* 1, 9, 8, 68, 69, 149-150; 2, 206, 210(1927).—"The psychology of human beings in relation to diet....."

W. shows the "mutual relations existing between the character of the foodstuff and the social human character of the consumer in Japan, the United States and North Africa." J. A. KENNEDY

Foodstuffs from yeasts. STANLEY SMITH. *Food Manuf.* 1, 118(1927). J. A. K.

The spoilage of foodstuffs. E. H. CALLOW. *Food Manuf.* 1, 10-1, 13(1927). J. A. KENNEDY

Recent advances in cereal chemistry. D. W. KENT-JONES. *Food Manuf.* 1, 129-30, 160-1(1927); cf. *C. A.* 19, 683.—This article is based on a thesis entitled "A study of the effect of heat upon wheat and flour, especially in relation to strength," which was presented by the author to London University. J. A. KENNEDY

Baby foods. E. H. CALLOW. *Food Manuf.* 1, 95-6, 98(1927).—The author discusses the ideal baby food, "humanized" milk, dried milk preps., peptonized foods, condensed milks and carbohydrate foods, and compares various milks. J. A. K.

Lead in carbonated beverages. H. W. PETHERICK. *Ann. Rept. of Pub. Health to June 30, 1927.* Great Britain.—A study of the source of Pb in carbonated beverages. The max. permitted and method of removing the source are given. G. R. G.

Determination of dextrose in the presence of proteins; application to the determination of starch in bread stuffs, particularly in "gluten bread." P. FLEURY AND G. BOVELDIEU. *J. pharm. chim.* 7, 249-55(1928).—See *C. A.* 22, 2417. S. WALDBOTT

Flour as a raw material. C. W. HERD. *Food Manuf.* 1, 65-8(1927). J. A. K.

Determination of butter in margarine. L. V. COCKS AND E. NIGHTINGALE. *Analyst* 53, 322(1918).—The Reichert-Meissl, Poleuske and Kirschner values are used for the detn. of the butter content of margarine but errors due to the personal equation and to the danger of volatilizing a little H_2SO_4 with the fatty acids makes it necessary to take special precautions. In fact the analyst should know the actual values of the butter used; the assumption of normal values is likely to lead to very appreciable errors. W. T. H.

The neutralization of milk and its detection. R. STROHECKER. *Z. anal. Chem.* 74, 1-28(1928); cf. *C. A.* 21, 3396-7. During the war, owing to the limited supply of milk, it was sometimes the practice to neutralize milk with $NaHCO_3$ to prevent it from curdling when it was no longer fresh. Such treatment has always been regarded as adulteration and considerable attention has been paid to the method of detecting the fraud. After discussing the effect of neutralizing milk and the reasons why none of the methods hitherto used to detect this neutralization are wholly successful, a new method is described which is more sensitive. If the sp. cond. of the serum obtained after treatment with dialyzed $Fe(OH)_3$ sol is detd. after adding HCl, it will be found that there is a loss in cond. when the milk has been neutralized and a gain in cond. when the milk has been watered. This loss is due to the fact that the HCl reacts with the Na lactate setting free lactic acid of inappreciable cond. When, on the other hand, the milk has been watered the lessened amt. of casein present makes its effect on the HCl less appreciable. To carry out the test by the new procedure, first det. the degree of acidity by the Soxhlet-Henkel method. Then to 50 cc. of milk add half as many cc. of 0.25 N NaOH as was required for 100 cc. in the above detn. dild. with doubly distd. water to make 10 cc. Mix and add 40 cc. of Merck's dialyzed ferric hydroxide. Stir vigorously and filter. Treat 20 cc. of the filtrate with 30 cc. of doubly distd. water and det. the sp. cond. at $18^\circ (L_I)$. To another 20 cc. of the filtrate add 25 cc. of doubly distd. water and 5 cc. of 0.2 N HCl. Mix well and again det. the sp. cond. (L_{II}). Then det. the sp. cond. of 5 cc. of the 0.2 N HCl mixed with 45 cc. of the water (L_{III}). This value holds as long as the same HCl and water are used. The loss in sp. cond. is then $L_A = L_I + L_{III} - L_{II}$. From an empirical table, find the acid degree (S_A) corresponding to (L_A). The difference between S_A and S (the degree shown by the Soxhlet-Henkel detn.) gives the no. of degrees corresponding to the neutralization of the sample. W. T. H.

Test for keeping qualities of milk, modified. E. D. DEVEREUX. *Mich. Agr. Expt. Sta., Quarterly Bull.* 10, 190-4(1928).—The use of p_H detn. as an indicator of milk quality is affirmed. In order to overcome the time-factor criticism of the Coolidge test, it was shown that the milk-inoculated tubes could be iced following as long as 6 hrs.' incubation, thus interrupting the test until the following day. The results checked in 93% of the cases with the control tubes. C. R. FRILLES

A study of the apparent viscosity of milk as influenced by some physical factors. G. M. BATEMAN AND P. F. SHARP. *J. Agr. Research* 36, 647-74(1928).—The viscosity coeff. of skim milk is dependent on the shearing force used in detg. it. Viscometers such as the ordinary Ostwald type operate at shearing forces in the region where the

coeff. of viscosity is changing most rapidly with change in shearing force. Mech. agitation may cause a decrease in the viscosity of milk contg. clumps of fat globules, but agitation causes no change in the viscosity of either fresh skim milk or homogenized milk. Skim milk progressively increases in viscosity with age. The aged material cannot be brought back to its value when fresh by repeatedly running through a viscometer, although it can be somewhat lowered in viscosity in this manner. Homogenization causes a distinct rise in the viscosity of whole milk, while it produces practically no change in the viscosity of skim milk. Pasteurization and freezing each produce a slight decrease in viscosity of skim milk. Viscosity values obtained by dilig. skim milk indicate that viscosity is not strictly a linear function of total solids.

M. S. ANDERSON

The influence of temperatures and certain other factors upon the percentage of fat in milk. EARL WEAVER AND C. A. MATTHEWS. Ia. Agr. Expt. Sta., *Research Bull.* 107, 158-80(1928).—The % of fat in milk was highest in Jan., declined gradually until Aug., and rose rapidly during the autumn. Ayrshire and Holstein tests were approx. 0.6% lower in the second half of the summer than in the first half of the winter. Guernsey and Jersey tests were approx. 1.1% lower. As measured by regression coeffs., butter fat tests were affected more by changes in environmental temps. than by other factors studied. High outside temps. are probably assocd. with low fat tests. The fat tended to be high immediately following freshening, declining for 2-3 months, then rising during the rest of the lactation. The literature bearing on this subject is fully discussed.

C. R. FELLERS

The effect of minute doses of iodine on milk secretion. O. STINER. *Schweizer med. Wochschr.* 57, 846-8(1927); *Bull. Hyg.* 3, 407.—One mg. of I added to the food of a cow increases the total milk yield, fat content and the tendency to become pregnant. In no case was it injurious.

GEORGE R. GREENBANK

Sanitary quality of some commercial milk powders. J. H. SHRADER, C. L. EWING, F. A. KORFF AND LILLIAN W. CONN. *Am. J. Hyg.* 8, 386-97(1928).—The analysis of 100 samples of milk powder from widely scattered geographical sources and collected in Baltimore showed them to be entirely free from living tubercle organisms. The milk supply from which these powders were made is excessively high in bacteria. Proper sanitation has not been followed in either plant or trade channels. Chem. analysis of 74 of the samples shows that the excessive bacteria count before manuf. is indicated by the presence of an approx. proportional content of ammoniacal products. A description in detail of the methods used is given, and results are extensively tabulated.

J. C. JURRJENS

Studies in cream viscosity. G. T. PYNE AND J. LYONS. *J. Dept. Lands and Agr. Ireland* 27, 121-8(1928).—An investigation was made to det. the possibility of increasing the viscosity of pasteurized cream by treatments which could be carried out in a creamery. Cream prepd. by sepn. at about 90°F. of milk which had been previously pasteurized and chilled overnight was much more viscous than pasteurized cream. Cream prepd. by resepn. at 90°F. of a lighter cream which had been previously pasteurized and chilled showed greatly improved viscosity but not quite so good as that obtained by the preceding method. Addn. of as much as 0.292% lactic acid to cream contg. 34% fat had no effect on the viscosity. Larger amts. increased the viscosity but imparted a sour taste to the cream. When cream contg. 53% fat was treated with 0.13% lactic acid the product was very viscous and no marked alteration in flavor and aroma resulted.

K. D. JACOB

Tests for reconstituted cream. F. W. RICHARDSON. *Analyst* 53, 334-5(1928).—Sometimes cream is made from milk powder, unsalted butter and water. It is pretty hard to detect such falsification by the taste. If, however, 5 g. is treated with equal quantities of benzene and alc. and the mixt. is centrifuged lightly, an amber upper layer of butter fat will be obtained with the fictitious cream, whereas with real cream the fat will remain emulsified in the test. By strong centrifuging, 3 distinct layers will be observed, whereas true cream will only give 2 layers. After sterilizing at 145° there is no reduction reaction with methylene blue in the imitation product whereas with fresh cream an instantaneous reaction is obtained.

W. T. H.

Glycerol in cream. A. F. LERRIGO. *Analyst* 53, 335-6(1928).—Heat 2 g. of cream in a flat-bottomed dish on the water bath for 20 min. and then in a steam-heated oven for 30 min. If 1% of glycerol is present the contents of the dish will fume when taken from the oven. Cool, weigh and again heat in the oven. As a result of the second heating there will be a slight increase in wt. with pure cream and a loss if glycerol was present. It has been suggested that glycerol is a suitable preservative for cream but the expts. here described indicate that it does not prevent souring.

W. T. HALL

Scientific control in the chocolate industry. H. W. BYWATERS. *Food Manuf.* 1, 113-6, 117(1927). J. A. KENNEDY

The composition of tea extracts prepared by various methods. ANON. *Ind. Mercur* 1926; *Ber. Afdel. Handelsmuseum Ver. Koloniaal Inst.* No. 28, 19 pp.—A survey of the influence of the extrn. procedure on the flavor of the tea and on the repartition of the caffeine. A. L. HENNE

Chemical composition of American-grown French cider apples and other apples of like character. J. S. CALDWELL. *J. Agr. Research* 36, 391-406(1928).—Analytical data are presented upon 21 French cider apples and 61 astringent varieties. Detns. are made of reducing sugar, sucrose, acid, total astringency, tannin, non-tannin astringency and total solids. French cider apples show no very large or const. modification in chem. character when grown near sea level and at 2170 feet elevation. The astringent apples are grouped into 3 classes: (1) astringent fruits of low acid content; these are fairly high in sugar but less than 0.5% acidity; (2) fruits whose acid ranges from 0.5 to 0.75%; (3) fruits with acidity of 0.8% or more and contg. a considerable degree of astringency. Each group contains varieties presenting a fairly wide range in astringent substances. M. S. ANDERSON

Chemical composition of the juices of some American apples. J. S. CALDWELL. *J. Agr. Research* 36, 407-17(1928).—Data are given upon the chem. compn. of the juices of 98 varieties of American-grown apples. Analyses of fruit grown in the same locality in different seasons show considerable variation in most chem. constituents due to seasonal variations. The acid-astringency-sugar ratio is an attempt to sum up in one expression the factors responsible for the collective effect upon taste organs of the constituents which they perceive. This ratio varies, not only for different varieties, but for the same variety grown during different seasons. M. S. ANDERSON

The effect of freezing upon the respiration of the apple. DONALD B. CARRICK. Cornell Univ. Agr. Expt. Sta., *Memoir* 110, 1-28(1928).—Incipient ice formation did not result in any visible color changes in the cells. Even slight freezing increased the granular texture and insipidity of the pulp, predisposed the fruit to fungus invasion and caused rapid break-down when held in cold storage. The speed of autolysis varied directly with the degree of freezing and was especially hastened when relatively large areas assumed the characteristic brown discoloration of dead tissue. An app. used in *respiratory measurements* is described. The rate of air flow through this respiratory app. affected the total amt. of CO₂ formed. Winesap apples frozen for 3 and for 6 hrs. after ice formation at air temps. of -7.5° to -8.5°, when measured at 0°, increased their respiration as much as 85% over the previously detd. normal performance. This acceleration lasted for several days, gradually declining for over 30 days. Winesap apples frozen sufficiently to kill $\frac{1}{4}$ of the cells at 0° excreted only $\frac{1}{4}$ the amt. of CO₂ which they had formerly produced as normal, unfrozen fruit. *Penicillium* soon invaded frozen apples held at 20°, the infection giving a marked rise in CO₂ production when compared to the previous rates. McIntosh and Baldwin varieties reacted similarly to Winesap. There are 20 literature citations. C. R. FELLERS

Jerusalem artichoke. C. E. CORMANY. Mich. Agr. Expt. Sta., *Quarterly Bull.* 10, 156-8(1928).—This crop yielded from 5 to 6 tons per acre but unless some cheap method of extg. the carbohydrates, chiefly *inulin*, is developed, the crop will never be of great importance. It is inferior to other crops as a silage crop or hog pasture. C. R. F.

The Jerusalem artichoke. L. E. DUNTON. *Forecast* 34, 295, 296, 332(1927); *Expt. Sta. Record* 58, 290.—The av. values obtained in analyses of 12 samples of Mammoth White French Jerusalem artichoke are given as moisture 81.2, total ash 1.263, P 0.0992, Ca 0.0227 and Fe 0.0034%. Attention is called to the relatively high content of P and Fe as compared with other root vegetables and the relatively low content of Ca. This would make a combination of artichokes with milk desirable for furnishing bone-building material. The fact that the carbohydrate of the artichoke is chiefly *inulin*, which is probably not available to the human organism, suggests the desirability of the use of artichokes in diets for diabetes and obesity. H. G.

University of Bristol fruit and vegetable preservation research station, Campden, Gloucestershire. ALFRED APPLEYARD. *Food Manuf.* 1, 145-7(1927). J. A. K.

Research in the canning industry. E. H. CALLOW. *Food Manuf.* 1, 143-4, 147(1927). J. A. KENNEDY

The new British food canning industry. STANLEY SMITH. *Food Manuf.* 1, 148-9(1927). J. A. KENNEDY

The practice of meat preserving and canning. E. W. LEWIS. *Food Manuf.* 1,

155-8(1927).—The basic principles of meat canning are brought out and an outline is given of the methods used in practice. J. A. KENNEDY

Carbohydrate transformations in carrots during storage. HEINRICH HASSELBRING. U. S. Bur. of Plant Industry. *Plant Physiology* 2, 225-43(1927).—Nine varieties of commercial stock and of table carrots were stored for varying periods of time at 39-40°F. and also at 32-35°F. The principal changes in compn. consisted in (1) an increase of reducing sugars resulting from the inversion of sucrose and (2) the hydrolysis of dextrins and hemicelluloses. Little change in compn. occurred after the first 10 weeks. No starch was found. The flavor of carrots is due chiefly to their natural sucrose content; accordingly, for cooking and canning purposes, the quality of the roots is highest immediately after they are dug. WALTER THOMAS

The composition of swedes. ALEXANDER LAUDER. *Scottish J. Agr.* 10, 428-33 (1927); cf. *C. A.* 20, 2550.—The av. dry matter content of different varieties of swedes grown from the same lots of seed varied from 10.32 to 12.66% depending on the locality. Likewise, the sol. solids varied from 7.83 to 9.48, insol. solids 2.49 to 3.17 and sugar 6.41 to 7.33%. No definite relation could be established between the quality of the roots and their content of N, P₂O₅, CaO, sugar and sol. and insol. solids. The total dry matter content appeared to be the best index of the quality of swedes. In feeding expts. on sheep varieties with different contents of dry matter gave the same results when the total dry matter fed was the same in each case. K. D. JACOBS

Note on the losses in mangels during storage. G. T. PYNE. *J. Dept. Lands and Agr. Ireland* 27, 33-5(1927); cf. *C. A.* 21, 967.—In a 5-months storage test, from Dec. 4 to May 3, on Yellow Oval mangels the percentages of the original constituents lost were H₂O 8.8, total dry matter 27.0, protein 22.2 and fiber 3.8. The total wt. decreased 10.1% during this period, and the total sucrose content decreased 29.5% during the first 2 months. The decrease in dry matter appeared to be independent of any changes in wt., "drying out," etc., in the roots due to local conditions. The roots were stored in a detached clamp protected by a thick covering of straw and located in an open position in a field. K. D. JACOBS

The iron content of plant and animal foods. W. H. PETERSON AND C. A. ELVEHJEM. Univ. of Wisconsin. *J. Biol. Chem.* 78, 215-23(1928).—The Fe content of about 150 common food-materials is given. Arranged in descending order with respect to their Fe content, these classes of foods are dried legumes, green leafy vegetables, dried fruits, nuts, cereals, poultry, green legumes, roots and tubers, non-leafy vegetables, fish and fruits. Samples of the same food vary widely in their Fe content. Orange and tomato juices contain less of the total Fe per unit weight than the whole fruit. Salt water fish contain more Fe than fresh water fish. The dark meat of poultry or fish contains more Fe than the light colored tissue. ARTHUR GROLLMAN

The variation of phosphorus content in South African vegetation. J. P. VAN ZIJL. *J. S. African Chem. Inst.* 11, 3-11(1928).—Analyses of pasture samples showed that new growth was richer in P₂O₅ than older material; e. g., stalks varied from 0.225 to 0.097% and blades from 0.533 to 0.148%. In pot-grown plants where a uniform water supply was maintained no such marked variations occurred. Field plants grown under conditions of abundant rainfall also showed only slight differences in P₂O₅ content of grasses with the advance of the season. W. C. EBAUGH

High-protein grains supplement to pasture for dairy cows. C. C. HAYDEN AND A. E. PERKINS. Ohio Agr. Expt. Sta., *Bimonthly Bull.* 13, 99-102(1928).—Pasture grass carries a considerably higher C₆ protein than the same plants have when full grown and made into hay. Therefore less protein is needed in the summer than in the winter ration. Exptl. data indicate that the use of high-protein grain mixts. in summer is not economical. C. R. FELLERS

Dairy cattle need phosphorus in ration. O. C. REED AND C. F. HUFFMAN. Mich. Agr. Expt. Sta., *Quarterly Bull.* 10, 151-6(1928).—A depraved appetite, such as a craving for wood or bones, is usually caused by a P-deficient ration and is often assocd. with soils poor in this element. Protein concn. or steamed bone meal were valuable sources of P for dairy cattle. Ground raw rock phosphate gave unsatisfactory results and disturbed the digestion of the animals. The possibility of F in the rock phosphate being responsible for the bad effects, is being investigated. C. R. FELLERS

The nutritive requirements of poultry. G. S. ROBERTSON AND R. G. BASKETT. Queen's Univ., Belfast. *Scottish J. Agr.* 11, 176-83(1928).—Addn. of 2.2% of a mineral mixt. contg. CaCO₃, NaCl, Ca₃(PO₄)₂, S, Fe₂O₃ and KI to a cereal mash increased the yield of eggs 20% and improved the size of the eggs and condition of the birds. Addn. to the ration of protein-rich foods such as soy bean meal resulted in a further increase of 10 to 20% in egg yield but had no effect on the size or wt. of the eggs or on the con-

dition of the birds. Fish meal was an effective source of both protein and minerals.

K. D. JACOB

Hydrocyanic acid in linseed cake and toxicity of some cakes. CH. BRIOUX AND A. RICHART. *Ann. sci. agron.* **45**, 27-41 (1928).—Analyses of 19 samples of linseed cake showed 0.005 to 0.86% of HCN. The content depends upon the content of the cyanogenetic glucoside, linamarin, in the cake, as well as the nature of the prior treatment. Feeding expts. indicate that, with young ruminants, linseed cake unusually high in the glucoside may cause poisoning when eaten as mash prepd. in advance with tepid water. Such conditions favor the rapid and more or less complete evolution of HCN. However, if the mash is prepd. with boiling water and from well-pulverized cake, particularly if cooked for a short time, the linase is destroyed and there is no danger from HCN. Glucose and molasses added to macerations of the cake appear to exercise a protective action against HCN poisoning. Linseed cake proved harmless when fed dry.

P. R. DAWSON

The disintegration of rice straw. H. IWATA. *J. Dept. Agr., Kyushu Imp. Univ.* **1**, 217-40 (1926); *Expt. Sta. Record* **58**, 166.—Expts. were undertaken to det. the effect upon the compn. and nutritive value of rice straw of boiling it in water and of distintegrating it with dil. alk. solns. The dry matter of rice straw has a starch value of about 20%. Boiling the straw in water for 3 hrs. did not change the compn. or nutritive value. Soaking in a 0.25% soln. of NaOH for 4 hrs. did not change the straw materially from the untreated state. Soaking in 0.75 or 1.5% soln. of NaOH for 4 hrs. or boiling in a 1% milk of lime soln. for 3 hrs., caused an extn. of a considerable quantity of in-crusting substances, an increase in the digestible matter, and raised the starch value of the dry matter to from 53 to 58%. As the lignin and Cl decreased the starch value increased, but not proportionally.

H. G.

Precautions for feeding spoiled sweet clover hay. L. M. RODERICK AND A. F. SCHALK. *N. Dakota Agr. Expt. Sta., Circ.* **35**, 1-4 (1928).—Sweet clover hay or silage which has molded or otherwise spoiled produced a specific disease in cattle known as "sweet clover poisoning." Loss of coagulating power of the blood resulting in hemorrhages usually causes death of the animal. Suspected fodder may be tested by feeding to rabbits which show the same bleeding symptoms a week or 10 days earlier than cattle fed upon the same hay. Death of the test rabbits should be a warning as to the poisonous character of the hay. The toxic principle has not been identified.

C. R. FELLERS

The poisoning of sheep on mountain grazing ranges in Nevada by the western chokecherry (*Prunus demissa*). C. E. FLEMING AND ROBERT DILL. *Nev. Agr. Expt. Sta., Bull.* **110**, 1-14 (1928); cf. *C. A.* **21**, 756. Post mortem findings based on field exams. proved chokecherry to be poisonous to sheep in the spring and early summer. The leaves lose their poisonous properties, which was found to be HCN, in the late summer and are quite harmless in the autumn. The poison is often set free in the sheep's stomach only after drinking water. Chokecherry poisoning is fatal and no known remedy has been suggested. Proper range and herd management are of value in reducing loss of animals.

C. R. FELLERS

The mass production of yeast for feeding purposes (STRICH) **16**. Elm seed oil [for food purposes] (KARDASHEV) **27**. Water pollution wastes: Milk-product wastes (HEPLER, *et al.*) **14**. Apparatus for sterilizing milk (Brit. pat. 279,902) **1**. Drum drier for fluid egg material (Brit. pat. 279,722) **1**.

Foods. M. FUJII. *Brit.* **279,985**, Sept. 11, 1926. Glutamic acid or one of its salts such as the hydrochloride or di-Na glutamate is used for neutralizing products prepd. from protein or carbohydrate materials such as fish, meat, wheat, maize, starch, casein or egg yolk by treatment with acid or alkali. The glutamic acid or its salt is preferably prepd. by heating animal or vegetable protein material in an autoclave with a catalyst such as powd. Fe or Fe oxide and a mineral acid under a pressure of 4 atm. or lower.

Treating flour. INDUSTRIAL APPLIANCE CO. *Brit.* **279,958**, Aug. 10, 1926. Flour is treated with a gaseous mixt. produced by bringing Cl contg. a small quantity of nitrosyl chloride into contact with aq. NH₃ dild. with an inert gas such as air. An app. is described.

Coloring for butter and oleomargarine. ADINO F. FILES. *Can.* **281,375**, July 3, 1928. A dry coloring material for butter (5 grains of coloring material per lb. of butter) consists of trituration dye (benzeneazo- β -naphthylamine and *o*-tolueneazo- β -naphthylamine) and rice flour in the proportions of 1 of dye to 24 of flour. *Cl. C. A.* **22**, 468.

Treating margarine mass. CARL HILDEBRANDT-SØRENSEN. Danish 37,435, May 9, 1927 and 37,723, July 18, 1927. Mech. details of app.

Apparatus for pasteurizing milk by the "holding" method. A. G. ENOCK & Co., LTD. AND E. C. ENOCK. Brit. 280,328, Sept. 21, 1926.

Cheese. LAKESHIRE CHEESE Co. Brit. 280,257, July 5, 1926. Comminuted cheese is exposed to direct contact with steam to heat it and render it semi-liquid or plastic and may be further treated with CO₂ before packaging. An app. is described.

Baking powder. ALFRED POLLOCK (to Fleischmann Co.). Can. 280,753, June 5, 1928. Compressed yeast (25-30% based on the final quantity of baking powder to be produced) is mixed with sugar materials (sugar, sirup or malt ext.) to the amt. of 10-25% of the yeast employed. The yeast is liquefied with development of CO₂ and marked fermentation. After liquefaction there are added filler (starch, flour, casein, dried milk, etc.) and if desired acid-supplying ingredient of baking powder (tartar, ammonium tartrate, tartaric acid, casein, calcium phosphate, etc.) and the mixt. is dried at low temp. The dry, ground mixt. is used in prepn. of baking powder.

Food flavoring or coffee substitute. A. E. KIENZLE. Brit. 280,432, Aug. 11, 1926. Sugar cane disks or chips are roasted and powdered.

Standardizing and solubilizing dry pectin preparations by adding sodium chloride. ALBERT LEO. U. S. 1,675,035, June 26.

Carbonating beverages. BRITISH DYESTUFFS CORPORATION, LTD., C. HOLLINS and E. CHAPMAN. Brit. 280,302, Aug. 19, 1926. To assist in retaining the CO₂, sulfonic acids are added (usually in the form of their Na salts) such as those of CH₃O-C₁₀H₈ or CH₃O-phenol condensation products, alkyl-naphthalenesulfonic acids, lignin-sulfonic acids, sulfonated higher fatty acids and the substances prep'd. from mineral oils and isopropyl alc. sulfonated as described in Brit. 274,611 (C. A. 22, 2268).

Feeding stuff emulsion. ALFRED OLSEN & Co., A. S. Danish 36,481, Sept. 6, 1926. An emulsion is prepared from oil, especially marine oils, in water, by means of casein and a phosphate, particularly Na₂HPO₄.

Food for animals. A. E. KIENZLE. Brit. 280,284, Aug. 11, 1926. Dried and ground fodder is made from sugar cane, which may be graded and mixed with various other foods.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Chemical industry. ARTHUR D. LITTLE. *J. Chem. Education* 5, 641-55(1928).—An address outlining the development of chem. industry "A specific chemical industry has its origin in a discovery in the lab. Its early development is commonly beset with difficulties. It grows through the reaction upon it of developments in other industries and through the conversion of its wastes into valuable products. It has no assurance of stability other than that furnished by continued research and the studied consideration of the trend of scientific progress and industrial development. When, however, competent technical ability is adequately backed by educated money and both are made subject to wise business management, chem. enterprises have shown remarkable earning power and a capacity for growth of which the du Pont company in this country and the I. G. in Germany are the outstanding examples." The need of close coöperation on the part of chemist, technician and selling side is emphasized. Illustrations are adduced from a long series of domestic and foreign industrial concerns.

W. C. EBAUGH

Imperial Chemical Industries, Ltd. ALFRED MOND, *et al.* *Chemistry and Industry* 47, 588-94(1928).—M. reported that 99% of shareholders of the 4 merging companies had agreed to an exchange of shares, that profits for 1927 were 4,567,000 pounds sterling, from which 125,000 pounds went for income taxes, 408,000 pounds were posted to reserve, 1,145,000 pounds were used for dividends of preferred shares, 82,000 pounds were carried forward, and the remainder was paid out as 5% dividends on ordinary capital, and 1 1/4% dividends on deferred shares. The nominal capital has been increased from 65,000,000 to 75,000,000; pounds new shares are issued at 33 s. for ordinary and 10 s. for deferred. The Company has now complete controlling interest in 40 mfg. and trading concerns and a large measure of control in 30 others, and their ramifications extend all over the world. More than 40,000 employees are in its various factories; freedom from labor disputes are due to "inheriting a happy tradition" of wise conduct on the part of the management, friendly relations with trade unions and personal contact with the workers. A system of works councils

has been put into operation; 653,000 ordinary shares are owned by the staff and workers; foremen's pensions, a works' magazine and the creation of a "real I. C. I. spirit" are factors in this happy condition. Useful contacts had been made with the (German) "I. G." but there was no agreement that would hamper the legitimate development of its activities or militate against Great Britain and the British Empire. All the Company's factories are working full time. In developing synthetic fertilizers, especially N-products, an immense industry was built up entirely by British scientists and engineers. A research organization has been developed to enable the fertilizer needs of any country to be studied so that the farmers can get the best results. Chilean nitrate can no longer be taken as a real competitor of synthetic N. The Company will soon be mfg. synthetic MeOH. Extensive investigations on the production of hydrocarbons from coal are under way. The honored custom of const. research is being continued, with adequate equipment, finances and staff. A research council includes some of the best-known scientists in Great Britain. A program of considerable expansion of the Company's program, with the financial arrangements necessary, is outlined. Harry McGowan, President, discussed the com. conditions in Great Britain, the Empire and in foreign countries, explainning the Company's relationship to each section. The Company has substantial investments in the Du Pont Co., the Allied Chemical Co. and the General Motors Corporation. The Company holds to its 4-fold responsibility, viz., to Great Britain and the Empire, to the shareholders, to the workers and to the consumer. The Company was formed to enable it to take care of itself against foreign competition, and was not designed to raise prices and create monopolies.

W. C. EBAUGH

The export industries of Norway. S. KLOUMANN. *Teknisk Ukeblad* **74**, 363-6, 380-2(1927).—A review.

C. A. ROBAK

Chemical industries and Merseyside. A. HOLT. *J. Soc. Chem. Ind.* **46**, 439-44T (1927).—The paper gives a brief résumé of the history and development of chem. industries in South West Lancashire and on the banks of the Mersey from early times till about the commencement of the present century.

B. C. A.

Chemical process efficiency. G. FIRTH. *J. S. African Chem. Inst.* **11**, 27-32 (1928).—The application of efficiency studies to the production of H_2SO_4 , nitroglycerin and fertilizers is outlined.

W. C. EBAUGH

Water supply and drainage for industrial plants. D. D. JACKSON. *Proc. Am. Assoc. Textile Chem. Colorists* **1928**, 171-8; *Am. Dyestuff Rept.* **17**, 383-90. An illustrated lecture.

L. W. RIGGS

Patents and colloid chemistry. HAROLD E. POTTS. *Chemistry & Industry* **47**, 636-43, 664-8(1928).

E. H.

Air separation and classification. E. C. BLANC. *Rev. matériaux construction trav. publics* **1928**, 177-83, 225-9.—The fundamental theory, the field of application and the historical development are reviewed. App. involving horizontal and rising currents of air and centrifugal force and regulating mechanisms are described.

F. O. A.

Pressure regulation in vacuum distillations. G. H. RICHTER. *Ind. Eng. Chem.* **20**, 682(1928).—A needle valve easily made from the base of a Tirrill burner, capable of adjustment to ± 0.5 mm., is described for use in adjusting pressures.

J. B.

Specifications—a new buying technic. F. J. SCHLINK. *Chem. Markets* **22**, 611-3 (1928).—Many industries exert increased sales pressure at a cost in amazing contrast to their expenditures for research, testing on specifications and due appraisal by modern methods. The use of specifications eliminates waste, forces business to follow direct lines from need to product, sharpens the edge of inspection, enables better judgment to be made as to the real cost of a product, and compels unenlightened manufacturers to effort to bring their products up to higher standards.

W. C. EBAUGH

Report of Committee D-9 on electrical insulating materials. H. S. VASSER, *et al.* *Proc. Am. Soc. Testing Materials* **1928**, 34 pp. preprint 77. Existing standards and tentative standards for many insulating materials are critically reviewed and 4 proposed tests are submitted for ratification as tentative standards. Existing standards discussed include those for molded insulating materials and tentative methods of testing insulating varnishes, elec. porcelain, elec. insulating materials for voltage effects at radio frequencies, untreated insulating papers, laminated sheet insulating materials, and insulated materials for resistance to impact. The "life test" of liquid insulation is regarded as too sensitive and modification of the test is being studied. A table, prepd. by A. E. Flowers, gives a summary of oxidation tests for evaluating insulating oils. The 4 proposed tentative methods of test are: for volatile matter and dielec. strength of insulating varnishes; for laminated sheet insulating materials; for testing

insulating materials for resistance to impact; and for testing varnished cloth tapes.

W. H. BOYNTON

Decreasing corrosion in the ice tank. R. E. GIBBS. *Power* 67, 1020-3(1928).—When the brine is maintained at a p_H of 7.5 to 8.5 by occasional addns. of CO_2 , corrosion is at a min.

D. B. DILL

Testing a carbon monoxide gas-mask. F. HEINRICH AND E. PETZOLD. *Chem. Fabr.* 1928, 19-22.—The Degea gas-mask for use in atms. contg. CO consists essentially of a filter impregnated with a catalyst, which promotes the oxidation of the CO to CO_2 by the O in the air, and is provided with an indicator which liberates C_2H_2 as a warning when the efficiency of the filter begins to be impaired. In air contg. 1.5% CO the life of the filter is about 40 min., and in air contg. 4.4% about 10 min. To test the efficiency of the mask the gases are passed through at a definite velocity, thence through K mercuric iodide to remove C_2H_2 , concd. H_2SO_4 to absorb hydrocarbons, $CaCl_2$ and P_2O_5 to remove moisture, and soda-lime and P_2O_5 to absorb CO_2 , and finally over CuO at 300° , any CO_2 formed being absorbed in soda-lime after drying in the usual way. For qual. detection of minute traces of CO the blood test gives the most dependable results; the ammoniacal silver soln. and palladous chloride tests are uncertain in the presence of H, C_2H_2 and CO_2 .

Apparatus and system for classifying powdered materials contained in dilute pulps. L. ANDREWS. Brit. 280,121, July 30, 1926. Brit. 280,122-3 also relate to app. for similar purposes.

Apparatus and system for hydraulic and mechanical classification of finely divided solids in pulp form. L. ANDREWS. Brit. 279,932, July 30, 1926.

Filtration system for deposition of tapered sheets of asbestos, sand and cement mixtures, etc. F. W. YOUNG (to Filtration Engineers, Inc.). Brit. 280,170, Nov. 4, 1926.

Surface condenser operation. F. HODGKINSON (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 279,901, Oct. 30, 1926. Gases are removed from the condensate collecting within a condenser by subjecting the condensate to a pressure lower than the vapor pressure corresponding to its temp. The condensate is collected in a water-seal integral with the condenser and divided into 2 zones which are exposed to different pressures so that evapn. of the zone under the lower temp. may be effected. Various structural features are described.

Distilling or evaporating liquids, etc. SYNTHETIC AMMONIA & NITRATES, LTD., R. E. SLADE, A. F. BURSTALL and W. F. CAREY. Brit. 279,526, April 30, 1926. Turbulent thick films of liquid flowing by gravity down pipes or other surfaces at a rate not less than 300 cc. per min. per cm. of periphery of the surface are employed in heat exchange, evapn., rectification, etc., or absorption of gases in liquids. An app. is described and among the processes mentioned are absorption of NH_3 in water, carbonation of NH_3 liquor, absorption of N oxides in water and evapn. or distn. of alc., NH_3 or salt solns.

Purifying gases. D. L. JACOBSON and H. A. GOLLMAR (to Koppers Co.). Brit. 280,165, Nov. 5, 1926. In removing acidic impurities such as H_2S and HCN from fuel or other gases by a process in which the gas is washed with an alk. liquid contg. a metal compd. and the sulfided liquid is regenerated by air or O to recover S, the washing liquid comprises a soln. of compds. such as those of As, Sb, Sn, Mo, V, W, Ge, U, Ir, Bi, Hg, Rh, In, Au or Pt, the sulfides of which are sol. in an alk. sulfide soln. Numerous details are given. Cf. *C. A.* 21, 2784.

Purifying sugar or other crystals. RAFFINERIE TIRLEMONTOISE SOC. ANON. Brit.

280,152, Nov. 4, 1926. The crystals are treated in centrifuges operated at high speed to remove substantially all mother liquor.

Emulsions. W. A. WHATMOUGH. Brit. 280,096, May 13, 1926. A protein soln. such as a bran ext. with which a small quantity of alkali is admixed is added to a fatty oil or the like contg. a small proportion of fatty acid, and other ingredients may be added, e. g., for making cosmetics.

Refrigerating apparatus of the absorption or adsorption type. I. AMUNDSEN (to Aktieselskabet Amundsen Refrigerator Co.). Brit. 279,850, Oct. 29, 1926.

Refrigerating apparatus of the absorption type. ALVAR LENNING (to Electrolux Servel Corporation). U. S. 1,674,830, June 26

Continuous-cycle absorption refrigerating system. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 279,898, Oct. 30, 1926.

Electrical insulation. I. G. FARBENIND. A.-G. Brit. 280,178, Nov. 6, 1926. Insulation which does not become conductive by charring (as by arcing of a switch) is formed of asbestos, slag-wool or the like, nitrocellulose, a softening agent such as tricresyl phosphate and may also include fillers and resins and solvents.

Electrical insulation. L. V. ADAMS (to British Thomson-Houston Co., Ltd.). Brit. 280,189, Nov. 8, 1926. Laminations of paper and mica flakes are cemented with a drying oil such as linseed, perilla or china-wood oil which has been heated for a sufficient time to carry it through the gel stage to the condition of a thick liquid. Degelled linseed oil 1% may be added to china-wood oil to assist its degelling. A semi-drying oil such as castor oil also may be used and gums such as copal may be added to the oils. The materials may be consolidated by pressure and baked at about 140°.

Insulation for electric conductors. P. H. BRACE (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 279,876, Oct. 28, 1926. A metal such as Mg is electrolytically deposited on the surface of the conductor and then subjected to an oxidizing atm. at high pressure and temp., e. g., to the action of high-pressure steam.

Heat-insulating material. WILLIAM K. NELSON (to The Insulex Corp.). Can. 281,140, June 19, 1928. An insulating compn. consists of 2 lbs. calcined gypsum, 4 oz. $Al_2(SO_4)_3$, 3 oz. $CaCO_3$, 6 g. soap, 10 g. gum arabic and 26 liquid oz. H_2O . Cf. C. A. 22, 2802.

Vacuum-insulated vessels. W. D. COOLIDGE (to British Thomson-Houston Co., Ltd.). Brit. 279,897, Oct. 30, 1926. Vessels with a filling of finely divided solid material such as lampblack, graphite, SiO or SiO_2 , Al_2O_3 or powd. carbides or borides within the vacuum space have a water-absorptive substance such as P_2O_5 assocd. with the inert material, to improve the insulation

14--WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Peroxidolytic activity of mineral waters; its expression by a numerical index. A. MONGEOT AND V. AUBERTOT. *Compt. rend. soc. biol.* 98, 905-7(1928).--Abandoning the technic of Glenard (cf. C. A. 5, 1477, 1956) the waters were tested as follows: To 20 cc. of the mineral water was added 5 cc. of H_2O_2 (100 vol. dild. to 10%), and the H_2O_2 present was detd. by titration with a 1 to 1000 soln. of $KMnO_4$ at the time of adding the H_2O_2 and 2, 24 and 48 hrs. later. The same operations were performed on 20 cc. of distd. water as control. The max. lysis of the H_2O_2 occurred in 24 to 48 hrs. The quantity of H_2O_2 which disappears from the mineral water divided by the quantity which disappears from the control gives the peroxidolytic index. For 3 fresh samples of Royat water from different sources the index was 14.5, 14.5 and 2.3. Bottled water from 3 other sources gave 10.0, 9.1 and 2.6. This action of mineral waters is attributed to the presence of ions, especially those of Fe and Mg. Boiling the water to remove CO_2 raises the index to 40 or above.

L. W. RIGGS

Spectrochemistry of Portuguese mineral waters; the Gerez water. A. PEREIRA FORJAZ. *Compt. rend.* 186, 1366-7(1928).--Fifty l. of the water was strongly concd., the alk.-earth elements were removed and the spectrum of the residue was obtained with a Cornu quartz spectrograph. Ge, Co, Ag and Pb were found in addn. to the elements previously found by chem. analysis. These 4 elements were identified by the rays 3269.7, 4555.4, 3280.8, 3639.7 and 3683.6.

L. W. RIGGS

Use of uranine dye in tracing underground waters. A. W. CROUCH. *J. Am. Water Works Assoc.* 19, 725-8(1928).--Uranine, a coal-tar deriv. from resorcinol, is a

reddish brown powder but dissolves in water, producing a green color. It is easy to handle, is easily detected and, in small quantities, is not harmful to public health. As a result it is considered a very satisfactory dye to use in tracing underground waters.

D. K. FRENCH

Interference of *Clostridium welchii* with Bact. coli tests in water analysis. JOHN F. NORTON AND MARION BARNES. *J. Am. Water Works Assocn.* 19, 729-30 (1928).—When *Clostridium welchii* are present, acidity is increased to p_H values of 4.2 to 4.3 in 24 hrs. as against a p_H of 5.0 to 5.3 for *B. coli*, and under such conditions the recovery of *B. coli* is uncertain. A possible interference is indicated.

D. K. FRENCH

Hydrogen-ion concentration of the water of Lake Geneva. W. H. SCHOPFER. *Arch. sci. phys. nat.* 8, 22-5 (1926); *Biol. Abstracts* 1, 17.— p_H detns. are given for water samples taken in series of depths at 4 stations in Lake Geneva on 4 dates. Surface readings varied between 7.6 and 7.85; bottom readings, between 7.2 and 7.65. p_H figures on Lake Lioson and Lake Chaussy also are given. Brief comparisons are drawn between lakes of Wisconsin and of France.

H. G.

Determination of gases dissolved in water. A. DE SALLES TEIXEIRA. *Rev. Brasil. med. farm.* 4, 86-9 (1928).—A modification of A. Florence's app. is described, which permits the absorption of gases and withdrawal of the absorbing solns. without disturbing the vacuum. The buret is provided at its upper end with a stopcock and funnel, closed by a stopper with capillary. The lower end is connected with a bulb, and the latter with the flask and the Hg container, both connections being made by three-way cocks. The flask of known vol. is filled with water, bulb and buret are evacuated and the water is boiled out. After the total gas vol. is read the KOH, pyrogallol and $CuSO_4$ or $CdSO_4$ are introduced in the proper sequence through the upper stopcock.

MARY JACOBSEN

Design and construction of small filtration plants. H. K. BELL. *J. Am. Water Works Assocn.* 19, 653-64 (1928).—A general summary of the various points to be considered, based on a wide experience in the practice of filtration.

D. K. FRENCH

Aeration of water. W. S. MAHLIE. *J. Am. Water Works Assocn.* 19, 692-703 (1928).—Aeration is especially valuable in the removal of Fe, and the reduction of tastes and odors and of objectional gases. It also results in some bacterial reduction.

D. K. FRENCH

Variations in the salinity of estuaries measured in situ by electrical conductivity. A. CHAUCHARD AND (MME.) CHAUCHARD. *Compt. rend.* 185, 1503-4 (1927).—A modified Kohlrausch cond. method is described for the detn. from a boat of the salinities of rivers and lakes in terms of the elec. cond. of the water. A correction must be applied for temp., but for depths of less than 10 m. the pressure has no appreciable effect.

B. C. A.

Purification of drinking waters. E. ROLANTS. *Rev. hyg.* 50, 373-92; 51, 449-66 (1928).—A general review of water purification methods and recent researches on this subject.

C. R. FELLERS

Simplified procedure for measuring the index of water pollution. CHARLES GAUSSEN. *Compt. rend. soc. biol.* 98, 1405-8 (1928).—The test medium was prepd. by the addn. of 30 parts of peptone (Poulenc, free from indole) and 5.0 parts of NaCl to 1000 of water. After boiling and filtering the solu., 1 drop of satd. 95% alc. soln. of toluidine blue was added and the mixt. sterilized at 115° for 20 min. The medium thus prepd. was distributed in tubes and flasks to which is then added the water to be tested in amts. from 1 drop to 100 cc. and the mixts. are kept at 37° for 36 to 48 hrs. From the color developed the no. of *B. coli* per unit vol. of water is estd.

L. W. R.

Report of committee on cross-connections. *J. New England Water Works Assocn.* June, 1928, 191-234.—The dangers of pollution by sewage, etc., are emphasized and a "partial list is given of epidemics caused by polluted water entering drinking water systems through cross-connections."

D. K. FRENCH

Sewage-polluted surface waters as a source of water supply. H. W. STREETER. *Public Health Repts.* 43, 1491-522 (1928).—The studies have shown that the efficiency of each sep. process involved in water purification, such as, e. g., coagulation, sedimentation, filtration and chem. disinfection, is influenced by a no. of factors, some of which are, and some are not, subject to phys. control. Among the former may be noted the various conditions of plant design, such as retention periods provided in basins and depths and sizes of filtering material; likewise certain measures of operation, such as the amts. of coagulants and disinfectants used, the p_H of the chem. reactions, notably those of temp., and variations in the turbidity and bacterial content of the raw water. The av. well-designed and well-operated rapid sand filtration plant, treating river waters such as are found in the Ohio and other river basins of the great Middle-Western

plains, is capable of producing, with a fair degree of consistency, a final chlorinated effluent of acceptable palatability and conforming to the revised U. S. Treasury Department standard, if the *B. coli* index of the raw water does not exceed approx. 5000 per 100 cc. A preliminary survey, now in progress, of a group of water-purification plants located along the Great Lakes has indicated thus far, however, that the av. plant treating raw waters derived from these lakes cannot produce consistently a final effluent of acceptable palatability and meeting the same standard of bacterial quality if the *B. coli* index of the raw water exceeds an amt. falling somewhere below 2000 per 100 cc. Under the most favorable conditions thus far met in practice, the av. water filtration plant treating river waters of the type above noted cannot produce consistently an unchlorinated effluent conforming to the Treasury Department standard if the *B. coli* index of the raw water exceeds 60 to 100 per 100 cc. In so far as plants treating Great Lakes waters are concerned, the corresponding av. limit appears to fall somewhere less than 10 per 100 cc. C. R. FELLERS

Oil pollution. C. H. ROBERTS. *Conseil Permanent Int. Explor. Mer. J. Conseil* 1, 245-75(1926); *Biol. Abstracts* 1, 790. —Gas oil, Diesel oil, 600 seconds oil and 1500 seconds oil were used in the expts. These oils represent the 4 types most commonly used at sea. It was found that (1) oil-films slow down absorption of O from air, but in very thin films, likely to be met with at sea, the slowing down was not appreciable. (2) Agitation, such as would be met with at sea, markedly increases the rate of absorption through an oil-film. (3) A simple method is suggested for checking spread of oil-fuel in restricted waters. (4) All the oils tested were found to be toxic to fish; this is believed to be due to sol. toxic substances and to emulsions. (5) On exposure to air, exts. of gas oil and Diesel oil lose much of their toxicity. An ext. of 600 secs. oil was unaffected by exposure but an ext. of 1500 secs. oil was more toxic. (6) Oil-films do not prevent the growth of fresh-water plants. H. G.

Water-pollution wastes: Milk-products wastes. J. M. HEPLER, H. S. MURPHY AND E. F. ELDRIDGE. Mich. Dept. Health and Conservation, unnumbered *Pamphlet*, 1-15(June, 1927).—A survey of methods of treatment of milk-products wastes was undertaken and previous results are carefully considered. Preliminary lab. expts show that in the chem. pptn. method a good flow is obtained and efficient settling occurs when sufficient quantities of FeSO_4 and NaOH are used. At least 0.6 p. p. m. of FeSO_4 must be used or the ppt. will be red in color. CaO or NaOH in quantities sufficient to produce a p_{H} of 7.5 to 8.0 will give a good flow and satisfactory settling, but produces a large amt. of sludge. Broad irrigation of milk-products wastes is recommended as a temporary expedient where possible. C. R. FELLERS

Water sterilization by chlorine. M. DIENERT. *Tech. sanit. munic.* 1928, No. 4, 75-83; cf. *C. A.* 22, 2629.—The dose to be employed should vary with the org. content, clearness and degree of contamination. The Cl must be thoroughly mixed with the water to ensure complete germ destruction. If the Cl water mixt. is agitated for at least 30 min. better results are obtained, not because of the long-continued action of the Cl but simply because of good mixing. Water properly treated with Cl will conform to the standards recommended by the Superior Hygiene Council. If water tastes of CH_3I special treatment must be used. This taste is due to oxvechlorides and may result from new pipes. Addn. of NH_3 is often useful in eliminating obnoxious odors and tastes from chlorinated waters. C. R. FELLERS

Removal of manganous salts from water. II. Mechanism of adsorption by manganese dioxide. J. TILLMANS, PAUL HIRSCH AND HEINZ GROHMANN. Frankfurt. *Gas u. Wasserfach* 71, 481-7(1928); cf. *C. A.* 21, 784. —Natural and synthetic MnO_2 adsorb Na^+ and Ba^{++} as well as Mn^{++} from solns. of the corresponding salts, but to a much slighter extent. No appreciable change in hardness of water is noted in practice. The adsorption of Mn^{++} decreases with decreasing water content of the hydrated MnO_2 and is proportional to the surface (for similar material only). A test for adsorptive efficiency has been developed, which depends on the catalytic decompn. of H_2O_2 . This test may be used for comparing similar material and for following changes in activity of the same material during use, but not for material from different sources. **III. Transformation from manganous to manganic state after adsorption.** *Ibid* 515-9.—Adsorbed Mn^{++} may be oxidized to Mn^{+++} by dissolved oxygen in the water in a purely chemical manner or by the aid of microorganisms, the latter more rapidly. The increase in activity of filters in removing Mn^{++} is due to the formation of hydrated MnO_2 on the surface of the filter material. Free CO_2 should be low. The manganese-fixing bacteria are harmed by low temperatures so the filter bed should be protected from freezing. When iron is present in water it should be removed before Mn^{++} . Chlorination should follow removal of Mn^{++} . R. W. RYAN

The microdetermination of iodine in potable waters. III. The oxidation method. MARIO SETTIMI. Lab. Chim. Sanità Pubblica. *Ann. chim applicata* 18, 104-7 (1928); cf. *C. A.* 22, 654.—0.002 *N* solns. of pure I and $\text{Na}_2\text{S}_2\text{O}_3$ in CO_2 -free water were prepd. for titration under different conditions to det. the source of error in the oxidation method of Fellenberg. The influence of temp., of concn. and of oxidation by Cl and by NaClO were studied individually. When the concn. of I is not much below 0.002 *N* and normal room temps. are used, titration with $\text{Na}_2\text{S}_2\text{O}_3$ gives satisfactory results. Only when the diln. approaches 0.0002 *N* does the temp. have a great influence on the results; the farther the temp. from 15° the greater the error. Even at 15° , however, the results are not reliable at dilns. as great as 0.0002 *N*. The influence of the I concn. is very small, and if at ordinary temps. the concns. of I and of $\text{Na}_2\text{S}_2\text{O}_3$ are not less than 0.002 *N*, microtitration gives reliable results. Oxidation with Cl water by the Fellenberg method, with NaClO by the Brubaker method (cf. *C. A.* 20, 3052-3) and with NaClO after EtOH extn. gave erroneous results, the expts. indicating that there is some unidentified oxidizing agent or other substance which complicates the reactions.

C. C. DAVIS

The new plant for removing oil from waste water at the chemical factory of C. F. Boehringer and Sons, Mannheim-Waldhof. SCHMEITZNER. *Chem.-Ztg.* 52, 388 (1928).—Oil-contg. waste waters (50 cu. m. per hr.) are led into the center of a clarifier (cf. Weickert, *C. A.* 21, 3693) 5 m. in diam., and then pass radially through the clarifying space (15.8 sq. m. area and max. depth of 2.9 m., holding 25 cu. m.) and under a peripheral ring to the discharge. The sepd. oil remains within the ring and is drawn off periodically by hand. The app. is made of concrete, and is entirely below ground level.

W. C. EBAUGH

Precautions necessary to prevent scaling in heating plants. H. BALCKE. *Gesundh. Ing.* 51, 386-90 (1928).—Softening with permutite is recommended. Another method is the decompn. of the carbonates of Ca and Mg by means of HCl . The CaCl_2 and MgCl_2 formed are very sol. and will not cause scale. Photographs of scaling before and after the treatment are given.

WAYNE L. DENMAN

Effect of certain Illinois waters on lead. O. W. REES AND A. L. ELDER. *J. Am. Water Works Assn.* 19, 714-24 (1928).—Waters high in excess CO_2 with or without O can dissolve Pb. NaCl is of importance in the corrosion of Pb but not in its soln. The addn. of lime or alk. silicates and the retention of a pH of 7.0 to 9.5 are all suggested remedies.

D. K. FRENCH

Modern boiler problems. A. G. CHRISTIE. *Power* 67, 946-9 (1928).—A discussion.

D. B. DILL

Pumping station practice. F. W. DEAN. *J. New England Water Works Assn.* June, 1928, 109-31.—A general discussion of the most effective types of boilers, their proper setting, construction and operation, to get their highest efficiency. Space is also devoted to direct acting and centrifugal pumps.

D. K. FRENCH

Iodine in the public water supplies of Massachusetts. N. W. CLARK. *J. New England Water Works Assn.* June, 1928, 132-6.—There are recorded the results of all I detns. made by the Mass. Dept. Public Health on public supplies during 1925 and 1926. The amts. run from none to 6.33 pt. per billion in surface waters and from none to 4.30 in ground waters. Modifications of analytical methods used are outlined.

D. K. FRENCH

Common errors and beliefs regarding ground waters. ALFRED SALMON. *L'eau No. 3*, 35-6 (1928).—A discussion indicating the ease with which ground waters may become polluted.

C. R. FELLERS

Engineering analysis applied to municipal waterworks. WM. SHAW. *Proc. Eng. Soc. Western Penna.* 44, 47-86 (1928).—The object of this study was to det. which was the more economical (a) to expend money for the improvements, necessary for the continued successful operation of the present Pittsburgh steam-operated system, or (b) to erect a new station equipped with electrically driven units. The necessary calcs. are well presented. Although the data indicate steam operation is the cheaper, no conclusions are drawn.

C. R. FELLERS

Boiler-feedwater treatment in the Southwest. PAUL F. HOOTS. *Elec. World* 91, 1340 (1928).—A detailed statistical report.

C. G. F.

Availability of nitrate oxygen in filter effluents. O. M. URBAIN. Urbain and Hunt, Columbus, O. *Ind. Eng. Chem.* 20, 634-5 (1928).—Nitrate O is available only after the dissolved O is depleted whether the dilns. be made from sewage or filter effluents. Bacteria use the O in nitrates only if no other source is available. Such conditions usually obtain only under anaerobic conditions. Nitrate O does not increase the available O balance of the receiving waters.

CARL R. FELLERS

The disposal of the sewage of the sanitary district of Chicago. CHAS. B. BURDICK AND L. R. HOWSON. Ill. State Water Survey, *Bull.* 23, 1-195(1928).—The present sewage discharge of the Chicago Sanitary District is approx. 800 million gals. per day and carries an org. load much higher than any other city furnishing reliable data. This excessive load is partly due to a few large industries which produce an amt. of pollution equiv. to that of 1.5 million people. Max. pollution standards recommended for the Chicago Drainage Canal and to be based on samples taken for 30 consecutive days are: (a) shall be practically free from settleable solids deposited in 2 hrs.; (b) shall contain dissolved O equal to or exceeding the biochem. O demand of said liquid for 5 days when incubated at 20°; (c) shall contain not less than 3 p. p. m. of dissolved O. Specific recommendations relating to the protection and metering of the water supply and sewage and waste disposal are outlined. Filtration is considered a prerequisite to the adequate disposal of Chicago sewage. Chicago can secure pure, clean water at all times by the filtration of its present supply. CARL R. FELLERS

Some methods of analysis of sewage and water. O'SHAUGHNESSY, C. H. HEWITT AND A. S. MILLER. *Surveyor* 72, 494-5(1927); *Bull. Hyg.* 3, 421(1928).—A review and criticism of recent methods of analysis. GEORGE R. GREENBANK

Comparative colon-aerogenes indices of water and sewage. RALPH E. NOBLE. *J. Am. Water Works Assoc.* 19, 733-46(1928).—Over 76% of samples examd. by the cyanide-citrate agar pour plate equalled or exceeded indices obtained by the standard fermentation method. From this and other evidence given in detail, the conclusion is drawn that "the plate method is a sharper or more sensitive measure of the actual mean density of organisms of the colon-aerogenes group in water or sewage than is the lactose fermentation method." D. K. FRENCH

The removal of phenols from waste liquors of by-product plants and its economic importance (WEINDEL) 21. The purification of ammoniacal waste liquors (OTT) 21. Influence of P on strength properties of cast iron pipe (MACKENZIE) 9. Apparatus for carbonating water (U. S. pat. 1,674,993) 1.

Purifying and softening water. HÖGANAS-BILLESOLMS AKTIEZOLAG AND NORDISKE NATROLITH AKTIESELSKABET. Brit. 279,788, Oct. 29, 1926. Silica gel or gels contg. siliceous substances are used and may be regenerated; e. g., clay formed under the sea and naturally contg. 1-2% Na₂O may be used and subsequently regenerated by HCl. The clay may be preliminarily purified by treatment with molten alkali bisulfate, washing and calcining at temps. up to 750° and may be formed into grains before or after calcining.

Automatic apparatus for softening water by treatment with reactive chemicals. CHARLES P. EISENHAEUER (to The Duro Co.). U. S. 1,674,717, June 26.

Boiler-scale remover. ALFRED BIAGINI. Can. 281,528, July 10, 1928. A boiler-scale remover consists of H₂O 100 gals., Na₂CO₃ 360 lbs., Na silicate 48 lbs., tannum 36 lbs. and NaOH 6 lbs.

Scale remover. JOHANN BILLWILLER. Can. 281,216, June 26, 1928. Artificial resin acids (abietic acid, pimaric acid), oxidized and polymerized, are mixed with vegetable products (glycerol, wood gum, tragacanth) to form a paste which may be added to boiler water to remove scale.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Classification of the soils of Quebec. AUGUSTE SCOTT. *Sci. Agr.* 8, 668-74 (1928).—A general discussion. C. R. FELLERS

Diversity of soil type in the Prairie Provinces and causes of the same. A. H. JOEL. *Sci. Agr.* 8, 651-64(1928).—The origin, classification, natural vegetation and crop suitability of prairie soils are investigated. C. R. FELLERS

Degree of acidity of Norwegian soils. K. O. BJØRLYKKE. *Tids. norske landbruk* 1926; *Proc. Internat. Soc. Soil Sci.* 3, 36(1927-8).—Examn. of a large no. of Norwegian soils revealed the following general relationships. Surface soils generally have lower p_H values than subsoils. Acidity is more pronounced in the older and more completely weathered soils. Soils rich in colloidal matter are usually less acid than sandy soils and cultivated soils than uncultivated. B. C. A.

Soil phosphorus studies. I. The colorimetric determination of organic and in-

organic phosphorus in soil extracts and the soil solution. F. W. PARKER AND J. F. FUDGE. Alabama Agr. Expt. Sta., *Soil Sci.* 24, 109-17(1927).—A detailed procedure for the colorimetric detn. of total and inorg. P in soils is given. Moderate amts. of SiO_2 do not influence the detn. Deniges' method is recommended as more sensitive than that of Fiske and Subbarow. The latter method may be more valuable for some other classes of work. II. The concentration of organic and inorganic phosphorus in the soil solution and soil extracts and the availability of the organic phosphorus to plants. W. H. PIERRE AND F. W. PARKER. *Ibid* 119-28.—Displaced solns. from 20 soils collected in 9 states contained an av. of 0.09 p. p. m. inorg. and 0.47 p. p. m. org. PO_4 . The 1:5 soil exts. averaged 0.35 inorg. and 0.22 p. p. m. org. phosphate. Plants absorbed all of the inorg. P but none of the org. from either soil ext. or soil soln. Corn made no growth when sol. org. phosphate was the only source of P but made good growth in the same soln. contg. inorg. PO_4 . The growth was almost proportional to the amt. of the latter present. The bearing of the results on plant nutrition is discussed. III. Plant growth and the absorption of phosphorus from culture solutions of different phosphate concentrations. F. W. PARKER. *Ibid* 129-46.—Culture solns. of low phosphate concn. to be favorable for plant growth must be supplied in large vol. per plant, the phosphate concn. must be kept up by very frequent renewals, and it must be free of Fe. Fe must be supplied occasionally for a period of 1 day. Max. growth of corn and soy beans was obtained in a soln. contg. 0.50 p. p. m. PO_4 . With 0.25 p. p. m. the dry weight was 75% of the max. If the concn. could be maintained const. good growth might be secured with 0.10 p. p. m. Plants do not obtain all of their P from the soil soln. as obtained by the displacement method. The solid phase of the soil has an important function in the P nutrition of corn and soy beans. The theory of the solvent action of CO_2 from plant roots does not adequately explain the absorption of P from soils. 33 references are given in the 3 sections. A. L. MEHRING

Determination of the phosphate requirement of soils. F. TERLIKOWSKI, S. MICHNIEWSKI AND M. KWINTCHIDZE. *Rocz. Nauk Rolniczych i Lesnych* 17, 309-35(1927).—In a critical examn. of methods for estg. soil fertility the importance of adapting the exptl. process to suit local soil conditions is emphasized. Fresh soil samples are essential in detg. phosphate requirements. Drying alters the proportion of sol. phosphate in soils to an extent peculiar to each soil. The amt. of soil phosphate assimilable by plants bears no definite relationship either to the total, water-sol. or citric-sol. phosphate present. Many soils, showing no phosphate requirement by the Mitscherlich method, were deficient according to the Nemec standard. There is a definite inverse relationship between the humus contents of soils and their water-sol. phosphate contents. B. C. A.

Distribution of phosphoric acid and potassium in soils. S. GERICKE. *Z. angew. Chem.* 41, 52-6(1928).—The absorption of phosphoric acid and K by plants from the soil depends not only on the presence of these materials in a readily assimilable form, but also on the phys. properties of the soil itself. The variation in size of the soil particles is an important factor; this may be detd. by shaking the soil with water, allowing to settle for a definite time, and pouring off the liquid contg. the smaller particles in suspension, thus dividing the sample into fractions of decreasing particle size. The results obtained depend largely on the method of prepn. of the analysis sample, which must be shaken or boiled with water or rubbed with a pestle to sep. the particles. P_2O_5 is found in all fractions, but chiefly in the fraction contg. particles of 0.02-0.2 mm., while K salts are concd. in the smaller particles (less than 0.002-0.02 mm.). Both substances are more readily assimilated by germinating roots from the fractions of larger particle size than from the closely packed soils of small particle size. B. C. A.

Active reaction of the soil solution as a factor controlling plant distribution. E. V. BELYAKOV. *Ber. Saratov Naturforscherges.* 2, 21-6(1927); Russian with German summary.—Some of the semiarid plant assocns. of the Saratov region showed no relation to the soil pH ; others were closely dependent on it. The semiaridity is not assocd. with marked alk., the greatest pH value being 7.4, and as low as 4.7 being noted. The alk. of semiarid and desert soils is usually overstd. Strongly alk. and strongly acid soils are rare; weakly acid, widespread. The acidity arises from CO_2 , weak org. acids and Fe sulfates. The reaction is less a matter of climate than of the chem. nature of the underlying rock-formations. The rocks investigated showed pH 3.2-8.0, a wider range than the derived soils. E. T. WHERRY

Comparative study of the state of saturation and the exchangeable bases of the red soil in the original condition and in thirty years' coffee culture. THEODURETO DE CAMARGO AND PAULO CORREA DE MELLO. *Landw. Vers. Sta.* 107, 189-206(1928).—The red soils of the virgin forest are as a rule well provided with adsorbable bases and

possess an alk. or very weak acid reaction. By the more or less complete leaching out of bases and the substitution by H ions of carbonic acid of the water the soil will little by little become poorer in bases and finally acid. The loss in adsorbable bases, chiefly Ca, contributes to the modification in structure of the soil, whose adsorptive power is considerably decreased and whose acidity by exchange is increased and the soil thereby made less suitable for the thriving of bacteria and plants. A characteristic of the red soils becoming poor in base exchange is the relative poorness in Ca and Mg and the abundance in Na. The absorption capacity of the red soils increases with the percentage content of replaceable Ca.

E. F. SNYDER

The deflocculation and plasmolysis of soil coatings. B. GANOSSIS. *Compt. rend.* 186, 1234-6 (1928).—The results of the effect of different salt solns. on soil permeability are given. The solns. reestablishing the permeability of the soil have been applied to the soil made impermeable by Na_2CO_3 as in previous expts. Besides the alkali carbonate, NaOH, NaCl and NaNO_3 finally bring about the complete impermeability of the soil, each soln. after different intervals. On the contrary $\text{Ca}(\text{NO}_3)_2$ and CaSO_4 as well as KCl, KNO_3 , HCl and HNO_3 behave as CaCl_2 in reestablishing the permeability of the soil.

E. F. SNYDER

Chemical corrosion of lead in soil. O. HAEHNEL. *Elektr. Nachr. Techn.* 5, 171 (1928).—An address. H's observations do not check those of American investigators. In general, bare cable sheaths buried in the soil seldom last for 25 to 30 years. Furthermore, there is considerable divergence in protective qualities of the various pitches and tars used for impregnating. Six photographs are shown.

C. G. F.

Contribution to the knowledge of the hydrogen peroxide-decomposing property of soils. K. SCHARER. *Landw. Vers. Sta.* 107, 112-87 (1928). Although the values for the catalytic action of soils exhibit no direct function of the p_{H} values of the soils, in this work it was again confirmed that undoubtedly relationships exist between the reaction of the soil and its H_2O_2 -splitting power, in that in general acid soils show this property in much less degree than neutral or strongly alk. soils. The content of Fe and Mn compds. in soils is indeed a very important, but not conclusive factor for the quantity of catalytic activity of soils. A higher content of total lime corresponds in general to a greater H_2O_2 -splitting power. A similar relationship is shown between the NH_4Cl -dissolved Ca and the catalytic action. Sandy soils show in general the least, loam and clay soils the highest, catalytic values. There are no clear relationships to be observed between the hygroscopicity of the soils and the H_2O_2 -splitting property. If one analyzes a soil mechanically and detcs. the catalytic power of the fractions, the coarser fractions show in general a less catalytic value than the fine. The catalytic power of soils is differently influenced by treatment with inorg. salts and org. substances; by treatment with HCl, AlCl_3 , HgCl_2 and CuSO_4 it is lowered and by NaOH and NH_4OH increased. By boiling and heating the air-dried soil at 100° to const. wt. the catalytic power is somewhat lowered, just as by sterilization. By ignition there follows a diminution of the H_2O_2 -splitting property. By exposure to ultra-violet light the catalytic action of the soil is somewhat removed. There exists no direct relationship between the total no. of bacteria and the H_2O_2 -splitting action. A large no. of references are given.

E. F. SNYDER

The cultivation of lucerne. ANDREW CUNNINGHAM. *Scottish J. Agr.* 11, 41-50 (1928).—An investigation was made of the factors affecting the growing of lucerne in southeast Scotland. In 4 expts. on soils of p_{H} 5.00-5.49 lucerne failed to grow, while it was successfully grown in a no. of expts. on soils of p_{H} 6 to 7.4. Inoculation of the soil with N-fixing bacteria resulted in some cases in an increase of more than 100% in the % of N in dry matter from lucerne. During the first season, the N content of the dry matter from lucerne grown on uninoculated soil varied from 1.63 to 2.28% while that from inoculated soils varied from 2.76 to 3.47%. Some strains of bacteria were more effective than others in increasing the wt. of the crop and the % of N in the oven-dried material.

K. D. JACOB

Chemical fertilizers for greenhouse lettuce. J. H. GOURLEY. *Ohio Sta. Bull.* 408, 22 (1927); *Expt. Sta. Record* 58, 137-8. —The results of expts. undertaken to det. to what extent chem. fertilizers, lime and green manures may be substituted for animal manures in the production of greenhouse lettuce indicate that, with soils such as used, heavy annual applications of 1 ton of 3-12-4 or 3-7-9 (N-P-K) per acre of complete chemicals plus a turned-under crop of soy beans may produce crops averaging 80% as large as those obtained from 30 tons of manure per acre and in certain seasons almost equal the yields from manure. It is suggested that in event of manure shortage half the material supplemented with 0.5 ton of high-grade chem. fertilizer should give excellent results. Complete fertilizer composed of NaNO_3 , acid phosphate and muriate

of potash proved superior to any single ingredient or to a combination of N and P or N and K. NaNO_3 used alone failed to increase yields and in fact depressed them about 8% below the control. Acid phosphate used alone in the same series gave a 26% increase and lime a 15% increase. In respect to soil reaction the strongly alk. soils used produced no deleterious effect provided ample plant foods were present. Not until a pH value of nearly 8.5 was reached was there any indication of lime injury manifested in spotting and injury to the edge of the leaves. H. G.

"Edelmist." ANDREW CUNNINGHAM. *Scottish J. Agr.* 10, 434-9(1927).—The manuf. of "Edelmist," or artificial barnyard manure, by the German process, is described. The product is superior to ordinary barnyard manure in fertilizer value and in keeping qualities. K. D. JACOB

The hygroscopicity of a few artificial fertilizers. ANON. *Ind. Mercur* 1926; *Ber. Afdel. Handels museum Ver. Koloniaal Inst.* No 27, 15 pp.—The hygroscopicity of several commercial fertilizers and their mixts. at different degrees of atm. moisture was studied. A. L. HENNE

Ammonia vs. nitrate (fertilizer). KABATÉ. *Rev. agr. Maurice* 5, 69-72(1928).—Field tests made in France on sugar beets during 1927 have given results which are summarized as follows. The max. yield of both roots and sugar was obtained by using NaNO_3 as the only source of N, in spite of the rainy weather; $(\text{NH}_4)_2\text{SO}_4$ gave the lowest yield, the difference between that and the max. being 10 times the mean error of the expt. NH_4 sulfate-nitrate gave yields in between the other 2. F. W. ZERBAN

Manganese as a fertilizer for coastal-plain soils. I. G. WILLIS. N. C. Agr. Expt. Sta., *Fertilizer Green Book* 9, No. 6, 17-20(1928).—Coastal-plain soils in N. C. which show marked Mn deficiency do not respond to heavy applications of phosphate even though the soils are low in P. Soils rendered neutral or alk. by liming frequently respond readily to applications of MnSO_4 and there is no evidence that strongly acid soils require treatment with Mn salts. Apparent Mn deficiency may often be remedied by free use of S, $(\text{NH}_4)_2\text{SO}_4$ and org. matter. K. D. JACOB

Manganese in agriculture. G. A. FRACANZANI. *Il coltivatore* 75, 432-8(1928).—Hyacinth bulbs, treated with $\text{Mn}(\text{NO}_3)_2$ injections, had a better and earlier root and aerial development than untreated bulbs or those raised on soil treated with Wagner's soln. The best results were obtained with relatively frequent 1-cc injections of a 2% soln. in conjunction with complete fertilization with Wagner's soln. A. R. M.

Experiments with fertilizer in the cultivation of sugar cane. VII. Ammophos 20 20. WM E. CROSS. *Rev. ind. agr. Tucuman* 18, 27-30(1927); cf. *C. A.* 21, 190.—The av. increase in yield obtained with 6 kg. Ammophos per furrow was 18.96 kg. sugar and 1873 kg. cane per ha., with 12 kg. Ammophos per furrow it was 19.07 kg. sugar and 1071 kg. cane. An excess of fertilizer apparently extends the vegetative period and delays the formation of sugar. The result obtained with 6 kg. is quite satisfactory as it reduces the cost of production, increases the resistance of the cane to diseases, speeds up growth and "closing" of the cane and permits the production of more cane within a smaller radius around the plant, thereby reducing the cost of transportation and the deterioration caused by delays. MARY JACOBSEN

Fertilizing meadows with mineral nitrogen. GISEVIUS and KLITSCH. *Z. Pflanzenernähr. Düngung Bodenk.* 7B, 1-15(1928).—Analyses of hay from fertilized meadows indicated that $\text{K-P}_2\text{O}_5$ applications produced larger crops with greater N content than did N applications. Complete artificial fertilizers yielded the largest crops, but the N content was lower than when K and P_2O_5 only were applied. When more than one cutting of grass was made in a season on plots receiving N only, the total yield and N content were higher with 3 cuttings than with 2. Meadows treated with P_2O_5 and K alone yielded larger crops and higher N contents with 2 cuttings than with 3. $(\text{NH}_4)_2\text{SO}_4$, NaNO_3 , and urea did not show very definite differences in their effects on herbage; NaNO_3 was generally superior in dry weather. P. R. DAWSON

Rhenania phosphate and its use in Hungary. LADISLAUS ERDÉLY. *Fortschritte Landw.* 3, 66-8(1928).—In numerous field and pot expts. the citrate-sol. P_2O_5 of Rhenania phosphate proved equiv. to the water sol. P_2O_5 of superphosphate. Rhenania phosphate is an acid-free substance robbing the soil of no active Ca; on the other hand it adds appreciable amts. of Ca to the soil. Hence in many cases it may surpass superphosphate in results. P. R. DAWSON

Examination and fertilizing of acid mineral soils. H. KAPPAN. *Z. Pflanzenernähr. Düngung Bodenk.* 7B, 16-29(1928).—The various methods of measuring soil acidity are compared and discussed. Detn. of the pH value must always be made and should be carried out on the soil suspension. For measuring the quantity of lime to be

applied to plants less sensitive to acid, the exchange acidity is to be employed. For more sensitive plants the quantity of lime is to be detd. by the hydrolytic acidity. The detn. of the abs. neutralization value (Kappen-Hilkowitz) and the degree of satn. (calcd. from the latter values) give a deeper insight into the acidity condition of the soil. The effectiveness of liming is governed by the fineness of grinding of the material, the thoroughness of distribution through the soil and the temp. and moisture content of the soil. In the application of the usual fertilizer materials to acid soils no change of procedure is necessary, provided adequate lime has been applied or is applied with the fertilizer. Without lime, however, fertilizer compds. tending to acidity should be avoided. The value of detg. the buffer capacity (Jensen) in selecting general fertilizer materials is discussed. P. R. DAWSON

Studies on nitrification and its relation to crop production on Carrington loam under different treatments. LEWIS W. ERDMAN and HARRY HUMFELD. Ia. Agr. Expt. Sta., *Research Bull.* 110, 262-91 (1928).—The nitrifying power of the soil from the sample plots was detd. by nitrification of (a) the N present in the soil, (b) $(\text{NH}_4)_2\text{SO}_4$ and (c) $(\text{NH}_4)_2\text{SO}_4$ in the presence of CaCO_3 . The incubation period was 30 days, after which the soil reaction was detd. Soil moisture was not affected by crop rotation or soil treatment. Crop rotation did not effect appreciably the nitrifying power of the soils which had been untreated for 12 years nor those which were fertilized, fertilized and limed or treated with crop residues and lime. Definite correlations were obtained between crop yields, the nitrifying power as measured by $(\text{NH}_4)_2\text{SO}_4$, and the reaction of the soils after 30 days' incubation. Perfect correlations were not obtained between the nitrifying power of the soils and crop yields when the test was made by measuring the nitrification of $(\text{NH}_4)_2\text{SO}_4$ in the presence of CaCO_3 , although all soils showed a high nitrifying power in all cases where the crop yields were high. The presence of lime increased the nitrifying power of soils. There was a definite correlation between soil reaction and soil nitrifying power. C. R. FELLERS

Chemical treatments for controlling the growth of buds of plants. F. E. DENNY. *Ind. Eng. Chem.* 20, 578-81 (1928). The use of Na thiocyanate, ethylene chlorohydrin, ethylene dichloride, thiourea and others, has been found effective in influencing plant growth. Such chemicals have been successfully employed in causing early development of dormant buds, such as those of potato tubers, gladiolus bulblets or various woody plants (lilac, crabapple, azalea, etc.). Gains of 2 weeks to 2 months in the time required to produce sprouts or blooms have been obtained. These chem. treatments have also increased the no. of buds that will grow, influenced the subsequent rate of growth and modified the relative amt. of leaf and flower development. E. F. SNYDER

Disinfection of flax seed. ERNST SCHILLING. *Faserforschung* 6, 105-15 (1928).—In field tests it was shown that the disinfection of flax seed does give increased yields and better straw when suitable materials are used. However, some recommended disinfectants actually restricted germination and gave smaller crops than were obtained when seed believed to carry fusarium and colletotrichum sickness was planted without treatment. Other disinfectants gave no definite results. Of the useful materials, "Agfa No. 30," gave the best results. No chem. identifications are given. E. R. CLARK

Dry disinfection of grain with continuous dusting machines. G. FRIEDRICHS. *Fortschritte Landw.* 3, 58-66 (1928).—The results are presented of expts. on the efficiency of several types of com. dusting machines and the factors involved are discussed. P. R. DAWSON

Determination of lime requirement. KURT MANTEUFFEL. *Fortschritte Landw.* 3, 68-9 (1928).—A discussion of the significance of lime requirement and its detn. under practical conditions, with particular emphasis on plants as indicators. P. R. D.

Experiments with weed-killers on garden paths at Craibstone. ALFRED HILL. *Scottish J. Agr.* 11, 203-9 (1928).— NaCl and H_2SO_4 temporarily reduced the no. of weeds on garden paths but ultimately appeared to stimulate growth. Fe sulfate and Na_2CO_3 had no pronounced weed-killing properties and dil. solns. of phenol, Na_3AsO_4 and gas-works liquor were not satisfactory. The best results were obtained with powder CuSO_4 at the rate of 1 lb. per 100 sq. ft., and with 1% solns. of NaClO_3 , the efficiency of both compds. decreasing with increase in rainfall during the first week of application. Fe sulfate was effective in killing moss on walks and solid NaOH removed green growth on concrete paths. K. D. JACOB

Killing field bindweed with sodium chlorate. W. L. LATSHAW and J. W. ZAHNLEY. *Kan. Agr. Expt. Sta., Circ.* 136, 1-15 (1928).—Aq. soln. of NaClO_3 , 8-9%, proved effective in killing bindweed in 3 applications without injury to surrounding trees or

shrubs. About 100 gals. will treat 1 acre. NaClO_2 is non-poisonous to livestock and does not injure the soil.

C. R. FELLERS

Attempts to control bunt (*Tilletia tritici*, Wint.) in wheat with a formalin-gypsum dust. H. H. STIRRUP AND H. T. CANFIELD. Midland Agr. and Dairy Coll., England. *Ann. appl. Biol.* 15, 245-50 (1928).—Variable control of the fungus was obtained with this dust. *T. tritici* probably comprises several biol. forms.

C. H. RICHARDSON

The use of tetrachlorethane for commercial glasshouse fumigation. T. PARKER. Abol Research Lab., Kent, England. *Ann. Appl. Biol.* 15, 251-7 (1928).—The white fly can be controlled by a dosage of 2.5-5 fluid oz. $\text{C}_2\text{H}_2\text{Cl}_4$ per 1000 cu. ft. of space at a temp. of 15.5-21°, the exposure being 12 hrs. Various methods of application are discussed. The compd. seems to have a selective action on white fly and mealy bug; certain species of aphids are unaffected. The effects of the compd. on various plants has been studied, a considerable no. of plants being unharmed by doses that are toxic to insects.

C. H. RICHARDSON

The toxicity of certain sulfur compounds to *Synchytrium endobioticum*, the fungus causing wart disease of potatoes. W. A. ROACH AND M. D. GLYNNE. Rothamsted Expt. Sta., England. *Ann. Appl. Biol.* 15, 168-90 (1928).— H_2SO_4 , H_2SO_3 , $\text{H}_2\text{S}_2\text{O}_4$, $\text{H}_2\text{S}_2\text{O}_5$ and $\text{H}_2\text{S}_2\text{O}_6$ were toxic to the winter sporangia of *Synchytrium*. The order of toxicity was the same in each case at the same p_{H} . The neutral salts were non-toxic. The toxicities of these acids are probably due chiefly to their H-ion concns. Acidified solns. of $\text{Na}_2\text{S}_2\text{O}_3$, $\text{Na}_2\text{S}_2\text{O}_4$ and Na formaldehydesulfoxylate were about 10 times as toxic as H_2SO_4 . The toxicity of the acidified solns. is tentatively held to be due to the thiosulfuric acid in them. NaOH was slightly more toxic than H_2SO_4 and persulfuric acid about 10 times as toxic, whereas H_2O_2 , Ca polysulfide and H_2S were only slightly toxic.

C. H. RICHARDSON

Control of chlorosis of the pineapple and other plants. MAXWELL O. JOHNSON. Calif. Pkg. Corp. Wahiawa, Oahu, T. H. *Ind. Eng. Chem.* 20, 724-5 (1928); cf. C. A. 11, 275. The yellowing or chlorosis of pineapple or sugar cane plants on highly calcareous Hawaiian soils is due to Fe deficiency. This disease has been erroneously called Mn poisoning. A spray of FeSO_4 , 4-6%, applied once a month effectively controlled chlorosis. On acid soils contg. only a normal amt. of CaCO_3 , this defect is affected by the availability of Fe in the soil, i. e., the relative acidity or alky. and the relative oxidizing or reducing agents in the soil. With soils of p_{H} above 4.5, the MnO_2 present constantly oxidizes any Fe to the unavailable ferric condition. Marcasite, a by-product of coal mining, when powd. and mixd. with infusorial earth and sprayed on the plants every 2 months at the rate of 8 lb. per acre effectively prevented chlorosis on pineapples and sugar cane. Applications of FeSO_4 or marcasite directly to the soil have been uniformly unsuccessful.

CARL R. FELLERS

Modern methods of disinfection and rat destruction. M. SILLEVAERT. *Bull. service med. du travail, Bruxelles* 5-6, Nos. 3-4, 57-72 (1926); *Rev. hyg.* 50, 213.— SO_2 was found to be a splendid insecticide and rat killer but a poor bactericide. CO was valuable only as a rat killer, and had little value as a house fumigant. HCN when used with due caution probably gave best results in the fumigation of ships, railroad cars or isolated buildings. CNCl was both a rat destroyer and an insecticide but its use is still limited. Because of its lachrymatory effects it is safer than HCN. Chloropicrin, though an efficient fumigant, proved very difficult to remove from the air, several days being required in some cases. Phosgene ranked high as an insecticide and rat killer. The principal objection to it is its extreme toxicity, causing pulmonary edema.

C. R. FELLERS

Chemical process efficiency [for production of fertilizers] (FIRTH) 13. Modification of Risdale's method for determining phosphoric acid (DODD) 7.

ERNST, FRANK A.: **Fixation of Atmospheric Nitrogen.** New York: D. Van Nostrand Co. \$2.50, postpaid. Reviewed in *Sugar* 30, 326 (1928).

WORTHEN, E. L.: **Farm Soils—Their Management and Fertilization.** New York: John Wiley & Sons. London: Chapman & Hall. 410 pp. Reviewed in *Expt. Sta. Record* 58, 116 (1928).

Fertilizer. I. G. FARBENIND. A.-G. Brit. 280,447, Aug. 11, 1926. A hot soln. of NH_4NO_3 contg. a Ca or K salt is solidified by spraying or cooling and the product is mixed with solid diammonium phosphate or hot concd. solns. of the latter can be used for prepg. fertilizers such as described in Brit. 256,972 (C. A. 21, 3101).

Fertilizer. E. BAUER and L. SZOLD (trading as Eisler & Szold). Brit. 280,219, Nov. 5, 1926. Spent molasses waste which has been concd. (but not beyond 35° Bé.) and cooled to 60° is mixed with the lime sludge obtained in refining sugar or with similar material from other treatment of lime with CO₂ and the product is dried at 100-105°.

Fertilizer. SOC. ANON. UNION AGRICOLE DE JODOIGNE. Brit. 280,226, Nov. 4, 1926. A mixt. of natural phosphates contg. a high proportion of phosphoric acid, and CaCO₃, with KCl is treated with H₂SO₄ and (NH₄)₂SO₄ is added to the product and it is then neutralized by adding a natural phosphate contg. a low percentage of CaCO₃, allowed to dry and harden and then ground.

Fertilizer. ERIC H. RICHARDS and HENRY B. HUTCHINSON (to Adco Ltd.). Can. 281,607, July 10, 1928. In prepg. a fertilizer by aerobic fermentation N is supplied by a compn. of 50% CaCN₂, 25% ground chalk and 25% ground mineral phosphates admixed together to such a fineness that substantially 60% of the mixt. will pass a 100-mesh sieve.

Fumigating with hydrocyanic acid. FLOYD J. METZGER and GEORGE C. BAUER (to Calif. Cyanide Co.). U. S. 1,675,123. A solid cyanide-contg. material such as Ca(CN)₂ is subjected to the action of moist air or other suitable moist gaseous medium capable of evolving HCN from the solid material, and the HCN is delivered to the space to be fumigated. An app. is described.

Insecticides and sheep dips. McDUGALL & YALDING, LTD. and P. J. FRYER. Brit. 280,256, Nov. 24, 1926. Active plant exts. such as Derris ext. are used with phenols and hydrocarbon oils and formed into emulsions.

Preparation of water-free alcohol. HEINRICH PINCASS. *Metallborse* 18, 117 8 (1928).—A description of processes to be found in the patent literature. J. B.

Chemical composition of the white wines of L'Herault. E. HUGHES and H. PAU. *Prog. agr. vit.* 89, 572-5 (1928).—A table of analyses of different wines of the 1927 vintage is given. P. R. DAWSON

Presence of glucuronic acid in wine from musty grapes. D. CHOCHAK. *Ann. chim. anal. chim. appl.* 10, 97 8 (1928), cf. C. A. 22, 1649.—It has been known that the conventional analysis of the total solids of wine made from musty grapes does not yield a summation sufficient to account for the entire amt. of solids present. This indicates that there is something present in the solids from wine made from musty grapes which is not present in wine made from grapes of good quality. This substance appears to be glucuronic acid which is present normally only in traces but is fairly abundant in musty grapes. In the wine from musty grapes, one sample showed 0.4 g. and another sample 1.25 g. of glucuronic acid per l. The method of Chirav or that of Brulé can be used for the detn. of glucuronic acid. W. T. H.

The mass production of yeast for feeding purposes. I. E. G. STICH. *Chem.-Ztg.* 52, 149-50 (1928).—A discussion in detail of the Delbruck process for the production of yeast in large quantities, and its economical value. II. *Ibid* 170 1.—A critical discussion of different processes for the production of yeast on a large scale. Production costs are given for one process and extensively tabulated, from the raw materials to the finished product. J. C. JURKJENS

Reinforced concrete vats and casks in breweries. EUGENE BORSAKI. *Ciment* 33, 154-5 (1928).—Concrete tanks lined with an org. material called "Ebony" have given good satisfaction when properly built. F. O. A.

The free-energy decrease of alcoholic fermentation. (FULMER, LEIFSON) 11A.

HEWITT, J. T.: **The Chemistry of Wine Making.** Report on Oenological Research, London: H. M. Stationery Office. 57 pp. 1s.

Device for drawing off fermented liquor from containers. S. A. GANTE. Brit. 279,552, July 28, 1926.

Filtering beer, wort, etc. HANSENA A.-G. and L. NATHAN. Brit. 280,395, Dec. 28, 1926. A filtering medium is mixed with a portion of the liquid under pressure and the medium is deposited on a support such as wire netting to form a filter for all of the liquid. An app. is described.

Sterilization of wort. EJNAR A. MEYER. Can. 281,067, June 19, 1928. Worts are treated with a material capable under operating conditions of liberating a halogen, e. g., a satd. aq. Cl soln.

Yeast. R. L. CORBY and W. H. F. BÜHRIG (to The Fleischmann Company). U. S. 1,673,735, June 12. In a continuous-addn. process of mfg. yeast by propagation with aeration over a period of about 8 hrs., the propagation of yeast may be initiated with aeration in a small portion of dil. nutrient soln. at a temp. of about 33° and yeast-nutrient soln. then gradually added, and after a few hrs. the temp. is slowly lowered to below 30°.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Determination of pepsin. K. HOFFMANN. *Pharm. Ber.* 2, 45-7(1927).—By Bachstetz's modification of Gross' method various com. pepsin preps. showed scarcely any activity. B. C. A.

Californian lemon and orange oils. L. BONACCORSI. *Boll. ufficiale staz. sper. ind. essence* 2, 1-3(1927).—A sample of pale yellow Californian lemon oil had d^{15}_4 0.8580, α^{15}_D + 63.8°, n^{20}_D 1.4709, aldehydes (as citral) 2.35%, sapon. value 9.33, fixed residue (water bath) 2.75% having sapon. value 193.9, soly. in 90% alc. 1:7. A sample of Californian orange oil gave d^{15}_4 0.8518, α^{15}_D + 98.5°, n^{20}_D 1.4693, aldehydes (as citral) 2.62%, sapon. value 4.58, fixed residue (water bath) 3.46% having sapon. value 160.91, soly. in 90% alc. (turbid) 1:8. B. C. A.

Characters of essences of aromatic plants cultivated in Calabria. L. BONACCORSI. *Boll. ufficiale staz. sper. ind. Essence* 2, 4-5(1927).—The flowerheads (leaves) of *Majorana hortensis* gave 0.48 (0.43)% of pale yellow essential oil having d^{15}_4 0.8912 (0.8868), α + 7.2° (9°), acid value 0.28 (0.56), sapon. value 13.07 (11.20), sapon. value after acetylation 64.72 (73.77), carbonyl compds. (as citral) 1.67 (2.03)%, soly. in 82.5% alc. 1:2.2 (1:1). The essence of *Thymus citriodorus* gave d^{15}_4 0.9020, α + 3.6°, acid value 4.48, sapon. value 30.01, carbonyl compds. (as citral) 13.50, phenols trace; sol. in 2 vols. of 70% alc. The essence of *Salvia trilobica* gave d^{15}_4 0.9200, α + 10.4°, acid value 1.68, sapon. value 8.66, sapon. value after acetylation 50.38, carbonyl compds. (as citral) 5.84; sol. in 1 vol. of 80% alc. Oil of *Pelargonium radula*, Ait (?) cultivated on the plain (hill) gave d^{15}_4 0.8970 (0.8966), α — 9° (—9.2°), n^{20}_D 1.4639 (1.4643), acid value 13.44 (12.30), sapon. value 62.71 (70), sapon. value after acetylation 277.81 (260.32), esters (as geranyl tiglate) 26.43 (29.50)%, total alcs. (as geraniol) 76.40 (72.12), free alcs. 59.20 (52.88), citronellol 36.70 (33.36), soly. in 70% alc. 1:2.1 (1:2.7). B. C. A.

Ergot. A. DAMONTE. *Giorn. farm. chim.* 76, 127-31(1927).—"Stabilization" of ergot by means of alc. under pressure is useless. Water extracts only part of the alkaloids, and the yield is scarcely increased when acidified water is used. B. C. A.

Determination of dextrose insulin equivalents. K. L. E. LAMERS. *XII Int. Cong. Physiol.* 1926, 94.—For the detn. of the dextrose equiv. of insulin, the sugar must be administered subcutaneously. Part of the sugar actually undergoes combustion, and part may be converted into acid products. B. C. A.

The ethereal oil content of fragrant plants of the southeastern territory. O. SOBOLEVSKII. *Ist. of Agr. Saratov. Ber. Saratov. Naturforscherges.* (Russia) 1, No. 2-3, 3-38(1925); *Chem. Zentr.* 1927, I, 112-3.—The ethereal oils were obtained by steam distn. of the finely divided plants. The yields increased with the quantity up to a const. value. With *Hyssopus officinalis*, *Origanum vulgare* and *Salvia officinalis*, the oil distd. rapidly, 90% of the yield being obtained during the first 30 min. With *Matricaria chamomilla* the rate of distn. was slow and const. over a long period of time. Intermediate in the rate of distn. were the oils from *Achillea nobilis*, *Angelica archangelica*, *Cannabis indica*, *Ocimum basilicum*, *Satureja hortensis*, *Tanacetum vulgare* and *Thymus marshallianus* Willd. The yields from the fresh plants and from dried and remoistened plants were considerably smaller than from the dry plants. To det. the losses of oil during the distn., the oil was completely removed from a sample of *Artemisia austriaca* Jacq., the residue was then impregnated with a known quantity of oil and steam-distd. Under these conditions the loss was small. The following % yields were obtained: *Artemisia absinthium* L. (blooming shoots) 0.47 (a paraffin-like solid sepd. from the distd. oil); *Artemisia austriaca* Jacq. 0.32-0.46; *Artemisia dracunculus* 0.44-0.47; *Artemisia vulgaris* 0.30; *Artemisia scoparia* 0.14; *Artemisia armenica* 0.08; *Artemisia campestris* 0.04; *Artemisia pontica* 0.03 (this was a sapphire-

blue color, whereas the oils from all other varieties of *Artemisia* were bright yellow); *Achillea millefolium* (flowers) 0.47-0.63 (leaves) 0.51; *Achillea nobilis* L. (flowers) 0.22-0.44 (leaves) 0.19-0.20 (whole plant) 0.20-0.26; *Angelica archangelica* L. (leaves) 0.08-0.14 (sharp pepper odor) (roots) 0.15-0.47 (sharp spicy odor); *Cannabis indica* Lam. (flowers) 0.13-0.20; *Hyssopus officinalis* L. (flowering) 0.47-0.48 (d. 0.9325; the yield diminished after flowering); *Matricaria chamomilla* L. (flowers 14 months after being picked) 0.08-0.25; *Mentha piperita* L. (flowering) 0.5-0.8; (leaves) 0.6-0.72; *Ocimum basilicum* L. (flowers) 0.4 (flowering plant) 0.4-0.5 (plant after flowering) 0.23; *Ocimum minimum* (after flowering) 0.19; *Origanum vulgare* L. (flowers) 0.74-0.76 (leaves) 0.21-0.41 (whole plant) 0.12-0.32; *Salvia officinalis* (leaves) 0.85-1.29; *Salvia nemorosa* (leaves) 0.04; *Satureja hortensis* L. 0.23-0.43; *Tanacetum vulgare* (flowers) 0.25-0.59 (leaves) 0.28-0.39; *Thymus marschallianus* Willd., 0.78-1.50; *Valeriana wolgensis* nov. sp. Kasakevich (roots) 0.53; *Melissa officinalis* 0.05.

C. C. DAVIS

Determination of santonin in Flores cinnae. H. BECKURTS. *Festschrift A. Tschirch* 1926, 6-12; *Chem. Zentr.* 1927, I, 2585-6.—Numerous expts. on the purification of crude santonin were carried out. To sep. santonin from resinous ingredients, various org. solvents were tried without success. Purification by means of KMnO_4 removed all impurities and completely pure santonin was obtained, though analyses showed losses of 6-10%. Conversion of santonin to difficultly sol. Pb santoninate proved to be impracticable, because of losses of 7.2-8.3%. A similar result was obtained when an adsorption agent was used or $\text{Al}(\text{OH})_3$ was tested as a clarifying agent. In further expts., attempts were made to remove impurities by coagulation with electrolytes or with colloids. K alum and FeCl_3 proved to be practicable, though with the former 2.1-2.3% losses were encountered and with FeCl_3 1.3-1.5% losses. The colloidal resin acids could be coagulated with $\text{Fe}(\text{OH})_3$ sol. Filtration of crude santonin solns. through Pukall filter candles gave losses of 1.9-2.4% of santonin. The best method of obtaining pure santonin crystals was ultra-filtration through a regular ultra-filtration app., in which case ultra-filtration should be carried out as late as possible in order to combine it with the Fromm method. Even this process does not, however, give complete sepn.

C. C. DAVIS

Noteworthy observations on recent investigations on digitalis. FOCKE. *Jahresbericht d. Caesar & Loretz A.-G. in Halle a. S.* 1925, 115-9; *Chem. Zentr.* 1927, I, 2448-9.—A report on the most important practical results of recent investigations on digitalis, with particular reference to the expts. of Sluyters (C. A. 19, 1324). The proportions of active substances in digitalis leaves are 35% gitalin, 14% digitalcin and 50% digitoxin. The essential effect of digitalis on warm-blooded animals is a diminution of the heart vol., though the heart-muscle performance is increased, and the vol. of blood discharged also becomes greater. The latest method of calcg. doses and the rectal administration of digitalis are also discussed.

C. C. DAVIS

An apparatus for the determination of alkaloids in lupines. F. KAMINSKI. *Chem.-Ztg.* 52, 467(1928).—A glass bottle is provided with a side tube at a certain distance from the bottom, connecting with a buret tube of 2-25-cc. bulbs by means of a 2-way stopcock, the other opening of which discharges the contents of the buret. The glass stopper of the bottle has a tube and stopcock blown into it. The lupine sample is extd. with NaOH and $\text{Et}_2\text{O}-\text{CHCl}_3$ mixt. for 24 hrs., and the ext. then blown into the buret. Filtration is thus avoided.

W. C. BAUGH

Observations on the preparation and action of thyroxin. BRCE NEPPI. *Boll. soc. ital. biol. sper.* 3, 165-72(1928).—Mostly a review of the work of Kendall and Harrington on the preparation of thyroxin. The I_2 content of thyroid glands from a Miland abattoir was detd. monthly. There was a slight increase during the summer months; the amt. varied from 0.126 to 0.20%. The lack of quant. parallelism between the physiol. action of thyroxin and thyroid is discussed. The hypothesis is advanced that during the extn. of the gland racemic thyroxin is obtained, which is not as active as the optical substance in the gland.

PETER MASUCCI

Method of differentiation and determination of the value of rhubarbs based on fluorescence. J. MAHEU. *Bull. sci. pharmacol.* 35, 278-88(1928).—All official rhubarbs show a deep reddish brown fluorescence under the Wood rays. The rhizomes of rhubarb may be divided into 2 classes: (1) True rhubarbs: *Rheum officinale* H. B., *R. languticum* Wall. and *R. emodi* Wall. which give the brown fluorescence and may be considered official. (2) The rhubarbs produced by *R. compactum* L., *R. undulatum* L., *R. ribes* L. and *R. raponticum* L., which give a violet fluorescence and are considered non-official. All rhubarb powders whose tinctures under the Wood rays give a violet fluorescence should be rejected.

L. W. RIGGS

Seeds of *Euphorbia verrucosa* jacq. PAUL GILLOT. *Bull. sci. pharmacol.* 35, 288-91(1928); see *C. A.* 22, 2676. L. W. RIGGS

A reaction of cocaine. P. GUIGUES. *Bull. sci. pharmacol.* 35, 292-3(1928).—The test for cocaine by Guerbet (cf. *C. A.* 15, 923) is commended and attention is called to the necessity of a rigid following of Guerbet's directions, particularly with reference to the fuming HNO_3 used. It is also recommended to prep. the SnCl_2 by dissolving Sn in HCl and evapg. the soln. on the water bath, the residue to be taken up with water and evapd. to dryness twice. The resulting salt was completely sol. in water giving the necessary very faintly acid soln. of SnCl_2 . L. W. RIGGS

Ultra-violet absorption spectra of the alkaloids of the tropan group and of certain biologic and pharmaceutical products. Applications to toxicology and practical pharmacy. A. CASTILLE AND (MLLE.) E. RUPPOL. *Bull. soc. chim. biol.* 10, 623-66(1928); cf. *C. A.* 21, 206.—Fifty-two new ultra-violet spectra were detd. for various substances and were illustrated in 15 charts of curves. Conclusions in part: The absorption spectrum of cyanuric acid in neutral or alk. soln. leads to the detn. of its constitution and to the exptl. verification of the partial enolization of its mol. A study of barbituric acid led to the detn. of the chem. configuration of veronal and luminal, this being a new contribution to the subject of tautomerism. Alkaloids were detd. in pharmaceutical preps., and in mixts., with large quantities of other org. matter. By this method 4 mg. of cocaine was detd. in completely putrefied cadaveric residues, and tryptophan was identified in the viscera. L. W. RIGGS

Researches on percolation. Rapidity of solution of immediate principles during percolation. I. Press cake of bitter almonds. M. BRIDEL AND (MLLE.) M. DEMAREST. *J. pharm. chim.* 7, 153-62, 201-7(1928); cf. B. and Barel, *C. A.* 20, 1302.—A parallel detn. of sucrose and amygdalose in bitter-almond press cake by the Bourquelot optical rotation method (a) in an ext. made with hot alc., (b) an ext. obtained by rapid percolation with 70% cold alc. showed quant. recovery of both principles by the percolation method, i. e., they practically remained unaffected by the enzymes present (sucrase and β -glucosidase). The enzymes also remained unchanged. In hot alc. extn. of the cake, 4 times as much alc. was needed as in percolating the same quantity. Sucrose passes entirely into soln. within 9 hrs., amygdalose within 12.5 hrs. of percolation. To ext. emulsin from the percolation residue, macerate the latter for 48 hrs. with 4 times its wt. of H_2O contg. $\text{C}_6\text{H}_5\text{Me}$, press out and filter, then ppt. casein with AcOH , filter and ppt. emulsin with EtOH and dry *in vacuo* over H_2SO_4 . The yield is 14 g. per kg. of press cake. The enzymic activities of this emulsin are practically identical with those of emulsin from sweet almonds, which also yield 14 g. per kg.; but the press cake of bitter almonds is 6-7 times cheaper. The yield of amygdalose is 30 g. per kg. II. Press cake of cotton seed. *Ibid* 433-47.—Raffinose (A) contained in cottonseed cake (cf. *C. A.* 17, 3017; 20, 171; 22, 2674) rapidly dissolves in 60% alc. upon percolation. In operating on 500 g. of cake contg. 36.464 g. A, 54.23% thereof passes into soln. (250 cc.) in 105 min., 92.93% in 5 hrs., soln. being complete in 10 hrs. By a modification of the Ritthausen method, a yield of 3.3% of A per wt. of the cake is obtained: Moisten 10 kg. of cottonseed cake with 5 l. of 60% alc., begin percolation at once with 10 l. of 60% alc. and collect 3 fractions each of 5 l.; to obtain the last fraction, displace it from the powder by addn. of 6 l. H_2O . From the 1st fraction distil off the EtOH until 2 l. of aq. residue is obtained; add 2 l. H_2O and 500 cc. of Goulard's ext. (basic Pb acetate) (B), filter and remove Pb with H_2S . Evap. the colorless soln. to dryness under reduced pressure, not above 50° to avoid hydrolysis of A by AcOH near the end of evapn. Take up with 85% alc., evap. to a sirup and recrystallize from 85% alc. Repeat the process on the 2nd and 3rd fractions without, dilg. before pptg. with B. Use 400 cc. of B for the 2nd, 300 cc. for the 3rd fraction. S. W.

The quality of compressed tablets, particularly as to solubility and ease of disintegration. WM. J. HUSA. *J. Am. Pharm. Assoc.* 17, 38-41(1928).—Specimens of tablets of 13 manufacturers were tested for their disintegrating properties by dropping them into H_2O at 80° . Most disintegrated at once but 2 were not dissolved in 2 days. Tablets of ovary and thyroid disintegrated in approx. 1 hr. H. notes that the U. S. P. and N. F. have not standardized tablets as completely has been done for many other preps. L. E. WARREN

The assay of a so-called cod-liver oil extract for vitamin-A content and calcifying properties compared to cod-liver oil. HAZEL E. MUNSELL AND HILDA BLACK. *J. Am. Pharm. Assoc.* 17, 139-44(1928).—The results given show that the EtOH -sol. ext. used in these tests contained a negligible amt. of vitamin-A and had no greater calcifying properties g. for g. than cod-liver oil. L. E. WARREN

Plasticity measurements on milk of magnesia. S. S. ARZOOMANIAN. *Lab. E. R.*

Squibb and Sons. *J. Am. Pharm. Assoc.* 17, 443-9(1928).—The consistometer is a 50-cc. buret with the stopcock removed and a capillary tube attached by rubber tubing. The diam. of the capillary is detd. either by viscosity measurements with standard liquids or by the Hg-thread method. The buret is filled and the contents are stirred with a long wire to remove bubbles, the plug in the capillary is removed and the time for stated fractions of the contents to run through the app. is noted by a stop-watch. Certain corrections are applied.

L. E. WARREN

Flueckiger's test for thymol and carvacrol. H. G. HEWITT. *J. Am. Pharm. Assoc.* 17, 524-5(1928).—The substance is dissolved in CHCl_3 and warmed gently with NaOH or KOH. In the presence of either phenol the CHCl_3 layer becomes red. The reaction takes place in 2 stages. Thymotinic or carvacrotinic aldehyde is first formed. These aldehydes combine with an excess of the remaining phenol to form one of the rosolic acid dyes, $\text{CH}(\text{C}_{10}\text{H}_{12}\text{OH})_3$.

L. E. WARREN

Analysis of tincture of lemon. L. B. FRANCHINA AND FRANK A. LEE. *J. Am. Pharm. Assoc.* 17, 553-5(1928).—The investigations followed the same lines as the studies on tinct. of sweet orange peel (*C. A.* 19, 1757). Five grades of lemons from California, 2 from Florida and 1 from Sicily were used. Tincts. were prepd. from each. The tincture from *Ponderosa* was less aromatic and less colored than from the other varieties. EtOH about 65%; oil of lemon 1.2 to 2.1. Tincts. were prepd. from the spent drug in each case. The vol. of oil varied from 0.1 to 0.6% and the EtOH content averaged higher than in the genuine tincts. F. and L. suggest that the oil content should not be less than 1% and the EtOH 75%.

L. E. WARREN

The discoloration of aloes in Mauritius. N. CRAIG. *Rev. agr. Maurice* 5, 83-5(1928).—A series of tests, results of which are tabulated, show that the darkening of aloes during storage is primarily due to oxidation by the air. Exposure to light increases the darkening, but has little effect in absence of air. The effect of humidity was not uniform in these expts., and no conclusion can be drawn. Treatment of aloes with SO_2 does not prevent darkening.

F. W. ZERIAN

Stereoisomerism and local anesthetic action. Separation of dimethylaminodimethylethylcarbinol into its optical isomers and preparation of two active stovaines (FOURNEAU, RIBAS) 10. Emulsions [for making cosmetics] (Brit. pat. 280,096) 13.

BECKURTS, HEINRICH. *Chemisches Praktikum für Pharmazeuten*. 3rd ed. completely revised of "Analytischen Chemie für Apotheker." Stuttgart: Ferdinand Enke. 605 pp. M. 36; bound M. 38.40.

STEWART, FRANCIS G. *Compend of Pharmacy*. 10th ed. revised and enlarged. Philadelphia. P. Blakiston's Son & Co. 200 pp. \$2. Reviewed in *Am. J. Pharm.* 100, 425(1928).

WASER, ERNST. *Synthese der organischen Arzneimittel*. Stuttgart: Ferdinand Enke. 436 pp. M. 16; bound in linen, M. 18.

Solid tincture of iodine. KARL JUNGSMANN and OSWALD KOLBERT. Can. 281,519, July 10, 1928. Forty-six g. pure stearic acid is dissolved in 800 cc. of alc. by heating. At the same time 3.68 g. of metallic Na is dissolved in 200 cc. of alc. The 2 solns. are combined at 55° to 70° and to the resulting soln. 30 g. of NaI is added. A soln. of 20 g. of I in 200 g. of alc. is added to the hot soln. with continuous stirring and the resulting liquor is run off into glass tubes and rapidly cooled. About 1 kg. of solid tincture of I is obtained.

Arsenobenzene derivatives. A. ALBERT. Can. 280,834, June 12, 1928. The semicarbazone of 3-hydroxybenzaldehyde-4-arsonic acid in the presence of glacial acetic acid is reduced by means of about 5 to 6 mols. of H_2PO_3 and 1 mol. of H_2SO_4 , calcd. upon 1 mol. of the arsenic compd. A new compd. of therapeutic value, colorless and mostly sol. in ammonia, is obtained.

Carbohydrate-acridine compounds. CARL SCHNORF and FRITZ HEFTI. U. S. 1,674,923, June 26. 2-Ethoxy-6,9-diaminoacridine galactose hydrochloride, formed from the components, is a yellow crst. solid, m. 208.0° (decomp.), sol. in water and not altered in aq. soln. by alkali or salt solns. Similar compds. which also are suitable for therapeutic purposes may be prepd. with lactose, mannose, glucose and maltose.

Propyl ester of 2-phenylquinoline-4-carboxylic acid. J. A. VON WULFING. Brit. 279,745, June 17, 1927. This compd., which is a therapeutic agent, may be prepd. by the usual esterification methods, e. g., with use of PrOH .

Metal salts of sulfarsenol. FREDERIC L. WYLD. U. S. 1,674,711. June 26. Complex metal compds. which may be used by *subcutaneous injection* are formed by the reaction of sol. metal salts such as $ZnCl_2$ or compds. of Mg, Cd, Cu or Ag with sulfarsenol in MeOH soln. and adding NaOH soln.

Vitamin preparations. S. GRONINGSATER and FISCHER-HOLLINSHED CO., INC. Brit. 280,212, Nov. 2, 1926. In transferring vitamins from one substance to another, *e. g.*, from cod-liver oil to cottonseed oil, a soln. is formed of the vitamin and the latter is then transferred from the soln. to the desired vehicle. Cod-liver oil may be first saponified with alkali in the presence of an org. solvent such as alc. and the cottonseed oil then added together with water and, after agitation, the materials allowed to sep. into layers.

Separation of enzymes from their solutions. HANS ALTGELT and OTTO HOCHMUTH (to Kalle & Co. Aktiengesellschaft). Can. 281,306, June 26, 1928. A ppt. is produced from Na phosphate and $CaCl_2$ in the satd. sol. of the enzyme, a salt of aromatic sulfonic acid is added, the ppt. filtered, dissolved in H_2O and the residue filtered off. Then the enzyme is pptd. together with the salt of the aromatic sulfonic acid by adding NaCl.

Germ-gland substance. WALTER HOHLWEG. Can. 281,054, June 19, 1928. Hormone oil is dissolved in alc. mixed with a powdery hydrate of an alk. earth until a thick paste is formed; water is added, the mixt. boiled with stirring, filtered and treated with CO_2 to ppt. the alk. earth.

Cosmetics, medicinal preparations, etc. H. H. VON KORNATZKI. Brit. 279,575, Aug. 7, 1926. Oil of amber obtained by the dry distn. of amber is washed with water, the extd. succinic acid is recrystd. and is mixed with the rectified oil in the same proportion as in the crude oil and the product is used as an ingredient of massage creams, dentifrices and other preps. for local application. Various formulas are given.

Lotion for treating foot-rot in sheep. P. G. MORGAN and G. R. PLOWMAN. Brit. 280,312, Sept. 1, 1926. HNO_3 (1.14 sp. gr.) 20, cryst. $CuSO_4$ 11.27, soap 0.25, vinegar (contg. 4% HOAc) 3, $NaNO_2$ 1 and water 64.48 parts.

Removing nicotine from tobacco. C. PORT. Brit. 279,757, July 16, 1927. Cigars, cigarettes, pipe or chewing tobacco, or snuff is subjected for 2-6 days to warm moist air and then heated quickly in a closed vessel to about 150° while the steam generated is drawn off by a pump or other suction device.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

Kinetics of the chamber process. V. P. ZALESSEKII. *J. Chem. Ind.* (Moscow) 3, 1279-83 (1926); 4, 128 (1927). From theoretical considerations Z. expressed previously the opinion that SO_3 is formed in the chambers, and advised injection of H_2SO_4 . To obtain exptl. evidence to support his contentions, a series of Orsat gas analyses in the pipe from the Glover tower, in the pipe connecting the first chamber with the second, and in the pipe leaving the Gay-Lussac tower were made. If gas samples taken directly from the chambers, instead of from the pipes, had been analyzed, the results would be misleading. Vol.-% of acid gases and of O_2 were detd. All the acid gases obtained in excess of the amt. corresponding to the change in O_2 content must be regarded as SO_3 . From these analyses and from tables and calcs. it is shown that the chambers contain 15-21% SO_3 , in spite of the reaction $SO_3 + H_2O = H_2SO_4$. The chamber process goes on chiefly through SO_3 formation as follows: Exceedingly small droplets of H_2O , by creating elec. fields attract SO_3 mols. in 3 concentric, spherical layers, the first consisting of 1 row of SO_3 mols., fairly stable, and its particles seldom detached. The second layer is not so stable, but is kept in comparative equil. by new mols. replacing those torn off. The third, comparatively thick layer consists of constantly inflowing and outflowing mols. Normally NO_2 acts chiefly on the third layer, oxidizing it to SO_3 , which dissolves in H_2SO_4 . If there be in the chambers a relative abundance of H_2O droplets, *i. e.*, a shortage of SO_3 , the third layer may be wholly absent, and the reaction of NO_2 takes place with the SO_2 which is close to the kernel, in which case a large amt. of polymerized anhydride (S_2O_8) is formed, which delays the oxidation of SO_2 . It is also shown that excessive increase of H_2O and increase in temp. must give losses of N oxides. Nevertheless it is not advantageous either to decrease the amt. of H_2O unreasonably, or to operate at exceedingly low temps., since H_2O acts as a catalyzer and also prevents formation of chamber crystals, and lowering of temp. slows up the reactions. The operating temp. should be kept between 0° and 100° .
Replacing air by O_2 would improve the operation.

BERNARD NELSON

New continental sulfuric acid plant operating on the Schmiedel-Klencke system. ARTHUR GROUNDS. *Ind. Chemist* 4, 155-8(1928); cf. *C. A.* 21, 2534—Flow sheet, illustrations, detailed dimensions, and operating data are given for the new Saaran H_2SO_4 plant of the Silesia Verein chemischer Fabriken. The plant differs from the usual in its use of Schmiedel boxes, which are preparatory units in which the gases are converted into a chem. and phys. state such that they will react readily and vigorously in a succeeding tower. The plant has a rated capacity of 27 tons of 142°Tw . acid per day, with a niter consumption equiv. to 2.94 parts NaNO_3 per 100 parts S burned, based on a 95.2% conversion of S to H_2SO_4 . The gas flows from 2 Lurgi furnaces through a hot-gas Cottrell precipitator to the Glover tower, from which it passes successively through Schmiedel box No. 1, tower No. II, Schmiedel box No. 2, towers III and IV and thence to the Gay-Lussac towers. The raw material for SO_2 production is Meggen pyrites. R. L. DODGE

Treatment of insoluble sulfates, particularly of celestite, with sodium carbonate solutions. I. YA. BASHILOV AND M. N. SOBOLEV. Institute of Applied Mineralogy and Metallurgy. *J. Chem. Ind. (Moscow)* 4, 113-7(1927).—Present com. methods of converting insol. sulfates into compds. of com. use consist in either fusing with Na_2CO_3 or reducing with charcoal, and are relatively expensive. Boiling BaSO_4 with an excess of an Na_2CO_3 soln. gives quite satisfactory results as regards speed and extent of conversion to BaCO_3 . With uncalcined, technical BaSO_4 reaction with Na_2CO_3 ceases when the ratio of the latter to BaSO_4 formed equals 3.07. If the Na_2CO_3 present is such that after all BaSO_4 is converted to BaCO_3 the ratio $\text{Na}_2\text{CO}_3 \cdot \text{Na}_2\text{SO}_4$ equals 2, after 11 hrs. about 77% of the BaSO_4 has been converted. This reactivity, at first very rapid, slackens gradually, as shown in diagrams. The excess of Na_2CO_3 has a decisive influence on the speed of reaction; e. g., if the Na_2CO_3 is 8 times the BaSO_4 , boiling 1 hr. is sufficient to transform 98.78% of the latter. The concn. of the Na_2CO_3 solns. has but a slight importance. In com. operation large excesses of Na_2CO_3 should be used to obtain a rapid conversion; the unused Na_2CO_3 can be used for another batch of sulfate or recovered by crystn. The conversion of CaSO_4 is even easier and more rapid than that of BaSO_4 . The equil. const. on boiling, $\text{Na}_2\text{CO}_3 \cdot \text{Na}_2\text{SO}_4$, is 0.032 for anhyd. CaSO_4 , vs. 3.07 for BaSO_4 . Hydrated CaSO_4 has a still lower equil. const. and the reaction is still faster, e. g., when gypsum is stirred with a 2% Na_2CO_3 soln. the reaction is finished in 1 hr. With SrSO_4 the equil. const. is 0.015, and reaction with Na_2CO_3 solns. is easy on warming and stirring. Stirring is all important with other sulfates also. Similar expts. were made with a Russian celestite contg. SrO 50.4, CaO 3.01, Fe_2O_3 + Al_2O_3 0.7, SO_3 39.65, CO_2 3.04, SiO_2 2.7, H_2O 0.37, calcd. total SrSO_4 89.32. The speed of reaction depended upon the fineness of the celestite, increasing on heating and on increasing the Na_2CO_3 excess. Impurities slow the reaction. The Na_2CO_3 concn. has no essential influence. In com. operation an excess of Na_2CO_3 should be used. With PbSO_4 the equil. const. is less than 0.01, and its conversion to PbCO_3 is, therefore, very easy. The above method may be used in chem. analysis to sep. BaSO_4 from CaSO_4 and SrSO_4 by using adequate amts. of Na_2CO_3 . R. N.

Preparation of sodium nitrite from Chile salt-peter. S. SAWA. *J. Pharm. Soc. Japan* 48, 260-3(1928).—In the manuf. of NaNO_2 from Chile salt-peter by the Pb method, the yield depends largely upon the H_3BO_3 content found as an impurity in the raw material. Other impurities have no influence. When the H_3BO_3 content exceeds 0.2% the yield falls to 41-55%, while below 0.15% nearly the theoretical yield can be obtained. NAO UYER

Natural amorphous silica. T. HEDLEY HARRY. *Ind. Chemist* 4, 226-8(1928).—A review of occurrence and uses. E. H.

Occurrence of indium in commercial iron sulfide and its extraction. J. G. F. DRUCE. *Z. angew. Chem.* 41, 79(1928).—A residue contg. In was found after continued treatment of com. FeS with H_2SO_4 . In oxide was eventually sepd. The original proportion was about 6 pts. in 100,000. B. C. A.

Georgian manganese regaining its old standing in world markets. L. J. BUCK. *Eng. Mining J.* 125, 1016-7(1928).—Caucasian Mn, which before the war made Russia the leading Mn producer during all but 4 yrs. (1908-11), is again on the market. An American company holding a concession from the Soviet govt. is now marketing a product of at least 85% MnO. ALDEN H. EMERY

Extraction of bromine from aqueous solutions of its salts. K. I. SHEDT. Crimean Research Institute. *J. Chem. Ind. (Moscow)* 3, 1200-3(1926).—In the Betts method of Br pptn. by phenol (*Mon. sci.* 16, 1(1902)) half the Br is lost as HBr according to the reaction $3\text{Br}_2 + \text{C}_6\text{H}_5\text{OH} = \text{C}_6\text{H}_4\text{Br}_2\text{OH} + 3\text{HBr}$. The following method is recommended: 100 cc. $\text{Br-H}_2\text{O}$ contg. 0.5634 g. Br is pptd. by the theoretical amt. of

phenol (11.3 cc. cryst. phenol in 1 l. H_2O), $Cl-H_2O$ is added in the calcd. amt. needed to decompose the HBr formed (35.7 cc. contg. 3.224 g. Cl per l.), then half of the previous amt. of phenol is added to fix the free Br , and alternate addn. of phenol and Cl each time decreased by half is repeated twice. The $C_6H_5Br_2OH$ is then filtered. By this quadruple pptn. with phenol 98% of the Br is recovered as $C_6H_5Br_2OH$, which can easily be decomposed into Br . $C_6H_5Br_2OH$ first ppts. in H_2O as a colloidal gel difficult to filter, but it coagulates after standing 5 min. and can then be easily filtered and washed on a Büchner funnel.

Nitrogen industry problems. F. C. O. SPEYER. *Chem. Trade J.* **82**, 575-7(1928).—The economics of the future of N fixation is considered.

E. H.

The fixation of nitrogen as oxide by electric discharges; its industrial future. E. BRINER. Univ. Geneva. *Bull. soc. chim. Belg.* **37**, 169-85(1928).—Discussion of the conditions required to permit the arc process to compete favorably with the Haber-Bosch process.

A. L. HENNE

Camphor: natural and synthetic. C. L. DeVULT. *Chemicals* **30**, No. 1, 9-11 (1928).—Comparative production statistics are given.

E. H.

The influence of acids on fuller's earth. O. ECKART. *Ölmarkt* **9**, 61-2; *Chem. Zentr.* **1927**, I, 2615; cf. C. A. **21**, 1717.—It is not believed that the activation of fuller's earth depends upon the formation of hydrated silicic acid, for in the waste liquors of the manuf. of fuller's earth no silicic acid could be found. It results from more profound decompn., in which case the decolorizing power is bad. The concn. is immaterial to obtain the desired result and the latter is dependent only upon a requisite quantity of acid. Org. acids are much inferior to mineral acids in dissolving out completely lime and alumina. Drying at 130° is necessary. The loss on ignition of activated earth is the same as that of the raw earth. With too much mineral acid, the clay skeleton is apparently destroyed, the surface area is diminished and the decolorizing power is in turn diminished.

C. C. DAVIS

Metal cements. P. MARTELL. *Apparatebau* **40**, 130-1(1928).—Directions are given for the prepn. of 23 cements for patching flaws in metals, joining metal to metal or to glass, porcelain, leather, etc.

J. H. MOORE

Evolution de la fabrication de l'acide sulfurique. Paris: L'Industries Chimique. 457 pp. F. 60. Reviewed in *Chem. Met. Eng.* **35**, 367(1928).

Hydrocyanic acid. I. G. FARBENIND. A.-G. Brit. 279,530, June 26, 1926. Formamide vapor is submitted to the catalytic action of natural or artificial zeolites, $CaCl_2$ or alkali carbonates (suitably at a temp. of $400-450^\circ$). When Na_2CO_3 is used, $NaCN$ is formed.

Sulfuric acid (contact process). ALPHONS O. JAEGER (to The Selden Co.). U. S. 1,675,308, June 26. A gaseous mixt. of SO_2 and O is passed at an elevated temp. (suitably about $420-550^\circ$) over a catalyst which contains at least one catalytically active non-siliceous base-exchange material such as a V compd. Numerous examples and details are given. U. S. 1,675,309 specifies the use of at least one multi-component zeolite having combined with it chemically a catalytically active component. Numerous examples and details are given.

Distillation of persulfuric acid. GUSTAV BAUM (to Niagara Electro Chem. Co., Inc.). Can. 281,156, June 19, 1928. $H_2S_2O_8$ is continuously distd. by heating in a no. of unit app. made of stoneware by a. c. of frequency lower than 500 per sec. with C electrodes preliminarily lixiviated with $H_2S_2O_8$, the intensity of current being below 1 amp. per sq. cm. and the electrodes being maintained at temp. not exceeding that of boiling $H_2S_2O_8$.

Separating constituents of alkaline mixtures containing oxysalts of arsenic or tin or both. HENRY HARRIS. U. S. 1,674,042, June 26. An aq. mixt. such as results from refining of Pb with $NaOH$, which contains $NaOH$ in strong hot aq. soln. together with oxysalts such as those of As , Sb and Sn , is brought to such a concn. that the oxysalts will substantially all sep. out on cooling, and cooling and sepn. are then effected.

Catalytic combustion of ammonia. H. PAULING. Brit. 279,511, Oct. 22, 1926. NH_3 and air or O are distributed over the catalyst by diffuser chambers, which may be in the form of orifices arranged with their larger cross-sections toward the catalyst. An app. is described.

Ammonia and acetylene. L. TOCCO and M. LANDI (to Soc. anon. ommium ind. chim.). Can. 280,980, June 12, 1929. $Ba(CN)_2$ prepd. by treating at 900° BaO with C and N , is heated at 200° in a stream of H to form NH_3 and BaC_2 . The NH_3 is re-

covered in the usual manner. The BaC_2 is treated with water to form C_2H_2 and $\text{Ba}(\text{OH})_2$. BaO is regenerated for use in the process.

Alumina. CHARLES M. BROWN. U. S. 1,675,157, June 26. In a cyclic process of treating alunite or other similar aluminous material in which some of the Al is combined with SO_3 , the raw material is sufficiently heated to drive off combined SO_3 , the calcined material is heated with an NH_4 sulfate, and the material is leached with water to obtain a soln. of NH_4 alum; Al is pptd. as hydrate by NH_3 released in the heat treatment, thus forming NH_4 sulfate.

Alumina. G. SCHOENBERG (to Metallbank und Metallurgische Ges., A.-G.). Brit. 279,870, Oct. 26, 1926. Aluminiferous material is fused with a reducing agent such as C in the presence of small quantities (preferably less than 3%) of sulfides or substances forming sulfides. Silicic and titanitic acids are first preferably sepd. from the raw material by use of inorg. acid and the remaining mixt. of Fe and Al salts may be converted to oxide before the first-mentioned treatment. S may be introduced as a gas or S-bearing combustion gases may evap. or decomp. the mixt. of Fe and Al salts.

Purification of ammonium bicarbonate. WILHELM GLUED and WILHELM RIESB. Can. 281,357, July 3, 1928. Crude NH_4HCO_3 is decompd. by heat; the gaseous products are kept at a temp. above that at which NH_3 and CO_2 combine; the solids are sepd. by mech. and elec. means without the use of absorbing substances; then the tech. pure gaseous products of decomposition are combined to form NH_4HCO_3 in the presence of H_2O . The NH_4HCO_3 seps. from the mother liquor in cryst. condition, whereby it undergoes a further purification.

Calcium molybdate. A. KISSOCK. Brit. 280,240, Nov. 6, 1926. Mo sulfide is roasted to produce MoO_3 substantially free from S, the MoO_3 is mixed with CaO and the mixt. is heated, suitably to about 760° . The process may be carried out continuously in a multiple hearth furnace of the gravity type into the lower part of which the lime may be fed. Cf. C. A. 22, 2444.

Cyanamides. N. CARO and A. R. FRANK. Brit. 279,812, Oct. 28, 1926; Can. 280,817, June 5, 1928. Cyanamides of alk. earth metals, including Mg, are made by passing gaseous HCN (which may be dild. with inert gases or NH_3) over the oxides, carbonates or oxide-forming salts, heated to above 400° . Cf. C. A. 22, 2816.

Cyanamides. N. CARO and A. R. FRANK. Brit. 279,811, Oct. 27, 1926; Can. 280,819, June 5, 1928. Cyanamides of Ca or Mg are formed by reacting on the carbonates, or mixed carbonates such as dolomite, with NH_3 at a temp. (suitably 700 – 850°) with CaCO_3 , 500 – 600° with MgCO_3 and 550 – 700° with dolomite) near or slightly above the dissocn. point of the carbonate. Ceramic or SiO_2 vessels are used and fluxes such as CaF_2 , CaO or Na_2CO_3 may be added.

Complex aurothiosulfate compounds. EINAR KEIDING. Danish 38,293, Dec. 27, 1927. A soln. of AuCl_3 is treated with an excess of iodide or bromide of the metal desired in the final product. The liberated I or Br is treated with thiosulfate to colorless soln. after which is added an adequate amt. of thiosulfate to form the complex aurothiosulfate. Cf. C. A. 21, 3425.

Complex aurothiosulfate compounds. EINAR KEIDING. Danish 36,761, Nov. 8, 1926. Complex aurothiosulfates of alkali, ammonium or alkaline earth metals are produced by dissolving gold iodide or bromide in an excess or iodide or bromide of the metal desired in the final product. The soln., which is prepd. in an alc. liquid, is made to react with a partly alc. soln. of thiosulfate according to the equation: $\text{AuBr} + 2\text{Na}_2\text{S}_2\text{O}_3 = \text{NaBr} + \text{Na}_2\text{Au}(\text{S}_2\text{O}_3)_2$. Cf. C. A. 21, 3425.

Phosphine. F. HEBLER. Brit. 279,751, July 1, 1927. In order to control or delay the action of water on Ca phosphide or other phosphide for generating spontaneously inflammable PH_3 (e. g., for use as a location indicator of torpedoes in naval training) the phosphide is coated with substances such as $\text{K}_2\text{Cr}_2\text{O}_7$, NaCl , sol. silicate, an alkali pyrophosphate or fused borax or with cellulose esters.

Anhydrous sodium sulfate. A. A. YAKOVKIN and Y. A. GROZHAN. Russian (Soviet) No. 1323, June 30, 1926. Vapors of compds. completely miscible or sol. in H_2O are used at temps. higher than required to obtain anhyd. Na_2SO_4 from the crystal hydrates or aq. soln. EtOH and MeOH are specified.

Recovery of zinc sulfate from dross. JESSE O. BETTERTON. Can. 281,282, June 26, 1928. Zn dross contg. flux, C and metallic Zn is screened. The screened fines are heated to volatilize the flux and oxidize the C and metallic Zn; the flux and oxide of C are passed to a condensing chamber and the flux is condensed therein; and the residue is leached to recover the Zn as ZnSO_4 . Cf. C. A. 21, 49.

Aluminum compounds. S. S. SVENDSEN (to Clay Reduction Co.). Brit. 279,515, Oct. 25, 1926. Bauxite, feldspar or other suitable aluminous material is heated to

34–100° with a soln. of NH_4F or NH_4 bifluoride to form NH_4 fluosilicate, fluotitanate or fluovanadate and AlF_3 and other fluorides. The soln. is dried and the residue is heated to 400–500° to volatilize SiF_4 , NH_3 and V and Ti fluorides. The residue is treated with a reducing gas to aid volatilization and reduce Fe to the ferrous state and is then treated with dry NH_3 and HCl gases at a temp. above the temp. of disoccn. of NH_4Cl to form NH_4F and chlorides of Al, K, etc. NH_4F and AlCl_3 are sepd. by fractional condensation and may be further utilized to produce other compds.

Removing phosphorus from gases. I. G. FARBENIND. A.-G. Brit. 279,710, April 11, 1927. P is removed from gases contg. it in the form of a fog by projection of very finely divided drops of liquid (such as water, acid or other aq. solns., org. liquids or liquid P) in a centrifugal or rotary gas-washing device or like app. The gases treated may be such as are obtained in the treatment of phosphate, silicic acid and C in an elec. furnace, consisting largely of CO and P.

Reducing solutions containing titanium and iron. TITAN CO. AKTIESELSKABET. Brit. 279,786, Oct. 28, 1926. A soln. such as that obtained by treating ilmenite with H_2SO_4 is treated with metallic Fe or material contg. mainly Fe. Solns. are used contg. 90–130 g. TiO_2 per l., at a temp. below 60° (although the temp. may rise above 60° near the end of the reduction). Sponge Fe in calcd. proportion may be used, or the reducing agent may be in excess.

Treating casein to obtain gelatinous solutions. AKTIESELSKABET SADOLIN & HOLMBLAD. Danish 38,291, Dec. 16, 1927. Casein particles are coated with a suitable amt. of a mucilaginous or gelatinous aq. ext. Before the treatment some alkali and a disinfectant may be added to the casein.

Casein compositions for making buttons or other molded articles. I. G. FARBENIND. A.-G. Brit. 279,863, Oct. 26, 1926. Glyoxal, or one of its derivs. or homologs, is used as a hardening agent in casein compns. which may also contain fillers, coloring substances, clarifying and softening agents, etc. Formulas are given of different mixts.

Phenol-ketone condensation products. CHEMISCHE FABRIK AUF AKTIEN, VORM. E. SCHERING. Brit. 279,856, Oct. 26, 1926. A crude mixt. comprising *o*- and *p*-cresols is condensed with a ketone such as acetone in the presence of a condensing agent such as gaseous HCl , at a temp. somewhat below 100°; the products may be sepd. by soln. in ether or the mixt. may be hydrogenated to obtain isomeric thymols or menthols.

Molding algin-containing material. CHAUNCEY C. LOOMIS and ARTHUR L. KENNEDY (to Plastic, Inc.) Can. 281,319, June 26, 1928. Dry and pulverize the algin-contg. material to a fine powder, add filler, then moisten with a min. amt. of H_2O or aq. soln. of NH_3 or alkali hydroxide or carbonate and subject to pressure in a mold. A hard homogenous mass is obtained contg. so little H_2O that only slight shrinkage occurs and warping is obviated. Cf. C. A. 21, 161.

Protein composition. MICHAEL LEVIN. U. S. 1,675,181, June 26. A gelatinous compn. suitable for use as an *adhésive* comprises a protein such as glue or gelatin and the mother liquor resulting from the production of sugar by the hydrolysis of starch obtained in concns. of about 42–52° Bx.

Adsorbent catalyzer. ALBERT GODEL (to Soc. de recherches & d'exploitations pétrolières). U. S. 1,674,897, June 26. An agglomerated mass of active charcoal is coated with a harder but less active C such as may be formed by use of sucrose and FeCl_3 and calcining. The product thus formed is suitable for use in recovery or sepn. of hydrocarbon vapors. Cf. C. A. 21, 305.

Absorbent materials. BRITISH DYESTUFFS CORPORATION, LTD., J. BADDILEY and E. CHAPMAN. Brit. 280,262, July 15, 1926. The absorptive properties of blotting paper, kieselguhr and other absorbent materials is improved by treatment with a small proportion of a naphthalenesulfonic acid or sulfonate or other suitable higher sulfonic acids.

Composition for cleaning and polishing varnished surfaces, etc. AUSTIN B. REEVE. U. S. 1,675,227, June 26. A non-saponaceous emulsion is formed of water 35–45, an oil such as a light mineral oil 35–50, a non-escharotic astringent, *e. g.*, tannic acid or alum 1, and a vegetable gum such as gum tragacanth 1 part which serves as an emulsifying agent. Colloidal clay, borax and rotten stone may be added.

Polishing composition for use on varnished or enameled surfaces, etc. E. R. ALEXANDER, R. B. ALEXANDER and A. J. KNIGHTS (trading as E. Roberts & Co.). Brit. 280,116, May 18, 1927. An aq. ext. is formed by soaking gum benzoin 4 oz. in water 1.5 pints for 3 days and to the strained ext. thus obtained there is added white petroleum oil $\frac{1}{2}$ pint, pptd. CaCO_3 4 oz., cochineal or other coloring material 1 oz. and sufficient addnl. water to make a total of 1 gal. The mixt. is heated and then allowed to cool.

Producing foam for fire-extinguishing or for other purposes. N. SANDOR. Brit. 280,208, Nov. 3, 1926. Compressed gas in finely divided state is introduced into a foam-forming liquid such as an aq. soln. of saponin, to which substances such as sugar or glue may be added for increasing the tenacity of the foam. The process may be applied to the production of "petrol air foam" for use as a fuel. An app. is described.

Composition for fireproofing and preserving wood, paper, cloth, etc. TAISAN SHIGA. U. S. 1,674,802, June 26. See Can. 270,490 (C. A. 21, 3434).

Washing and drying silica or other gels. I. G. FARBERIND. A.-G. Brit. 279,941, Aug. 4, 1926. The material is washed and dried while in the form of sheets or plates supported by open frames in which the gel has been caused to set.

Metallic piston packing. HAMPTON P. RHODES. U. S. 1,674,839, June 26. A cylindrical core of rubber is surrounded by a mixt. of babbit, graphite and oil, and by an outer protecting covering of fabric.

Porous materials. ERIK CHRISTIAN BAYER. Danish 38,216, Dec. 12, 1927. Foam-forming org. substances are added to the mass, for instance org. alkali salts, saponin, etc., or the mass is mixed with a foam previously produced by means of the like substances. Cf. C. A. 22, 469.

Sealing composition. MADP P. EBBESEN. Danish 36,438, Aug. 20, 1926. A mixt. of alkalies and fatty oils, starch and water glass is specified in which the mixt. of alkalies and fats is all or in part replaced by soaps.

Adhesive composition. JOHN MCGAVACK (to Dominion Rubber Co., Ltd.). Can. 281,646 July 10, 1928. A tacky rubber compd. is formed by treating resinous material of vegetable origin (wood pitches, oleoresins, balsams, hard, soft and liquid resins) with a solvent (pinene, turpentine, spindle oil and solvent naphtha), emulsifying the softened material in H₂O and intermixing the emulsion with an aq. dispersion of rubber.

Chewing gum. H. W. MATHESON (to Canadian Electro Products Co., Ltd.). Brit. 280,247, Nov. 8, 1926. Synthetic resins such as those made from a vinyl ester and an aldehyde (as described in Brit. 280,246; cf. C. A. 22, 3056) are used together with, or as a substitute for, gum chicle.

Oxidizing, bleaching and purifying composition. H. BLUMENBERG, JR. (to Amos M. Buley). Can. 280,815, June 5, 1928. Al₂(SO₄)₃·18H₂O partly dehydrated by heating to 120° and ground to pass a 200-mesh screen is mixed with Ca(OC1)₂ in proportions of 1 to 3 mol. and 5-10% inert material (diatomaceous earth) is added.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Study on the manufacture of ceramic liquid gold. TOSAKU YOSHIOKA AND KENJI NAKANISHI. *J. Japan. Ceram. Assoc.* 33, 573-80 (1925).—The manuf. of liquid Au has been studied, chiefly the Schwarz process. Conclusions: (1) Turpentine or resin is as good as turpentine oil for the manuf. of liquid Au. (2) In the prepn. of balsam contg. S too long boiling increases the reducing quality of the product and renders the liquid Au inferior, while that made of balsam contg. free S due to insufficient boiling produces a spotted film of Au on firing. (3) There is no material difference in the quality of Au balsam contg. S between the Schwarz and the Dutertor processes. (4) Bi added to the liquid Au increases the thermal stability, luster and adherence of Au film. These actions are encouraged by the presence of Co and other metals. (5) The reducing quality of turpentine oil can be removed without any loss by exposing it to the sun in an air-tight vessel of quartz glass. S. KONDO

The resistance of glass toward corrosion by water. Study of ordinary window-glass. Principal constituents: silica, soda, lime, magnesia. MAURICE SCOHV. *Bull. soc. chim. Belg.* 37, 186-203 (1928).—The optimum compn. for Fourcault glass is SiO₂ 72.5, Na₂O 13.5, CaO 10.5, MgO 2 and (SO₃, F₂O₃, Al₂O₃) 1.5%. This glass is very easily machined, does not devitrify and is very resistant toward the atm. agents.

The devitrification of old glass. H. RITCHIE CHIPMAN. Dalhousie Univ., Halifax, N. S. *Proc. Trans. Nova Scotian Inst. Sci.* 16, 144-6 (1928).—Expts. carried out with 20-30-year-old bulbs verify Germann's conclusions (cf. C. A. 15, 934). Devitrification is a surface phenomenon. A. L. HENNE

Losses in sheet-glass production. STANG. *Keram. Rund.* 36, 287-8 (1928).—

Attention is devoted to the prepn. of the raw materials and especially the advantages of using cullet in the melting of wire glass. Sand should be well dried before using. Excessive mixing of batch materials is wasteful, since some gr. sepn. of the batch constituents takes place during storage in the batch bins. Good economies may be effected in the wire-glass industry by carefully scpg. the wire from the waste glass, usually by grinding the glass thoroughly, then dissolving the wire and making a final sepn. with a magnet. Cullet thus recovered shows only a 2% loss in wt. in melting whereas a 21% loss in wt. is incurred when raw batch materials are used. Cost of recovery of cullet is given as 40% of the cost of raw materials per ton of glass produced.

H. INSLEY

The brown coloration of glasses by sulfides. R. ECKERT AND F. H. ZSCHAOKE. *Keram. Rund* 36, 203-6(1928).—Two glasses with the comps SiO_2 70, CaO 10, Na_2O 20 and SiO_2 73, CaO 10 and Na_2O 17% were melted in small batches in fireclay crucibles and in larger batches in pots. Various reducing agents and compds. contg. S were added to cause the brown coloration. Conclusion: It is not advantageous to add S in any form in which it oxidizes easily to SO_2 or SO_3 during the melting because of lack of control of reducing conditions and loss of coloring agent and difficulties in refining. Coal is not a perfect reducing agent and when used in excess produces foaming and consequent refining difficulties. H_2S is satisfactory as the carrier of sulfide but cannot be economically used in melts of com. size. FeS_2 introduced as a batch material with just enough coal to give the necessary reducing conditions is a satisfactory coloring agent. The molten colored glass may again be decolorized by introducing O.

H. INSLEY

Relative deformations of glass and fused silica under the influence of temperature variations. A. ARNULF. *Rev. d'optique* 6, 316-27(1927); *Science Abstracts* 31A, 15.—With an interference method tests were made on slabs of glass and fused silica, the slabs being 20 mm. in diam., 9 mm. thick and having plane parallel faces. Whether for reflection or refraction the silica has the advantage of a much smaller coeff. of dilatation than glass and a thermal cond. 9 times as great. The effects of heat on one face of the slab were tested to imitate the case of reflection, and of heat throughout the slab to imitate the case of refraction. In the former case the silica is deformed 50 times less than the glass. In the latter case, if steady states are reached, the 2 substances are practically equally affected, the variation of the n being the predominant factor for silica and dilatation for glass. If temp. changes are rapid silica is less affected on account of its greater cond. The objection to the silica is its want of homogeneity and residue of birefringence, and these are against its use for refraction, but it is of most importance for mirrors.

H. G.

Dielectric data on Pyrex. C. L. DAWES AND P. H. HUMPHRIES. Harvard Univ. *Elec. World* 91, 1331-2(1928); 8 illus.—A piece of Pyrex "A" glass 20.3 cm. square (chem.-ware glass) was tested in a high-voltage bridge at a const. potential of 5000 v. Up to 5000 v. and more the voltage had no effect on the power factor and capacitance. The curves for the watt loss per cu. cm. are practically straight lines. The dielec. const. decreases with increase in frequency and increases with temp. These relationships are common with dielectrics. Over wide ranges of frequency and temp. there is no ionization and apparently no hysteresis lag. The total power loss is not proportional to frequency; the increase of loss over that at zero frequency is proportional to frequency.

C. G. F.

Elementary proof of the shale-likeness of clay particles. DMITRY P. KRYNINE. *Public Roads* 8, 250(1928).—A description of method and photograph of app.

A. E. GRAY

The refractory clays of the Ural. M. O. KLER. *Trans. Inst. Econ. Mineral. Met. (Moscow)* 1927, No. 33, 1-123.

E. H.

Developments in refractory materials. ALFRED B. SEARLE. *Fuel Econ. Rev.* 7, 65-71(1928).

E. H.

The measurements of the thermal expansion of refractory materials up to 1600°. K. ENDRELL AND W. STEGER. *Arch. Eisenhüttenwesens* 1, 721-4(1927-8); *Stahl u. Eisen* 48, 722(1928).—A critical review of the methods used for the detn. of the thermal expansion of refractory materials disclosed the fact, that only comparative methods are reliable. An app. developed to be used up to 1600° is described in detail. Fire-clay bricks with medium or high Al_2O_3 content show up to 1300° little and very uniform expansion; above 1300° they show contraction. Fireclay bricks high in SiO_2 exhibit irregularities due to the transformation of SiO_2 , i. e., a considerable expansion up to 1450°, followed by contraction at higher temps. Magnesite bricks show a uniform strong expansion up to 1500°, followed by little contraction. Silicate bricks with a

sp. gr. up to 2.35 do not expand from 600° to 1600°, a silicate brick with a sp. gr., of 2.40 has a const. vol. up to 1400°. Silicate bricks with a sp. gr. of 2.45 and 2.54, in which the transformation of the SiO_2 is not complete, show a strong expansion above 1200° and attain a total expansion of 2.85 and 3.35%, resp., of their total length.

J. A. SZILARD

Analysis of refractory materials. I. H. J. VAN ROYEN. *Stahl u. Eisen* **47**, 1696-9(1927).—Silica in quartzite and silica brick is detd. by loss in wt. after the usual HF treatment; the residue is dissolved in fused pyrosulfate and the Fe detd. by titration with TiCl_3 . In a sep. portion, also treated with HF, the Ti and Al are pptd. together as phosphate and weighed; the ppt. is dissolved in fused pyrosulfate and the Ti detd. colorimetrically, the amt so found multiplied by 3.15 being subtracted from the wt. of mixed phosphates to obtain the wt. of AlPO_4 . Mn is detd. by the Vollhard method, and CaO and MgO are detd. as usual. The analysis of clays and grog is carried out in a similar manner, except that the sample is decomposed by fusion with alkali carbonate and the mixed Al and Ti phosphates obtained are redissolved in HCl and repptd. to remove absorbed Na salts. Cr should be tested for and, if found, the corresponding wt. of Cr phosphate is deducted from the wt. of combined phosphates. To det. Ti gravimetrically in this ppt. it is fused with a large excess of Na_2CO_3 , the mass leached with water, the insol. Na titanate collected and dissolved in HCl, and the Ti pptd. by Gooch's acetate method.

B. C. A

An outline of the manufacture and application of vitreous enamels. WILFRED MAVOR. *Metal Ind.* (London) **32**, 641-3(1928); *Chemistry & Industry* **47**, 435-7.

Feeding mold charges of molten glass. JOHN R. KELLER (to Hartford Empire Co.). U. S. 1,675,273, June 26. Mech. features.

Forming figured glassware from separate films of glass united into a single sheet while still soft. EDWARD DANNER. U. S. 1,674,856, June 26. An app. is described.

Apparatus for producing and handling rolled glass sheets. SOCIÉTÉ ANON. DES MANUFACTURES DE GLACES ET PRODUITS CHIMIQUES DE ST. GOBAIN, CHARENTY-ET-CHER. Brit. 279,860, Oct. 30, 1926.

Apparatus for continuous manufacture of sheet or plate glass. CHARLES HEIZE. U. S. 1,675,217, June 26.

Apparatus for annealing glassware. KARL E. PEILER (to Hartford-Empire Co.). U. S. 1,674,794, June 26.

Continuous annealing-leer for glassware. A. W. RUSSELL (to British Hartford-Fairmont Syndicate, Ltd.). Brit. 279,835, Oct. 26, 1926.

Reinforced glass. W. C. TAYLOR (to Corning Glass Works). Brit. 280,196, Nov. 6, 1926. Transparent sheets are formed by joining glass sheets with an intervening reinforcing material having approx. the same index of refraction as the glass. "Pyralin" may be used with lime tank glass.

"Splinterless" glass. L. BARTELSTONE. Brit. 279,671, Dec. 21, 1926. A film of non-solvent such as castor oil or linseed oil is applied to sheets of celluloid, cellulose acetate or the like and glass sheets are united to these by the action of heat and pressure.

Purifying clay, etc. T. W. PARKER and DARTMOOK CHINA CLAY CO., LTD. Brit. 279,694, Feb. 28, 1927. Clay or like material contg. Fe is bleached and decolorized by treatment with acid, with or without a reducing agent, and with aq. solns. of salts the bases of which do not form colored compds. with non-chromophoric acid radical. Among the salts which may be used are: Al sulfate, Na, K or NH_4 alums, and various salts of Al, Ca, Ba or Mg.

Refractory articles. GRANT S. DIAMOND (to Electric Refractories Corporation). U. S. 1,674,961, June 26. In forming crucibles, muffles or other refractory articles, MgO and cryst. graphite are mixed with a binder such as tar, molasses or a synthetic resin and with a glazing material, e. g., a neutral silicate, and the articles are molded, baked, further coated with glaze, and rebaked.

Continuously operating plant for burning refractory materials, etc. HEINRICH KOPPERS (to The Koppers Development Corporation). U. S. 1,674,985, June 26.

Circular kiln suitable for firing ceramic products. THEODORE C. PROUTY and WILLIS O. PROUTY (to American Encaustic Tiling Co., Ltd.). U. S. 1,674,992, June 26.

Cast metal crucibles. JOHN W. MARDEN (to Westinghouse Lamp Co.). U. S. 1,675,119, June 26. A cold cast refractory metal crucible such as may be formed of Mo, Ta, W or like metal is provided with a lining of thoria or other inert refractory material which is cold-cast in the crucible.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Evolution and progress in the manufacture of limes and cements. P. FERON. *Rev. matériaux construction trav. publics* 1928, 201-3. F. O. A.

Lime and cement in the State of Sao Paulo. ERNST SCHNEIDER. *Tonind.-Ztg.* 52, 912-3(1928). F. O. A.

The origin of the theories regarding hydraulic lime and cements. J. MERCEYRON-VICAT. *Ciment* 33, 1826(1928).—Historical. F. O. ANDEREGG

The determination of lime in cement raw mixes. FRANZ KUBIK. *Tonind.-Ztg.* 52, 678(1928).—Because of the presence of $MgCO_3$, both the titrimetric and gasometric methods gave high results, especially the latter. Either method may be used if the correction is const. Although the difference of 0.5% CaO in the finished cement may have considerable influence on its hydraulic properties, this is about the exptl. error in the analyses. F. O. A.

Cement making from waste materials. II. E. T. ELLIS. *Concrete* 31, [6], 96-7 (1927); *Building Sci. Abstracts* 1, 28.—E. discusses briefly the manuf. of Parian cements from old wall plaster, superphosphate-factory residues and water-softening wastes; the production of calcareous cements from the residues arising from the manuf. of $KClO_3$ and from the production of HNO_3 from the N of the air, and, finally, the recovery of lime suitable for the manuf. of cement from the waste products of caustic-soda plants. H. G.

Slag cement, its nature and properties. JEAN C. DE LANGAVANT. *Rev. matériaux construction trav. publics* 1928, 87-90, 139-43, 171-6, 208-15.—A general review of the properties of slag cements, including setting time, strength, constancy of vol. resistance to corrosive waters. F. O. A.

Definition of slag cement in Germany. ANON. *Tonind.-Ztg.* 52, 681-2(1928).—Slag cement may contain 15-69% portland cement ground with basic granulated blast-furnace slag of which the ratio $(CaO + MgO + \frac{1}{2} Al_2O_3) : (SiO_2 + \frac{2}{3} Al_2O_3)$ shall be greater than 1. The slag must not contain more than 5% MgO and the retarder shall not exceed 3% of the mixt. F. O. A.

A new method of burning cement. KARL BIEHL. *Tonind.-Ztg.* 52, 1015-7 (1928).—Claims are made that by the use of the Andreas system a raw material can be burned in a shaft kiln without briquetting, into a clinker fully as good as that of the rotary kiln. Saving of fuel, elimination of ring formation, sharp burning and rapid cooling are advantages of this system. F. O. A.

The behavior of trass cement in corrosive waters. H. RACH. *Tonind.-Ztg.* 52, 1059-60(1928).—Standard briquets were made from a ready-mixed trass cement and immersed in 2.5% $MgSO_4$ without any perceptible effect for 3 yrs. Other briquets only partly immersed suffered partial disintegration of the half extending into the air (due to efflorescent action). F. O. A.

Lime in cement-trass mixtures. TH. KIKKE. *Tonind.-Ztg.* 52, 1037-8(1928).—A mixture of 1 part portland cement, 0.5 part Bavarian trass, 0.75 part lime putty and 5 parts standard sand gave strengths similar to 1:3 cement-sand mortars and also low permeability. F. O. A.

New experiments with aluminous cements. R. FERET. *Rev. matériaux construction trav. publics* 1928, 135-9, 166-71; cf. C. A. 22, 149.—The importance of using as little water as possible with aluminous cement is emphasized. F. O. A.

The action of a large excess of water on aluminous cement. HUGO VIERHELLER. *Tonind.-Ztg.* 52, 611-4(1928).—Aluminous cement can be drowned out by an excess of water. CO_2 from the air of ground water does not affect the hardening reactions. F. O. A.

Aluminous cement in practice. FRITZ BÜCHI. *Beton u. Eisen* 27, 174-8(1928).—From a series of tests in comparison with regular specimens, the conclusion is reached that flexural tests with beams made on the job should give reliable indications of the strength of concrete made with aluminous cement. F. O. A.

Comparative setting-time observations with the Vicat needle and the "automat." NITZSCHE. *Tonind.-Ztg.* 52, 1036-7(1928).—The height reached by the wheel of the "automat," which is similar to that used in the ceramic industry, was observed when the initial set of several different cements was reached, as detd. by the Vicat needle. A fairly const. value was obtained which was nearly independent of the load on the wheel. F. O. A.

Review of the literature of the constitution of portland cement clinker. H. RICHARZ. *Tonind.-Ztg.* 52, 586-9, 634-7, 786-8, 826-9, 852-4, 1078-81(1928); cf. *C. A.* 22, 2041. A bibliography of 81 references is included. F. O. A.

Study of the health hazard in a large portland-cement plant. L. R. THOMPSON, DEAN K. BRUNDAGE, ALBERT E. RUSSELL AND J. J. BLOOMFIELD. *Pub. Health Rpts.* 43, 1497-8. *Public Health Bull.* 176, 1-138(1928).—Detns. were made of the no. of dust particles in the air in several parts of the plant. Careful phys. exams. were made of all employees over a 3-year period. Ca. dusts generated in the manuf. of portland cement do not predispose workers to tuberculosis or to pneumonia, though exposed workers experienced an abnormal no. of attacks of diseases of the upper respiratory tract, especially colds, acute bronchitis, tonsil and pharynx diseases and influenza. About 60% more time was lost from work by workmen in dusty departments over that lost by employees in non-dusty departments at the same plant. Limestone dust was slightly more deleterious than cement dust. When the dust in the atm. is less than about 10 million particles per cu. ft. it probably does not constitute a health hazard. Work in a cement-dusty atm. predisposes to certain skin diseases such as boils, conjunctivitis and to deafness. Improved ventilating systems and general plant modernization are the chief remedies advocated. C. R. FELLERS.

The construction and destruction of the Helgoland harbor. RICHARD GRÜN. *Tonind.-Ztg.* 52, 500-4(1928).—A description of the construction of the concrete work of the harbor and its destruction by means of wave action, explosives, washing away of supporting sand and sulfate action. F. O. A.

The compressive strength of non-cubic concrete specimens. BERNWARD GARRE. *Tonind.-Ztg.* 52, 504-5(1928).—The shorter the specimen the higher the strength, perhaps this is due to the greater amount of the stronger surface material. F. O. A.

The application of protective coatings on concrete. RICHARD GRÜN. *Tonind.-Ztg.* 52, 824-6(1928); cf. *C. A.* 21, 4041. A heavy asphalt coating upon a concrete made with a cement low in lime gives best results with acids. Bituminous coatings are valuable against the aggressive action of most salts, while phenolic condensation products are valuable against fatty oils. The concrete should be carefully made with plenty of cement, with trass admixtures, with properly graded aggregates and with about 10% water. The concrete should be allowed to age as much as practical and the surface must be dry and clean. The greatest of care should be used in applying the protective material. The first coat of bitumen should be well diluted, the second and third, however, undiluted. Each coat should have adequate opportunity to dry out. F. O. A.

Strengthening and enduring concrete with sulfur. W. H. KONNER. *Stone Tr. J.* 46, [5], 217(1927); *Building Sci. Abstracts* 1, 21-2. --Tests carried out on concrete impregnated with S showed in some cases an increase of tensile strength from 151 to 2000 lb. per sq. in. and compressive strengths up to 10341 lb. per sq. in. were obtained. The method of impregnation is discussed and it is stated that creosoting cylinders can be adapted for use with S. The cause of the increased strength may be the contraction of the S on solidifying. Impregnated concrete is not so fire resistant as untreated, but the fire hazard is very slight. No satisfactory method of treating existing structures has been yet devised. H. G.

The action of sulfate water on concrete. Further tests of specimens immersed in Medicine Lake, S. Dakota. DALTON G. MILLER. *Public Roads* 8, 203-12(1927). --Compressive tests made after exposures of cement cylinders up to 3 1/2 years in Medicine Lake, S. Dak., (2.34-4.72% $\text{MgSO}_4 \cdot \text{Na}_2\text{SO}_4$) give rise to the following conclusions: standard portland cements from different plants vary greatly in compression resistance. High alumina cements are satisfactory with one exception. Cylinders cured in steam at 100° are satisfactory after 3 years. Photographs and tables are given. A. H. G.

Relation between sodium sulfate soundness test and the absorption of sedimentary rock. D. O. WOOLF, JR. *Public Roads* 8, 225-8(1927). --There is no abs. correlation between Na_2SO_4 soundness test and failure of sedimentary rock through frost action, but it is of value in indicating questionable concrete aggregates. Photographs and tables are given. A. E. GRAY.

Effect of various salts in the mixing water in compressive strength of mortars.

F. E. GIESECKE, H. R. THOMAS AND G. A. PARKINSON. *Univ. of Texas Bull.* No. 2730; *Public Roads* 8, 248-9 (1928).—Investigation shows (1) NaCl , Na_2SO_4 , and Na_2CO_3 are injurious to portland cement mortars; (2) MgCl_2 and MgSO_4 have little effect on mortar strength; (3) strength ratios increase with age whether the salt reduces or increases mortar strength; (4) sulfates are not necessarily injurious to mortar strength; (5) 6% FeSO_4 increases mortar strength approx. 20%; and (6) relatively few natural waters contain high enough total solids to make them unsafe for use in concrete. A. E. G.

Stone preservation and decay. A. P. LAURIE. *J. Roy. Inst. Brit. Architects* 35, 283-9 (1928); *Carp. & Build.* 102, 396-8; *Building Sci. Abstracts* 1, 69.—L. deals with the chief mech. and chem. causes of decay, and draws attention to the part played by the mortar in the joints and by salts introduced from the subsoil water. The importance of examg. the site from a geological point of view is emphasized. Under the subheading "Stone Preservatives," the use of "Si ester" and the practice of mixing trass with the mortar are discussed. H. G.

A rapid method for determining iron in hydraulic products. MARC ELBER. *Rev. matériaux construction trav. publics.* 1928, 161-2.—The permanganate method is used. F. O. A.

Principles of kiln-seasoning of timber. I. Types of commercial kilns in use. S. T. C. STILLWELL. Dept. Sci. Ind. Research Forest Prods. Research *Special Rept.* No. 2, 11 pp (1928). B. C. A.

The use of portland cement for cementing the casings of petroleum wells (ZEVADA)
22. Stock for building boards, roofing, etc. (U. S. pat. 1,675,244) 23.

BRADLEY, HAROLD and HANCOCK, C. C.: *Modern Road-making.* London: Contractors Record, Ltd. 280 pp. 15s. net. Reviewed in *Chem. Trade J.* 83, 8 (1928)

Cement. HARVEY R. DURBIN (to International Cement Corp.). Can. 281,304, June 26, 1928. In the production of high-grade cement, more than the normal amt of lime is admixed with the usual constituents of normal Portland cement, and the whole is burned to incipient fusion, permitted to cool, ground and reburned to incipient fusion.

Waterproof cement. MCKINLEY GANNON (to Gannon Products Co.). U. S. 1,675,265, June 26. A cement suitable for general purposes, mending, etc., is formed of acetone 5 gals., celluloid 10 lbs., shellac gum 4 lbs., denatured alc. 0.5 gal., camphor 2 oz. and "banana oil" 4 oz.

Composition for floors. FREDERIC E. BOELKOW and FRIEDRICH W. O. LISTING U. S. reissue 17,010, June 26. See original pat. 1,635,982 (C. A. 21, 2974).

Porous cement products, etc. A. MENAGER. Brit. 280,116, May 20, 1927. The press cake obtained in sugar refining and composed mainly of CaCO_3 and colloidal substances is used with an acid to generate bubbles in plastic materials such as plaster or cement compns., insulations contrg. MgO , etc.

Artificial stone. F. TRACHSEL, J. WIEDMER and P. ZIGERLI. Brit. 280,104, May 2, 1927. A cement mixt. is used contrg. org. fibers which have been treated with a water-glass soln. to which about 1% of turpentine oil has been added and with a reagent which will ppt. an insol. Si compd. on the fiber. Various other ingredients such as fillers and coloring substances or waterproofing agents may be added.

Tile, etc. L. F. BARRINGER (to Can. General Elec. Co., Ltd.). Can. 280,936, June 12, 1928. A tile or stoneware article comprises asbestos and an inorg. binder, and is provided with a water-impervious, heat-resisting coating of a resin or mixt. of ester resins, made from a polyhydric alcohol and a polybasic acid capable of becoming infusible and insol. by heating, a plasticizer and an opaque filler.

Paving. H. H. SHORTER. Brit. 280,251, May 14, 1926. A paving suitable for tennis courts comprises a "hardcore" or clinker foundation, a porous "cushioning" layer which may be formed of clinker, ragstone or slag sprayed with cold emulsified bitumen and a top layer which may comprise aggregate 62, cement 3, coloring such as Reading green 15 and bitumen emulsion 20 parts.

Paving blocks. N. THOMAS. Brit. 280,120, June 10, 1927. Molds for concrete blocks or similar products are lined at their base with oiled paper which crinkles irreg-

ularly on contact with the wet materials and thus gives the molded product a slightly undulated surface.

Paving composition. TRINIDAD DEUTSCHE OEL-UND ASPHALT-A.-G. Brit. 279,885, Oct. 30, 1926. An emulsion suitable for coating stone for road-making may be formed of asphalt bitumen 500, oleic acid 20, and a 2% NaOH or KOH soln. 120 parts. A vibrating app. for coating and laying the stone is described.

Road-making material. A. C. BROWN and J. T. HINES. Brit. 280,011, Oct. 11, 1926. In order to preserve road-making material in soft condition suitable for laying, crushed stone or like material is treated with a colloidal soln. of resin oil dispersed in kerosene or the like, before mixing with the bituminous binder and filling materials. The colloidal soln. should contain about 25% of resin oil and the entire mixt. may comprise: crushed stone 2030, colloidal soln. 12, asphaltic or bituminous material 123, filler 60 and lime 11 parts.

Tar macadam. J. HINGS. Brit. 279,628, Oct. 22, 1926. Warm moist aggregate is dipped into a bituminous or tarry coating material which may be in the form of an aq. emulsion.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Calculation of the combustion temperature in blast furnaces. K. MÜHLBRADT. *Stahl u. Eisen* 47, 1813-6(1927).—A theoretical discussion of the mechanism of the combustion of coke in a blast furnace, with special reference to the temp. distribution. In the blast furnace the reaction takes place between heterogeneous phases; hence all calcs. of the initial temp. of the glowing C based on the principles of gas combustion lead to erroneous results. Thermodynamic considerations of the equilibria in the furnace indicate that there are 2 initial temps. very different from one another, one due to the reaction in the solid phase and one to that in the gaseous phase, and that the temp. in any zone of the furnace is dependent on the extent to which each reaction takes place in that zone, modified by the effects of convection, conduction by the hot blast and radiation. This theory is shown to account for observed facts in the distribution of temp., effect of varying wind pressure and reactivity of the coke.

B. C. A.

A study of energy. MARIANO B. OBREGÓN. San Luis Potosí. *Mém. rev. soc. cient. "Antonio Alzate"* 47, 73-110(1927).—This is a somewhat general study of the many factors which det. the efficiency with which the energy of various fuels is converted into mechanical energy by means of engines and motors, including steam and internal-combustion types. Formulas, data and illustrative calcn. are given.

R. H. LOMBARD

The heat-power plant with Benson boilers in the Gartenfeld cable factory of the Siemens-Schuchert works. H. GLEICHMANN. *Apparatebau* 40, 121-5(1928). Descriptions of boilers for gas and powd.-coal firing with plans showing pipe-line connections to the various units.

Water and coal as sources of power. A. A. POTTER AND H. L. SOLBERG. *Power* 67, 802-5(1928).—The classification of fuels and coal resources of the U. S. are discussed.

D. B. DILL

Pulverized coal in stationary railway power plants. I. ANON. *Power* 67, 1032-6(1928).—A report by a sub-committee on "Coal Fired Plants" of the *International Railway Fuel Assoc.* Without considering powd. coal a panacea, its advantages are as follows: less trouble due to poor coal; flexibility in operation; more rapid and complete combustion; lower banking, standby and low-load losses; higher rating or more boilers per stack; less operating labor; lower maintenance cost. II. *Ibid* 1072-5. —Pulverizer units, furnace design and wall construction are discussed. III. *Ibid* 1118-21. —Ash disposal, wall construction and method of firing are discussed. IV. *Ibid*

1160-1.—Fundamental requirements of the ideal unit pulverizer are reliability, efficiency and low maintenance. D. B. DILL.

Pulverized-lignite experiments. R. L. SUTHERLAND, N. T. BOURKE AND E. J. O'KEEFE. *Power* 67, 1141-4(1928).—Preliminary drying was necessary. The av. rate of fuel consumption was 2.44 lb. of lignite as fired or 16,540 B. t. u. per cu. ft. of effective furnace vol. as compared with 19,100 B. t. u. with Pocahontas coal. D. B. D.

Nitrogenous matter in coal. C. W. SHACKLOCK AND J. DRAKELEY. *J. Soc. Chem. Ind.* 46, 478-81T(1927).—The quantity of N extd. by means of dil. H_2SO_4 from peat, lignite, sub-bituminous, bituminous and anthracite coals decreases in the order given, and is not influenced under the conditions of the expt. by particle size provided the coal is first passed through a 30-mesh sieve. N in the form of amide compds., monoamino and diamino acid has been distinguished and detd. The monoamino acids appear to be the most persistent compds., and with coals account for over 70% of the extd. N. The diamino acids exist in coals in quantities which are too small to det. by the methods employed in this investigation. The amide compds. are present in all the fuels, and account for 15-20% of the N extd. from the coals. B. C. A.

Lancashire coalfield. Wigan Four-foot seam. ANON. Dept. Sci. Ind. Res., *Fuel Res.* 1927; Physical and Chemical Survey of the National Coal Resources, No. 10, (60 pp. 1927).—Samples of coal taken from the Wigan Four-foot seam in 10 different districts have been examd. in detail. The seam is of good quality, consists of fairly hard and moderately bright coal contg. a certain amt. of durain, and is seldom split by thick shale or dirt bands. The thickness varies from about 2 ft. on the east to a max. of 6 ft. 3 in. at Garswood, thence thinning slightly towards St. Helens. The seam yields a good coking coal, which is used chiefly as a house or as a gas coal; it produces a coke which is usually only slightly swollen. The moisture content is normal, about 2-3%, except for the Garswood sample (5.6%). The ash content varies from 2.6 to 9.9%, the av., however, lying between 3 and 4%. The av. volatile matter content is high. The S. content tends to be high in the Tyldesley and Atherton districts, but elsewhere is comparatively low. The results of lab. carbonization assays at 600° indicate the suitability of this coal for gas manuf. Washing tests made on 3 of the samples show that the coal lends itself to purification by both float-and-sink and froth-flotation methods. B. C. A.

A short history of the gas industry in Japan. SAKURA OKAMOTO. *J. Fuel Soc. Japan* 7, 31-6(English Section) (1928).—The development of the gas industry in Japan is discussed. F. I. NAKAMURA

Recent developments in the purification of gas. H. ZOLLIKOFER. *Monats-Bull. Schweiz. Ver. Gas-Wasserfachmännern* 7, 78-86; *Chem. Zentr.* 1927, 1, 2496.—A detailed review and discussion of the "Seaboard" process of the Am. Koppers Co. for the removal of H_2S and HCN by means of soda lye, with the recovery of S. The C_1H_4 purification process of Lenze and Rettenmaier (Hamborn) is also described, in which the crude gas is cooled to 0° or -2°, with recovery of concd. NH_4OH , the sepn. of tar by the Cottrell process with the "Lurgi" app. (Lurgi Apparatebau-Gesellschaft, Frankfurt) and the drying of gas (with the object of preventing corrosion) by compression, cooling, absorption with $CaCl_2$ and SiO_2 gel through storage in a water-free gas container, are all described. C. C. DAVIS

The separation of coke-oven gases by intense cooling. OTTO HUPPERT. *Metallbörse* 18, 509-11(1928).—A brief description of the methods in use and statistics. J. BALOZIAN

Comparison of the most important methods employed in the cleaning of blast-furnace gas. V. HARBORD. *Iron Steel Inst.* May, 1928 (advance copy), 28 pp.—The actual works records for a no. of large British plants were used in compiling data for comparing the efficiency of different types of installations. The "efficiency" of dust removal is conditioned by the fineness of the particles, almost any method being efficient for coarse particles. The "efficiency" is further conditioned by the effect of the treatment on the sensible heat of the gas. Certain types of gas cleaners are designed to preserve the heat of the hot gas, while others necessitate the cooling of the gas prior to treatment. The Kling-Weidlein wire mattress cleaner and the Lodge-Cottrell electrostatic cleaners belong to the first class. Wet cleaning plants reduce

the temp. of the gas and also remove the moisture, thus providing a more combustible gas than the high-temp. dry treaters. If a dust content of about 0.5 g. per cu. m. is sufficient, electrostatic plants or a washer of the tower and spray type without disintegrators will do. If a lower dust content is required a washer of the disintegrator type or a Halberg-Beth filtration plant is necessary. The Kling-Weidlein plant is only satisfactory as a primary cleaner, or in conjunction with an electrostatic cleaner if retention of sensible heat is required. The cost of operation of the electrostatic cleaners is less than that of other types but the av. dust content of the cleaned gas is higher. The Halberg-Beth bag cleaner gives a lower dust content in the final gas and its cost of operation is no more than that of any other type of cleaner. The high capital cost and the handling of the dry dust are the 2 main objections to this plant. The most efficient kinds of wet washers are of the combined tower and disintegrator type. A comparison table contg. data on the operation of 12 plants, and tables contg. the observed results in the operation of all the types of plants investigated are included. Also in *Blast Furnace Steel Plant* 16, 901-5. J. W. SHIPLEY

Investigations on the temperatures and composition of gases in the combustion chamber of a shaft furnace. DIEPSCHLAG. *Giesserei* 15, 3-6(1928).—The combustion chamber of a shaft furnace may be divided into 2 parts, the lower, in which the oxidation of C to CO_2 takes place, and the upper, in which the CO_2 is reduced by further C to CO. Based on theoretical considerations, a gas compn-temp diagram is plotted, it being assumed that the max. CO_2 content is 21%. The curve shows that in the oxidizing zone the temp increases, with increasing CO_2 , to a max 1605°, and decreases in the reducing zone to a final value of 314°, there still being CO_2 present, indicating that the Boudouard equil. had already been reached. The oxidizing and reducing zones not being sharply sep'd in practice, the actual curve is more rounded at the point than the theoretical. This is verified by a plot of calcd. values from the data of Kreisinger (*Stahl u. Eisen* 1923, 1351), for a roasting hearth. To test the theoretical conclusions further, a small exptl. shaft furnace is constructed and expts are conducted using varying sizes of fuel and air velocities. In general these values confirm the theoretical conclusions. Thus, the temp. of the combustion chamber increases to a max. and then falls off, this temp. being higher the greater the air velocity. When the size of the fuel is decreased, the highest temp. zone is lowered and the oxidizing zone is smaller. A zone of complete combustion where the CO_2 content is 21% could not be detected, the max. being 16.5%. An explanation accounting for the mechanism of combustion in the furnace is given. J. BALOZIAN

Removal of carbon-sulfur compounds from coal gas by oil washing. K. L. DAWSON. Nova Scotia Tramways and Power Co., Halifax. *Eng. J* 11, 266-81(1928).—A description of the app. and the theoretical considerations upon which the efficiency of the operation is based are given. No. 1, Pale Paraffin oil with a mean mol wt. of 250 is used in a series of 3 scrubbers for removing the S compds. $\text{C}_2\text{H}_4\text{S}$ is also removed. After the S compds. and $\text{C}_2\text{H}_4\text{S}$ are removed by distn. the oil is returned to the scrubbers. After several months the mol. wt. of the conditioned oil increased to 300 and its S content was slightly increased. Scrubber 1 removes but little of the S, while in scrubber 3 the greatest transfer of S compds. occurs. This is explained by the existence of 2 S compds. in the gas, CS_2 and $\text{C}_2\text{H}_4\text{S}$. The $\text{C}_2\text{H}_4\text{S}$, which has been removed increases the absorption of the S compds. by the oil. The lower the temp. of the gas passing through the scrubbers the greater is the efficiency of absorption. A reduction of 50% in the S content of the gas is obtained and less than 35 grains of S per 100 cu. ft. is left in the gas. Tables contg. operating costs and log sheets for the scrubbing units are included. J. W. SHIPLEY

Analysis of lignite oils. A. LABAD OCÓN. *Quím. ind.* 5, 33-5(1928).—Oil from Aragon lignites distd. under technical conditions yielded the following fractions: 14.8% b. up to 220°, 10.4% b. 220-250°, 17% b. 250-300°. The 1st fraction yielded: 4.7% b. up to 150°, 5.8% b. 150-185°, 4.3% b. above 185°. The neutral oils obtained by washing with H_2SO_4 66° Bé. and NaOH had the following compn.:

B.p.	Up to 150°	150-200°	200-250°	250-300°	Up to 150°	150-210°
Percent, $\text{C}_8\text{H}_{18}+2$	8 }					
Percent naphthenes	17 }	20	25	30	25	33
Percent aromatic	24	18.4	18.4	17.0	29.6	28.8

Percent cyclic satd.	38.3	42.3	45.1	37.3	36.4	47

MARY JACOBSEN

Determination of unburned flue gases by combustion over copper oxide. HANS MIRS. *Gas u. Wasserfach* 71, 509-15(1928).—Methane can be detd. in flue gases contg. 2% methane with an accuracy of 92%, by burning on Cu oxide at temps. from 780° to 890°, depending on the length of the Cu oxide catalyst and the gas rate. H₂O, CO, H or CO₂ has no influence on the combustion of CH₄ at the given temps. H, however, retards combustion at temps. 50-100° lower. The velocity of the combustion is greatest at the front of the Cu oxide and decreases toward the rear. In order to secure concordant results in the tests, the Cu oxide was repeatedly oxidized and reduced until further oxidation and reduction gave no further change in the percentage of methane oxidized at a given temp.

Low-temperature tar oils. F. D. MARSHALL. Carlton Main Colliery Co., Barnsley. *Gas J.* 182, 727(1928).—A permanently water-white spirit is obtained by treating low-temp. tar distillate up to 170°, after extn. of tar acids and bases, with petroleum ether. The thick oil thrown out has drying and elastic properties, forming a good varnish for metal surfaces.

Continuous tar distillation. W. KARSTEN. *Teer u. Bitumen* 26, 297-9(1928).—A description of present industrial standard practice. The preheated tar passes down through downward-pointed nozzles in the diaphragms of a column, against a counter-current of superheated steam passing through upward-pointed nozzles to avoid interference. Here the tar is distd. down to pitch, the consistency of which is controlled by the quantity and temp. of the steam. The vapors pass on through a series of other columns in which various fractions are removed in succession by partial condensation. Heat is economized by interchangers at suitable points. Advantages over batch distn. are heat, labor and space economy and short exposure to heat, resulting in less pitch and a lower free C content.

The removal of phenol from ammonia liquor with recovery of raw phenol or phenolate lye. ERICH KOCH. *Teer u. Bitumen* 26, 281-4(1928).—A description and discussion of present industrial practice. The recovery of the considerable quantity of benzene, retained by the ammonia liquor, after the phenols have been washed out with benzene, is necessary to the economic success of the process. It is successfully accomplished by washing with a paraffin oil.

The removal of phenols from waste liquors of by-product plants and its economic importance. A. WEINDEL. *Glückauf* 63, 401-9; *Chem. Zentr.* 1927, 1, 2233.—The harmful effect of phenols is described, particularly with reference to their effect on flora and fauna of streams which they usually enter from the waste liquors of gas works and coke-oven plants. Their origin, methods of treating the NH₃ liquor in which 1.5-4.5 g. per l. are present and the necessity for sanitary and economical reasons for their removal are also discussed. Methods for removing the phenols without recovering them are described. The use of waste liquors from NH₃ plants for quenching coke, their treatment with gases of combustion and steam in special towers and their biol. decompn. by the Fowler process improved by Bach, are almost wholly replaced by processes in which the phenols are recovered. The Preiss process, i. e., neutralization with H₂SO₄ of waste liquors freed from lime sludge, extn. with C₂H₆ and pptn. with NaOH, is uneconomical, and essentially more advantageous is the process introduced by the "Emscher Genossenschaft," which involves direct extn. with C₂H₆ of the NH₃ liquor, washing with H₂SO₄ and removing pyridine so that pure, white (NH₄)₂SO₄ is produced. The process is described in detail.

The problem of the purification of ammoniacal waste liquors. E. OTT. *Monats-Bull. Schweiz. Ver. Gas-Wasserfachmännern* 7, 75-8; *Chem. Zentr.* 1927, 1, 2496.—A discussion of the special importance of removing phenols from NH₃ waste liquors by destruction or extn. as a means of maintaining surface and ground waters in a pure condition. Particular stress is laid on conditions in Switzerland. The Bach process perfected at the Emscher Genossenschaft, in which the phenols are oxidized biologically and rendered harmless by decompn., and the purification accomplished by such means, are described in detail.

Heat of coking of gas and coking coals. II. ERNST TERRES and MARTIN MEIER. *Tech. Hoch. Braunschweig. Gas u. Wasserfach* 71, 457-61, 490-5, 519-23(1928).—Errors in previous detns. of heat of coking by Terres and Wolter (*C. A.* 22, 1457) are noted and corrected. Heat of coking is now defined as the quantity of heat necessary to convert 1 kg. air-dry coal at 20° into coke and gaseous products at any given temp. by including the energy in kg. cal. corresponding to the external performance of work by the gaseous products. Addnl. precautions are given in regard to the calibration of the app., which must be carried out under conditions as nearly like those of the detns. as possible. Curves for the heat of coking are given for 15 German and English coals between

600° and 1100°. These curves vary widely and explain abnormalities noted in coking coals on a com. scale. Heats of coking cannot be estd. from the analysis of the coal and small-scale gasification expts., but can be detd. directly with little more difficulty than a B. t. u. detn. A simplified method for detg. heats of coking is being developed. The low heats of coking found for these coals lead one to believe that excessive heat is required in com. coking installations on account of losses due to radiation and conduction. R. W. RYAN

The determination of volatile matter in coke. FREDERICK J. EATON AND STUART PEXTON. *J. Chem. Soc.* 1928, 1215-7.—This method combines the rapidity of the A. S. T. M. method with the trustworthiness of the Bone and Silver method for coals. The coke, in a Pt crucible, is heated in an elec. furnace. Errors due to oxidation are avoided by passing a current of N through the furnace. Variations in check detn. should not exceed $\pm 0.05\%$. A table shows comparative results. DAVID GORDON

Reactivity of coke. J. H. JONES, J. G. KING AND F. S. SINNATT. H. M. Fuel Research Station, Greenwich. *Iron Steel Inst.* May, 1928 (advance copy), 20 pp.; cf. C. A. 22, 1841.—A large number of British coals were examd. for the velocity of the reaction between CO₂ and the carbon of the coke in forming CO at a temp. of 950°. The reactivity values are measured by the vol. of CO produced when a definite vol. of CO₂ is passed at a constant rate over a definite vol. of sized coke at a const. temp. The value is not const. for a given sample but alters as the treatment with CO₂ is prolonged. The previous heat treatment of the coke appears to have an effect upon the reactivity value. Coals from various localities differ quite markedly, although carbonization was carried out in similar ways. Coals from Yorkshire coal gave higher values than Durham or South Wales coal. No correlation between the shatter test and the reactivity values for detg. the quality of coals could be discovered. Reactivity values are persistent and characteristic for any one coal and may be arrived at by using CH₄, CO or O₂, as well as by using CO₂. No reactivity is exhibited by any coal examd. when it is cooled down in the presence of CO₂ instead of N. The authors do not offer any satisfactory explanation of the phenomena. Plates showing the values for the various coals examd. and of the app. accompany the paper. J. W. SHIPLEY

Review of coke-oven technology during the year 1927. G. E. FOXWELL. *Fuel Econ. Rev.* 7, 25-9 (1928). E. H.

Equilibrium relations in the water-gas reaction (NEUMANN, KÖHLER) 2. Purifying gases (Brit. 280,165) 13.

Fuel. W. H. ROGERS. Brit. 280,349, Oct. 25, 1926. A small proportion of petroleum or crude benzene or similar material is added to road sweepings together with water, clay or other ingredients and the mixt. may be molded into lumps or briquets. Ashes, saw-mill sweepings, sawdust and spent hops also may be used.

Fuel briquets. HUGH H. HANSARD. U. S. 1,675,268, June 26. A mixt. of pulverized coal and liquid hydrocarbon material such as Mexican petroleum is heated to drive off volatile constituents and those of low b. p. and the residue of coal and high b. p. constituents of the liquid hydrocarbon material is formed into briquets.

Fuel briquets. PETER JUNG. U. S. 1,675,272, June 26. Briquets are formed contg. a large proportion of a solid fuel such as small coke together with a small quantity of peat or other solid fuel ground to substantially colloidal fineness so that it is capable of forming a permanent suspension in water; this colloidal material is evenly distributed throughout the mass and is in addn. to such colloidal material as may naturally occur in the solid fuel.

Liquid fuel (a liquefied mixture containing butane and butylene). M. MÜLLER-CUNRADI (to I. G. Farbenind. A.-G.). U. S. 1,673,620, June 12. A fuel suitable for lighting, welding or operating internal-combustion engines may be produced by mixing butane and butylene.

Carbureting apparatus. O. A. SAARINEN. Brit. 280,242, Nov. 5, 1926. Liquid fuel is evapd. from blocks of porous material such as gypsum, asbestos, pumice, brick or coal, provided with air passages. Various structural features are described.

Continuous distillation of carbonaceous fuels. WALTER E. TRENT (to Trent Process Corporation). U. S. 1,675,315, June 26. In distg. coal to produce coke and recover different fractions of oils, the material is introduced into a series of coking containers in one of which it is heated sufficiently to vaporize volatile constituents and form a coke residue; exhaust combustion gases and vaporized products from this container are passed successively through the series of containers to heat the material to progressively decreasing temps. and substances thus volatilized are condensed in sep. fractions; the different containers are successively heated to coking temp. An app. is described.

Hydrogenation of carbonaceous material. CARL KRAUCH, WALTER SIMON and MATTHIAS PIER (to I. G. Farbenind. A. G.). Can. 281,651, July 10, 1928. Carbonaceous material is treated with H in the presence of a catalyst selected from the groups 4 and 3 of the periodic system, Cu-Fe mixts, porous C, active SiO_2 , hydrosilicates, Al_2O_3 and MgO . The resulting product is treated with H with the aid of a catalyst selected from the group Co, Mo, W and their compds. Both operations are carried out under an elevated pressure with streaming H and with a low partial pressure of the material to be converted.

Apparatus for carbureting fuel gas. E. FAUCONNIER and A. SIMPERE. Brit. 280,203, Nov. 4, 1926. The app. may be controlled by a pyrometer in a kiln or other app. heated by the gas under treatment.

Water-gas generator. MADS P. EBBESEN. Danish 37,567, July 7, 1927.

Destructive hydrogenation. I. G. FARBENIND. A.-G. Brit. 279,825, Oct. 28, 1926. Destructive hydrogenation and other heat-treatment of coal, tar, oils, etc., is effected in vessels, the walls of which serve as elec. resistances, e. g., tar may be passed through a long tube formed of an alloy contg. Ni 60-65 and Cr 10-15% assocd. with Fe and low in C, which is elec. heated to about 420° .

Washing coal and recovering values from the wash water by settling and pressure filtration. WIGAN COAL & IRON CO., LTD. AND A. E. LEEK. Brit. 279,766, April 22, 1926.

Gravity separation of slurry from coal washings, etc. A. E. LEEK and WIGAN COAL & IRON CO., LTD. Brit. 279,525, April 22, 1926. An app. for filtration and other treatment is described.

Purification of coal gas. CHARLES J. RAMSBURG (to Koppers Co.). Can. 281,670, July 10, 1928. A hygroscopic medium such as H_2SO_4 or HPO_3 of relatively high concn. (60°Bé) is used to dry the gas, and the acid which has become dild. in the drying operation is used for the removal of NH_3 from the gas prior to the drying operation.

Supplying oil and gas for internal-combustion engine operation. MOTORENFABRIK DEUTZ A.-G. Brit. 280,239, Nov. 5, 1926. A mixt. of air and poor-quality gas or a dil. mixt. of a gas of better quality is compressed to not over 32 atm. and ignition is effected by injecting a small quantity of oil less than would itself alone suffice for running the engine.

Gas meter. PARKINSON & COWAN (Gas Meters), LTD. AND F. THORP. Brit. 280,049, Dec. 8, 1926.

Reducing corrosion in gasometers. J. A. FLETCHER and C. R. NORMAN. Brit. 280,134, June 24, 1927. In order to minimize corrosion, an oil emulsion is used as a liquid seal; the emulsion may be formed of cottonseed oil, mineral oil, fish oil, NH_3 and water by violent agitation.

Recovering oils, tars, etc., from emulsions. H. W. ROBINSON and D. W. PARKES. Brit. 280,059, Dec. 24, 1926. Emulsions of water-gas tar or the like or of oils are made slightly acid and mixed with a finely divided solid hydrocarbon such as C_{10}H_8 (unless this is already present in sufficient proportion). Creosote oil or like material also may be added and the acidity may be produced by use of CO_2 , SO_2 or flue gases.

Coke-oven construction. FOUNDATION OVEN CORPORATION. Brit. 279,955, Aug. 7, 1926.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

F. M. ROGERS

World's petroleum production in 1927. RYUICHIRO YENOMOTO. *J. Fuel Soc. Japan* 7, 26-8 (English Section) (1928).—A review. F. I. NAKAMURA

The role of cracking in the petroleum industry. P. BURGART AND A. GRABETZ. *Tech. moderne* 20, 377-87 (1928); cf. *C. A.* 22, 676.—A review is given of the history of cracking, the different methods now in use and the influence of catalysts. P. T.

The flow and measurement of petroleum products in pipe-lines. S. W. ADY. *J. Inst. Petroleum Tech.* 14, 222-35 (1928).—The Reynolds, Fanning and Weymouth equations for measuring the flow of liquids and gases in pipes are stated and discussed. Measurement by Venturi or orifice meters and by the Pitot tube is discussed and formulas are given for the necessary calcs. with each. Viscosities of paraffin hydrocarbons from methane to octane inclusive are given for normal temp. and pressure as calcd. by the formula $\eta = \lambda/\sqrt{3/\rho p}$, in which η = viscosity of the gas, λ = mean free path, ρ = pressure of the gas and p = d of the gas. D. F. BROWN

The flow of fluids in pipes. E. S. L. BEALE AND P. DOCKSEY. *J. Inst. Petroleum Tech.* 14, 236-62 (1928).—A theoretical discussion is given of the Reynolds criterion and its use in detg. the friction factor $R/\rho v^2$, in which R is the frictional force per unit area of pipe surface, ρ is the fluid density and v is the mean linear velocity of fluid in the pipe. The effect of pipe roughness is discussed and a set of "Stanton Curves" connecting $R/\rho v^2$ and the Reynolds criterion given. The equations of flow for liquids and gases are derived from first principles, and put in form for use by the practical engineer. D. F. BROWN

Flow and measurement of gases in pipes. J. S. M. AULD. *J. Inst. Petroleum Tech.* 14, 263-4 (1928).—The papers by Adey and by Beale and Docksey (preceding abstracts) are discussed. D. F. BROWN

Operating a continuous plant for refining distillates. J. C. MORRELL AND D. J. BERGMAN. *Chem. Met. Eng.* 35, 350-4 (1928).—App. and methods of operation for the continuous treatment of petroleum distillates with acid and plumbite solutions are described with drawings and photographs. D. F. BROWN

The behavior of Emba crude oil in the refinery. EDWARD PYHALA. *J. Inst. Petroleum Tech.* 14, 330-50 (1928).—Light medium and heavy crude oils are obtained from the wells at Emba. The kerosene content in the light and medium oils varies from 1.8 to 27.5%, and rises to 20% in the heavy oils. Naphthenic acid content of Emba kerosene distillate varies from 0.2 to 1.27%. The crude oil contains practically no paraffin. High-grade lubricating oil distillates can be obtained from this crude if special distn. methods are used to prevent the formation of ceresin due to decomposition phenomena which occur with ordinary distn. methods. Careful attention to certain proportions in the lye treatment during the treating process is also necessary to remove certain constituents which easily emulsify and are not removed by the usual treating methods. D. F. BROWN

Commercial oil deposits and main structural features. T. H. R. GARRETT. *J. Inst. Petroleum Tech.* 14, 351 (1928).—Discussion of Stamp (*J. Inst. Petroleum Tech.* 14, 38-63 (1928)). The theory that oil fields could have been destroyed by burning underground or by distn. is refuted. D. F. BROWN

The mineral-oil industry in 1927. RICH. KISSLING. *Chem. Umschau Fette, Oele Wuchse u. Harze* 35, 126-31, 145-9 (1928).—An annual review bearing the following captions: I. Production. II. Transportation and storage. III. Treatment. IV. Application. V. Examn and testing. VI. Scientific investigations. VII. Literature, with 21 titles of books or pamphlets and 380 references. P. ESCHER

Transformer oils. MAURICE VAN RYSELBERGE. *Bull. feder. ind. chim. Belg.* 7, 217-28 (1928).—General survey. A. L. HENNE

Flame characteristics of "pinking" and "non-pinking" fuels. G. B. MAXWELL AND R. V. WHEELER. *J. Inst. Petroleum Tech.* 14, 175-89 (1928).—Explosions within a closed steel cylinder, without a moving piston, are investigated photographically. The cylinder, 38 cm. long and of 15.2 cm. internal diam., is provided with a window of plate glass along one side, a plug for igniting at one end and an optical pressure indicator at the other. In the explosion of a mixt. contg. 3% of C_4H_{10} by vol. in air (the mixt. for max. power) at 1 atm., the flame passes through the charge with an accelerated speed until it is slightly beyond the mid-point of the cylinder where it is checked and then

continues until it strikes the end of the cylinder and an actinic after-glow is started. During the explosion, the pressure rises evenly and no sound is heard. Increasing the initial pressure of the 3% C_4H_{12} -air mixt. to 2 atms. causes an audible "ping" on explosion and rapid vibrations of the pressure of the exploded mixt. As the flame in the explosion of a mixt. contg. 3.5% of C_4H_{12} in air at 1 atm. accelerates and approaches the end of the cylinder, the pressure record shows vibrations of the same frequency as those of the flame and synchronizing with them. The explosion of all mixts. contg. from 3.2 to 3.8% of C_4H_{12} in air at 2 atm. produces a high-pitched squeal and a violent "kick" on the pressure records. Explosions of "max.-power" (3.0%) C_4H_{12} -air mixts. at 1 and 2 atms. initial pressure are inaudible and a highly actinic after-glow is almost continuous behind the flame front. "Pinking" is suppressed in a 3.5% C_4H_{12} -air mixt. at 2.5 atms. by decreasing the length of the cylinder to 25.4 cm., and in a 3.8% C_4H_{12} -air mixt. at 2.5 atms. by turbulence caused by the revolution of a fan at 2500 r. p. m. mounted within the cylinder at the ignition end. The addn. of $PbEt_4$ as vapor, in quantity corresponding to 2.5 fluid ounces per gal. of C_4H_{12} , to a 3.8% C_4H_{12} -air mixt. causes violent pinking, but when the $PbEt_4$ vapor is decompd. before ignition of the C_4H_{12} -air mixt. the explosion is silent. These results confirm the view (C. A. 22, 870) that the decompn. products of $PbEt_4$, and not $PbEt_4$ itself, have antiknock action.

R. E. SCHAAD

The extraction and refining of paraffin wax. W. ALLEN. *J. Inst. Petroleum Tech.* 14, 328(1928).—The common process of removing wax from oil consists in rapid re-distn., chilling and filter-pressing of a cracked paraffin distillate. After its removal from the press, the wax is melted and run into the trays of the sweating plant where the sweating is continued until the required temp. is reached. The sweated wax is refined further and graded according to its m. p.

R. E. SCHAAD

Decomposition of paraffin wax on heating. H. I. WATERMAN, J. N. J. PERQUIN AND H. A. VAN WESTEN. *J. Inst. Petroleum Tech.* 14, 318-27(1928); cf. C. A. 22, 497.—An improvement of Rast's method (C. A. 16, 2060) for detg. mol. wts. by the lowering of the m. p. of camphor gives 417 and 427 as the mol. wt. of ordinary Rangoon paraffin wax, and 282 to 328 and 266 to 342 for the mol. wts. of its cracking and Bergmization residues, resp. The n and mol. wt. of the wax remain unchanged after being heated intermittently in a closed, previously evacuated glass tube for 64 hrs. at 306° by vapors of boiling Ph_2CO . Rangoon paraffin wax, mol. wt. (Rast) 410, no Br addn., d_{20} 0.7744, setting-point (Shuokff) 58.0°, is relatively thermoresistant in an atm. of N up to 370°. Heating it for 10 hrs. at 370° causes decompn. and lowers the av. mol. wt. to 360. The gas, low-boiling distillate, and residues contain unsatd. hydrocarbons. The residues have approx. the same n and sp. gr. as the original wax. The heating temps. are maintained const. to within about 2° by a specially constructed thermoregulator.

R. E. SCHAAD

Treatment of benzine obtained by cracking processes and low-temperature carbonization with sulfuric acid and with liquid sulfur dioxide. A. ERDÉLY AND L. ALMÁSI. *Brennstoff-Chem.* 8, 358-60(1927).—The action of H_2SO_4 was tried in various concns. on samples of benzine from cracked Russian petroleum, and cracked and uncracked low-temp. tar from brown coal. The action began with acid of 40% concn. It acted both as a solvent and as a polymerizing agent. The polymers were not removed from the benzine even by 100% H_2SO_4 . Liquid SO_2 was tried but it effected only partial sepn. of aromatics and unsatd. compds.; the refined product, however, was water-white.

J. D. DAVIS

Determination of aromatic and unsaturated hydrocarbons in benzine by means of sulfuric acid. R. KATTWINKEL. *Brennstoff-Chem.* 8, 353-8(1927).—Previous methods based on the solvent action of H_2SO_4 for aromatics and unsaturates are discussed. K. detg. aromatics + unsaturates in a 10-cc. sample by shaking with 30 cc. of a mixt. of 30 g. P_2O_5 in 100 cc. H_2SO_4 (d. 1.840). Unsaturates alone are detd. by shaking the sample with a mixt. of 5 g. boric acid in 100 cc. H_2SO_4 (d. 1.840). The boric acid mixt. does not dissolve aromatics; P_2O_5 in H_2SO_4 catalyzes sulfonation and thus aids soln. of aromatics.

J. D. DAVIS

Flash-point determinations in the standard flash-point tester. G. MEYERHEIM AND FR. FRANK. *Chem. Lab. Handel u. Ind., Berlin W 35. Erdöl u. Teer* 4, 272-3 (1928).—Satisfactory checks were obtained on various oils with the Marcusson, Schütter-Göckel and Sommer-Runge app. when the precaution was observed of keeping the thermometer bulb 2-5 mm. from both the bottom and the side of the crucible. F. S. G.

The recovery of gasoline from field and refinery gases with special reference to the Bayer charcoal process. I. EDELEANU. *J. Inst. Petroleum Tech.* 14, 286-317(1928).—In the charcoal adsorption process for recovering gasoline from natural and refinery

gas the quality of the charcoal depends upon (1) the development of inside capillary surface per unit of wt., (2) the capillary vol. per unit of wt., (3) the diam. of the capillaries and (4) the chem. character of the surfaces. Typical charcoal adsorption plants are described in detail with the aid of sketches and photographs. Use of the Ejector Vacuum-Evaporator has resulted in great economy of the rinsing steam used.

D. F. BROWN

Separation of lead tetraethyl from solution in petroleum spirit. F. W. TOMS AND C. P. MONY. *Analyst* 53, 328-9(1928).—Since, for the present at least, the use of "ethyl gas" is prohibited at Jersey, Channel Islands, it was interesting to see how the poisonous Pb compd. could best be removed. By passing SO_2 into the gasoline the Pb was converted eventually into PbSO_4 and the gasoline could be decanted off from the insol. powder.

W. T. H.

Rept. of Committee D-2 on petroleum products and lubricants. F. A. HULL, *et al. Proc. Am. Soc. for Testing Materials* (preprint) No. 72, 104 pp.(June, 1928).—Reports from the following subcommittees are included: petroleum, paraffin wax, pptn., oxidation at high temp., sampling and gaging, cloud and pour points, gas oil, nomenclature, crude petroleum, C residue, autogenous ignition of petroleum products and fuel oil. The report on the "Testing of Petroleum Products" is designed to give authoritative information on gravity, color, cloud and pour points, m. p. of paraffin wax, and petroleum, viscosity, consistency, volatility, tests for illuminating oils, wick feed test, water and sediment, pptn., emulsification, oxidation at high temps., dielec. strength, C residue, acidity in gasoline, neutralization no., total S, doctor test, sapon. no. and analysis of grease. There are also included in the report proposed tentative definitions of terms relating to petroleum, and proposed tentative methods of test for distn. of crude petroleum; for the detn. of autogenous ignition temps.; and for the gravity of petroleum products by means of the hydrometer.

M. R. FENKE

Petrol engine lubricants and lubrication. J. M. EVANS. *J. Inst. Petroleum Tech.* 14, 352(1928); cf. Kelly, C. A. 22, 1846.—Lubricating oil of sp. gr. 0.919, closed-cup flash 385° F., viscosity at 70° F. 1330", 100° F. 380", 140° F. 125", 200° F. 54" and cold test (below) 0° F. is now being made from California crude by a special adaption of the Edeleanu process. Conradson carbon values are of the order of 0.03 and resistance to oxidation is very marked.

D. F. BROWN

The use of portland cement for cementing the casings of petroleum wells, and for plugging the wells. M. J. ZEVADA. *Bol. petroleo* 24, 410-2(1927).—The necessity is emphasized of using for these purposes only cement which conforms to approved specifications. The specifications adopted in Sept., 1916, by the Am. Soc. for Testing Materials are recommended, and a Spanish translation of them is given. In mixing cement for the above uses 40% H_2O is suggested. This cement mixture can be injected easily by pumping and it sets readily.

R. H. LOMBARD

Kentucky rock asphalt. W. R. JILLSON. *Kentucky Geol. Survey* [6], 30, 95-103 (1927); *Eng. Mining J.* 125, 1011-3.—In Kentucky the Chester (Upper Mississippian) and Pottsville (Lower Pennsylvanian) rocks contain bituminous sandstones averaging 8.19 and 7.94% of bitumens, resp. This material is finding an extensive market as a road-surfacing material.

ALDEN H. EMERY

The importance of wood turpentine in chemical industry. M. J. RIEMERSMA. *Chem.-Ztg.* 51, 823-5(1927); cf. C. A. 21, 1703.—Wood turpentine is just as valuable as gum spirits for most purposes. It must be free from impurities and water and should be purchased for its pinene content.

G. G. SWARD

Hardwood tar and the future of wood distillation. A. KAROLYI. *Chem. Markets* 22, 623-4(1928).—In a (Yugoslavia) plant working up 175 cords of beech wood daily 14 gal. of tar per cord is obtained. From this come 15 lbs. water with 10% AcOH , MeOH etc., 5 lbs. light oil (75-100°), 1 lb. light oil (100-130°), 25 lbs. heavy oil (130-180°), 17 lbs. hard pitch and 12 lbs. water and gas. The dil. acid is worked up with crude pyroigneous acid by the Suida (patented) process of distg. a mixt. of heavy tar oils, esters, phenolic oils, water and acid (without the use of lime and H_2SO_4), and thus getting a product that can be coned. *in vacuo* to a high-grade AcOH . The detarred and dealcoholized pyroigneous acid is transformed continuously into AcOH of 95% in 1 operation. By 2 subsequent operations 98-99% acid is obtained. Instead of the former cost of \$1.40 per cord for CaO and H_2SO_4 , there is a consumption of tar oils of only \$0.16 per cord.

W. C. EBAUGH

Report of Committee D-15 on thermometers [for use in testing petroleum products] (FULWELER, *et al.*) 1. Oleic, palmitic and stearic acids as mother substances of petroleum (ZELINSKI, LAVROSKI) 10. Action of strong H_2SO_4 on olefins and alcohols

(ORMANDY, CRAVEN) 10. Recovering oils, tars, etc., from emulsions (Brit. pat. 280,059) 21. Destructive hydrogenation (Brit. 279,825) 21. Producing foam [for use as fuel] (Brit. pat. 280,208) 18.

Petroleum Development and Technology in 1927. New York: Am. Inst. Mining and Metallurgical Engineers. 844 pp. \$6 (cloth bound).

SCHWARZ, R.: **Petroleum Vade Mecum: International Petroleum Tables.** 5th ed revised. Berlin: Verlag für Fachliteratur. 407 pp. Reviewed in *J. Inst. Petroleum Tech.* 14, 354(1928).

Cracking and distilling petroleum oil. WILLIAM R. HOWARD (to Universal Oil Products Co.). U. S. 1,674,827, June 26. An app. is described comprising a still in which a steam pump is placed which feeds oil to the still and discharges exhaust steam into the still.

Apparatus for cracking hydrocarbon oils in the vapor phase with or without accompanying use of steam or permanent gases. R. K. COLLINS. Brit. 280,034 and 280,039, Nov. 12, 1926

Distilling emulsified mineral oils. GUSTAV EGLOFF and HARRY P. BENNER (to Universal Oil Products Co.) U. S. 1,674,819, June 26. A bulk supply of oil contg. emulsified water is introduced into a still and heat is applied directly to the surface of the oil in the still by steam pipes and the point of application of the heat to the oil in the still is lowered as the oil level descends in consequence of evapn.; external heat is finally applied to the still to vaporize remaining oil. An app. is described.

Refining hydrocarbons. HENRY BLUMENBERG, JR. (to Amos M. Buley). Can. 280,816, June 5, 1928. To remove objectionable color or odor from cracked gasoline and distillates add $Al_2(SO_4)_3$ and $Ca(OCl)_2$ mix for about 30 min., and gradually heat to 50° or 60°. Sep the gasoline from the sludge formed and distil.

Refining and stabilizing hydrocarbon products. EUGENE A. PRUDHOMME (to Soc. intern procédés Prudhomme). U. S. 1,674,796, June 26. Material such as a fraction b. 200–400° is vaporized at a temp. below 400° and the vaporized products are all passed at a temp. above 180° through purifying material contg. Ni and Cu oxides or other suitable metallic oxide and through catalytic material such as a Ni, V or Co catalyst and then through activated C with the addn. of CO, H, water gas or other reducing gas without further heating. An app. is described, and the treatment specified serves to produce a product b. 60–220°.

Purifying hydrocarbon oils. HERBERT G. M. FISCHER (to Standard Oil Development Co.) Can. 281,168, June 19, 1928. Ash constituents are removed from hydrocarbon oils, by treatment with H_2SO_4 to remove asphaltic constituents, neutralizing with NaOH, injecting steam to distil off naphtha and kerosene and decomposing the soap into Na_2SO_4 and liberation of SO_2 , hydrating the Na_2SO_4 with H_2O and an alc. at 150–200° F. Oil is allowed to stand and $Na_2SO_4 \cdot 10H_2O$ speedily seps. out.

Condenser for liquefying hydrocarbon oil vapors. ARTHUR G. BOGARDUS (to Universal Oil Products Co.). U. S. 1,674,850, June 26.

Recovering liquid hydrocarbons from vapors and gases by absorption. ALEXANDER CLARKE (to United Hydrocarbons Co.) U. S. 1,674,852, June 26. Hydrocarbons which have been absorbed from casing head gas or natural gas are distd. from the absorbing medium and evolved vapors and gases are compressed and cooled to obtain a liquid fraction and a vapor and gas fraction; these fractions are sepd. and the gases and vapors are reheated and admixed with fresh quantities of vapors and gases evolved in the distg. operation. An app. is described.

Carbonaceous fuel. ALFRED OBERLE (to Universal Oil Products Co.). U. S. 1,674,837, June 26. Residue from destructive distn. or cracking of petroleum hydrocarbons is treated with steam under pressure, dried under reduced pressure and then caused to absorb a combustible gas such as the gas formed by oil cracking.

Internally reinforced cylindrical petroleum still. ARTHUR E. FEW, JR. (to Sun Oil Co.). U. S. 1,674,918, June 26.

Apparatus for gasifying heavy oil in an incandescent chamber containing a catalyst. C. CHILOWSKY. Brit. 279,834, Oct. 27, 1926.

Recovery of oil from oil-field emulsions. W. K. HOLMES (to The Texas Co.). Can. 280,797, June 5, 1928. The emulsion is treated with an equal vol. of solvent (preferably a petroleum distillate having gravity between 35° and 50° Beaumé), agitated with air and heated to 150–175° F.

Separation of naphthenic acid compounds from coastal oils. O. E. BRANSKY (to Standard Oil Co.). Can. 280,795, June 5, 1928. A distillate having a flash pt. of about

500° F., viscosity 200 sec. Saybolt at 100° F. is treated with alkali (10 to 20% soln. soda ash and sufficient is added, say from 5 to 20% completely to neutralize the oil); the oil is then agitated with from 10 to 20% MeOH, EtOH or iso-PrOH. The alc. ext. is removed and distd. for removal of alc., the naphthenic acid compds. remaining as a residue. This residue is purified by acid treatment and steam distn.

Treating hydrocarbon oils with liquid sulfur dioxide. WILHELM HESS (to Allgemeine Ges. für chemische Industrie). U. S. 1,674,676, June 26. See Brit. 268,726 (C. A. 22, 1470).

Purifying mineral and tar oils with liquid sulfur dioxide. ALLGEMEINE GES FÜR CHEMISCHE INDUSTRIE. Brit. 279,774, Nov. 1, 1926. In a counter-current process, the velocity of the ascending oil is reduced immediately before or after leaving the treatment tower to facilitate sepn. of entrained SO₂. An app. is described.

Separating oils from tars, tar oils, etc. HERBERT WITTEK. U. S. 1,674,710, June 26. Vapors of tar, tar oil or pitch or the like substantially free from paraffin are confined with an org. solvent such as alc. which will dissolve the acid constituents not miscible with paraffin oil and with vapors of an oil such as paraffin oil composed mainly of hydrocarbons of the paraffin series; the vapors are condensed and the resulting layers which form are sepd. Cf. C. A. 21, 3123.

Wetting agents. BRITISH DYE STUFFS CORPORATION, LTD., J. BADDILEY and F. CHAPMAN. Brit. 279,990, Sept. 20, 1926. Mineral-oil fractions of which the bulk is susceptible of sulfonation and which have an initial b. p. above 200° (preferably above 240°) are sulfonated to produce wetting agents. Fractions of the ext. obtained by treating Borneo petroleum with liquid SO₂ and fractions obtained in oil-cracking processes may be used.

Revivifying fuller's earth. RUDOLPH R. ROSENBAUM. Can. 281,077, June 19, 1928. Fuller's earth which has been used in filtering hydrocarbons, is treated with liquid SO₂ to flush out and dissolve the hydrocarbons remaining in the earth. The resulting liquid, is collected, the insol. are sepd. from the sol. hydrocarbons, and the SO₂ is converted to gaseous form to remove it from the fuller's earth and from the extd. hydrocarbons. Cf. C. A. 22, 485.

Use of thallium and its compounds to prevent knocking in internal-combustion engines. ASIATIC PETROLEUM CO., LTD. and A. C. EGERTON. Brit. 279,560, July 29, 1926. Tl or Tl oxide may be vaporized outside the cylinder by an elec. arc or a Tl compd. may be mixed with the fuel or otherwise injected into the engine. Compds. which may be used include. Tl ethyl, benzylate, phenylethylate, oleate, amyl-alcoholate and acetoacetate.

Lead tetraethyl. W. S. CALCOTT, A. E. PARMELEE and F. R. LORRIMAN. Brit. 280,169, Nov. 3, 1926. See U. S. 1,664,021 (C. A. 22, 1677).

Lubricant. LUTHER B. LOCKHART (to The Standard Oil Co.). Can. 281,329, June 26, 1928. A lubricant is produced by admixing 92 parts of a viscous lubricant oil (of paraffin type) having a viscosity of 340 to 350 sec. Saybolt at 100° F. and 8 parts of a light distillate oil having a boiling pt. range of 320° to 460° F. The mixt. has a viscosity of about 184 sec. Saybolt at 100° F., a flash pt. of about 150° F. and contains about 8% of fractions boiling between 320° and 450° F.

Solid lubricant for axles on carriages, etc. NIELS P. SÖGAARD. Danish 37,978, Sept. 26, 1927. Two parts of light resin is mixed with 10 parts of petroleum and the mixt. is poured successively under const. stirring into 2 parts of freshly slaked lime which has been stirred up with 1 part of water. The stirring is continued until the mixt. becomes viscous and adhesive, after which 2 parts of melted Mexico bitumen is added.

Regenerating used lubricants. N. E. FUNK and ALFA-LAVAL CO., LTD. Brit. 279,636, Oct. 29, 1926. Used lubricating oils are washed with water, sepd. from the water and from impurities and reused. An app. is described.

Cracking of asphalt and heavy mineral oils. D. PYZEL. Can. 280,902, June 12, 1928. Inert material is passed through a combustion zone, and the asphalt or oil is sprayed on the material as it enters the zone. Air is introduced into the zone, and steam introduced into the lower end of the zone beneath the air inlet. The inert material is withdrawn from the zone and recycled therethrough and the vapors from the upper end of the zone are condensed to recover light hydrocarbon oils.

Emulsion of asphalt in water. AAGE H. MICHELSEN. Danish 38,178, Nov. 21, 1927. Asphalt is added with heating and stirring to a primary emulsion consisting of a mixt. of glue, drilling oil, soap and K₂CO₃. Finally water is added.

Bituminous composition. NAAMLOOZE VENNOOTSCHAP NEDERLANDSCHE BIMS-CEMENT- EN ASPHALTINDUSTRIE. Brit. 280,085, March 7, 1927. Liquefied bitumen is mixed with a porous filler under the action of heat and pressure. Ground natural

limestone, with or without burnt limestone, tuff, infusorial earth, trass or dolomite may be used, as may also solvents such as C_6H_6 , CS_2 , ligroin or CCl_4 .

Bituminous coatings and linings for metal and concrete pipes and tubes, etc. R. ILLEMANN and R. A. WHITSON. *Brit.* 279,687, Jan. 26, 1927. Natural rock asphalt or powd. artificial asphalt or mixts. such as limestone or silica and bitumen are used. *Cf. C. A.* 22, 1226.

Recovering neutral pitch and acid from oil-refining sludges. J. PICKERING and J. JUBB. *Brit.* 279,613, Oct. 4, 1926. Sludges obtained in refining mineral oil with H_2SO_4 or oleum are sprayed with a solvent such as acetone while heated and agitated and the sludge is further treated with water or an aq. soln. such as a soln. of $NaCl$ or Na_2CO_3 and different materials are sepd. An app. is described.

Portable furnace and retorts for carbonizing wood in bulk, sawdust, olive stones, etc. A. ENDERS, R. BILLEN AND SOC. ANON. LA CARBONISATION INDUSTRIE. *Brit.* 279,700, April 9, 1927. Two retorts are internally heated by gases from furnaces or gas generators on which the retorts are mounted and condensers are arranged for connection to each retort in turn.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Does the theory of micellar complexity apply in the study of cellulose? M. CATOIRE. *Bull. soc. chim. biol.* 10, 714-35(1928).—The details of swelling and of deflocculation of the cotton fiber denote a complex structure which is degraded by stages acting as voluminous polymers which do not decomp. by the immediate liberation of their mols of their constituents, but by the formation of other polymers and these in turn still others, before the final monoses are reached. The demineralization of cellulose effected on the acetyl deriv. in clear acetic soln. by repeated pptn. is never complete. There remains after the last operation a mol. of SiO_2 for 1000 mols of $C_6H_{10}O_5$. This demineralization occurs by the division between certain micelles, the more voluminous contg. SiO_2 as a constituent and not as an impurity, and the less voluminous which perhaps contain a biologic complex of polymers of $C_6H_{10}O_5$ and (SiO_4) . Swelling, deflocculation and depolymerization of cellulose are influenced by the presence of minerals especially by the alk. earth bases, which cellulose contains in the natural state, and to a less extent by mineral elements artificially incorporated. The desiccation of nitrocellulose, especially when it is poor in alk. earth salts, has a depolymerizing action, since it becomes more sol. in acetone or alc.-ether as the desiccation is prolonged. Acetocellulose having stood in 0.1 N alkali and then dried loses its property of swelling and it dissolves in ordinary solvents. L. W. RIGGS

Röntgen diagrams of nitrocellulose and acetylcellulose. ST. V. NÁRAY-SZABÓ AND G. V. SUSICH. *Z. physik. Chem.* 134, 264-70(1928).—The characteristic fiber diagrams of nitrocellulose were prepd. The identity period along the fiber axis is for nitrocellulose 26.6 ± 0.5 A. U.; for acetylcellulose 10.3 ± 0.3 A. U. The diagrams infer different degrees of esterification since a well-defined lattice is only obtained with a completely substituted product. M. R. FENSKE

The study of cellulose and cellulose acetates by means of x-rays. JEAN J. TRILLAT. *Compt. rend.* 186, 859-61(1928).—By means of Coolidge tubes with either Cu or Cr targets and a cylindrical spectrograph, many samples have been studied. In the amorphous compds. the halos were studied by means of a microphotometer. Cotton linters give a characteristic cryst. but little accentuated diagram. There is exptl. evidence of the existence of very small interplanar distances of the order of 1.2 A. U. which are attributed to the arrangement of the C atoms. Oxycelluloses and hydrocelluloses give very good cryst. diagrams, identical with those of cellulose, except that the orientation of the crystallites has disappeared in almost all cases, showing that these materials are formed for the most part from the same structural elements as cellulose itself. Hydrocelluloses give a cryst. diagram different from that of cellulose, which is the same for all regenerated products prepd. in a homogeneous phase (viscose silk, denitrated nitrocellulose, etc.). Alkali cellulose gives a cryst. diagram analogous to that of the hydrocelluloses but the lattice is enlarged, and there are indications of the formation of compds. between the cellulose and the alkalies. Cellulose acetates possess a portion which is very clearly cryst., dispersed in an amorphous phase. Their soln. and transformation into homogeneous acetates leaves this structure intact so long as the degree of acetylation is high. Hydrolysis causes the disappearance of the cryst. part first. This is doubtless the triacetate. The principal halo obtained corresponds to an inter-

mol. distance of 5.2 A. U. and the outer halo to a distance of 2 A. U. When the material becomes acetone-sol., the cryst. part disappears and the halo is enlarged, indicating sepn. of the mols. As the degree of acetylation decreases, the mols. draw closer together again, and the inner halo becomes much more acute, while the outer halo disappears. The differences in the diagrams are sufficient to enable them to be used for chemical control.

A. W. KENNEY

Preparation of cellulose nitrate. E. BERL AND E. BERKENFELD. *Z. angew. Chem.* 41, 130-2(1928); cf. Berl and Klaye, *C. A.* 2, 184, 898.—The N content and viscosity in acetone soln. of a sample of cellulose nitrate depend rather on the compn. of the waste nitrating acid than on that of the original acid mixt. used, since an equil. is set up between cellulose nitrate and acid. Curves showing the N content and viscosity corresponding to varying waste acid compns. are given for both linters and wood cellulose, and the results are much more regular than those obtained when these properties are correlated with the compn. of the starting acids. Increase of the H_2SO_4 content above 60% causes a sharp diminution in the viscosity of the product, and the viscosity of nitrated linters is greater than that of nitrated wood cellulose with the same waste acid compn.

B. C. A.

A contribution to the knowledge of the ligninsulfonic acid. M. SAMEC. *Archiv. hem. farm.* 1, 104-11(1927); cf. *C. A.* 17, 634; 18, 2248; 21, 2796.

J. K.

Paper mill motorization improves production and quality. R. S. LOWRY. *Flec. World* 91, 1395(1928).

C. G. F.

Process steam for paper mill produced by hog fuel and oil. P. SANDWELL. *Power* 67, 849-52(1928).—Hog fuel is burned in Dutch ovens to supply 30% of the steam. The remainder is supplied by fuel oil, the burners being mounted on the rear wall of a common combustion chamber.

D. B. DILL

Isolation of lignin (KALB, *et al.*) 10.

HESS, KURT: *Die Chemie der Zellulose und ihrer Begleiter.* Leipzig: Akademischen Verlagsgesellschaft m. b. H. 900 pp. Price about M. 60.

Cellulose. KARL Y. KYLANDER. *Can.* 281,568, July 10, 1928. In a preliminary boiling process for cellulose, the cuttings are moistened and satd. with liquids to which acetic acid is added by means of air, gas or steam pressure. Without subsequent washing, this is followed by the usual boiling with the addn. of acids and phosphates.

Regenerated cellulose structure. BRNO BORZYKOWSKI AND JOHANNES HECK (to Borvick-Syndikat, Ltd.) *Can.* 280,724, June 5, 1928. A regenerated cellulose structure is pptd. from viscose contg. dissolved or mixed therein oily materials, e. g., liquid or solid fatty oils, soaps, textile oils, also emulsified mineral oils and tetralin and other hydrogenated hydrocarbons. The setting bath may be dil. H_2SO_4 with or without added salts, alcs., NH_4 salts, glucose, etc.

Amino derivatives of cellulose. I. G. FARBERIND. A.-G. *Brit.* 279,801, Oct. 30, 1926. Alkali cellulose is esterified by treatment with benzenesulfonic acid, the product is acetylated, and the mixed ester boiled with $PhNH_2$ and alc. Cellulose toluene-4-sulfonic acid is boiled with diethylamine and alc., and the product is acetylated. The aminocellulose derivs. produced are sol. in org. solvents and may be used for making threads or films. They can be easily dyed fast tints. Other similar starting materials also may be used in the formation of similar derivs.

Cellulose acetate solutions or plastic compositions. I. G. FARBERIND. A.-G. *Brit.* 279,771, April 26, 1926. A formate, acetate or phthalate of ethylene glycol monomethyl ether is used with cellulose acetate compns. which may also contain natural or artificial resins, coloring substances, drying oils and various other solvents and plasticizers. Cf. *C. A.* 22, 2663.

Cellulose esters. I. G. FARBERIND. A.-G. *Brit.* 279,796, Oct. 26, 1926. Cellulosic material such as cotton (preferably after swelling for at least 4 hrs. at 10° in a 40% NaOH soln.) is esterified by treatment with a chloride of an inorg. acid such as P oxychloride or sulfuryl chloride to form esters such as cellulose phosphate or sulfate. Cf. *C. A.* 22, 1237.

Artificial silk. I. G. FARBERIND. A.-G. *Brit.* 279,888, Oct. 30, 1926. In spinning "viscose silk," the thread, while passing from the spinning nozzle to the collecting spool, is either not bent at all or at most through an angle of 150° and the thread preferably issues in a vertical direction from the bath. The method is applicable to viscoses of high viscosity and low cellulose content such as unripened viscose or viscose prepd.

from unripened alkali cellulose. The threads obtained dye well and possess an extensibility of 18% or more. An app. is described. Cf. C. A. 22, 2664.

Artificial silk. O. FAUST. Can. 280,860, June 12, 1928. Immature viscose (from immature alkali cellulose) is spun from a nozzle into a bath contg. naphthalene-sulfonic acid condensed with CH_3O . Or, mature viscose is spun in a mineral acid bath for production artificial horsehair, the bath contg. also naphthalenesulfonic acid condensed with formaldehyde.

Centrifugal apparatus suitable for the manufacture of artificial silk. KABRI-FABRIK A.-G. Brit. 279,911, Nov. 1, 1926.

Moistening and stretching artificial silk. HOLKENSEIDE GES. Brit. 279,791, Oct. 26, 1926. In a process in which the material, in skein form, is alternately stretched and slackened by jerking rollers which carry it, the material is dried and then moistened again before or during the stretching treatment.

Improvement in tenacity or elasticity of artificial silk. S. OHSAKA. Can. 280,894, June 12, 1928. The colloidal soln. for artificial silk is mixed with a colloidal soln. of vegetable protein or animal albumin and forced through a spinning orifice and at same time is coagulated. The yarn is then heated with H_2O at 70-100, and finally dried.

Conical wood-chip distributor for chemical pulp boilers. EINO CASTREN and EINARI OKSA. U. S. 1,675,211, June 26. A cone-shaped device is suspended at the inlet of a pulp boiler and in the path of the charge, and connections are provided for admitting steam under pressure under the cone to assist in evenly distributing the charge inside the boiler.

Alkali pulp. G. A. RICHTER (to Brown Co.). Can. 280,726, June 5, 1928. To produce a fiber high in α -cellulose a kraft pulp is washed and sepd. from black digesting liquor, screened and thickened with liquor contg. alk. compds. The thickened pulp mixed with a soln. of caustic soda (between a max. concn. at which mercerization takes place and a min. concn. at which purification of the pulp is not effected) or other alk. compds. and treated at 30° to permit alk. solutions to remove non- α -cellulose.

Wood pulp. LINN BRADLEY and EDWARD P. MCKEEFE (to The Bradley-McKeeffe Corp.). Can. 281,105, June 19, 1928. Wood is treated with a liquor contg. Na_2SO_3 and Na_2CO_3 in the ratio of 16.5 to 10 parts) to ($1\frac{1}{2}$ to 2 parts). Cf. C. A. 22, 2841.

Wood pulp. LINN BRADLEY and EDWARD P. MCKEEFE (to the Bradley-McKeeffe Corp.). Can. 281,285, June 25, 1928. Wood is cooked under pressure at an elevated temp. with a liquor contg. 40 to 60 g. per l. of NaOH , 10 to 30 g. per l. of $\text{Na}_2\text{S}_2\text{O}_3$ and 15 to 45 g. per l. of Na_2S . The total Na content of liquor is at least 12% on the bone-dry wt. of wood cooked.

Wood pulp. WALLACE H. HOWELL, JR. Can. 280,056, June 19, 1928. Wood is cooked under pressure, the spent liquor is withdrawn from the digester and without cooling is coned in an evaporator heated by hot vapor from the digester. The pulp is washed while in the digester with hot wash liquor at a temp. above that at which lignin becomes set, the wash liquor is withdrawn and without cooling coned in an evaporator. The pulp is washed in hot H_2O at temp. above that at which lignin sets, the second wash liquor is withdrawn and utilized for the first step wash in a succeeding batch.

Paper. A. L. KENNEDY (to The Plastic, Inc.). Can. 280,789, June 5, 1928. To 454 g. cotton rag fiber thoroughly pulped add 22 g. kelp contg. both algin and algulose reduced to aq. soln. by incorporation of 2 g. NaOH dissolved in 25 cc. water. Mix to produce a homogeneous mass. Add 16 g. of ZnSO_4 dissolved in 200 cc. water to act as precipitant. Wash the mass until the wash water shows the presence of no sulfates. Paper made from this mass is flexible, with increased resistance to electricity, heat, cold, oils and moisture.

Newsprint paper. WILLIAM H. MILLSPAUGH (to The Paper & Textile Machinery Co.). U. S. 1,674,980, June 26. Paper of extra strength but of usual compn. and thickness is made by simultaneously forming wet sheets of half the usual thickness of the ordinary wet sheet and consolidating them into a single sheet.

Bleaching pulp. OTTO KRESS (to Am. Lakes Paper Co.). Can. 281,008, June 19, 1928. Sulfate or kraft paper pulp is treated with a quantity of bleaching powder $1\frac{1}{2}$ less than that required to produce the desired degree of whiteness; the partially bleached pulp is washed to remove residual Cl and decompn. products; the pulp is washed into laps and sprayed with NaHSO_3 soln. until 60 to 100 lbs. per ton of dry pulp has been added. The treated pulp is stored to complete action of the NaHSO_3 . Cf. C. A. 22, 868.

Suction roll for paper-making apparatus. BELLOIT IRON WORKS. Brit. 279,528, June 24, 1926.

Suction roll for paper-making apparatus. W. H. MILLSAUGH. Brit. 279,643, Nov. 5, 1926.

Suction rolls for paper-making apparatus. BELOIT IRON WORKS. Brit. 279,768-9, June 24, 1926.

Automatic steam control and differential for paper machines. COLE STICKLE. U. S. 1,674,845, June 26.

Finishing paper by moistening and subjecting to heavy pressure. STUART W. WEBB, JOHN G. CALLAN and ALBERT ALLEN (to Eastern Mfg. Co.). U. S. 1,674,848, June 26.

Stock for paper, building boards, roofing, etc. GEORGE F. BLOMBERG. U. S. 1,675,244, June 26. A fibrous stock is incorporated with a pulpy jelly obtained by macerating or digesting prewashed kelp and with rubber.

Apparatus for coating paper with coloring compositions. CLARENCE O. THORNH (one-half to Philip G. Baltz). U. S. 1,675,066, June 26.

Impregnating paper, cardboard, etc., with waterproofing or other compositions. MANUFACTURE DE MACHINES AUXILIAIRES POUR L'ELECTRICITE ET L'INDUSTRIE. Brit. 280,386, Dec. 10, 1926. Mech. features.

Waterproof paper and pasteboard. BENNETT, INC. Brit. 280,083, Feb. 28, 1927. A paper furnish of waste wax paper is disintegrated and the wax dispersed, e. g., with Na silicate, and the material is run off on a paper-making app. Other fibrous material and auxiliary ingredients also may be added.

Pulp from waste paper. L. GRENAUDIER. Brit. 279,516, Oct. 25, 1926. Disintegrated printed paper such as that formed from wood pulp is boiled in a 0.1% soap soln. with const. stirring and skimming until the scum has become nearly white, then rinsed, pulped in a beater, boiled in a 0.1% Na_2CO_3 soln., dild. with hot water, stirred and skimmed until the scum is white, and then rinsed.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

Roger Bacon's gunpowder and his secret wisdom. TENNEY L. DAVIS. Mass. Inst. Tech. *Ind. Eng. Chem.* 20, 772-4 (1928). E. H.

Fifty-second annual report of His Majesty's inspectors of explosives. T. H. CROZIER, R. A. THOMAS, H. E. WATTS, J. HARCOURT GIBBS. *Home Office Repts.*, May, 1928, 40 pp.—This report for 1927 is divided into Part I Explosives, and Part II Petroleum. Brief discussions of chem. work on explosives include the following: TNT contg. 34% H_2O was found to be capable of detonating satisfactorily; a fireworks compn. contg. KClO_4 , Al and As_2S_3 (orpiment) was found to be extremely sensitive to friction and violently explosive. Such compns. are condemned as being entirely unsafe to mix: the volatility of glycol dintrate now being used in explosives has necessitated considerable modification of methods of analysis. Statistics are given on accidents in manuf., storage transportation and use of explosives for each year from 1919 to 1927 inclusive. Three accidents occurred with *Pb trinitroresorcinolate*; in one an explosion occurred during the breaking up of lumps of the explosive between the fingers during the drying operation, only a small part of the charge on the drying table exploding; in another the entire charge of 15 lbs. detonated in the dryhouse from unknown cause, killing the attendant; in the third, 16 lbs. of the dry, sifted explosive detonated, probably from the dropping of a pasteboard container, or from static electricity generated on the person of the operator, who was insulated by rubber boots and a thick felt floor covering. The operator was killed. The explosion of a pressure kier in which 400 lbs. of nitrocellulose had been heated for nearly 5 hrs. under a pressure of 20 lbs. per sq. in. was attributed to sudden decompn. of a part of the charge. The steel cover of the kier was blown through the roof of the building. Reference is made to progress in the development of the radial pressure bar test for strength of detonators, but no details are given. Under the heading of Petroleum are discussed numerous explosives and fires involving gasoline, two with C_2H_2 , and one with CS_2 . C. G. STORM

The testing of blasting caps. M. TAKLÉ. *Z. ges. Schiess-Sprengstoffw.* 23, 51-3 (1928).—In the usual methods of testing, the cap is exploded by the spit from a safety fuse, it being assumed that this method produced complete explosion. Usually the kind and grade of fuse to be employed is not prescribed. Comparative Pb plate tests of No. 6 and No. 8 Hg(ONC)₂-tetrayl blasting caps were made, with ignition by means of safety fuse (110 sec. per m.), fireworks fuse (60 sec. per m.) primer caps from rifle cartridges.

and primer caps from grenades. For ignition by the percussion caps, the open end of the blasting cap shells was cut off so as to bring the charge close to the primer, which was held in a suitable fixture and fired by means of a firing pin struck by a falling wt. A limited no. of tests showed that the effectiveness of the blasting caps varies appreciably with the mode of ignition, increasing in the following order; (1) fireworks fuse, (2) safety fuse, (3) rifle primer, (4) grenade primer. Facilities for more accurate quant. tests of strength, such as the methods of Wöhler or Sucharewsky (*C. A.* 21, 3744) were not available.

The new nitrating process of Dr. A. Schmid. R. NEUBNER. *Z. ges. Schiess-Sprengstoffw.* 23, 44-6(1923).—N. discusses the many striking safety and economic advantages of the new continuous process for nitration, sepn. and washing in the manuf. of nitroglycerin (*C. A.* 21, 4070). Among safety advantages are reduction in quantity of explosives in process, continual agitation of reacting materials and finished product, reduction in no. of attendants, elimination of separate buildings for each process.

The development of airplane bombs. K. REICHERT. *Z. ges. Schiess-Sprengstoffw.* 23, 9-12, 37-41(1928).—The construction of various types of high-explosive bombs is described. A soln. of yellow P in CS_2 , which ignites spontaneously in air, was used as a charge for incendiary bombs. The soln. contained lumps of the P and also bundles of celluloid strips, for the purpose of spreading fire.

Liquid-air explosives in non-gaseous coal mines. F. STEPHAN. *Z. ges. Schiess-Sprengstoffw.* 23, 46-51(1928).

Liquid air, a new safety explosive, or the problem of safe blasting solved. C. BUNGE. *Z. ges. Schiess-Sprengstoffw.* 23, 44(1928).—Controversial B. states that claims made for greater safety in use of liquid-air explosives are not supported by accident statistics or by various investigations. Such explosives are more sensitive to impact than is dynamite, and undergo marked changes in compn., and hence in energy content, as a result of evapn. during preps. for firing the shot.

The risk of detonating-gas explosions in electric steam plants with electrode boilers. LARS VIERMANN. *Teknisk Ukeblad* 74, 269-72(1927).—It has been shown by practical expts. at a Norwegian plant that the design and dimensions of the active parts, particularly the electrodes, have a decided influence upon the formation of H_2 . The occurrence of d. c. has to be kept under efficient control and can in some cases be compensated.

Firedamp explosions: The projection of flame. II. M. J. BURGESS. Safety in Mines Research Board (London). *Paper No.* 42, 9 pp.(1928); cf. *C. A.* 20, 3815.—The distance of flame projection from firedamp explosions, initiated by spark from the closed end of a steel gallery 7.5 ft. in diam. was detd. for columns of explosive mixt. 26.75 and 53.5 ft. long. The columns were closed off by a shutter which was opened immediately before firing. With the shorter column, flame from a mixt. contg. as little as 6.3% CH_4 was projected 60 ft. through the gallery beyond the shutter. Max. lengths of projection were obtained with mixts. of about 10.5% CH_4 , viz. 120 ft. with the shorter column and 220 ft. with the longer (4.1 and 4.5 times the length of column.). The extent of flame was measured by the ignition of thin strips of cordite suspended at intervals near the top and in the center of the gallery. Except with the weaker mixts., the flame traveled farther in the center than along the top of the gallery, indicating a pointed flame-front. In general, the results confirm conclusions reached from lab. expts. in tubes 5.5 and 9 cm. diam. and 15-17 cm. long.

The occurrence and detection of hydrogen in mines. HEYER. *Z. ges. Schiess-Sprengstoffw.* 23, 77-8(1928).—The probable causes of the presence of H in potash, salt and coal mines, and the usual methods for its detection and detn. are discussed. A color comparison method for the detn. of quantities as small as 0.01 to 0.05% is described which depends upon the production of a blue color in a contg. soln. colloidal Pd.

A method for the photographic examination of moving flames. A. GREVILLE WHITE. Nobel Labs., Ardeer. *J. Chem. Soc.* 1928, 1159-61.—The method depends on the fact that progress of flame causes an abrupt change in the optical properties of the medium through which it passes. Light passing through the seat of disturbance is refracted, so that if a beam passing through the tube contg. the gas mixt. falls on a photographic film moving at right angles to the direction of the flame, the progress of the flame is indicated on the plate by two lines, one dark and one light. The velocity of the film being known, the angle between the lines and the direction of its motion gives a measure of the velocity of the flames at any selected portion of the tube.

Explosion of liquid-air-cooled charcoal tubes. J. TAYLOR. *J. Sci. Instruments* 5, 24 (1928).—An explosion may be caused by liquid air coming into contact with highly activated charcoal through cracking of the charcoal tube. It is suggested that the latter should be surrounded by a thin metal tube. B. C. A.

Lead shot coated with a harder metal such as Cu (Brit. pat. 279,781) 9.

Explosives. O. MATTER. Brit. 280,249, Nov. 8, 1926. Percussion ignition charges are formed of Pb azide alone or mixed with substances such as trinitrotoluene, tetranitromethylamine or pentaerythritol tetranitrate.

Explosives comprising gelatinized nitrocellulose. R. K. HEZLET and A. HIGHFIELD. Brit. 279,529, June 25, 1926. In the prepn. of explosives such as blasting gelatin, gelignite, ballistite and "solventless" cordite, nitroglycerin or a nitric ester for gelatinizing nitrocellulose has sufficient alc. added to it to make it a good solvent for the nitrocellulose, e. g., 2-5% of alc. may be used.

Fuse composition. JORDON HOMER STOVER and JOHN PARSONS (to John Parsons). Can. 281,349, June 26, 1928. A fuse compn. for use with self-lighting cigars and cigarettes consists of a mixt. of 10 parts wood flour, 4 parts KNO_3 , 8 parts of a 12 oz. nitrocellulose soln. and 5 parts EtOAc.

Igniting composition. JORDON H. STOVER and JOHN PARSONS (to John Parsons). Can. 281,350, June 26, 1928. An ignition compn. contains 4 parts KClO_3 , 1 part S, 3 parts of a frictionizer, $\frac{1}{2}$ part red P mixed in dry form. Two parts of the powder are mixed with 1 part nitrocellulose soln. of consistency of 12 oz. of nitrocellulose to a gal. of the soln. in a dispersing agent, as benzene and EtOAc. The resulting mixt. is spread on a fuse band and dried.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

The dyeing of millinery materials. E. GILLON. *Ind. Chemist* 4, 223-5 (1928).—A review. E. H.

Fluorescence of dyed fabrics. L. KUMMERER. *Melliand's Textilber* 9, 415-6 (1928).—A tabulation of fluorescence colors seen with a screened Hg arc. H. R. C.

Some causes of uneven dyeing. H. R. HIRST. *J. Soc. Dyers Colourists* 44, 163-70 (1928).—This study is limited to fabrics made of wool. The causes of uneven dyeing are classed as follows: (1) tendency of the dye to uneven distribution on account of its great affinity for the textile material; (2) local modification of the fabric whereby its affinity for dyes is altered; (3) faulty mech. manipulation. The causes and their removal are considered in detail. L. W. RIGGS.

Dyeing of "Tubize" rayon fabrics. B. L. HATHORNE. *Am. Dyestuff Rept.* 17, 401-2 (1928).—Tubize is yarn made by the nitrocellulose process and named for the Belgian town where Chardonnet erected the first artificial silk factory. Tubize is the strongest of the synthetic yarns and is benefited by a hard boil. Its affinity for the general run of direct cotton colors is about midway between that of scoured raw cotton and of highly mercerized cotton. It can be dyed with basic colors in light and medium shades without a previous mordanting. Dyes of the triphenylmethane group show affinity for Tubize and give bright shades with good fastness to washing. Peroxide bleaching may be used if the temp. does not exceed 65°. NaClO is not recommended but can be used if carefully handled. The 3 points emphasized in dyeing are: selection of proper dyes, boiling the goods and avoidance of soap or sol. oil. L. W. RIGGS.

Report of the sub-committee on light fastness. II. Fading of dyed textiles in the light transmitted by various glasses. W. D. APPEL and WM. C. SMITH. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 180-92; *Am. Dyestuff Rept.* 17, 410-22. Twenty selected dyeings were exposed to sunlight without glass cover and under window glass, Correx, Vita and 6 other glasses of known transmission. The fading was recorded in the form of quant. reflection measurements. The spectral distribution of the radiation and the extent to which the fading of the dyeings was effected by changes in the distribution and intensity produced by passage through the glasses was reported and illustrated in 10 charts of curves. The visible and long-wave-length ultra-violet radiation in sunlight was relatively more important in comparison with the short-wave-length ultra-violet than is commonly supposed. Window glass was considered satisfactory for covering the samples in the standard sunlight exposure tests. L. W. R.

Addition of pyridine to dye vats. M. FREIBERGER. *Z. angew. Chem.* **41**, 133 (1928); cf. Binz and Prange, *C. A.* **22**, 779.—The author refers to his previous publication (*C. A.* **15**, 3752), not cited by Binz and Prange, in which the improvement in the rate of reduction of indigo obtained by the addn. of pyridine and similar bases to the vat is described. B. C. A.

Production of aniline black from aniline. A. LINKE AND W. SCHRAMKE. *Melliand's Textilber.* **9**, 328-30(1928).—In the quick process using Cu there are losses of 30-50% between the PhNH_2 used and the increased wt. of the goods. The loss is partially the result of evapn. promoted by the disocn. of aniline salt at high temp. and partially caused by reaction with excess Cr in the after-treatment. E. R. C.

Effect of light on indigo. R. HALLER, J. HACKL AND M. FRANKFURT. *Melliand's Textilber.* **9**, 415(1928).—Since isatin was identified in an indigo-dyed cotton fabric which had been faded by exposure to sunlight under glass, it appears that the fading of indigo is due to oxidation. With other vat colors, for example Indanthrene Yellow, the effect of light is reduction. Cf. *C. A.* **21**, 4075. E. R. CLARK

Reserve salts. CHARLES M. KEYWORTH. *J. Soc. Dyers Colourists* **44**, 177-8 (1928).—Methods for the identification and detn. of reserve salts are described. L. W. RIGGS

Ultra-violet light in chemical textile research. M. NOPITSCH. *Melliand's Textilber.* **9**, 136 8, 241 4, 330(1928).—Fluorescence colors seen with a screened Hg arc are valuable for rapid identification of fibers and textile chemicals. The cellulose fibers appear yellowish and the protein in fibers bluish. Viscose rayon appears distinctly yellow, while acetate rayon is distinctly blue-violet. The violet fluorescence seen with jute disappears upon extrn. with petr. ether. The results of the examn. of current color cards and of starches, fats, wetting agents and the like gave data of definite value. E. R. CLARK

Photomicroscopy of textile materials with dark-field illumination. A. KLUGHARDT. *Faserforschung* **6**, 129-32(1928).—A series of photomicrographs obtained with the aid of a Hauser condenser (Emil Busch, Rathenow) show a wealth of detail. E. R. C.

Mbocaya fiber. FRIEDRICH TOBLER. Sorau Research Inst. *Faserforschung* **6**, 126 8(1928). A South American palm, *Coccotheca totai*, yields a fiber known in the Argentine as "mbocaya." This fiber is fine, slightly lustrous and somewhat wool-like in feel. It occurs in bundles about 40 cm. long and 2-4 mm. in diam. Strands of fibers may be readily combed out, giving a product of the general appearance of flax. The single fibers are rather weak. Chemically they are of but a slightly lignified type. Fabric manuf. is not impossible. E. R. CLARK

A method for detecting damaged wool. WILHELM SIEBER. *Melliand's Textilber.* **9**, 326 8(1928). Damaged wool has been detected by the biuret reaction, by the estn. of KOH-sol. N compds., and by Allworden's reaction using phosphotungstic acid. A newer method is based on the dyeing of tyrosine with alk. diazo soln. This can be prepd as follows: 2 g. sulfanilic acid, 3 cc. H_2O and 2 cc. concd. H_2SO_4 are added slowly to 1 g. NaNO_2 in 2 cc. H_2O . This is filtered and dissolved in 10% Na_2CO_3 . While the reagent decomposes rapidly it dyes only the tips of undamaged wool red, while wool which has been attacked with alkali or acid, or which has been excessively damaged mechanically is uniformly colored. Similar results may be obtained more conveniently by use of a 1% soln. of benzopurpurin. Micrographs are reproduced. E. R. CLARK

Comparison of South American and German-grown flax. ANNEMARIE LAUCHE. Techn. Hochschule, Dresden. *Faserforschung* **6**, 227-33(1927).—Cross-section micrographs illustrate the coarser nature of the fiber as grown in Uruguay for seed and cut, as compared with that grown in Germany for fiber and pulled. The same strain of seed was used in each case. E. R. CLARK

Measurement of the resistance of flax yarns to wear. G. F. NEW. *J. Textile Inst.* **18**, 595-605T(1927).—The test samples, suspended vertically and carrying tension pieces, are submitted to rubbing through the oscillatory motion in a vertical plane of hardened steel bars of cylindrical cross-section. The angle of contact between the yarn and the rubbing surface, and the tension in the yarn largely affect the no. of oscillations withstood, and must be suitably chosen according to the material tested. Increase in fiber quality (as estd. in the trade), yarn twist or amt. of pre-spinning treatment given (within ordinary limits) produces a yarn with higher resistance to wear; boiling decreases this resistance while sizing greatly increases it. The results, in general, are concordant with the actual weaving behavior of a series of yarns or sizes. B. C. A.

The ability of aminated and pyridinated yarn to combine with acid substances. P. KARRER AND S. C. KWONG. *Helv. Chim. Acta* **11**, 525-9(1928); cf. *C. A.* **20**, 3819;

22, 2062.—The aminated yarn was produced by treatment of yarn with NH_3 and contained 0.71% or 0.05 g. equiv. of N. This yarn fixed on the av. about 0.05 g. equiv. of the following acids: H_2SO_4 , HCl , HClO_4 , H_2CO_3 , AcOH , H_3PO_4 , and $p\text{-CH}_3\text{C}_6\text{H}_4\text{SO}_3\text{H}$. This seems to prove that the taking up of these acids by aminated yarn is a salt formation process. With more complex substances, such as acid dyes, the combinations between them and the aminated cellulose does not follow strictly stoichiometric proportions. This may be due to incomplete taking up of the dye or to adsorption processes. Pyridinated cellulose did not combine with H_2SO_4 , HCl , HClO_4 , H_2CO_3 , AcOH or H_3PO_4 in dil. aq. soln., and did not fix exactly equiv. wts. of the 5 dyes tested.

LOUISE KELLEY

Improvements in dry-cleaning and laundry processes. A. E. HATFIELD AND E. A. ALLIOTT. *J. Soc. Dyers Colourists* 44, 170-7 (1928).—This paper gives an account of the various factors affecting dry-cleaning, and traces the basis of recent improvements which give better results with greater economy. Analogous methods can be applied to wet-cleaning and laundry washing.

L. W. RIGGS

Laundering with hydrocarbon-containing soap followed by perborate bleaching. E. V. DRATHEN AND K. SOGSTETTER. *Melliand's Textilber.* 9, 416-8 (1928).—Excellent results were obtained in the laundering of soiled wool by the use of suds made with naphtha-contg. soap followed by bleaching with neutralized perborate soln.

E. R. C.

A distinction between raw and bleached cotton present together. WILHELM SIEBER. *Melliand's Textilber.* 9, 404 6 (1928). The unbleached cotton shows some affinity for Victoria Blue.

E. R. CLARK

The bleaching process. W. KIND AND H. KORTE. *Melliand's Textilber.* 9, 330-2, 409-15 (1928).—The accelerating or retarding action of constituents of the bleach bath is traced to p_{H} value following Chibbrens and Ridge (*C. A.* 21, 2192).

E. R. CLARK

Iodometric evaluation of enzymic desizing agents. R. HALLER, J. HACKL AND M. FRANKFURT. *Melliand's Textilber.* 9, 309-12 (1928). Since the aldoses formed by the degradation of starch have a low viscosity in soln. making for easy rinsing out, a measure of the rate at which they are formed is a measure of the activity of the desizing agent. For estn. of the aldoses, iodometric methods are preferable to the use of Fehling soln., being both more simple and more accurate. The method of Auerbach and Bodlander (*C. A.* 17, 512) gave best results of the several which were tried. From the consumption of oxidizing agent in the alk. soln. a value per kg. of the enzyme prepn. may be calcd.

E. R. CLARK

Bombyx mori. I. The effect of H-ion concentration upon the coagulation of liquid silk. II. Quantitative changes of cystine, tryptophan and tyrosine in proteins of silkworms (NAKAJIMA) 111. Acid soaps (HARTMANN; KAGE) 27. Acid basic dye-stuffs (KAGAN) 10. Methods of analysis of leather dyes (JONES) 29. Apparatus for acidulating wool (U. S. pat. 1,674,786) 1.

SCHULTZ, GUSTAV. **Farbstofftabellen.** Band I und II. 7th ed. revised and enlarged by Ludwig Lehmann. Berlin Weidmannsche Buchhandlung M. 8; subscription price M. 6

Dye. I. G. FARBENIND. A-G. Brit. 280,436, May 5, 1927. A greenish yellow dye fast to light and oil is made by coupling diazotized 4-chloro-2-nitroaniline with acetoacetic *p*-chloroanilide. The dye may be deposited on a substratum to form a lake.

Dyes. L. CASSELLA & Co., Ges. Brit. 280,217, Nov. 2, 1926. Halogen derivs. of anthanthrone are prepd. by condensing 1,1'-dinaphthyl 8,8'-dicarboxylic acid to anthanthrone in H_2SO_4 soln. and then halogenating the product in the same soln. without sepn. Br and I may be used together for the halogenation.

Dibenzanthronyl derivatives. KARL ZAHN AND PAUL OERIWAT (to Grasselli Dye-stuff Corporation). U. S. 1,675,014, June 26. By heating the ethers of Bz-1-iodo-Bz-2-hydroxybenzanthrones with Cu powder in an inert solvent such as PhNO_2 new diethers of Bz-2-Bz-2'-dihydroxy-Bz-1-Bz-1' dibenzanthronyls are obtained which by the action of alk. condensing agents can be converted into dyes. The intermediate forms brown needles, m. 387-390°.

Fast colors on vegetable fibers. F. STRAUB (to Soc. anon. pour l'ind. chim. à Bâle). Can. 280,981, June 21, 1928. A dye bath is prepd. with 2 parts of Cr compd. of the azo dyestuff from diazotized 2-amino 4-chloro-5-nitro-1-phenol and 2,5-amino-naphthol-7-sulfonic acid (acid coupling) 50 parts of Glauber's salts or 30 parts of common salt; 100 parts of cotton is introduced into the bath at 60-70°, boiled up within $\frac{1}{4}$ hr. and dyed a further $\frac{1}{2}$ to $\frac{1}{4}$ hrs. The dyed cotton is rinsed and dried.

Dyeing "viscose silk," etc. BRITISH DYESTUFFS CORPORATION, LTD. AND J. BADDILEY. Brit. 280,320, 1926. Monoazo dyes are used as are obtained by coupling diazotized amines and their derivs., including sulfonic and carboxylic acids, with 2-amino-5-naphthol-7-sulfonic acid or its *N*-substituted derivs. Numerous examples are given.

Dyeing acetylcellulose. GEORGE H. ELLIS and ERNEST GREENHALGH (to Henry Dreyfus to The Can. Celanese, Ltd.). Can. 281,180, June 19, 1928. Colored patterns are produced on material comprising acetylcellulose by locally applying a prepn. comprising a thiocyanate and an org. compd. capable of coloring acetylcellulose which has been solubilized by pretreatment with sulfuricnoleic acid or other substance of oils or fatty characteristics contg. salt-forming groups or with salts of such compds. such as their alkali or ammonium salts or with mixts of said solubilizing agents. Cf. C. A. 21, 3752.

Dyeing cellulose derivatives. HENRY DREYFUS. Can. 281,193, June 19, 1928. Cellulose acetate, etc., are dyed with an aq. colloidal soln. of a coloring compd. which comprises at least one alc. group linked to an anthraquinone dye nucleus through C only, said colloidal soln. being prepd. by preheating the compd. with a solubilizing agent.

Dyeing cellulose derivatives. HENRY DREYFUS. Can. 281,194, June 19, 1928. A cellulose deriv. is treated with an aq. soln. of NH_4SCN and then dyed with an aq. dispersion of a relatively water-insol. coloring compd. The dispersion is prepd. by preheating the compd. with a solubilizing agent comprising a Na salt of sulfuricnoleic acid.

Dyeing cellulose derivatives. HENRY DREYFUS. Can. 281,195, June 19, 1928. Cellulose acetate material is treated with 15% solns. of aliphatic acid salts of mordant metals (especially with salts of hydroxy aliphatic acids) and after absorption of the mordant metals is dyed with mordant dyes. Mordant salts particularly useful are those of lactic, citric, glycolic and acetic acids.

Dyeing furs and other materials. BRITISH DYESTUFFS CORPORATION, LTD., R. S. HORSFALL and L. G. LAWRIE. Brit. 279,942, Aug. 4, 1926. Furs, bone, ivory, horn, resins such as "synthetic glass" and celluloid films are colored by concd. dye solns. contg. water and hydroxyl derivs. of benzene hydrocarbons, e. g., furs may be dyed a deep blue with a soln. of Alizarine cupra blue B and resorcinol.

Dyeing, printing and stenciling. GEORGE H. ELLIS, HENRY C. OLPIN and ERIC E. WALKER (to Henry Dreyfus.). Can. 281,192, June 19, 1928. Materials which are deleteriously affected by alkali sulfide, are dyed by applying S dyestuffs in conjunction with both alkali sulfide and alkali hyposulfite to reduce the quantity of alkali sulfide sufficiently to avoid deleterious action on the fibers.

Printing fabrics with vat dyes. I. G. FARBENIND. A. G. Brit. 279,864, Oct. 26, 1926. The material is first printed with the dye thickened with a soln. of cellulose ester or ether and is then treated with a reducing agent and an alkali and steamed. Water sol. cellulose alkyl ethers are suitable for the process.

Fabric-printing apparatus. A. CROMPTON AND CALICO PRINTERS' ASSOCIATION, LTD. Brit. 280,376, Dec. 2, 1926.

Textiles. CAMILLE DREYFUS. Can. 280,645, June 5, 1928. Textiles are prevented from becoming fluffy and losing appearance by treating the yarns with a soln. of cellulose acetate, or other org. deriv. of cellulose to give a permanent finish.

Treatment of fabrics. GEORGE H. ELLIS (to Henry Dreyfus.). Can. 281,189, June 19, 1928. Woven or knitted fabrics contg. cellulose esters or ethers are treated to render them immune from development of faults by lack of cohesion between the threads, by impregnating at 100° with strong aq. solns. or dispersions (10% concn.) of oily or fatty substances, of salt-forming carbocyclic compds. or salts thereof, of sulfonated aromatic fatty acids or salts thereof, of resin soaps or salts or soaps of resin acids.

Retting flax, etc. BRITISH DYESTUFFS CORPORATION, LTD., C. HOLLINS and E. CHAPMAN. Brit. 279,583, Aug. 24, 1926. A retting bath is used contg. 0.5-2.0% of wetting agents such as sulfonic acids derived from $\text{CH}_3\text{O}-\text{C}_{10}\text{H}_7$ condensation products or CH_3O PhOH condensation products, alkylnaphthalenesulfonic acids, substances prepd. by sulfonating mineral-oil fractions and condensing the products with isopropyl alc., ligninsulfonic acids, naphthenic acids, taurocholic and sulfonated higher fatty acids.

Treating hemp or similar fibers. L. LAPIERRE. Brit. 279,946, Aug. 5, 1926. In order to give hemp or other similar ligneous fibers a silky appearance the material after degumming is treated for about 2 hrs. at 120° with a soln. formed from water, KNO_3 , ammoniacal K sulfide, NaCl, Na borate, Mg sulfide and ammoniacal Cu oxide,

then washed, rinsed with 2% HCl soln., treated with 1% "oxaline oil," then with a 1% KNO_3 soln., dried and sepd.

Cleansing and bleaching compositions. R. VIDAL. Brit. 280,193, Nov. 5, 1926. Comps. for washing and bleaching textile materials are prepd. by treating with NaOCl or other alkali hypochlorite fatty acids or animal fats or oils, with or without admixt. with mineral oils. Oleic acid or oils such as those from peanut, copra, whale, soy, maize or tallow may be used.

Detergents suitable for use on textile materials. I. G. FARBERIND. A.-G. Brit. 279,877, Oct. 27, 1926. Stable solid solns. are obtained by dissolving an alkali or NH_4 salt of an alkylated or cycloalkylated aromatic hydrocarbon in an org. solvent with or without the addn. of a water-binding agent. Among the substances which may be used are: Na butylnaphthalenesulfonate, Na isopropylnaphthalenesulfonate, Na or NH_4 dibutylnaphthalenesulfonate, Na cyclohexylnaphthalenesulfonate and the sulfonates of butylbenzene, isopropylxylene and dibutyltetrahydronaphthalene together with solvents such as dipentene (as obtained as a by-product in making camphor from turpentine oil), diacetone alc., heavy benzine, $\text{C}_2\text{H}_2\text{Cl}_4$, solvent naphtha and 1,3-butyleneglycol. Na_2CO_3 , pumice or kaolin is also specified in some of the formulas given. The comps. are mixed with H_2O to prep. them for use.

Delustering cellulose acetate products. GEORGE H. ELLIS (to Henry Dreyfus). Can. 281,352, June 26, 1928. Patterns are produced on fabrics contg. cellulose acetate by the local application of substances which accentuate or which diminish the delustering action of hot aq. media or moist steam, and thereafter treating the fabrics with hot aq. media or moist steam.

Mercerizing. CHEMISCHE FABRIK VORM SANDOL. Brit. 279,784, Oct. 29, 1926. The action of alkali mercerizing liquor on natural or artificial cellulosic fibers is accelerated and made more uniform by adding a small proportion of a mixt. of phenols and hydrogenated aromatic compds. such as those derived from C_{10}H_8 , naphthols and phenols. The treatment also renders the material susceptible of more even dyeing.

Weighting artificial silk. R. CLAVEL. Brit. 280,094, March 30, 1927. In a process as described in Brit. 277,602 (C. A. 22, 2 63) successive weighting baths are used without intermediate washing or neutralization, and at least one of the baths, prior to the pptg. bath, has an acid reaction or contains a protective colloid. After weighting, and preferably before squeezing, the material may be treated with an alk. bath contg. dyes and tanning substances.

Weighting cellulose acetate fabrics, etc. C. DREYFUS and H. PLATT (to British Celanese, Ltd.). Brit. 279,502, Oct. 23, 1926. Weighting of fibers, yarns or fabrics of cellulose acetate or other cellulose esters or ethers is effected with a soln. of metallic salts such as SnCl_4 or ZnCl_2 ; the cellulose deriv. is subjected to a swelling or gelling action before or during the treatment and the weighting is fixed in insol. form by washing or soaping. Formic acid, HOAc , PhOH , furfural or pyridine may be used as gelling agents, and pptn. of Sn may be effected by Na_2CO_3 , NaHCO_3 , NH_3 , NaOH , KOH , or $\text{Ca}(\text{OH})_2$.

Apparatus for singeing yarns. SCHWARZ & CO. Brit. 280,201, Nov. 2, 1926.

Fabrics comprising cellulose esters or ethers. C. DREYFUS (to British Celanese, Ltd.). Brit. 280,195, Nov. 4, 1926. Designs are produced on fabrics such as those comprising cellulose acetate or propionate or ethyl cellulose, by engraved rollers under heat and pressure or by similar treatment.

Hair felt. ALBERT L. CLAPP (to Beckwith Mfg. Co.). U. S. 1,674,948, June 26. Rag or sulfite pulp or other similar cellulosic material is beaten with a soap such as Na or K oleate or stearate and long hair is then added and the fibers are combed out and the mixt. is run off on a wet paper machine. The product is suitable for heat and sound insulation, etc. Cf. C. A. 22, 2848.

English standard specifications for paints. ANON. *Farben-Ztg.* 33, 622-3(1927).

J. S.

Preparation of luminous paints. R. DECKERT. *Farbe u. Lack* 1927, 172, 182.—A series of formulas is given.

J. S.

Origin and prevention of watermarks in white coatings. ANON. *Farbe u. Lack* 1927, 149.—When exposed to the atm. in the presence of Fe and Cu, paints contg.

ZnO become watermarked; those contg. basic Pb carbonate do not. The Fe and Cu hydroxides formed appear first as colloids which are easily washed off by the rain. As they coagulate very slowly in the presence of white lead their removal is complete. The coagulating action of the ZnO is immediate and the coagulated metal hydroxide stays with the paint film.

Accelerated kneading of coating materials. PAUL GRUNDLACH. *Farbe u. Lack* 1927, 138-9.—Various kneading app. used in the paint, varnish and lacquer industry are described. J. S. SCHALCH

History of the chrome colors. H. BING. *Farbe u. Lack* 1927, 111, 129, 158. J. S.

The use of gas in making dry colors. ISMAR GINSBERG. *Chem. Markets* 22, 635-6, 694(1928).—By reason of the greater efficiency with which it can be burned, the ease of regulation of combustion, its cleanliness, convenience and the simplicity of the appliances for using it, gas fuel serves well in the dry-color industry for effecting chem. reactions, roasting minerals and burning the dry colors. W. C. EBAUGH

Colors for glass painting. E. O. RASSER. *Farbe u. Lack* 1927, 314, 333.—Formulas are given for the prepn. of china paints. J. S.

German standards for white lead. ANON. *Farben-Ztg.* 23, 621(1927). J. S.

Plasticity and flow determination of paints. H. VOLLMANN. *Farben-Ztg.* 32, 1904-6(1927).—The plasticity of a paint is the result of coagulation of the disperse phase, the coagulation depending on the properties of the vehicle as well as of the pigment. Expts. made with blanc fixe and various vehicles, such as benzene, benzine, tetralin, turpentine, linseed oil, and paraffin oil, show that in a medium of colloidal structure the pigment is pptd., although much more slowly, to a denser sediment than in a non-colloidal liquid. The plasticity, of which the flow is a certain function, is detd. by measuring the latter with the flow meter of Mallison, modified by V. The app., consisting of a system of calibrated grooves, the latter being provided on one end with receptacles of known capacities, is set in a vertical position. For operation it is lowered to a certain level, whereby the liquids are allowed to flow along the grooves. The progress of flow is marked at intervals. Flow curves are given for paints consisting of equal parts of pigments, such as blanc fixe, lithopone, chromium yellow, zinc white and vehicles, such as linseed oil varnish, a 1:1 mixt. of linseed oil and standoil, and ester gum varnish. J. S. SCHALCH

The red lead question. H. RAHDER. *Farben-Ztg.* 33, 741-3(1927).—The advantages claimed for modern "high-dispersion" red leads are: non-settling, easy brushing, good spreading power and consequent cheapness. R. complains, however, that no attention has hitherto been paid to questions of actual rust prevention, and his preliminary tests indicate that in adhesion, resistance to water, etc., the "modern" red lead is inferior to the "classic." B. C. A.

The analysis of paints with graphite base. RAYMOND JACQUES. *Ann. chim. anal. chim. appl.* 10, 98-100(1928). A convenient method for the analysis of graphite paint is given in detail and the compn. of 2 typical paints is shown. Twenty-five g. of the paint was extd. with ether several times, filtered through a tared Gooch crucible, and resin was removed by washing with alc. Oil of turpentine was detd. by distn. of 25 g. of varnish with 100 cc. H_2O , measuring the vol. of oil in the distillate, with a correction of 0.35 cc. for oil absorbed by H_2O . The pigment of one of the paints contained 30% of graphite, 14.5% of $ZnCO_3$, 12.5% of Fe_2O_3 plus Al_2O_3 and 30.8% of ZnO. The method of analyzing the pigment involved no new feature. W. T. HALL

Studies on the physiological properties of titanium dioxide and titanium white. K. B. LEHMAN and LUDWIG HERGET. *Chem.-Ztg.* 51, 793-4(1927).— TiO_2 fed for six months to various animals proved harmless. Two methods for the detn. of Ti are given. G. G. SWARD

Basic sulfate liquor in lithopone manufacture. W. N. HIRSCHL. *Chem.-Ztg.* 51, 599(1927).—Zinc salts present in the mother liquor in lithopone manuf. are, during clarification, pptd. as $3ZnO \cdot ZnSO_4 \cdot 8H_2O$. G. G. SWARD

Oil absorption of highly dispersed pigments. F. HÜLSKAMP. *Farbe u. Lack* 1928, 254-5.—Forty g. of highly dispersed red lead ground in 100 g. linseed oil occupied 2.3 times the vol. of 20 g. ordinary red lead also ground in 100 g. oil. The discrepancy is due to the formation of foam with the former. G. G. SWARD

General interpretation of the drying processes of fatty oils. B. SCHEIFELE. *Farben-Ztg.* 33, 739-41(1927).—The drying processes of all drying oils, whether of the tung oil, linseed oil or poppyseed oil groups, are explained with reference to the relative unsatn. of their mols. and consequent tendency to gel formation. B. C. A.

Polymerization as the cause of the drying of fatty oils. JOH. SCHEIDER. *Farbe u.*

Lack 1927, 75-6, 135-6.—A review of various theories covering the drying process of fatty oils. J. S.

Aging of boiled oil. F. WILBORN. *Farben-Ztg.* 33, 864(1927).—Over a period of 10 months, samples of boiled oil were prepd. monthly by incorporating a standard amt. of Pb-Mn resinate (the same "melt" being used throughout) in the same well-preserved linseed oil. A similar series was prepd. with Co linoleate as drier. At the end of this time no appreciable sedimentation had occurred in any sample, and the drying times of the oils showed no significant "aging" variation. This is contrary to previous statements to the effect that the driers in boiled oil gradually lose effectiveness by pptn. B. C. A.

Influence of driers on the drying of oil of amber. F. WILBORN. *Farben-Ztg.* 33, 862-4(1927).—Addns. of Pb-Mn resinate and of Co resinate to redistd. oil of amber are graphically shown to accelerate the drying by catalyzing resinification. The results are briefly discussed. B. C. A.

Molecular and absolute drying action of various metals. F. QUINCKE AND K. KAMPHAUSEN. *Farbe u. Lack* 1927, 341-3.—The usual method of detg. the relative dryness of paint films with the fingers does not give const. results. Q. and K. successfully used for this purpose the capillary action of filter paper. The height of rising of the oil gives a direct measurement for the drying action of the metal whose salt was used as drier. The amt. of drier necessary to obtain the optimum drying action is proportional to the mol. weight of the corresponding metal and is 0.003 mol. per 100 g. linseed oil. Charts and tables are given showing the drying action of various metals in combination with linseed and tung oil or linseed-tung oil mixts. With the following the drying time of linseed (a) and tung oil (b) in the presence of a drier is given in fraction of the drying time of the drier-free oil $\frac{1}{10}$ to $\frac{1}{15}$: a Co, b Co, Fe, Mn, Cu. $\frac{1}{10}$ to $\frac{1}{4}$: a Mn, Pb; b Cr, Pb, Zn, Ni $\frac{1}{2}$: a Fe, Ni, U, Cr; b—. $\frac{3}{4}$: a Ba, Cu, Mg, Sr, Mo, Zn, Ca, W; b Ba, Mg, Sr, Cd. J. SCHALCH

Manganese compounds as drier bases. FELIX HEBLER. *Farbe u. Lack* 1927, 258-60.—Review of various Mn compds used as drier bases. J. S.

Water-resistance tests [on paints and varnishes]. H. WOLFF. *Farben-Ztg.* 33, 921-3(1928).—In a series of expts. on water-resistance of paints and varnishes under varying conditions, conflicting results were obtained according to whether the immersion was continuous or intermittent, and whether temporarily or permanently hard water or distd. water was used. The following standard method of procedure is suggested: Films (1 or 2 coats, according to the type of material) on clean glass and iron plate are half-immersed in water after 48 hrs. air drying. If tap water be used, it should be freed from temporary hardness. The immersion is continuous, daily examn. being made for milkiness, softening, etc. A parallel series of tests should be run, the films being allowed to dry out after each 2 days' immersion, and the reversibility of any changes observed. R. C. A.

The numerical determination of drying time and hardness of paints and varnishes. RICHARD KEMPF. *Z. angew. Chem.* 40, 1296-301(1928). The character of the mark made by the rim of a wheel, knife edge or a point indicates the degree of drying or hardness of a film. The marking piece is fixed at the end of a beam and the film is caused to travel while in contact with the former. Provision is made for either a const. or a gradually increasing load on the wheel, etc. At the end of each detn. the film is automatically shifted for the succeeding detn. Details of the construction of the app. are given. The author recognizes three periods, fluidity, gel and hard. G. G. SWARD

Newer manufacturing methods for varnishes. HANS REBS. *Farbe u. Lack* 1927, 128.—A review. J. S.

Painting and lacquering of railroad cars. ANON. *Farbe u. Lack* 1927, 92.—The painting and lacquering process and cost calcs. are described. J. S.

Nitro-oil or combination lacquers. F. KOLKE. *Farben-Ztg.* 33, 861. 2(1927). The combination of nitrocellulose varnishes with oil varnishes is discussed. Curves are given showing the limits of compatibility of tung oil with 20% $\frac{1}{4}$ -sec. nitrocellulose solns. in butyl acetate and in hexalin acetate. B. C. A.

Newer results of the study of cellulose and their importance for the lacquer industry. JOH. SCHEIBER. *Farbe u. Lack* 1927, 190-1.—Under the influence of ultra violet rays and temp. changes cellulose esters become brittle; this is apparently due to crystn. The ability of these esters to crystallize is proved by the discovery of well-defined acetylcellulose crystals and by the fact that cellulose esters when mixed with true solns. do not follow the adsorption law of Freundlich, but follow the distribution law of Henry. J. SCHALCH

Clarification of nitrocellulose lacquers. ADOLF HECK. *Farbe u. Lack* 1927, 151.—

The construction and efficiency of the "Union Filter Centrifuge," used for the clarification of lacquers, are described. J. S.

Plasticizers for nitrocellulose lacquers. ANON. *Farbe u. Lack* 1927, 297.—The usefulness of various plasticizers is discussed. J. S.

Examination of plasticizers for nitrocellulose lacquers. E. v. MÜHLENDahl AND H. SCHULZ. *Farbe u. Lack* 1927, 276; cf. C. A. 22, 1861.—The *evaporation rate*, detd. by heating 10 g. of the plasticizer in a glass dish of 75 mm. diam. to 100° and expressed in g. product lost per 100 g. sample, is after 10 days for castor oil 0.1, tricresyl phosphate 0.5, triphenyl phosphate 1.0, amyl phthalate 8.1, "Elaol" 8.2 and after 2 days for camphor 99.8. The influence of the plasticizer on the nitrocellulose under the *action of light and heat* is judged from the color of a mixt. of equal amts. of the 2 products which was heated to 100° or exposed to the rays of a quartz lamp. In order to det. the *solvent power* of the plasticizer for nitrocellulose, 4 g. of the latter are dissolved in 8 g. alc. and 8 g. plasticizer. The no. of cc. of benzene necessary to ppt. the cotton from the soln. is a direct measure of the solvent power. This varies with different nitrocelluloses; with "AB 100-collodion cotton" it is for camphor 88, "Elaol" 44, amyl phthalate 41, triphenyl phosphate 38, and tricresyl phosphate 35. In castor oil the collodion cotton is only partly dissolved J. SCHALCH

Sulfur-phenol resins for the manufacture of shellac substitutes. ANON. *Farbe u. Lack* 1927, 286.—Phenol resins are made water-insol. by sulfuration. Formulas for the manuf. of sulfur-phenol resins are given. J. S.

Hardening and esterification of rosin. F. PYHÄLA. *Farben-Ztg.* 33, 801-3 (1927).—P. describes a new process for the esterification of rosin in open kettles, the customary losses and darkening being avoided. Finely divided Ca compds. of the appropriate higher alcs., phenols, etc., are gradually added, with stirring, to molten rosin. The temp. is maintained at 180-220° until effervescence ceases and a calm melt is obtained. By careful working a pure ester is produced, lime being deposited quantitatively as a sediment in the kettle. Exptl. details are given for the prepn. of esters of rosin with glycerol (mono- and tri-glycerides), phenol, cresol, β -naphthol, resorcinol and borneol. B. C. A.

Exploitation of the euphorbias in South Africa; obtaining resins and rubber. W. SPOON. *Ind. Mercur* 1927; *Ber. Afedel. Handelsmuseum Ver. Koloniaal Inst.* No. 32, 28 pp.—The latex of the euphorbias from South Africa contains little rubber and much resin; the plants cannot be cultivated, nor regularly tapped; their economical exploitation is not very promising. A. L. HENNE

Are there resinogenic and resinophoric groups? HANS WOLFF. *Z. anorg. Chem.* 40, 1010-11 (1927). Resins are the result of conditions rather than of certain chem. groups. As a heuristic principle resinogens may be considered as reaction groups which tend to the formation of compds. of high mol. wt. G. G. SWARD

Report of Committee D-15 on thermometers [for use in testing tung oil] (FULWELLER, *et al.*) 1. Low-temperature tar oils (MARSHALL) 21. Apparatus for drying veneer (U. S. pats. 1,675,284-5) 1.

CHAMPOUR, MALEPEYRE, VILLON, and CHAPLET, A.: *Nouveau manuel complet de la fabrication des encres de toutes sortes.* Paris. Encyclopédie Roret L. Mulo. 380 pp. P. 15.

Titanium pigments. B. LAPORTE, LTD., H. E. ALCOCK and I. E. WEBER. *Brit.* 280,435, April 27, 1927. A white pigment is made by mixing a paste of Ti hydrate and a paste of BaSO₄ which has been prepd. as described in *Brit.* 252,768 (C. A. 21, 2537) and heating to above 650°; examples are also given in which C is used as an addnl. ingredient and the temp. is carried to 700-950°.

Grinding and mixing plant for making paints, ink, etc. J. R. TORRANCE AND TORRANCE & SONS, LTD. *Brit.* 280,041, Nov. 30, 1926.

Ink. U. A. D'INZEO. *Brit.* 280,088, March 9, 1927. An indehble writing or printing ink for use on paper sensitized with an aq. or alc. soln. of gallic or tannic acids comprises Fe(NO₃)₃ or a chromate such as that of K in water or other suitable solvent.

Inks. BRITISH DYE-STAUFFS CORPORATION, LTD., C. HOLLINS and E. CHAPMAN. *Brit.* 279,908, Aug. 19, 1926. The fluidity of inks is improved by adding a dispersing or wetting agent such as a sulfonic acid of the CH₃O-C₁₀H₇ or CH₃O-phenol condensation products, alkylnaphthalenesulfonic acids or sulfonated mineral oils which may

be isopropylated or not. Mention is also made of the possible use of ligninsulfonic acids, naphthenic acids, taurogallic acid and sulfonated higher fatty acids and products such as described in Brit 274,611 (*C. A.* 22, 2268).

Printer's ink. M. LUDVIGSEN. Danish 37,548, May 20, 1927. Waste products from the manuf. of sulfite cellulose such as waste liquor or terpenes and resins are evapd to the desired concn. (40-60% dry matter) and the residue is mixed with oil or fat. The latter may be replaced by linseed-oil fat. The sulfite liquor residue or terpenes should amount to between 60 and 90% of the total wt. of the ink mass.

Printers' ink. AKTIESELSKABET SADOLIN & HOLMBLAD. Danish 38,262, Dec. 19, 1927. In a paste brayed from oil and pigment is emulsified up to 50% of an oil free aq. soln. contg. not less than 10% of a glutinous org. substance with the exception of gum and casein.

Lacquer. JOSEPH G. DAVIDSON (to The Carbide and Carbon Chemicals Corp.). Can. 281,640, July 10, 1928. A thinner for pyroxylin lacquers comprises not more than 30% EtOAc and EtOH, not more than 20% of $\text{HOCH}_2\text{CH}_2\text{OMe}$ and $\text{AcOCH}_2\text{CH}_2\text{OMe}$ and the remainder a suitable hydrocarbon solvent (toluene, or mixt. of toluene with other hydrocarbons such as xylene or petroleum naphthas). Cf. *C. A.* 22, 2850.

Cellulose ester and ether compositions. H. BRADSHAW (to E. I. DuPont de Nemours & Co.). Brit 279,520, Oct. 25, 1926. In forming pyroxylin lacquers or other similar compns., tetrahydrofurfuryl alc. or a similar alc. of high b. p. is used as a solvent and may be mixed with other solvents, fillers, plasticizing agents, etc.

Synthetic resins. H. W. MATHIESON and F. W. SKIRROW (to Canadian Electro Products Co., Ltd.) Brit. 280,246, Nov. 8, 1926. Gummy or resinous products are made by reaction of vinyl acetate, vinyl formate or other suitable vinyl ester with a satd. aldehyde such as AcH , with or without an inorg. acid or other catalyst.

Molded articles of synthetic resins. K. A. STUBBS. Brit. 280,017, Oct. 14, 1926. Cups, saucers, plates or other articles are formed from synthetic resin or similar moldable powder with a lace or other openwork pattern pressed into the material during molding to produce a decorative effect.

Coating composition. R. H. KIENLE and L. V. ADAMS (to Can. General Elec. Co.) Can. 280,937, June 12, 1928. A soln. of resin prepd. from glycerol and phthalic anhydride and contg. phthalic acid is treated with an alk. material to neutrality, and the clear soln. decanted from the compd. of the alkali and the acid constituent of the resin and any excess of uncombined alkali. Basic pigments or fillers (ground) may be suspended in the soln. of resin without coagulation.

Condensation products of urea with alcohols and ketones. I. G. FARBENING A.-G. Brit. 280,238, Nov. 6, 1926. Oily or resinous products are obtained by condensing urea or one of its derivs. with an alc. or ketone, at a temp. below 120° in the presence of strong H_2SO_4 or other suitable catalyst. Butylene glycol, the acetal from glycerol and acetaldehyde and diacetin may be used in various examples which are given. Cf. *C. A.* 22, 2673.

Phenolic condensation products. FRANZ KURATH (to Economy Fuse and Mfg. Co.) Can. 280,747, June 5, 1928. A phenol and a compd. contg. a reactive methylene group (e. g., formaldehyde) are boiled under a reflux condenser in the presence of furfuralamide.

Phenolic condensation products. O. A. CHERRY and F. KURATH (to Economy Fuse and Mfg. Co.) Can. 280,746, June 5, 1928. Phenol and com. formaldehyde are boiled under a reflux condenser in the presence of furfuralamide until the mixt. seps. into 2 layers and slight thickening occurs. The mixt. is concd. by distn. under reduced pressure until the substance is anhydrous, or the supernatant liquid is treated with furfuralamide and the resultant water decanted. A potentially reactive resin is obtained which is hardened by heat at low temp. without application of pressure, or may be mixed with fillers to form hard, infusible compact, resistant articles by combined action of heat and pressure. Or, a fusible resin is made by heating a phenol and CH_2O under pressure in absence of a condensing agent. To this permanently fusible resin is added a quantity of CH_2O or polymer thereof sufficient to render the product infusible upon heating, and a quantity of furfuralamide (from 20 to 75% by wt. of the fusible resin). After admixt. with filling material, the product may be hardened by heat and pressure. Cf. *C. A.* 22, 2818.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Statistics of fats and oils. ANON. *Oil and Fat Ind.* 5, 176-9(1928). E. S.

Organic peroxides as bleaching agents. F. VISSERT HOOFT. *Oil and Fat Ind.* 5, 180-2(1928).—Benzoyl peroxide is used by making a paste with the oil after ascertaining by trial the proper amt., which varies from 0.05 to 0.2%. The oil is heated to 80° to 90° and the paste mixt. stirred in thoroughly. The time of the treatment varies greatly with the nature of the oil. Sometimes 20 min. is enough and sometimes even after a few days an after-bleaching is seen. No deposits are formed and no filtering is necessary. After the benzoyl peroxide has lost its available O there remains a small quantity of benzoic acid which can be volatilized readily if desired. E. S.

Problems of the oil refiner. G. G. FOX. *Oil and Fat Ind.* 5, 167-70(1928).—A discussion of the relation of the refiner to the buyers and chemists. E. S.

Relation between analysis and properties of sulfonated oils. F. G. A. ENNA. *J. Intern. Soc. Leather Trades Chem.* 12, 204-10(1928); cf. *C. A.* 22, 182.—The superior nourishing property of sulfonated fish oils, as compared to sulfonated castor oil, is ascribed to lower degree of sulfonation, resulting in a less stable emulsion, which produces a more desirable distribution of the oil throughout the skin. The method of Stiasny and Riess (*C. A.* 20, 302, 998) for detg. sulfonated oil in admixture with unsulfonated is recommended. H. B. MERRILL

Chemistry of the Kreis reaction. J. PRITZKER AND R. JUNGKUNZ. *Am. Perfumer* 23, 280-1(1928); *Seifensieder-Ztg.* 54, 946(1927).—The investigations of Powick furnish satisfactory explanations for a series of phenomena when fats and oils become rancid. The most essential results are as follows: (1) As a result of direct tests the following compds. do not come under consideration: formic, acetic, butyric, capronic, heptylic, nonylic, caprylic, acrylic, azelaic, hydroxystearic, dihydroxystearic and diketostearic acids, and azelaic, butyric, heptylic, nonylic, crotonic aldehydes and formaldehyde, methylglyoxal, acrolein, dihydroxyacetone and oleic acid ozonide (2) Glycerol and the unsapon portions of fats play no part in rancidity. (3) The color of the Kreis reaction was examd. spectroscopically and found identical with that of acrolein- H_2O_2 and phloroglucinol-HCl. (4) From the mixts. acrolein, H_2O_2 and HCl colorations are obtained both with resorcinol-benzene and with naphthoresorcinol-ether which were identical with those that under equal conditions were obtained from spoiled fats. (5) Synthetically prepd. epihydrinaldehyde diethylacetal yielded a positive Kreis reaction, the color of which, spectroscopically examd., agreed with that obtained from rancid fats. (6) From epihydrinaldehyde diethylacetal it was possible to prep. a red phloroglucide of epihydrinaldehyde, which is easily sol. in glacial AcOH and concd. HCl. The HCl soln. is spectroscopically identical with the soln. which is obtained from spoiled fats in the Kreis reaction. (7) When fats become rancid there is presumably formed the glycerylacetate of the epihydrinaldehyde. Epihydrinaldehyde acetal is volatilized neither with H_2O vapors nor in a vacuum. (8) The evolution of the Kreis reaction must be conceived in such a way that the epihydrinaldehyde is first formed from the acetal under the influence of HCl, which with phloroglucinol forms the red condensation product, epihydrinaldehyde phloroglucide. (9) An hypothesis regarding the chemistry of rancidity is illuminated by the possibility of the formation of epihydrinaldehyde by autooxidation of oleic acid. In addition to this the formation of other aldehydes such as have been observed by other investigators in rancid fats and oils is not excluded. E. SCHERUBEL

Determination of iodine numbers by the Margosches method. G. BRACHMANN AND A. MOROSOV. *Oil & Fat Ind.* (Russia) 1926, No. 2-3, 73-7; *Chem. Zentr.* 1927, I, 2616.—EtOH contg. 1-2% AmOH was used as solvent for the fats which were studied. This mixt. readily dissolves hard fats, so that methods which on account of the difficult soly. of solid fats in pure EtOH are limited to liquid fats are open to much wider application with this solvent. C. C. DAVIS

A simple method for determining the oil content of seeds and other oil-bearing plants. DAVID A. COLEMAN AND H. C. FELLOWS. U. S. Dept. Agr., *Tech. Bull.* 71, 1-13(1928); cf. *C. A.* 22, 692.—The Wesson or refractometric method of detg. of the oil content of such materials as cottonseed, cocoa, chocolate, cacao meats, cacao shells, flaxseed, linseed meal, peanuts and soy beans was investigated. Briefly the method consists in measuring the change in % of the fat or oil solvent as it becomes diluted with the oil extd. from the sample. The solvent used was halowax, grade No. 1000 or 1007, the trade name for an impure monochloronaphthalene. The lab. set up

of app. is shown. Conversion tables are necessary to det. the actual % of oil in the oil-halowax mixt. Refractometer readings are read to 5 decimal places. Comparisons of the optical with the standard ether-ext. method showed a striking agreement for several types of oily substances. In only 3 of 70 instances was the difference greater than 0.25%. Substances contg. over 8% of oil may be analyzed by the optical method with more accuracy than where the oil content is less than this figure because the n of the halowax changes to a greater extent than where only a small quantity of oil is present. The method is reliable, safe and rapid. Detns. can be made in 15 min. at a cost for materials of less than 1 cent per test. C. R. FELLERS

A simplified method for the determination of oil contents in seeds. G. BRACHMANN. Brakhman Krasnodar. *Oil & Fat Industry* (Russia) 1926, No. 9, 5-8. —Put about 4 g. of seed in a bottle with cork stopper. Add 100 cc. of ether minus the expected amount of oil, stopper the bottle and let stand overnight. An equil. is reached in that time; i. e., the % of oil left in the seed and the % in ether are same. The error is far below the limits. Draw off 50 cc. of the soln. of oil in ether and evap. in a tared dish. The wt. of dried residue after evapp. the ether multiplied by 200 is the % of oil. A. A. BOEHTLINGK

Analytical aspects of the oil and seed-crushing industry. HARRY THOMPSON. *Fertilizer, Feeding Stuffs and Farm Supplies J.* 13, 292-3 (1928). —Comparative analyses were made with ethyl and petroleum ethers as solvents in the detn. of the oil content of seed. With Egyptian cotton oil cake, Egyptian cottonseed and linseed cake, Et₂O gave 5.12, 23.75 and 9.50% and petroleum ether 4.62, 22.75 and 8.80% oil, resp. Problems in connection with the analysis of oils and oil cakes are briefly discussed. K. D. JACOB

Elm-seed oil. K. KARDASHEV. *Oil & Fat Ind.* (Russia) 1926, No. 2-3, 78-84; *Chem. Zentr.* 1927, 1, 2615-6. —A study was made of the seeds of 2 types of elm growing in Russia (*Ulmus effusa* Willd and *Ulmus scabra* Mill.) to ascertain their oil content and the possibility of using the oil for food purposes. The yield of oil from the dry seeds by pressing was 20-25% by wt. It was a thin light yellow, odorless liquid. In phys. and chem. properties it resembled coconut oil or palm oil. The Reichert-Meissl no. was 4.62-5.77, Polenske no. 37.4-41.50 and I no. 15.90-25.00. Expts. showed that it is suitable for food purposes. Because of the small yield of seeds per tree (35 kg. per 1000 trees), the production of oil is promising only in regions thickly grown with elms. Comprehensive data and tables appear in the original. C. C. DAVIS

Perilla oil from Far-East provinces. E. LYUBARSKIY. Vladivostok. *Oil & Fat Industry* (Russia) 1926, No. 4-5, 10-12. —This oil was obtained from *Perilla ocymoides* seed cultivated in the above provinces. The oil is easily obtained from this seed. It is transparent, of slightly yellow tint, has a faint odor disappearing after standing and also seps. some foots. Extn. with Soxhlet yields 44% oil having acidity 1.11, sapon. no. 192.25, I no. (Hubel) 206.32. A. A. BOEHTLINGK

The oil-palm industry and its future. H. M. LANGTON. *Chemistry & Industry* 1927, 655-64 (1928) E. H.

(Extraction of oil from) oil palm in Malaya. B. BUNTING, B. J. EATON AND C. D. V. GEORGI. *Malayan Agri. J.* 15, 353-71 (1927). —The prepn. of a palm oil of low acidity necessitates modification of the native processes of West Africa; the essential features of the process adopted in Malaya are (a) use of only ripe, undamaged fruit, (b) sterilization of the fruit before treatment to destroy the naturally occurring enzymes which promote development of free fatty acidity, and (c) rapid extn. of the oil. The sterilization is effected by heating the fruit under slight steam pressure, after which it is transferred to a digester consisting of a vertically arranged cylindrical vessel fitted with beaters whereby disintegration of the oil cells is effected. It is then transferred to a centrifugal extractor contg. a perforated basket and having a well-fitting lid provided with a jointed steam pipe whereby steam is injected into the mash while the centrifuge is being operated, thereby facilitating the expulsion of the oil. The period of oil extn. is 15 min. and the oil is purified and freed from sludge and moisture by centrifuging in a machine of the De Laval type. Between 85 and 87% of oil in the pericarp can be recovered efficiently. The acidity of the oil is about 3% (as palmitic acid). B. C. A.

Composition of the fatty acids present as glycerides in elasmobranch oils. THOMAS P. HILDITCH AND ALBERT HOUTERROOKE. *Analyst* 53, 246-57 (1928). —The work described in this paper was undertaken to obtain quant. data on the compn. of the fatty acids present as glycerides in shark-liver and other fish-liver oils which are characterized by a high content of non-saponifiable matter, chiefly squalene. Shark-liver oil contains 61% of solid acids and 38.8% liquid acids but practically the same acids

are present in each, except that myristolic acid was identified only in the liquid acids and arachidic acid only in the solid acids. The combined acids analyzed as follows: myristic acid, 1.0%; palmitic acid, 13.2%; stearic acid, 1.3%; arachidic acid, 1.2%; myristoleic acid, 0.2%; palmitoleic acid, 3.5%; oleic acid, 35.4%; gadoleic acid, 16.4%; cetolic acid, 15.8% and selacholeic acid, 12.0%. The presence of highly unsatd. C_{22} and C_{30} acids and of palmitoleic acid has hitherto been a typical feature of marine animal oils and also exclusive to this class. It would seem probable that there is some connection between the deficiency of these derivs. and the presence of large quantities of squalene in the shark-liver oils. Have the acids in question disappeared in the elaboration of the hydrocarbon in the shark or are they present as decompn. products from squalene? The analytical data given here indicate that the biochemical relationships between squalene and the unsatd. fatty acids of typical marine animal oils merit detailed study.

W. T. H.

Oil from mustard seed and husks. V. MOLODOVSKII. N. Novgorod. *Oil & Fat Industry* (Russia) 1928, No. 2, 37.—The following data are, resp., for the original oil and the oil blown 10, 40 and 75 hrs.: d_4^{20} 0.918, 0.924, 0.944, 0.966; Engler viscosity at 20° 9.9, 13.0, 42.0, 238.0; acid no. 0.6, 0.36, 0.205, 4.0; sapon. no. 188.4, 261.0, 244.0, 254.0; I no. 116.2, 112.6, 85.3, 62.6; hydroxy acids —, 2.92, 10.82, 24.04%; unsapon. 0.6, 1.57, 1.76, 4.78%. The oil was blown at 90–110°. The high I no. for unblown oil is explained by the presence of mushroom seed (I no. 135–142). The blown oil could be used for aviation motors instead of castor oil. The husks contained moisture 5.15–8.2%, protein 5.2–26.28%, oil 11.8–14.1%, cellulose 22.0% and ash 5.58%.

A. A. BOEHLINGK

Report on the value of certain trees in Congo as a source of oil. J. PIÉRAERTS AND F. DE WINTER. *Mut. grasses* 20, 8194–8(1928).—*Glyphea grevilloides*, extd. by petr. ether, gives a pale greenish yellow oil, of agreeable taste and almost without odor. In its physical and chem. properties it is nearest to cottonseed oil. *Cephanolema polyandrum*. This oil also belongs to the same group as cottonseed oil. The economic value of these oils under the present conditions is doubtful. Tables show in detail the constns. of these oils compared with those of cottonseed oil.

P. THOMASSET

Hydrogenation of vegetable oils with water-gas. K. BUTKOVSKII. *Oil & Fat Industry* (Russia) 1926, No. 2, 3, 45–7.—A mixt. of equal parts of sunflower and cottonseed oil was hydrogenated. Seven expts. were made at temps. from 180° to 250°. Ninety-five g. of oil and 5 g. of Ni catalyst were used. The av. I no. was 78.3 and duration of expt. in each case 5 hrs. The water-gas before entering the app. was treated with 2 N NaOH, Fe_2O_3 powder and 10% sawdust, hydrated lime and 10% sawdust. Best results were obtained at 220–250°, the titer of the solid product was 36°, the I no. 66.92. Hydrogenation of same mixt. under similar conditions but only for 2 hrs. 15 min. by means of H_2 resulted in an av. I no. of 35.7. The most unfavorable results obtained were with a titer of 43.6° and I no. of 55.02.

A. A. BOEHLINGK

Action of carbon monoxide on the nickel catalyst in the hydrogenation of fats. E. MASHKILLEISON. *Oil & Fat Industry* (Russia) No. 2–3, 47–50.—In the presence of CO more time is required to hydrogenate oleic acid, either that originally present in the sunflower oil used or that produced from the linoleic acid that also was present. The % of oleic acid never dropped below 77.1. M. advises working towards a certain low I no. without considering the time required to obtain it. In this case the difference between H_2 -CO gas and H_2 could be noticed easily.

A. A. BOEHLINGK

Hydrogenated rape (colza) oil. I. F. KITAEV. Kharkov Tech. Inst. *J. Chem. Ind. (Moscow)* 3, 1150(1926).—A sample of com. hydrogenated rape oil used in soap manuf. had the following constns. I no. (Hubl) 48.5, Hehner no. 95.2, sapon. coeff. 188, sp. gr. at 100° 0.85; m. p. 47°; av. mol. wt. of fatty acids 312–15; titer of fatty acids 46; neutralization no. 177.5, I no. of fatty acids 46. The fatty acids of this hydrogenated oil are as follows: behenic acid 10.40, stearic acid 33.75, erucic acid 41.60 and rapic acid 11.25%. The process of hydrogenation of rape oil takes place chiefly at the expense of rapic acid and to a lesser degree at the expense of erucic acid. The particular characteristics of the soaps obtained from this hydrogenated oil are due to behenic, erucic and rapic acids. The characteristics in question are not favorable: the soaps do not take up marble, crystallize badly, become yellow in the course of time and, above all, the oil saponifies badly.

BERNARD NELSON

Production of fatty acids and fats from the hydrocarbons of petroleum. S. IVANOV. *Oil & Fat Ind.* (Russia) 1926, No. 4–5, 7–10; *Chem. Zentr.* 1927, I, 2619.—A comprehensive review of the expts. of Ubbelohde, Eisenstein, Grün and others on the oxidation of com. hydrocarbons to fatty acids, and the possibilities of the com. application of the individual processes.

C. C. DAVIS

The transformation of fats into hydrocarbons. B. MELIS. Reale Ist. Industriale Palermo. *Ann. chim. applicata* 18, 108-14 (1928).—The hydrocarbon oil distillates obtained from the distn. of animal and vegetable fats with KOH, CaO and water (cf. C. A. 19, 1340) were fractionated and examd. qualitatively. Concd. H_2SO_4 brought about an intense polymerization and the formation of resinous oxidation products, SO_2 being evolved. Dil. H_2SO_4 indicated the presence of olefins, AgNO_3 the presence of aldehydes or perhaps alcs. and phenols, Br the presence of aromatic compds., and concd. HNO_3 the presence of terpenes. The results in general indicate that the hydrocarbon oils obtained by the distn. of fats with Ca(OH)_2 contain members of all series of hydrocarbons present in natural petroleum. If the distn. were carried out under pressure to promote rehydrogenation, the compn. would approach closely that of natural petroleum. Even at atm. pressure, however, the distillates are more nearly like natural petroleum than those of Mailhe, who used ZnCl_2 . The hydrocarbon oil always condenses above a layer of water formed by extensive dehydration of the org. compds. by the alkalis. C. C. DAVIS

Bleaching of fats for soap making. E. RICHARDSON. *Am. Perfumer* 23, 277-9 (1928).—This is a discussion of well-known methods. E. SCHERTBEL

Acid soaps. M. HARTMANN AND H. KAGI. *Z. anorg. Chem.* 41, 127-30 (1928); cf. C. A. 19, 1757.—The higher fatty acid N-carboxyl derivs. of asymmetrically substituted ethylenediamine, e. g., (diethylaminoethyl)oleamide ("sapamine"), yield readily sol. neutral salts with most inorg. and org. acids possessing the properties of soaps. The bases are readily obtained by heating the fatty acid or its chloride with diethyl-ethylenediamine, and may be distd. in a high vacuum. The salts are viscous liquids in the anhyd. condition, and their aq. or acid solns. form a lather even at great diln., the limit being at 0.5 pt. per million. Addn. of alkali causes the base to be pptd. and destroys the lathering power, while the salt is pptd. in a colloidal hydrated form from concd. soln. on addn. of NaCl. Unlike alkali soaps, these salts are not pptd. by metallic salts in dil. soln., since, when pptn. would normally occur, the insol. metallic salt remains in colloidal soln.; thus, on adding AgNO_3 to the HCl of the base colloidal AgCl , which is not coagulated by HNO_3 , is formed. Colloidal solns. of Au and other metals may be readily obtained by this method. The aq. solns. of the salts have remarkable oil-emulsifying properties, the surface tension at the oil-aq. soln. interface being too small to measure by known methods. This property makes the solns. of value in the textile and dyeing industries, as in their presence, even in min. quantity, vegetable and animal fibers are very readily wetted. In certain cases where sensitivity to alkali is an objection, the base is converted into a quaternary NH_4 base, stable to alkali, by heating with methyl chloride, dimethyl sulfate or a similar substance. Also in Soap 3, No. 4, 33-5. B. C. A.

The use of naphthenic acids in boiling soap. A. BRUSILOVSKII. *Oil & Fat Ind.* (Russia) 1926, No. 2-3, 66-70. *Chem. Zentr.* 1927, I, 2616. In the refining of petroleum, considerable quantities of Na naphthenate are present in the waste liquors. This product can be utilized to advantage in the prepn. of curd soaps, filled soaps, etc., as a substitute for coconut oil. Detailed directions are given for its use. C. C. DAVIS

The glycerol content of curd soaps. JOSEF GROSSER. *Allgem. Öl-Fett-Ztg.* 24, 76-8; *Chem. Zentr.* 1927, I, 2143. The literature on the subject is scarce and inaccurate. A great no. of analyses of curd soap produced in Czechoslovakia showed a glycerol content over 2%, in some cases over 7% (detd. by the dichromate method). It is proved mathematically that 2% glycerol in the curd represents a loss of about 25% of the original quantity of glycerol, when neutral fats were the chief ingredients of the mixt. C. C. DAVIS

Polymerization of soaps from linseed and sunflower oils. G. PETROV AND S. DIMAKOV. *Oil Fat Ind.* (Russia) 1926, No. 4-5, 16-8. The process of Brit. Pat. No. 127,814 (C. A. 13, 2462) was applied to sunflower-oil soap (I) and linseed-oil soap (II). Four expts. were made with I on (a) fatty acids of soap before heating, (b) slightly alk. 50% soap, (c) 50% soap, (d) 50% soap. The products had acid no. 203.0, 203.5, 195.8, 202.2; sapon. no. 205.5, 206.8, 197.3, 205.1; I no. 136.4, 100.52, 92.2, 138.1; viscosity 4, 6, 15 and 4 sec.; color light yellow, yellow, dark, dark. Heating times were 0, 5, 5 and 5 hrs.; temps. 0° , 190° , 205° , 180° and 160° 170° ; pressures in the autoclave 0, 12, 10.5 and 0 atm. Five expts. with II on (a) fatty acids of soap before heating, (b) 50% soap, (c) 50% soap and 40% Na_2CO_3 , (d) slightly alk. 50% soap, (e) 50% soap in presence of 35% NaOH 40° Bc. gave acid no. 203.2, 203.5, 205.5, 201.9, 192.2; sapon. no. 205.7, 206.5, 208.2, 204.8, 202.0; I no. 200.88, 194.9, 141.81, 154.8, 58.96; viscosity 3.10, 3.10, 7.5, 6 and 31 sec.; color light yellow, light yellow, dark, —, —. Temps. were 0° , 180° , 200° , 180 - 190° and 200° ; heating times

0, 5, 5, 5 and 5 hrs.; pressures 0, 0, 0, 0 and 0 atm. Conclusion: Presence of Na_2CO_3 and particularly of NaOH increases the viscosity and lowers the I no. When large quantities of caustic are not present iron autoclaves are the most suitable containers
A. A. BOEHLINGK

Filtration apparatus for washing nickel catalyst (SOSENSKII) 1. Soaps as colloidal electrolytes (McBAIN) 2.

Purifying fatty materials. CARL VAN OVERSTRAETEN. Can. 281,267, June 26, 1928. The residuums or ppts. resulting from the purifying of the waste waters from the washing of wool and like fatty substances are washed with lukewarm H_2O , boiled in alkali, dried by a current of air, heated under pressure in a digester at 500° , the floating fat is decanted and boiled in H_2O to remove the remaining impurities.

Soap. J. TENGLER. Can. 280,911, June 12, 1928. Coconut oil (2 parts) is mixed with NaOH soln. of 38°Bé and let stand 5 or 6 hrs. A hard compn. results, which is melted with 80 parts of benzene (warm or in form of vapor), and the mass is cooled and then pulverized. A saponaceous mass with fat content 10% and high alkali content is hardened until pasty or semi-fluid, and to this is added the pulverized benzene-contg. saponaceous mass and mixed to coat the pulverized particles with semi-fluid mass. The resulting mass is cooled to form a hard soap. The pulverized particles are thus sealed to prevent escape of benzene.

Detergents. I. G. FAKHRENDI. A.-G. Brit. 280,110, May 31, 1926. Saponaceous compns. for use with sea water or in dyeing, fulling or other baths which are acid or contain Ca or Mg salts comprise mixts. of soaps or Turkey-red oils with an aromatic or hydroaromatic sulfonic acid or salt of such acid of high wetting power. There may be added ingredients such as sulfite cellulose liquor, borax, $\text{C}_{12}\text{H}_{25}$, glycerol, cyclohexanol, alcs. or ethylene glycol monoethyl ether. Several examples of suitable mixts. are given.

Washing compound. G. S. PETROV. Russian (Soviet) No. 1448, July 31, 1926. Polymerized drying or semi-drying oils are mixed with mineral oil, or aromatic or aliphatic aromatic sulfonic acids and neutralized or made slightly alk.

28-- SUGAR, STARCH AND GUMS

F. W. ZERBAN

The English beet-sugar industry. C. D. ADAMS. *J. Soc. Chem. Ind.* 47, 179-85T (1928)

Manufacture of sugar direct from cane in India, 1926-27. WYNNE SAYER. *Agr. I. India* 23, 58-9 (1928).--Statistical. K. D. JACOB

Experiments in planting sugar cane without burning the trash. WM. E. CROSS. *Rev. ind. agr. Tucuman* 18, 116-23 (1928).--It is practically feasible to leave the trash without burning, in every second middle, cultivating the other one, and every yr. to alternate the middles so treated. The soil benefits from the N and org. substance and the sugar yields are increased. The procedure is particularly recommended for plantations invaded by weeds. MARY JACOBSEN

Influence of cane variety on field yields. L. BAISSAC. *Rev. agr. Maurice* 5, 74-9 (1928).--The pedigree of P.O. 2878 is shown in form of a diagram. Through the rapid expansion of this variety in Java sugar yields per acre are quickly increasing over those obtained with the older varieties. In Hawaii also total sugar production is rising much faster than total acreage, through the planting of superior varieties and other cultural measures. In Mauritius little progress has been made along this line. The new Java varieties may or may not prove successful there. Care should be taken not to import diseases with them, and they should be subjected to warm-water treatment before being planted. F. W. ZERBAN

The "Uba Marot" or "Gros Cailloux" variety of sugar cane. N. CRAIG. *Rev. agr. Maurice* 5, 68-9 (1928).--The principal cane variety in Mauritius, the White Tauna, is showing signs of deterioration. The Uba Marot is a bud variation of the Uba, gives high tonnage and is highly resistant to disease, but it is low in sucrose and purity, and matures slowly. As it is a promising variety for certain lands, it is being used in fertilizer tests. F. W. ZERBAN

High-pressure evaporation in cane-sugar factories. P. HONIG AND J. F. BOGSTRÅ. *Arch. Suikerind. Mededeel. Proefsta. Java Suikerind.* III, 377-441 (1928).--The evapn. of cane juices at high temp. was studied in a carbonatation and in a defecation factory. A survey is given of the literature on the technical problems involved. Expts. were made

in 2 mills with a specially constructed small app. which was running parallel to the factory evaporator in order to have the factory sirup and the exptl. sirup comparable. The exptl. app. was a triple-effect of semi-Kestners. Each body consisted of 1 tube of 3 m. length, and the juice was preheated in a small heater. The temp. of the juice in the 3 bodies was, resp., 114.5°, 108° and 102° and the juice was 8.5 min. in the app. But by feeding less thin juice, several expts. were made to study the influence of the time during which the juice was exposed to high temp. Thin juice and sirup of all expts. were analyzed for sucrose, reducing sugar, p_H , color and turbidity. The results are tabulated and discussed. If the time during which the juice was in the exptl. app. did not exceed 9 min., and if the juice was concd. to 50 Brix, the destruction of sucrose and of reducing sugars was in case of carbonatation juice perhaps a little higher than in common factory evapn. when the juice was slightly acid, and a little lower when the juice was slightly alk. In defecation juices no destruction of sugars was found. An exact control of p_H is necessary. The change in color between thin juice and sirup was in high-pressure evapn. the same as in factory evapn. The sirup from carbonatation juice was slightly more turbid in high-pressure evapn. Incrustation formed rapidly in the high-pressure app. with defecation juice and it will perhaps be necessary to use superheat defecation (Deming).

P. R. PEKELHARING

Determination of the hydrogen-ion concentration of sugar juice without hydrogen or quinhydrone on bare platinum. MAX TRÉNEL. Preuss. Geolog. Landesanstalt, Berlin. *Fortschritte Landw.* 3, 455 6(1928).—Expts with samples of juice showed that definite potentials sufficiently reproducible for the purpose of controlling satn. of juice can be obtained with bare Pt and without quinhydrone. The electrometric detns. were carried out in "half elements" connected by KCl bridges with diaphragms made from pressed-filter-paper stoppers. The concn. element corresponded to the scheme: $+Pt|0.01\ HCl|satd.\ KCl|sugar\ soln.|Pt-$. The p. d. was measured by T's "acidimeter" and a Siemens and Halske self-registering galvanometer served as a zero instrument. While the results are not abs., they enable the detn. of the end points of the 1st and 2nd satns. with satisfactory accuracy.

P. R. DAWSON

Can the Petree process be used to advantage in Tucumán? W. M. GRAYSON. *Rev. ind. agr. Tucumán* 18, 67-76(1927).—The av. increase in purity from mixed to defecated juice for the past 4 yrs. by using the Petree Process was 0.4 higher than that obtained by ordinary defecation and during the last yr. it was 1.1 higher. The sugar quality is better and the losses are lower. The saving in filter material, fuel and manual work amts. to 0.47 pesos per ton cane.

MARY JACOBSEN

Influence of starch on the manufacture of sugar, and its removal from the juice. E. HADDON. *Rev. agr. Maurice* 5, 80-2(1928); cf. *C. A.* 21, 3761.—The trouble experienced with juice from the Uba cane is due not to cane wax, as claimed by some, but entirely to starch and its hydrolysis products. The starch cannot be removed by carbonatation. Filtration with kieselguhr removes it, but very large filtering surfaces are required. Better results are obtained with a diastatic enzyme, sold under the trade name of "Ubase." Its optimum activity is at p_H 7.0 to 7.5, but the useful range is 6.5 to 8.0. It liquefies 2400 times its own wt. of starch in 30 min. The optimum temp. is 60-80°. The amt. to be used is detd. by the I test. The abnormal viscosity of the juice is entirely destroyed, and filtration becomes easy. The enzyme process may be combined with kieselguhr filtration.

F. W. ZERRAN

Accurate temperature measurement in sugar boiling. J. VALENTINE BACKES. *Food Manuf.* 1, 119-22, 136(1927).—The ideal thermometer which combines ease of reading with most accurate results is the long-stem dial type.

J. A. KENNEDY

Starch products in the paper and textile industries. ROBERT P. WALTON. *Am. Dyestuff Rept.* 17, 371-4(1928).

L. W. RIGGS

Barium compound of technical interest from starch. E. STERN. *Z. angew. Chem.* 41, 88-91(1928).—The pptn. of starch by means of its BaO compd. avoids the necessity of evapn. large quantities of water in prepg. sol. starches and starch pastes. The solns. obtained by treating starch with dil. $NaOH$ solns. yield the whole of their starch content as a ppt. on addn. of the equiv. quantity of $BaCl_2$; the ppt. is readily collected on a filter and dried, and on treatment with a sol. sulfate (e. g., Na or Al sulfate) in presence of water regenerates the sol. starch compd. with pptn. of $BaSO_4$. The probable compns. of the various starch preps. and compds. are discussed.

Purifying molasses and sugar juices electrolytically. JOSEPH DE BRIEV. Brit. 280,321, Sept. 13, 1926. An app. is described in which the material is treated first to eliminate acids and then to eliminate salts. Air, steam or other gas may be blown in to prevent emulsifying.

29—LEATHER AND GLUE

ALLEN ROGERS

Robert Lepetit. AUGUST GANSSER. *J. Intern. Soc. Leather Trades Chem.* 12, 187-92(1928).—An obituary.

Henry Richardson Procter. *J. Intern. Soc. Leather Trades Chem.* 12, 93-130 (1928).—Procter Memorial Issue. A collection of biographical and appreciative articles by associates of the late "Father of Leather Chemistry," with a complete bibliography of his writings.

Action of acids on vegetable-tanned leathers. A. DEFORGE. *Haute aux cuirs* 1928, 164-71.—A review of recent work.

Methods of analysis of leather dyes. A. JONES. *Ing. chim.* 12, 47-59(1928).—J. gives details for the detn. by usual means of the d., ash, sepn. of solvents by fractional distn. and presence of MeOH and EtOH; also for the identification of the residue after distn. The dyes are sepd. into 4 groups (cf. *Chem.-Ztg.* 22, 437(1898)) according to their reaction toward a soln. of SnCl₂ and HCl. The individual dyes are sepd. according to tables included in the article.

Label glues. H. GLASER. *Farbe u. Lack* 1927, 173.—Formulas are given for the manuf. of label glues.

The evaluation of glue. J. WETZLER. *Kunststoffe* 24, 546; *Chem. Zentr.* 1927, I, 2154.—According to Rudeloff (cf. *C. A.* 14, 2429) the strength (100R) is related to the viscosity η by the equation: $R = a\eta + b$, where a is 8 for all solns., $b = 75 - 0.26A$ and A is the % water added. Errors are conditioned by variations of the electrolytic const. and by the H-ion concn., which must therefore be maintained const. By dialysis, glue solns. can be made practically free of electrolytes, but thereby become turbid and opalescent and diminish in strength. Examples are given of the power of absorbing water as a measure of the quality of glue.

C. C. DAVIS

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Homogeneous rubber and the idea of an elastic molecule. HEINRICH FEUCHTER. *Kautschuk* 1928, 103-6.—An analogy is drawn between the structure and properties of racked rubber and of liquid crystals, which are known to be bundles of long mols. in parallel orientation. F. has assigned a melting temp. to racked rubber in the same sense that there are definite melting temps. for liquid crystals. There is a limit or optimum length of mol. for the formation of liquid crystals. But there may be endless mols. or chains in rubber and in other substances subject to polymerization. These may account for the similarities with liquid crystals, and also the differences such as plasticity and the absence of x-ray interferences for liquid crystals as compared with the definite fiber patterns for racked rubber.

G. L. CLARK

Plasticity and elasticity of rubber. A. VAN ROSSEM AND H. VAN DER MEIJDEN. *Congrès international pour l'essai des matériaux* (Amsterdam) Sept. 12-17, 1927 (preprint), 8 pp.—The compression method was chosen for measuring the plasticity of uncured and cured rubber, but the Williams app. (*C. A.* 18, 1763), was not used, because it does not measure plasticity. Instead of maintaining a const. total pressure over an increasing area, a const. pressure per unit area was used, which was readily accomplished by compressing the rubber on a raised circular plate of 1 sq. cm. area. If deformation under stress or compression is not permanent, a substance is either viscous or elastic, and therefore it is of great importance in detg. plasticity to measure not only the decrease in thickness but also the recovery and its rate. Three properties may be distinguished during deformation under shearing stress: (1) *plasticity*, i. e.,

instantaneous deformation and instantaneous recovery; (2) *plastic flow*, i. e., no recovery after removal of stress, and (3) *pseudo-plastic flow*, i. e., slow recovery (elastic after-effect) after removal of stress. In the expts. described, all these properties were investigated. Masticated crepe was maintained under pressure at 16°, 30°, 45°, 50°, 60° and 70° and the rate of deformation and the rate and extent of recovery after release were detd. The higher the temp., the softer was the rubber, judged by the extent of compression. At 16° a small elastic recovery was followed by a large elastic after-effect, with ultimate complete recovery. At 30° complete recovery took place, but more slowly. At 45° there was only partial recovery, and therefore at this temp. the masticated rubber was partly plastic. At 60° the plasticity became greater, and at 70° the rubber was almost completely plastic, the elastic after-effect being very small. The results show that compression-time curves are misleading, since masticated rubber at 16° is not plastic but shows pseudo-plastic flow with an elastic after-effect, whereas at 70° it is truly plastic. Vulcanized rubber S (92.5-7.5) mixts. in different states of cure were then tested in a similar way, the rate of compression and recovery being measured at 18°, 100°, 130° and 147°. At 18° and after short cures, there was elastic recovery and elastic after-effect but no evidence of plasticity. With increase of cure, the elastic recovery increased rapidly so that after long cures it became the only effect. At 100° and short cures, there was elastic recovery, as well as some elastic after-effect and plasticity. The last 2 properties became relatively smaller with increase in time of cure until at long cures only elastic recovery was manifest. At 130° the phenomena were much the same as at 100°, with relatively more elastic after-effect. At 147° and short cures, the elastic recovery and after-effect were relatively less and the plasticity was greater. With increase in time of cure the elastic recovery increased, the elastic after-effect decreased and the plasticity decreased slowly, the latter so slowly that even after the longest cure it still played an important part in the properties. Cured rubber is therefore plastic to a considerable degree. When under-cured, the plasticity is evident even at 100°, but when cured for longer times it shows considerable plasticity only at 147°. The results are given in detail in tabular and graphical form.

C. C. DAVIS

An explanation of some of the difficulties in abrasion testing of rubber. HARLAN A. DEPEW. *Trans. Am. Soc. for Testing Materials*, Preprint No. 98, 9 pp (June, 1928).—Resistance to abrasion is not a fundamental property of vulcanized rubber, but is the resultant effect of resistance to cutting and resistance to tearing. The relative importance of these 2 component effects varies under different conditions of wear, and therefore an abrasion test can duplicate any particular condition of wear only if the cutting and the tearing factors are balanced in the same proportion as in the actual conditions of wear. This means a discontinuance of present abrasion tests and the development of a test for detg. resistance to cutting and to tearing where the proportional effect of these 2 actions can be controlled. This conclusion is based on expts. with different types of mixts. in different states of cure, abrasion being obtained on the original N. J. Zinc Co. app. and on a modified form in which wear was made intermittent by continual lifting and rebound of the rubber from the track. The first type with different types of mixts. in different states of cure, abrasion being obtained on the original N. J. Zinc Co. app. and on a modified form in which wear was made intermittent by continual lifting and rebound of the rubber from the track. The first type is largely a cutting test, whereas in the second type tearing is accentuated and cutting is minimized, the latter type more nearly simulating the effect on a tire. On the first type, the resistance to abrasion increases with the time of vulcanization, whereas on the second type the resistance is a max. at about the same cure at which the tensile strength is a max. Most abrasion machines accentuate the tearing effect, so that only the second type of app. is comparable with many conditions encountered in actual wear.

C. C. DAVIS

Further experiments on the influence of fatty acids on vulcanization. G. STAFFORD WHITBY AND BURKE A. EVANS. *J. Soc. Chem. Ind.* 47, 122-6T(1928); cf. W. and Greenberg, *C. A.* 21, 341.—The conclusion of Martin and Davey that with a sufficiently high proportion of ZnO, accelerators are activated equally well either in the presence or absence of resin acids (cf. *C. A.* 17, 2203; 19, 3037) is true only of certain accelerators. Expts. show that with other accelerators, fatty acids have an activating effect even with a high proportion of ZnO. The expts. were carried out by curing resin-free rubber (acid no. of 20) with mercaptobenzothiazole (I), anhydroacetaldehydeaniline (II), "808" (III) and hexamethylenetetramine (IV), with different proportions of ZnO and with and without the addn. of different proportions of stearic, oleic or linoleic acid. With I, the addn. of an org. acid was necessary to effect vulcanization, regardless of the proportion of ZnO. Stearic acid had the greatest activating effect, oleic acid a weaker effect and linoleic acid the weakest effect. The rate of vulcanization increases with increase in the acid content, and the best results were obtained with a proportion

of acid higher than that normally present in crepe or sheet, so that in general it should be advantageous to add stearic acid or its like to mixts. accelerated by I. The addn. of stearic acid to mixts. accelerated by II, III or IV also increased the rate of vulcanization, regardless of the proportion of ZnO, though not nearly so much as with I. The readiness with which *stearic acid* and *ZnO* react is shown by expts. in which stearic acid (1.5 g.) and ZnO (2.5 g.) in toluene (100 cc.) were (1) shaken 20 min. at room temp. and (2) boiled 40 min., 15% and 96%, resp. of the stearic acid reacting. Also in *India Rubber J.* 75, 872-5(1928).

C. C. DAVIS

Important shortening in the time of cure of dipped goods in sulfur chloride vapor. RUDOLF DITMAR and GUSTAV BALOG. *India Rubber J.* 75, 911(1928).—An English version of *C. A.* 22, 1060.

C. C. DAVIS

The vulcanized racking of broken rubber. HEINRICH FEUCHTER. *Kautschuk* 1928, 48-51.—While racking is easily demonstrated with raw rubber it is very difficult with vulcanized. The action of heat upon the vulcanized racking of broken rubber (calendering) is the opposite of unvulcanized racking. Specimens 50 × 50 mm. of calender-racked vulcanized rubber were used. There was no sensible release of tension in the sense of an anisotropic elastic change in form (longitudinal or direction of calendering as compared with transverse) up to 100°. Thus vulcanized racking is thermo-elastically form-conservative. The swelling is anisotropic: in 30 min. at 20° in benzene the dimensions increased 30%, longitudinal, and 104% transverse. Upon deswelling, the original dimensions are restored. The racking tension of vulcanized racking is reversibly removed by swelling, the *swelling defect*, is calcd. and plotted as a function of temp., decreasing with increase in temp.

G. L. CLARK

Racking and restoration of unbroken rubber. HEINRICH FEUCHTER. *Kautschuk* 1928, 8-12, 28-30; cf. *C. A.* 21, 1898, 1902, 1903, 3487.—The phenomenon of racking is of the greatest importance both theoretically and practically, since the most essential structural elements of animal and plant tissues are similarly fibered. Methods of racking are reviewed. A small strip of rubber (best *Hevea* sheet) is grasped at the ends with both hands, and as quickly as possible stretched almost to the breaking point. After this max. adiabatic extension, the warm strip is cooled for a min. while held under tension. Upon release there is only a slight contraction, and a tough fiber is obtained. For racking at higher temps. the strip is immersed in warm water for 1 min., removed and instantly stretched. The following are representative data:

Racking in %	500	600	750	1000	2000	4000	10,000
Original cross section	2 × 2	2 × 2	2 × 2	2 × 2	2 × 2	2 × 4	2½ × 5
Original length	12	13	13	10	5	2.5	1
Racked length	72	91	110.5	110	105	103	101
No. of rackings	1	1	1	1	4	12	50
Preheating in H ₂ O		30°	50°	80°	80°	90°	90°

The breaking strength shows a max. of 130 kg. at 500% racking, and a min. elasticity at the same point on curves which do not include all of the tabulated data. Tables present also the time function of thermal release from racking, e. g., the % release at 95° for racking of 2000% is 1840% after 1 sec., 1900 after 1 min. and 1920 after 10 min. Next the heat function of thermal racking release is illustrated in S-shaped melt-lines (temp. vs. % residual set after racking release), e. g., a piece racked 10,000% with a length of 10.1 cm. had the following lengths and % set: 20°, 10.1, 10,000%; 30°, 9.8900%; 40°, 4.1, 4000%; 50°, 1.4, 1300%; 70°, 1.15, 1050%. With 500% racking at 20°, the breaking strength is 790 kg. per sq. cm. and the elongation at breaking is 60%, while at 30° the vastly different values are 125 and 540, resp.; at 95° 40 and 630. The crit. point for 4000% racking is at 40°, changing from 910 and 20 at 20° to 300 and 260. Data on the racking and relaxation of rubber D (diffusion-rubber) are presented. The melt line is much steeper than for crepe rubber, since by a change from 25° to 30° as the temp. of racking release, the % of residual set falls from 1000% to 55%. Conclusion: The racking of rubber is a function of the presence of the more sol. rubber D, which is the carrier of the elastic properties of raw rubber. The elasticity cannot be ascribed to mols. or aggregates of pure compds. or to the simple unit cell detd. by x-rays, but to a particle which embodies the necessary properties. In the colloidal micelle, a higher phys., chem. and thermodynamic entity, in which all parts are harmoniously bound, is to be found the source of elasticity.

The thermal and calorific values of rubber and rubber-like substances. M. LE BLANC AND M. KRÖGER. Univ. Leipzig. *Z. Elektrochem.* **34**, 241-4(1928); cf. C. A. 20, 2431.—As a means toward the ultimate explanation of mol. phenomena such as polymerization, the absorption of heat as a function of temp. was measured in rubber under various conditions of rest and stress. Measurements of the sp. heat of rubber, stretched and unstretched, heated and not heated, vulcanized and unvulcanized, showed that in general the sp. heat increases with the temp. (-80° to 40°). There were certain irregularities noted, but these were not sufficient to render doubtful the conclusion cited. Max. points, *c. g.*, in the sp. heat-temp. curves, occurred close to the temp. of hardening and loss of elastic properties (in the range of -40°). C. C. DAVIS

The rubber fiber and the cellulose fiber. HEINRICH FEUCHTER. *Kautschuk* **1928**, 73-5.—To account for the properties of rubber for which simple theories of valence and at.-mol. ideas are inadequate, F. has proposed the principle of shell-aggregates and shell-crystn. with irrational indices—a crystal system with distorted space lattice arrangement. The elastic property of racking vulcanized rubber is compared with the optical properties of nitrocellulose (Ambronn). An analogy is estd., since in both cases a chem. action (vulcanizing with S, and nitrating, resp.) upon a fiber leaves intact an individual group or crystallite, whose disperse cryst. property is estd. as the elementary particle of an elastic colloidal aggregate. G. L. CLARK

The coloring of cold-cured rubber. W. E. SANDERSON. *J. Soc. Dyers Colourists* **44**, 137-42(1928).—The use of org. coloring substances in rubber goods cured with S_2Cl_2 is surveyed in a concise yet comprehensive manner, with the inclusion of formulas and details of processes used in the best modern practice. I. W. RIGGS

Degree of fineness and reinforcing power of rubber fillers. WERNER ESCH. *Gummi-Ztg* **42**, 1921(1928).—The relation between the apparent *d* and the true *d*, as a criterion of fineness, a concept already developed by E. long ago, is discussed. C. C. DAVIS

Studies on the aging of vulcanized rubber. V. Action of sunlight and heat on the mechanical properties of vulcanized rubber. TAKEJI YAMAZAKI. *J. Soc. Chem. Ind. (Japan)* **31**, 233-42(1928); Suppl. binding, 65-6. (In English.) Five series were prepd. from the same mixt. of 92.5% rubber and 7.5% S by vulcanization at the same temp. for 5 different periods of time (60-180 min.). They were then exposed to bright sunlight in summer at room temp., and in winter at room temp., in early spring at $60-64^{\circ}$ in an air oven and in darkness in a Geer oven. The time of exposure varied from 8 to 64 hrs. After treatment, they were tested for stress at 500% elongation, tensile strength and ultimate elongation, and in some cases the free S and acetone ext. were detd. Some test pieces were made especially thick, and slices were cut after exposure from outer and inner layers and were tested. The time of vulcanization had a remarkable effect on the aging properties. The deterioration due to sunlight was great even in winter and was very marked in spring at 60° . The acetone-sol components increased during aging and the free S decreased. The outer layers of the test pieces exposed to sunlight were brittle and non elastic, but the inner layers were in fairly good condition. The test pieces subjected to the Geer test showed only small differences between the outer and inner layers. For detg. the degree of deterioration, mech. tests are quicker and more reliable than chem. tests, and in aging tests the influences of light must be taken into account. VI. Action of sunlight filtered through colored glass on the mechanical properties of vulcanized rubber. *Ibid* 243-57; Suppl. binding, 66-7. (In English).—The test pieces were prepd. in the same way as in the preceding paper. The sunlight was filtered through one of 2 colored glass filters, (1) transparent down to 3300 Å. U. and (2) down to 4360 Å. U. The samples were exposed to the filtered light at 40° or 65° for various lengths of time and from 8 to 250 hrs. After treatment, they were tested for the stress at 500% elongation, tensile strength and ultimate elongation. The test pieces exposed to the light through the filter (1) showed serious deterioration even at 40° , but those exposed to the light through the filter (2) showed slow deterioration at 40° , and somewhat marked at 65° . The stress at 500% elongation was somewhat higher in the test pieces exposed to the light through filter (1) than those exposed to the light through the filter (2), showing greater stiffening in the former case. It is concluded that if light is used in the aging test, the selection of the light source is an important question. SHUMPEI OKA

The lamellar packing of rubber. M. KRÖGER. Univ. Leipzig. *Kolloid-Z.* **45**, 47-52(1928).—The paper is the beginning of a study of the capacity for potential

energy as a function of the magnitude of deformation, state of cure and temp., a microscopic study of surfaces, the influence of compounding ingredients on longitudinal and lamellar deformation, the optical effects accompanying lamellar deformation in distinction to longitudinal deformation, heat effects, changes of d. during deformation and elec. cond. during lamellar deformation. The absorption of energy in the transformation of rubber to a state of lamellar packing takes place in a different way from the absorption of energy during transformation to rod packing. With increasing deformation, the internal tension passes through a max. and then a min. The capacity for potential energy is at its max. value smaller than in longitudinal stretching. Lamellar effects caused by the addn. of ingredients, which are common to all ingredients of similar particle size, are described. A new app. for observing microscopically the surface configurations during lamellar packing is described. C. C. DAVIS

The double refraction of rubber in the undeformed and in the deformed state. M. KRÖGER. Univ. Leipzig. *Kolloid-Z.* 45, 52-6(1928) —In its normal undeformed state, raw rubber shows double refraction, but when stretched it shows biaxial positive double refraction. This change is unmistakable as soon as it can be observed in the direction of extension. Vulcanized rubber can be considered to show only uniaxial and biaxial positive double refraction. Lamellar deformation (cf. preceding abstr.) leads in all cases to weak biaxial negative double refraction. C. C. DAVIS

Report on "Revertex." IMPERIAL INSTITUTE *Trop. Agr.* (Ceylon) 70, 5-11 (1928).—Revertex is difficult to handle quantitatively. ZnO made into a paste with H₂O can be mixed into revertex merely by stirring. Three revertex mixings: (1) 10% S, (2) 5% S and 5% ZnO and (3) 3% S and 47.5% ZnO, were tested. When the revertex S mixing was plasticized for the standard time of the Imperial Institute, it was more plastic than plantation rubber, judged by the rate of extrusion (14-18). The mixing high in ZnO took 24 min. to plasticize, while plantation rubber required 30 min. for the same degree of plasticity, 665 watt-hrs. being required to plasticize the revertex and 1025 watt hrs. to masticate and mix the plantation rubber. No satisfactory est. of the mixing and drying costs of revertex can be given. Revertex mixings easily scorched after addn. of S. After heating at 100° for 20 and 90 min., n. detd. with the plate plastometer was 109 and 168. The revertex-S mixing vulcanized 10 times as quickly as sheet or crepe mixings. In the presence of ZnO, revertex vulcanized nearly as quickly as the corresponding sheet or crepe mixings contg. 1% diphenylguanidine. Continued vulcanizing for 45 min. did not alter the properties of the revertex ZnO mixing appreciably. The tensile strength, elongation under a load of 1.04 kg. per sq. mm. and slope for the 3 mixings were 2300, 2440 and 2690 lb. per sq. in., 805, 694 and 573%, and 39, 33 and 41, resp. When a revertex-S mixing was vulcanized 8 mm. at 148° and then artificially aged in an oven at 70°, the tensile strength increased from 1590 lb. per sq. in. at the start to 2260 after 96 hrs. and then decreased to 1460 after 300 hrs. and to 850 after 600 hrs. The elongation under the load mentioned above remained approx. const. to the end. Crepe and smoked sheet in the same tests decreased in strength from the beginning and much more rapidly than the revertex, and also decreased in elongation after only 144 hrs. Revertex mixings were not superior in tensile strength to the corresponding dry rubber mixings contg. a suitable org. accelerator. A. L. MEHRING

The reclaiming of rubber. A. M. MUNRO. *Chem. Eng. Mining Rev.* 20, 281 (1928).—A review. E. H.

Exploitation of the euphorbias of South Africa; resins and rubber (SPOON) 26.
Adhesive composition (Can. pat. 281,646) 18.

Treating rubber stock. HENRY R. MINOR (to General Carbonic Co.). U. S. 1,675,124, June 26. Solidified CO₂ is used to control the temp. of rubber during processing.

Apparatus for drying rubber, etc., in circulating air. TOMLINSONS (Rochdale), LTD. AND E. W. SMITH. Brit. 280,016, Oct. 14, 1926.

Apparatus for calendaring rubberized sheet material. ARTHUR A. FRANK (to The Fisk Rubber Co.). U. S. 1,674,772, June 26.

Finishing rubber articles. SKAPHIS D. SHINKLE (to The Dominion Rubber Co., Ltd.). Can. 281,123, June 19, 1928. Vulcanizable articles are finished by coating with a varnish, comprising boiled linseed oil and S₂Cl₂, and then to a gaseous current contg. NH₃.

Rubber shoe soles. L. C. BATEMAN. Brit. 279,531, June 26, 1926. Crepe or sheet rubber is used together with sheet material obtained by impregnating woven, felted or loose fibers with latex, drying and consolidating under heat and pressure.

Rubber vulcanization accelerators. S. M. CADWELL (to Naugatuck Chemical Co.). Brit. 279,815, Nov. 1, 1926. Vulcanization is accelerated by use of halogen derivs. of aldehyde-amine condensation products such as those obtained from aliphatic aldehydes contg. 2-7 C atoms by condensation with a primary amine. Numerous examples are given.

CHEMICAL ABSTRACTS

Vol. 22.

SEPTEMBER 10, 1928

No. 17

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Welded construction produces safer and cheaper pressure equipment. R. S. McBRIDE. *Chem. Met. Eng.* 35, 396-400(1928).—The principles of design, welding and testing of high-pressure app. are discussed.

Chemical engineering memoranda. III. Drying and calcining plant. CHARLES H. BUTCHER. *Ind. Chemist* 4, 91-2(1928), cf. C. A. 22, 1875; **IV. Condensing and cooling units.** *Ibid.* 135-7. Ordinary calcus. are made for surface condenser or heater design, except that a table is given (source not stated) of heat transfer coeffs. for H_2O velocities of 0.008 to 4.0 ft. per sec., and vapor velocities of 3 to 15 ft. per sec. **V. Condensing and cooling units.** *Ibid.* 199-200.—*Cooling ponds* (without sprays) will dissipate generally 3 to 4 B. t. u. (exceptional cases up to 20) per sq. ft. per °F. per hr. *Spray ponds* should cool 15-20 gal. per sq. ft. superficial pond area per hr., from 110-120° F. to 70° F. *Cooling towers* cool 1-2 gal. per min. per sq. ft. ground area for atm. towers, 6 gal. for natural or forced draft towers. Forced draft towers may be 30 ft. high, natural draft up to 60-80 ft.

W. L. BADGER

An automatic mercury cleaner. F. J. DEBT. *Chemistry and Industry* 47, 618 (1928).—In the device described and illustrated, the filtered Hg is lifted up a tube 130 cm. long, 3 mm. internal diam., is deposited in a tube 30 cm. long, 2.5 cm. outer diam., is broken up into a fine spray by passing through cotton fabric, falls through a 50 cm. column of 5% HNO_3 and returns by a tube 50 cm. long, 5 mm. internal diam. to the original vessel.

RUBY K. WORNER

The unimeter, a new measuring device for chemical control. L. BLOCH and H. G. FRÖHLING. *Chem. Ztg.* 52, 488-90(1928).—The app. is a polarizing photometer for the detn. of the color and light-transmitting and reflecting powers of solids and liquids, the candle power of lights, etc. It resembles a compd. microscope. Directions for use are given.

J. H. MOORE

Calculation shows minimum heating surface for evaporators. Bo HÖGLUND. *Chem. Met. Eng.* 35, 157(1928). If F is the heating surface per effect in sq. m., P is metric ton heats per 24 hrs., r is heat of vaporization in cal. per kg., d_1 and d_2 , ... are the water evapd. in each effect in kg., k_1 and k_2 , ... are the heat transfer coeff. in each effect, and T is the total available temp. drop in degrees, then for min. heating surface, $2F = (10 Pr/24.60) (\sum \sqrt{d/k})^2 / T$.

W. L. BADGER

The first multiple-effect evaporator. W. L. BADGER. *Ind. Eng. Chem.* 20, 55 (1928).—A reference to an article in 1836 apparently mentioning a multiple-effect salt evaporator at "Kenhawa Salt Springs, Va."

W. L. BADGER

Revised psychrometric chart assists high-temperature design. IRVIN LAVINE and R. L. SUTHERLAND. Univ. of North Dakota. *Chem. Met. Eng.* 35, 224-8(1928).—The Grosvenor humidity chart is extended to 680° F. Methods of calcn. are given and typical problems are solved.

W. L. BADGER

A McLeod gage of wide range. A. A. BLISS. *Science* 68, 38-9(1928).—A reservoir of 0.01 the vol. of the main reservoir is sealed in parallel to the main one and increases the range down to pressures that can be read on an ordinary Hg manometer.

J. H. MOORE

Periodically operating emulsifying apparatus. A. SIVOLOBOV. *J. Chem. Ind.* (Moscow) 4, 152-3(1927).—The app. employed to emulsify oil and water, i. e., for the purpose of extg. phenols from oils, consists in a rapidly revolving conically shaped piece, or else disks in a centrifugal mill. To avoid the use of a motor S. constructed a different app. in which water pressure was utilized, a circumstance which reduced the costs of the operation practically to nothing. A detailed description of the app. and a drawing are given. Expts. have shown that the app. works satisfactorily. Its defects are: periodicity of operation and abundance of faucets which are subject to deterioration.

BERNARD NELSON

A new design of apparatus for the moving boundary method of determining transference numbers. EDGAR R. SMITH. Bur. of Standards. *J. Am. Chem. Soc.* **50**, 1904-6 (1928).—A new app. for the detn. of the transference no. by the moving boundary method eliminates the need of a calibrated measuring tube and makes possible repeated detns. on the same soln. One half the cell is closed during the detn. and after the current has passed Hg is withdrawn from the closed side sufficient just to restore the motion across the boundary. The Hg is weighed to det. the vol. of soln. passing the boundary. D. H. POWERS.

Apparatus for the determination of the boiling-point elevation. FRANZ RUSCH. Techn. Hochschule, Munich. *Ann. Physik* **85**, 647-8 (1928). A test tube 4 × 24 cm. is fitted with a stopper which carries a Beckmann thermometer and a reflux condenser. In the bottom of the test tube is a simply made geyser pump, which throws against the thermometer the liquid and vapor mixt. in 2 streams. A. L. HENSE.

A still for the preparation of pure water. HAROLD S. KING. Dalhousie Univ. Halifax, Nova Scotia. *Proc. Trans. Nova Scotia Inst. Sci.* **16**, 176-7 (1928). K. describes an improved way to connect the flask and the tin condenser. A. L. HENSE.

The balance. JOHN J. SWILDENS. *Patron. Weekblad* **65**, 562 (1928). An elementary discussion of the fundamental principles of weighing. A. W. DOX.

Note on the McBain-Bakr balance for the sorption of vapors by fibrous and film materials. P. T. NEWSOME. *Chemistry and Industry* **47**, 594. *Ind. Eng. Chem.* **20**, 827 (1928).—An illustrated description of a modification of the quartz fiber spring balance previously described (*et. C. I.* **20**, 1151). The sorption of vapors by fibrous and film materials may be measured by suspending the sample from the spring, evacuating and introducing by stopcock controls a small quantity of liquid. The pressure and elongation of the spring are measured with a cathetometer. The complete app. includes a device for admitting the vapors from a liquid which attacks stopcock grease. This device also makes possible a study of the successive absorption of 2 different liquids. RUDY K. WERNER.

Sensitiveness and time of oscillation of simple and compound balances. MAX RAUDNITZ. *Z. Ver. deut. Ing.* **72**, 43-7 (1928). A mathematical paper on the influence of the form and arrangement of the beams, the arrangements of the knife edges, and the load, with 6 cuts and 8 tables. J. H. MOORE.

An apparatus for delivering gas at a constant pressure. THOMAS GRAY. *J. Soc. Chem. Ind.* **47**, 187-ST (1928). A simple modification of the aspirator type of app. J. H. PERRY.

A proposed automatic spectrum analyzer. ARTHUR S. BRODER. *Instrumentry* **1**, 281-3 (1928). The app. is proposed primarily for the identification of gases. A characteristic bright line from any type of spectroscopic is allowed to fall on a photoelectric cell which operates a recorder or signal. J. H. MOORE.

Colorimeter for determinations. I. LORBER to the Firm of C. Zeiss. *Brit.* **280,552**, Nov. 10, 1928.

Filter. ERNEST J. SWEETLAND. U. S. 1,677,503, July 17.

Filter for gasoline or other liquids. AUGIE L. HANSEN to Herbert S. Strauss. U. S. 1,676,024, July 3.

Multi-ply fabric filter for air or other gases. ANDERS JORDAHL. U. S. 1,676,191, July 3. Structural features.

Pressure and vacuum filter for oil, etc. GASTON J. LIPSCOMB. U. S. 1,676,268, July 10.

Funnel for permanent attachment with a receptacle to be filled. R. A. L. VOLLET. *Brit.* **280,501**, Nov. 12, 1926. Structural features.

Funnel and vent tube construction. GLEN G. HILFORD. U. S. 1,676,986, July 10.

Photometric reflectometer. FRANK A. BENFORD to General Electric Co. U. S. 1,677,014, July 10.

Still for water. ERNEST V. OLIVER. U. S. 1,677,795, July 17.

Electron-emitting cathodes. GUSTAV LIEBERT to Sueddeutschen Telefon Apparate, Kabel u. Drahtwerke A. G. U. S. 1,676,701, July 10. Alk. earth oxides or other suitable electron emitting substances are first mixed with a C compd. of high mol. wt. such as resin or paraffin (both materials being in finely pulverized form), the materials are heated and fused together and then used as a coating on cathodes which may be formed of Pt or Pt-Ir.

Röntgen-ray apparatus. P. E. HARTH. *Brit.* **280,636**, Aug. 17, 1926. Shields opaque to Röntgen-rays comprise 75-95% of finely divided BaSO₄ together with a binder such as pitch, bakelite, rubber or polymerized China wood oil. Mention is

also made of shields made from rubber and finely divided metals such as Bi and Pb. Structural features are described.

Furnace for producing and diluting products of combustion for use in drying cores, etc., or for other purposes. GUSTAVE BLUEMEL (to Drying Systems, Inc.). U. S. 1,676,070, July 3.

Heat-exchange apparatus suitable for forming froths, etc. CECIL R. HOUSEMAN (to Air Reduction Co.). U. S. 1,677,777, July 17.

Press for the cold extruding of tubes from metal disks. EWALD WALTHER. U. S. 1,675,676, July 3.

Conduit and associated apparatus for measuring the quantity of powdered coal or other materials carried in suspension. ARTHUR R. SMITH (to Bailey Meter Co.). U. S. 1,677,691, July 17.

Apparatus for testing pipe fittings, etc., for blowholes and cracks. FERDINAND A. HAMILTON (to Southern Calif. Gas Co.). U. S. 1,675,802, July 3.

Time- and temperature-controlled electric switch. AUGUST J. MOTT LAU (to Westinghouse Elec. & Mfg. Co.). U. S. 1,677,361, July 17.

Apparatus for automatic moisture control in storage chambers. WALLACE C. WRIGHT (to American Shoe Machinery Co.). U. S. 1,677,856, July 17.

Apparatus for indicating or controlling atmospheric humidity. W. M. TRAFTON (to American Modeling Co.). Brit. 280,821, March 23, 1927.

Apparatus for humidifying bakers' ovens, proof boxes, etc. FRANK A. ANETSBERGER and W. M. ANETSBERGER. U. S. 1,676,763, July 10.

Controlling air supplied to drying apparatus. ADOLPH W. LISSAUER (to Louisville Drying Machinery Co.). U. S. 1,676,786, July 10. The vol. of air circulated in drier is varied in accord with the temp. of the products of evapn. carried off by the air. An automatic thermostatic control device is described. U. S. 1,676,787 specifies a heat exchange app. suitable for driers.

Apparatus for compressing gases and storing and utilizing liquefied gases. STUDIENGES. FÜR GAS INDUSTRIE. Brit. 280,568, Nov. 10, 1926.

Apparatus for liquefaction of gases to obtain helium, etc. RICHARD C. TOLMAN, WILLIAM L. DELBAUER, JOHN W. DAVIS and MONTAGUE H. ROBERTS. U. S. 1,676,225, July 3.

Liquefaction and rectification apparatus for obtaining oxygen and nitrogen from air. MESSER & CO., GES. Brit. 280,581, Nov. 15, 1926.

Apparatus for transferring and transporting liquefied oxygen or other gases. STUDIENGES. FÜR GAS INDUSTRIE. Brit. 280,588, Nov. 15, 1926.

Absorption plant for gases and vapors. FRITZ ROTTMANN and FRIEDRICH BROHMMEYER. U. S. 1,677,000, July 17. An app. is described which is adapted for use in making HNO_3 , treating coke oven gases or for other purposes.

By-pass valve for gas-washing apparatus. RUDOLPH ROSNER. U. S. 1,677,148, July 17.

Safety device for acetylene gas lines. JAMES I. ANDERSON (to Air Reduction Co.). U. S. 1,677,225, July 17.

Thermostat for gas burners. CLARENCE H. HARGOOD (to The C. C. C. Co.). U. S. 1,677,340, July 17.

Thermostatic electric switch. ALFRED DANIKER. U. S. 1,677,710, July 17.

Thermostatic electric switch. ROY D. MAILEY (to Cooper Hewitt Electric Co.). U. S. 1,676,794, July 10.

Thermostatic electric switch. LOUIS A. M. PHELAN and CLIFFORD HOTCHKISS (to Absolute Con-Tac-Tor Corporation). U. S. 1,676,921, July 10.

Thermostatic electric switch. LOUIS A. M. PHELAN (to Absolute Con-Tac-Tor Corp.). U. S. 1,676,922, July 10.

Thermostatic electric switch. LOUIS A. M. PHELAN and CLIFFORD HOTCHKISS (to Absolute Con-Tac-Tor Corp.). U. S. 1,676,923, July 10.

Thermostatic control device for electric circuits. REUEL C. CHESHER (to Schlosser Bros., Inc.). U. S. 1,676,478, July 10.

Thermostatic device for control of electric circuits. HARLAN S. GANO (to Westinghouse Electric & Mfg. Co.). U. S. 1,675,340, July 3.

Thermostatic device for control of gas or other fuel burners. WILLIAMS OIL-O-MATIC HEATING CORP. Brit. 280,771, March 7, 1927.

Thermostatic valve. JEAN V. GIESLER (to Fulton Syphon Co.). U. S. 1,675,341, July 3.

Thermostatic water valve. LOUIS M. SPENCER (to General Motors Corp.). U. S. 1,675,620, July 3.

2—GENERAL AND PHYSICAL CHEMISTRY

GEORGE L. CLARK AND J. H. REEDY

- Jean-Baptiste Dumas.** C. MATIGNON. *Rev. sci.* **65**, 417-24(1926). An address, with portrait, reviewing Dumas' career. A. PAPINEAU-COUTURE.

- Recent advances in science: Physical chemistry.** R. K. SCHOFIELD. Univ. of Durham. *Science Progress* **23**, 32-7(1928).—A review of recent work on the electron theory of valence. JOSEPH S. HEPBURN.
- Recent advances in science: History of chemistry.** E. J. HOLMYARD. Clifton College. *Science Progress* **23**, 37-41(1928). Review of recent works on the history of chemistry in ancient, Arabic, medieval and later times. JOSEPH S. HEPBURN.
- History of Russian platinum.** B. MENSHUTKIN. *Ann. inst. platine* **5**, 201-6 (1927). H. G.
- Industry and science.** MARC VAN LAER. *Bull. assoc. élèves inst. sup. fermentation Gand* **29**, 192-201(1928).—An address. A. PAPINEAU-COUTURE.
- The mechanical and physical laboratories for testing metals, lime and cement at the Polytechnic Institute of the University of Grenoble.** PIERRE DEJEAN. *Rev. sci.* **66**, 46-52(1928).—Descriptive. A. PAPINEAU-COUTURE.
- The elementary chemistry courses at Princeton.** GREGG DOUGHERTY. Princeton University. *J. Chem. Education* **5**, 851-3(1928). E. H.
- New-type versus old-type [educational] tests: a comparison.** KENNETH D. DOBBS. *J. Chem. Education* **5**, 854-7(1928). E. H.
- The principle of the chemical problem.** PAUL V. MCKINNEY. WOOSTER College. *J. Chem. Education* **5**, 858-60(1928). The method of explaining to students the solution of chem. problems is discussed. E. H.
- Deceptive advertisements.** CHARLES F. MASO. Mt. St. Mary's College, Emmitsburg, Maryland. *J. Chem. Education* **5**, 876-8(1928). Dry mixts. advertised for the generation of H_2S in school and college labs. are shown to be less satisfactory than the usual $FeS-HCl$ method and to be more than 18 times as expensive. E. H.
- The fourth census of graduate research students in chemistry.** CLARENCE J. WEST AND CALLIE HULL. *J. Chem. Education* **5**, 882-3(1928). E. H.
- A study in units of volume.** K. M. PERSING. *J. Chem. Education* **5**, 725(1928). Direction sheets for prepg. 3 cardboard measures of l., cc. and qt. are shown. Students are required to construct these models outside of class periods, and the results are satisfactory in making the units real to them. W. C. EBAUGH.
- Free space numbers.** II. W. HERZ. *Z. anorg. allgem. Chem.* **171**, 14-7(1928).—The ratio of the diff. between mol. vols. at the critical temp. and at 0° abs. to the "free space" (cf. *C. A.* **19**, 1213) of 30 org. and inorg. compds. approximates 0.87. HCl is an exception, 0.714. G. B. TAYLOR.
- The preparation of optically clear selenium for use in index media.** L. T. BROWN-MILLER. *Am. Mineral.* **12**, 43-8(1927). The microscopic opaque particles which are produced in molten Se are shown to be SeO_2 . These may be removed by three distns. in a CO_2 atm. C. B. SLAWSON.
- The density of sodium azide.** E. MOLES. *Anales soc. españ. fis. quim.* **26**, 133-5 (1928).—In a previous article (*C. A.* **18**, 1217) the d. of NaN_3 was given as 1.481 to 1.483. It was found later that this was a misprint and should have been 1.841 to 1.843. Redtn. of a sample from the same source as before gave $d_4^{25} = 1.8656$ (crude) 1.844 (1 recrystn.) and 1.8443 (2 recrystns.). Further drying over P_2O_5 gave $d_4^{25} = 1.8473 \pm 0.0004$ as the most probable value. E. M. SYMMES.
- Some modern aspects of crystallography.** F. IAN G. RAWLINS. *Science Progress*

23, 106–17(1928).—A review with bibliography devoted to x-ray data, infra-red spectra, deformability of crystal units, coordination nos. and thermodynamics of assemblages.

JOSEPH S. HEPBURN

Crystal structure of α -manganese. G. D. PRESTON. *Phil. Mag.* [7] 5, 1198–206 (1928).—Laue photographs of α -manganese show that this material crystallizes in the cubic system. The oscillating-crystal method shows that the lattice is of the body-centered type, and a powder photograph gives the side of the cube as 8.894 ± 0.002 A. U. The d. is detd. to be 7.44 g./cc. Observed intensities of reflection of the oscillating crystal photographs are satisfactorily accounted for by placing the crystal in the space group T_d^2 .

GEORGE GLOCKLER

Crystal structure of β -manganese. G. D. PRESTON. *Phil. Mag.* [7] 5, 1207–25 (1928).—The β modification of Mn stable above 742° has been examd. at room temp. by the Laue oscillating-crystal and powder methods. The results show that the material crystallizes in the cubic system O_c (or O_h), the unit having a side of 6.29 A. U. and contg. 20 atoms. The groups O^6 and O^7 are enantiomorphous and indistinguishable by x-ray methods. These 2 groups are the only possible ones which can account for the observed intensities of reflection.

GEORGE GLOCKLER

X-ray investigations of SnS_2 , TiS_2 , TiSe_2 , TiTe_2 . IVAR OFTEDAL. *Z. physik. Chem.* 134, 301–100(1928). The line positions and intensities of the powder diagrams of TiS_2 , TiSe_2 and TiTe_2 can be satisfactorily explained by means of the CdI_2 type of structure. The same was also detd. earlier for SnS_2 . The dimensions of the elementary cells of SnS_2 , TiS_2 , TiSe_2 and TiTe_2 are given.

M. R. FENSKE

Röntgenographic studies on the structure of complex iron cyanides. RUDOLF BRILL AND H. MARK. *Z. physik. Chem.* 133, 443–55(1928).— $(\text{NH}_4)_4[\text{Fe}(\text{CN})_6]$ and 8 of the substances resulting from its step wise reduction at 400° with time were subjected to diffraction analysis. Three cryst. phases were found, and in some cases many more. Besides the initial compd. and the final α -Fe, another compd. certainly was $(\text{Fe}(\text{CN})_2)_n$, cubic, $d_{100} = 15.9$ A. U., mol. formula $(\text{Fe}(\text{CN})_2)_3 = \text{Fe}_3[\text{Fe}(\text{CN})_6]$. Hence the reduction mechanism must be $(\text{NH}_4)_4[\text{Fe}(\text{CN})_6] \rightarrow (\text{Fe}(\text{CN})_2)_3 \rightarrow$ intermediate carbinides, nitrides, etc., $\rightarrow \alpha$ -Fe.

G. L. CLARK

Röntgenographic researches on iron catalysts for ammonia synthesis. O. EISENHUT AND E. KAUPP. *Z. physik. Chem.* 133, 456–71(1928), cf preceding abstract.—The Debye-Scherrer method of powder analysis was used for catalysts which were prepd. according to the patent of the B. A. S. F., Ger. 249,447, and from complex Fe salts $\text{KAlFe}(\text{CN})_6 + x\text{KCl}$. All of these showed principally pure α -Fe, independently of the method of formation or use. The B. A. S. F. catalyst consisted primarily of Fe_3O_4 in the beginning. The catalyst from the complex salts after reduction also contained Fe_3N , Fe_3C , C, etc., in small quantities.

G. L. CLARK

The form of the carbon atom in crystal structure. I. E. KNAGGS. Davy Faraday Lab., Royal Institution. *Nature* 121, 616–7(1928).—Objections are raised to the conclusion of Gerstaecker, Moller and Reis (*C. A.* 22, 2089) that the crystal structure of pentaerythritol tetraacetate has the space-group C_{4h}^2 with the tetragonal lattice Γ_4 . Their assumption of a simple four-fold axis of symmetry, with the bonds from the central C atom directed towards a square base is regarded as improbable. Independent exptl. work by K. has led to the conclusion that the space-group is C_{4h}^4 and the symmetry a four fold alternating axis. This is in keeping with the usual space-relations of the C atom. The exptl. decision between the space-groups C_{4h}^2 and C_{4h}^4 depends on the absence or presence of all odd-order reflections from the (001) plane. Only the second order is found, the first order being definitely absent. First-order reflection from the (001) plane was reported by G., M. and R. From their data it is not possible to det. to which plane the reflection was due, nor to rule out the possibility of its being the Cu-K β reflection from the (011) plane. Dimensions of the unit cell are given which do not agree well with those given by G., M. and R. They are $a = 11.98$ A. U., $c = 5.47$. By taking the d. as 1.273, this gives the number of mols. in the unit cell as 1.99.

F. A. JENKINS

The crystal structure of thiourea. LÁSZLÓ DEMÉNY AND ISAMU NYITA. Inst. of Phys. and Chem. Research, Hongo, Tokyo. *Bull. Chem. Soc. Japan* 3, 128–36(1928).—The cryst. structure of $\text{CS}(\text{NH}_2)_2$ has been detd. by the Laue photographic and x-ray spectrometric methods. The unit of structure built upon the simple orthorhombic translation group Γ_0 , is of the dimensions $a = 5.47$, $b = 7.64$ and $c = 8.5$ A. U. and contains 4 mols. The density is 1.408. The plausible space group being Γ_1^{16} , a possible atomic arrangement, neglecting H atoms, is as follows:
 $4C|u, v, 0; -u, \frac{1}{2} - v, \frac{1}{2}; \frac{1}{2} - u, \frac{1}{2} + v, 0; \frac{1}{2} + u, -v, \frac{1}{2}|$ with $u = 0.186$,
 $v = 0.144$;

4S{u, v, 0; -u, $1/2 - v$, $1/2$; $1/2 - u$, $1/2 + v$, 0; $1/2 + u$, -v, $1/2$ } with $u = -0.095$, $v = 0.270$

and $8N \begin{cases} x, y, z; -x, $1/2 - y$, $1/2 + z$; $1/2 - x$, $1/2 + y$, -z; $1/2 + x$, -y, $1/2 - z$; \\ -x, $1/2 - y$, $1/2 - z$; x, y, -z, $1/2 + x$, -y, $1/2 + z$; $1/2 - x$, $1/2 + y$, z. \end{cases}$ with $x = 0.300$, $y = 0.164$ and $z = 0.144$. The mol. has the symmetry of C_{2v} , it has one plane of symmetry in it. In such a model, the distance C-S is 1.81 Å, U, and C-N is 1.39 Å. U. Discussion is given of the cryst and mol. structures in comparison with those of urea.

A. L. HENKE

The crystal form of urea nitrate. ALBRECHT HESTERMANN. *Z. Biol.* **86**, 561-8 (1927).—The crystals are neither hexagonal nor rhombic. They are usually monoclinic. The usual hexagonal forms show (in converging light between crossed Nicol prisms) the biaxial interference figure. The rhombic forms are "Klinopinakoid" crystals.

FRANCES KRASNOW

The order of magnitude of the ideally built-up lattice regions in actual crystals.

A. SMEKAL. *Ann. Physik* **83**, 1202 (1927); *Science Abstracts* **31A**, 7. Attention is called to the high values found for the magnetic moment of certain liquid crystals, which indicate the existence of carriers made up of from 10^4 to 10^5 mols. S has, on various ground, upheld the theory that solid crystals are built up of elements of about this size, in which the mols. are arranged ideally. A no. of facts connected with photo-electric sensitiveness, phosphorescence and elec. cond. point to the existence of these ideally built structural units. Other phenomena which may depend on them are the change in size of grain in metals due to a small trace of impurity, the fact that the action of Lenard's phosphores depends on an optimum value of the amt. of added heavy metal, some of Kohlschütter's topochem. reactions, and perhaps the structure of "high molecular" org. substances.

JOSEPH S. HERRICK

The gaseous condition of normal substances. KURT WOHL. *Univ. Berlin. Z. physik. Chem.* **133**, 305-49 (1928).—A Wohl's equation of condition, $p + \{a f_1(T)/v(r-b)\} = \{c f_2(T)/(r-b)\} = RT$ (cf. *C. A.* **16**, 868), holds for normal substances below the crit. temp. for the entire stable gaseous condition with an error of 1% for pressure; at the crit. temp. to the crit. vol. and below $T = 2.53T_c$, the vol. approaches $v_c/4$ as a limit. Above the crit. temp. the formula applies within an error of 2% for pressure with a limit which varies between r_c and $1.1r_c$ for $T_c = 175.1^\circ$. Isopentane, Et_2O and CO_2 can be represented by the equation, and C_2H_6 by a slight change in the temp. function of the 3rd member, also falls within the limit $\pm 2\%$. The current belief that SO_2 is assocd. in the gaseous condition is found to be in error. The 2nd virial coeffs., a measure of the deviation of the gas from the ideal condition, in the reduced condition agree very well with each other. For CO (0.198), CH_2Cl_2 (0.385-115%) and HCl , N_2O , C_2H_2 , C_2H_6 , C_2H_4 , Me_2O , Cl_2 , SO_2 , the calc'd. values agree well with those det'd. exptly. in the range $0.8T_c$ to $2.5T_c$. Below $0.8T_c$ the abs. values of the coeff. falls more rapidly with temp. than is indicated by the equation. From his investigation W. concludes that the theorem of corresponding states has the same form from the highly attenuated state to the crit. d. The normal substances included in the study extend from those of quadrupolar mols. to those with high dipolar moment. It is not the high dipolar moment of an associating substance which is characteristic, but rather the preponderance of the polarizing effect due to the fixed dipolar moment over that due to the shifting of the electrons and atoms. As a consequence, the theories of Keesom and Falkenhagen are not in agreement with the expts. with normal substances.

E. R. S.

Measurement of the kinetic heat effect in air, hydrogen and argon. K. RECKNER. *Ann. Physik* **85**, 831-65 (1928).—If a directional motion is superimposed mechanically upon the unidirectional motion of the mols. of a gas due to its temp., both the translatory and rotatory energies of the mols. act upon a thermometer or pyrometer in the same manner, provided the free path of the gas mols. is greater than the linear dimensions of the thermometer. This effect is known as the *Garde effect* or *kinetic heat effect*, and its mechanism is thoroughly studied in connection with a mol. air pump, the temp. being measured in a high vacuum (rotated at from 2500 to 4000 r. p. m.) by means of a

pyrometer consisting of 12 Cu constantan elements. The temp. difference between the mols. as they approach the surface of the thermoclement and after they are repelled divided by the temp. difference between the approaching mols. and the surface itself, gives what is known as the accommodation coeff. (a). This depends upon the mol. wt. of the gas and the character of the surface, but is independent of the material of which the surface is composed. The rougher the surface the more nearly a approaches the upper limit of 1. Detn. of a gave the following results for air, $0.938 \pm 0.4\%$; for H_2 , $0.434 \pm 0.3\%$, for A, $0.789 \pm 0.3\%$. In measuring the kinetic heat effect at very low pressures, the accommodation coeff. consists only of the translatory temp. motion and is designated by a_1 , the rotatory accommodation coeff. being designated a_2 . With A, a monatomic gas, a and a_1 are identical, while with polyatomic gases this is not so and a_2 is also different from a_1 . For air, measurements give for $a_1 = 0.94$ and for $a_2 = 0.52$, while for H_2 , $a_1 = 0.43$ and $a_2 = 0.20$. The results thus show that for polyatomic gases $a_2 < a_1$ and the equalization between the surface temp. and the translation temp. is more complete than the equalization between the surface temp. and the rotation temp. of a gas.

H. STOERTZ

Characteristics of homogeneous exothermic gas reactions. ROBERT N. PEASE AND PAUL R. CHESBRO. *Proc. Nat. Acad. Sci.* 14, 472-5 (1928). The rates of reaction of such gases as CH_4 and H_2 with O_2 may be greater in an empty reaction tube of Pyrex glass than in a tube filled with broken Pyrex, although the latter should favor the surface reaction. This result was more pronounced after poisoning. The explanation is believed to lie in the development of reaction centers in the body of the gas. These reactions are all exothermic. Newly formed mols. of products possess not only the energy subsequently to be liberated as reaction heat but also the original heat of activation of the reacting mols. The energy thus accumulated probably leads to the development of miniature explosion waves which, if unhindered, produce cumulative effects. When the tube is filled with broken glass the development of such reaction centers is limited because the available vol. is decreased and the bits of glass act as temporary reservoirs for the excessive energy of reaction centers. These conclusions are also in accord with the exptl. results of Hinshelwood and Thompson (*Proc. Roy. Soc.* 118A, 170 (1928)).

E. R. SMITH

The laws of expansion of gases and vapor tension. A. AMERIO. *Nuovo cimento* [N. S.] 5, 39-40 (1928). The historical development of these laws. L. T. FAIRHALL

Diffusion of hydrogen through iron. W. E. DEMING. *Phil. Mag.* [7], 5, 1081-4 (1928). The usual method of studying diffusion of gases through material bodies has been to apply a pressure P on one side and to make the pressure on the other side of the slab equal to zero. This procedure does not permit distinguishing between the two theoretical equations $x \text{ vol.} = K_1 A t (P_1 - P_2)^{1/2}$ and $x \text{ vol.} = K_2 A t (P_2 - P_1)^{1/2}$, where m = amt. of gas, x = thickness, t = time, A = area, P_2 and P_1 are high and low pressure, α and K are consts., because for $P_1 = 0$ the two equations become identical. D. GEORGE GLOCKLER

The molecular structure of liquids and solids. G. ANTONOFF. *Bull. soc. chim.* 43, 163-77 (1928). A crit. study of the variation in vapor pressure and other properties as a function of temp. in systems in which one or more condensed phases are present, leads to the following conclusion: The number of mols. per unit vol. is the same in two or more phases in equil. The degree of assocn. κ of a liquid can therefore be calcd. from the vapor density d_v and the liquid density d_l as $\kappa = d_l/d_v$. A close study of the variation of d_l of liquids with temp. shows discontinuities corresponding to changes in the degree of assocn. Over a temp. range from the crit. point down, A. calcs. the following values for κ for EtOAc and PrOH, resp.: 2, 6, 18, 36, 144, 864 and 2, 12, 36, 144. Similar results are obtained with SO_2 , CO_2 and the monatomic gases at low temps. These facts do not confirm the difference between normal and assocd. liquids, since there is no marked dissimilarity between EtOAc and PrOH. The theory applies probably also to the case of solids. G. CALINGAERT

Vapor pressures of binary systems. ALFRED W. PORTER. *Trans. Faraday Soc.* 25, 343-7 (1929). P. discusses the application of the law of Duhem Margules to the vapor pressure of binary systems. Data on water-sugar and water-KCl solns. are utilized to illustrate the relations derived. C. H. GREENEWALT

The vapor pressure of single substances and binary mixtures. Vapor pressure of mercury and graphite. J. J. VAN LAAR. *Z. anorg. allgem. Chem.* 171, 42-60 (1928).—A. Vapor-pressure equations are derived theoretically. B. Vapor pressure of mercury in mm. is given by equation $\log p = -(3167/T) + 7.985 - 0.000135 T$ from -40° to $+800^\circ$. From formulas and other data the crit. consts. are 1480° and 1150 atm. to $+800^\circ$. For graphite the calcd. m. p. is $3850^\circ K.$, b. p. $5300^\circ K.$, crit. temp. $8000^\circ K.$ and C.—For graphite the calcd. m. p. is $3850^\circ K.$, b. p. $5300^\circ K.$, crit. temp. $8000^\circ K.$ and

critical pressure 1500 atms - *D.* Polemical against Weissenberger on vapor pressure of binary mixts. *G. B. TAYLOR*

Boiling-point curves of mixed liquids. ROY R. DENSLOW. *J. Chem. Education* **5**, 727-32(1928). - Because of the simplicity of app., speed of operation, use of small amt of liquid and fair accuracy, the b. p. method of Siwoloboff (*Ber.* **19**, 795(1886)) was adopted. It consists in placing about 0.5 cc. of the liquid in a small fairly thin-walled tube (made from 6-mm. tubing) which, with a thermometer, is immersed in a well-stirred bath of a suitable heating liquid. In the liquid under examn. is placed a capillary tube about 2 cm. long and 1 mm. diam., open at the bottom and closed at the top. With the capillary in the liquid, the bath is heated with const. stirring until a rapid stream of bubbles comes from the capillary. The outer bath is then allowed to cool (with const. stirring) and when the bubbles cease and the liquid starts to suck back, the thermometer is read, giving the b. p. With 5-cc. samples of one liquid, mixts. contg. 0, 20, 40, 60, 80 and 100 mol. % of the other are prepd. B. p. detns. on such solns. are then made rapidly and the results plotted (temp. against % compon.). the graphs show the possibility of sepg. benzene-toluene and ether-EtOH solns., as they approach ideal b. p. curves, and the impossibility of sepg. CHCl_3 - Me_2CO and CHCl_3 - MeOH solns., since they show a max. and a min. b. p. curve, resp. If a class is divided into sections this expt., taking only one lab. period, illustrates the meaning of mol. %, gives practice in calcg. with it, illustrates an important method for detg. b. p. of pure liquids and mixts., the relation between vapor pressure and external pressure when the liquid is at the b. p. and when superheated, the difference between ideal solns. and others, and the behavior of 3 types of binary mixts. of miscible liquids; at the same time it gives data with which to prep. temp.-compu. diagrams for such 2 component systems. *W. C. E.*

Contribution to the study of molecular forces. I. The variation of the vapor pressure of a few liquids produced by gases under high pressure, and its relation to the van der Waals constant a_2 . A. ECKEN AND F. BRISLEF. *Z. Physik. Chem.* **134**, 230-42(1928). The increase in vapor pressure of a liquid in the presence of a compressed gas affords a simple method of computing the van der Waals constant of attraction between mols. of different species. The vapor pressure of CS_2 under increasing pressure of CO_2 , N and H is measured by means of an interferometer. Values of a_{12} for these and other substances are calcd. from the author's own data as well as for some from the literature. The Bertholet equation relating the mutual mol. attraction a_{12} to the individual mol. attractions a_1 and a_2 , $a_{12} = \sqrt{a_1 a_2}$, applies satisfactorily to the diatomic gases. *G. CALINGAERT*

Heat transmission of liquids flowing through tubes. L. SCHILLER AND TH. BOCKBACH. *Physik. Z.* **29**, 340-2(1928). From theoretical considerations, it is calcd. that $ad/\alpha_w = 0.0395 (\sqrt{d\rho_w/\lambda_w})^{0.75}$. This equation resembles the empirical Nusselt equation: $ad/\alpha_w = 0.0292 (\sqrt{d\rho_w/\lambda_w})^{0.85}$. Exptl. facts are better represented by $A. L. BENNE$

Measurement of diffusion constants in liquids. G. VON BÉKEV. *Physik. Z.* **28**, 812-4(1927). An interferometric method is described for the measurement of diffusion constants of liquids; data are cited relating to aq. 0.25 N carbamide and water, and to aq. 0.25 N KCl and water, which show that the accuracy of the method is approx. 0.1%. *B. C. A.*

The action of magnetic, electric and mechanical forces upon mesophases. H. ZOCHER. *Physik. Z.* **28**, 790-6(1927). A new statistical definition of mesophases is given. The latter comprise the systems known as "liquid crystals" or "anisotropic liquids." Only in the case of enantimorphous systems can a magnetic field induce an elec. polarization. The elec. anisotropy depends upon the chem. constitution. A derivation of mechanical characteristics of mesophases is given together with a mathematical detn. of equl. in a magnetic field with consideration of mechanical hindrances. The existence of an orientation owing to an anisotropic inner friction has been confirmed by expts. *EMIL KLARMANN*

Cohesion and intermolecular repulsion. R. K. SCHIFFIELD. *Phil. Mag.* [7], **5**, 1171-6(1928). The cohesion in a number of highly compressed liquids and gases has been calcd. over a wide pressure range. As the vol. is reduced the cohesion first increases to a max. and then decreases. The results cannot be reconciled with the view that mols. resemble rigid spheres, but are readily accounted for on the view that the force between two mols. is repulsive when they are very near together, and attractive when they are further apart. *GEORGE GLOCKLER*

The dipole momentum and the anisotropy of liquids. J. EMERT AND H. V. HARTER. *Physik. Z.* **28**, 786, 90(1927). The directive mol. forces cannot in a first approximation

be derived from dipole forces. Better results are to be expected by a further mathematical development of the general premise of Oseen (cf. *C. A.* 19, 1646). E. K.

Some experiments on intensive drying. RONALD H. PURCELL. *J. Chem. Soc.* 1928, 1207-15.—The effect of removing the last traces of water from the reactants in the reduction of the oxides of Cu, Bi, Hg and Ag by CO is described. With Cu and Bi oxides the temp. required for reaction increased with the time of drying up to 425-30°. When this max. was reached further drying had no effect. Either these oxides react with CO at 430° in the absence of water or appreciable amts of water are given off by the glass app. or by the oxides at that temp. With HgO and Ag₂O no change in the rate of reduction was observed with drying for as long as 6-8 months. The effect of other substances as catalysts in the absence of water on the reduction of CuO with CO was studied. Et₂O, EtOH and C₂H₆ appeared to catalyze the reaction to some extent but not so efficiently as water. SO₂ and Br₂ had no catalytic effect. The org. liquids may have undergone incipient decompn. with CuO or they may not have been sufficiently dried. The reduction of CuO with H₂ was not affected by drying nor was the formation of HgO from Hg and O₂. J. S. REICHERT

Separation of binary liquid mixtures by silica gel. I. H. G. GRIMM AND H. WOLFF. *Z. angew. Chem.* 41, 98, 103 (1928).—An investigation of the efficiency of processes involving silica gel in effecting a sepn. of binary liquid mixts. which cannot be sepd. by fractional distn. Three methods have been investigated. The first consists in allowing the liquid mixt. to percolate through a column of gel. In the second method the liquids are boiled and the vapors passed into a fractionating column packed with gel. In the third method the fractionating column is surrounded by a vapor jacket, so that both substances are maintained in the vapor phase. Liquid retained by the gel is recovered by heating to about 250° and collecting various fractions. The gel is regenerated by heating at 250-300° in a vacuum. The present measurements have reference to the mixt. of EtOH (15.85%) and CCl₄ (84.15%) of min. b. p. The comps. of the various fractions were detd. refractometrically. In all cases the first fractions consist almost entirely of CCl₄. The degree of sepn. increases with decreasing grain size, decreasing size of pores, and increasing diam. of the column used. With a gel of fine grain and having narrow pores, about 60% of pure CCl₄ was obtained by the percolation method. The sepn. effected under comparable conditions by the 3 methods are roughly the same. On account of its simplicity the first method is to be preferred. II. H. G. GRIMM, W. RAFFENBUSCH AND H. WOLFF. *Ibid.* 104-7.—The sepn. effected when certain binary mixts. of various org. liquids are allowed to percolate through a column of silica gel have been investigated. When the heat changes produced by wetting silica gels with the components of the binary mixts. are compared with the results of the percolation expts. it is found that the component producing the greater heat effect is most strongly adsorbed and that the degree of sepn. increases with increasing difference between the heats of wetting. The heat of wetting is influenced by various factors, e. g., grain size, size of pores. The following values (g.-cal./g. of gel) refer to a gel of grain size 0.2-0.5 mm. having very narrow pores: cyclohexane, 6.25; hexane, 6.5; CCl₄, 7.3; chloroform, 10.9; toluene, 11.3; benzene, 11.3; propyl alc., 20.8; water, 20.95; MeOH., 22.95; EtOH., 23.7. A gel having much wider pores gave values about 50% smaller. Addn. of small quantities of EtOH to CCl₄ produces a remarkable increase in the heat of wetting, addn. of 0.125% of alc. raising the heat of wetting to a value which is approx. the arithmetic mean of the values for the 2 components. B. C. A.

Diminution of index of refraction and density in binary liquid mixtures. L. COUSNON. *Arch. sci. phys. nat.* 10, 136-41 (1928).—A mathematical proof is given that the changes in n and d are of the same sign for binary liquid mixts. C. H. G.

Some miscibility relations of acetic anhydride. DAVID C. JONES AND HAROLD F. BETTS. *J. Chem. Soc.* 1928, 1177-92.—Solv. curves were detd. for binary systems composed of Ac₂O with C₂S₆ (I), cyclohexane (II) and decane (III). Based on calcd. internal pressures Ac₂O should be completely miscible with these solvents. The concn. by wt. of Ac₂O at the crit. soln. temp. is as follows: for I, 36.17% at 29.83°; for II, 47.33% at 52.45°; for III, 52.11% at 85.50°. The mean concn. curves for Ac₂O with I and II are straight lines, while with III it is slightly curved though it intersects the soly. curve at the crit. concn. point. In the phase rich in the less polar constituent these systems show a good agreement of the soly. values with the theory of corresponding states. The position of Ac₂O in the internal pressure series is considered in relation to its soly. The influence of HOAc on the crit. soln. temp. of Ac₂O with I, II and III was in no case greater than 1° for 5% of HOAc. J. S. REICHERT

Some physical properties of acetic anhydride and related substances and their

constitutional significance. DAVID C. JONES. *J. Chem. Soc.* **1928**, 1193-1200. —The lowering of the f. p. of cyclohexane and benzene by Ac_2O was detd. For cyclohexane the ratio of mols. found/mols. calcd. varies from 1.09 to 2.67 for concns. of 0.335 to 5.33 g./100 g. solvent. Only the results for very low concns. are regarded as true values for the mol. wt. of Ac_2O in this solvent. The increase in values with increasing concns. probably is a pos. deviation from Raoult's law. For benzene the mol. wt. is normal up to a concn. of 3.8% with a slight tendency to increase in the higher concns. The temp. coeff. of mol. cohesion and of mol. surface energy for Ac_2O , CS_2 , PhNH_2 , and cyclohexane are normal whereas HOAc gives about half the calcd. values. The parachor and the constitution of HOAc , Ac_2O and EtOH are discussed. Since the associated OH groups in ales. are more polar than the ethereal oxygen Et_2O is more sol. in the satd. hydrocarbons than EtOH . The assocd. HOAc is less polar than Ac_2O and consequently is less sol. The following groups are arranged in the decreasing order of their effect on soly. in water: $\text{COH} > \text{CO} > \text{CHOH}$, $\text{CHOH} > \text{O} > \text{O} > \text{O}$, there being little difference between CO and OH . J. S. REICHERT.

The capillary action of mercury in the absence of gas-grown skins. I. J. MANLEY. *Phil. Mag.* **37**, 5, 958-962 (1928). —After removal of the adsorbed layer of gases from a barometer tube the curvature of the Hg lessened. Hg wets a perfectly clean glass surface like other liquids, although there is no liquid film of Hg remaining on the gas-free glass-surface that has been in contact with Hg. GEORGE GLOCKLER.

The surface layer of liquids and the size of molecules. SERGIUS G. MOKRISHIN. *J. Phys. Chem.* **32**, 879-884 (1928). —Ostwald's equation, connecting the heat of evapn., λ , with surface tension, σ , and the area of liquid surface A , $\lambda/2 = \sigma A$, has been used to calcg. the diam. of a mol. The application of this equation to such a calcn. is open to objection because of the lack of data on the shape of mols. and the structure of surface layers of liquid. Fresh support is adduced for the correctness of the author's formula for calcg. the diam. of mols. cf. *C. I.* **19**, 594. From theoretical considerations the surface layer of liquid should have a smaller d. than the main liquid. R. L. DOTY & E.

A colloidal theory of surface tension. SATYENDRA RAY. *Kolloid Z.* **45**, 9-12 (1928). —The consequences of molecular orientation in liquids on surface tension phenomena are discussed. J. G. McNALLY.

Adsorption at crystal-solution interfaces. III. Individual macroscopic ammonium alum crystals grown in presence of gelatin and dyes. G. W. BENNETT AND W. G. FRANCE. Ohio State Univ. *J. Exp. Chem.* **11**, 571-584 (1928). cf. *C. I.* **21**, 35608, 37890. The present work covers a study of adsorption of dyes, gelatin, and amino acids by the various faces of NH_4 alum. The growth ratios of this alum were detd. both with and without these foreign substances. Adsorption was found only at the cube faces and was specific in character. The effects are explained on the basis of residual valences, polar groups and interionic distances in the crystal lattice. Extending these ideas to the study of flocculation of suspended sols is suggested. The growth ratio $V_{100} : V_{111}$ for pure ammonium alum was found to be 1.53. C. H. KERR.

Sorptive power of lignin. E. WIEBERKIND AND G. GARBE. *Z. anorg. Chem.* **41**, 107-112 (1928). Lignin is a gel carrying a neg. charge capable of adsorbing alkalis, NH_3 and basic dyes. The sorption is irreversible and hence indicative of subsequent formation of compds., probably of a mol. type. The quantity of substance taken up depends on various factors (water content of the lignin, duration of the process, etc.). H_2SO_4 and HCl are also fixed, the latter acid by most lignin only, formation of solid solns. being followed by a chem. combination. Lignin takes up considerable quantities of I. Of the amt. taken up only a fraction can be removed by thiosulfate. The fact that the soln. of I. acquires no measurable acidity, even on long keeping in contact with lignin, indicates that there is no substitution of H in the lignin mol. by I, but rather the satn. of some unsatd. linking. Neutral salts are not adsorbed, although there is considerable sorption of KHSO_4 . Three types of lignin were used, obtained by Willstätter's method from oak, beech, and a wood of Japanese origin, resp. The sorptive powers were, in general, very similar. B. C. A.

The color produced by iodine in the presence of starch. E. ANGELESCU AND J. MIRESCU. Inst. chim. agr., Bucharest. *J. chim. phys.* **25**, 327-42 (1928). No expts., whether carried out by the present or former authors, demonstrate the formation of a chem. compd. between iodine and starch. Harrison's hypothesis, that I forms a colloid soln. protected by starch is erroneous because in the presence of cholic acid, the color appears at the time the acid saps from the soln. as a colloid, and the protective power should have reached a max. when the acid was in true soln. The coloration of *mol. starch* or cellulose by I cannot be regarded as a protection phenomenon. A more plausible explanation is based on *adsorption*. The blue color characterizes iodine,

not starch; other colloids give it also. The role of KI has been explained as follows: KI transforms I in I_2 ; the latter is easily adsorbed by starch, whereas I is only little adsorbed, and KI not at all. KI has also a physical effect, increasing the dispersion of starch; it intensifies the blue color, beyond a certain concn it changes the blue into purple.

A. L. HENNE

Adsorption from solution by ash-free adsorbent charcoal. V. ELROY, J. MILLER AND SELMA L. BANDEMER. *J. Phys. Chem.* **32**, 829-42 (1928); cf. *C. A.* **21**, 3147.—An attempt was made to det. the isoelec. point of charcoal by measuring its adsorption from buffer solns. Unpurified charcoals gave anomalous results. Purified ash-free blood charcoal decreased the acidity of acid buffer mixts. by adsorption of the acids, and increased the alk. of the less alk. buffers through hydrolytic adsorption of acid from salts, with the liberation of alkali. From the results it is certain that the method of adsorption from buffer solns. cannot be used for the detn. of the isoelec. point of charcoal.

R. L. DODGE

Extraction of iodine from weak iodine-water solutions. O. YU. MAGIDSON. *Scientific Chem. Pharm. Inst. J. Chem. Ind. (Moscow)* **4**, 3-8 (1927).—M.'s method consists in acidifying weak I ion solns. by H_2SO_4 , treating them with a nitrite to liberate I_2 , and bringing them in close contact with an adsorbent by means of filtration, mixing, etc. The adsorbent contg. I is sep'd from the soln. and treated chemically first for the retransformation of I into the ion state, and finally for the recovery of the adsorbent in its previous condition. $2I^- + 2H^+ \rightarrow O_2 + H_2O + I_2$; $I_2 + \text{adsorbent} \rightleftharpoons (I_2 \text{ adsorbent})$; $(I_2 \text{ adsorbent}) + H_2O + SO_2 \rightarrow 2I^- + 2H^+ + SO_4^{2-} + \text{adsorbent}$. If the adsorbent is well selected, an I concn. 200-300 times as great as that of the original soln. is obtainable, and the usual chem. treatment for sep'n. of I can be employed. Various adsorbents have been tried, particularly charcoal, solid starch, different kinds of cellulose, albumins. The best results were obtained by filtering acidified weak I waters with liberated I through a layer of potato starch. The starch contg. I is then treated with an acid soln. of sulfite which exts. the I and passes it into soln.: $I_2 + 2NaHSO_3 + H_2O \rightarrow 2HI + Na_2SO_4$. (The starch which is thus regenerated is used again for another adsorption of I.) When the concn. of I in the new soln. reaches 0.5% and over, the soln. is oxidized by the addn. of about 250 g. of permanganate per 1 kg. of dissolved I, and this permits the sep'n. of crystals of I. This method was tried on waters of some Russian lakes contg. I salts in very dil. soln., and its applicability for economic large scale I extns. has been demonstrated. The expense in the cost of H_2SO_4 used represents 84% of the total expense of all materials employed and of the elec. energy consumed. Tables and diagrams are given.

BERNARD NELSON

The application of our adsorption equation. M. N. CHAKRAVARTI AND N. R. DHAR. *Kolloid Z.* **45**, 12-21 (1928). The adsorption equation given by C. and D. (cf. *C. A.* **22**, 1073) is in closer agreement with exptl. values given by other authors than the logarithmic equation. The following cases of adsorption are considered: various Ag salts by AgI , acids and alkali by humic acid, acids and AsO_4^{3-} by $Fe(OH)_3$, HCl by animal membranes, $HIOAc$ by carbon, I_2 by charcoal and ions of different valence by $BaSO_4$ and charcoal. Results with $BaSO_4$ indicate an adsorbed layer not greater than one mol. thick.

J. G. McNALLY

The influence of a few colloidal substances on the velocity of absorption of carbon dioxide by sodium carbonate solutions. PAUL RIGU AND LEON LORTIE. *Compt. rend.* **186**, 1543-6 (1928). Peptone, pepsin, gelatin or starch was added to Na_2CO_3 solns. The velocity with which CO_2 is absorbed by these solns. decreases first very rapidly. As soon as a 1/1000 concn. of the colloid is reached, a further addn. no longer influences the CO_2 absorption velocity. The new velocity is then about 2% of the initial one.

A. L. HENNE

The rate of absorption of sulfur dioxide by alkaline solutions. PAUL RIGU AND P. A. BÉRARD. *Compt. rend.* **186**, 1433-6 (1928). The effect of temp. and concn. on the rate of absorption of SO_2 by milk of lime has been detd. The rate of absorption was found to increase with decrease of temp. and increase of concn. over the range 5-55° and 0-13.6 mol. % $Ca(OH)_2$.

C. H. GREENEWALT

The adsorption kinetics for molecules attached at more than one point. ROBERT E. BURK AND DAVID C. GILLESPIE. *Proc. Nat. Acad. Sci.* **14**, 470-2 (1928). The atoms of an adsorbed mol. should be considered to be separately attached to individual atoms of the surface. If the atoms of P mols. of A-B were thus attached the rate at which they would be desorbed is $PM^{\alpha+\beta}e^{-(E_A+E_B)/RT}$ ($\alpha + \beta$), where M is the vibration rate of the underlying surface atoms, E_A and E_B are the energies necessary to break the adsorption bonds and α and β are the av. times that A and B, resp., are loose before returning to the surface. If the mols. were attached by a single point the rate of desorption would

be $2PMe - E_T/RT$, where E_T is the energy involved in the single bond. Singly and doubly attached bonds would thus come off at equal rates only if $M(\alpha + \beta) = 2$. Such a kinetic complexity may be related to the rough proportionality between the assocn. of substances and their b. ps.

E. R. SMITH
